essential fatty acid (EFA), a polyunsaturated acid, such as linoleic, alpha-linolenic, and arachidonic acids, essential in the diet for proper growth, maintenance, and functioning of the body. EFAs are prostaglandin precursors that play important roles in metabolism. They are also necessary for the normal functioning of the reproductive and endocrine systems and the breaking up of cholesterol deposits on arterial walls. The best dietary sources are natural vegetable oils, such as soy and corn oils; margarines blended with vegetable oils; wheat germ; edible seeds, such as pumpkin, sesame, and sunflower; and fish oils, especially cod liver and other fish body oil. Although rare, a deficiency of EFAs causes changes in cell structure and enzyme function, resulting in decreased growth and other disorders. Symptoms include brittle and lusterless hair, nail problems, dandruff, allergic conditions, and dermatoses, especially eczema in infants. Also excessive amounts may reduce the level of vitamin E in tissues and cause other metabolic disturbances.

essential fever, fever occurring in absence of a known infectious disease.

essential hypertension, an elevated systemic arterial pressure for which no cause can be found. It is often the only significant clinical finding. Individuals with elevated blood pressure are at risk for cardiovascular disease. In examining patients with essential hypertension, clinicians consider the complex mechanisms that control blood pressure, such as the arterial baroreflex, body fluid regulators, the renin-angiotensin system, and vascular autoregulation. Also called **primary hypertension.** See also **benign hypertension, malignant hypertension.**

essential mixed cryoglobulinemia, a rare condition characterized by deposition of type II cryoglobulins without a detectable cause, inducing cutaneous vasculitis, synovitis, and glomerulonephritis. See also **cryoglobulin.**

essential nutrients, the carbohydrates, proteins, fats, minerals, vitamins, and water necessary for growth, normal function, and body maintenance. These substances must be supplied by food because most are not synthesized by the body in the quantities required for normal health.

essential oils, a class of generally aromatic volatile oils; the essences extracted from plants for use in flavoring foods, perfumes, and medicines. Some essential oils have been used therapeutically for thousands of years.

essential pruritus [L, *essentia,* quality, *prurire,* to itch], localized or general pruritus that begins without a preexisting skin disorder.

essential thrombocythemia, A myeloproliferative neoplasm characterized by extreme thrombocytosis. Approximately 50% of essential thrombocythemia cases are characterized by presence of the JAK2 mutation. See **thrombocytosis.**

essential tremor, an involuntary fine shaking of the hand, the head, and the face, especially during routine body movements. It is a familial disorder inherited as an autosomal-dominant trait and appears during adolescence or in middle age, slowly progressing as a more pronounced disorder. The precise cause of this condition is not known. Essential tremor is aggravated by activity and emotion and can be reduced in some patients by the administration of mild sedatives, such as propranolol and diazepam, or with alcohol consumption. Also called **benign essential tremor, familial tremor.** Compare **parkinsonism.**

essential vertigo [L, *essentia,* quality, *vertigo,* dizziness], a form of vertigo for which no organic cause has been found.

EST, abbreviation for **electric shock therapy, electroshock therapy.** See **electroconvulsive therapy.**

established name, the name assigned to a drug by the U.S. Adopted Names Council. The established name, generally shorter than the chemical name, is the name by which the drug is known to health practitioners. Also called **generic name.** See also **chemical name, trademark.**

Estar, a trademark for a coal tar preparation used to treat eczema and psoriasis.

estazolam /estaz′olam/, a benzodiazepine used as a sedative and hypnotic in treatment of insomnia, administered orally.

ester /es′tər/ [Ger, *Essigäther,* acetic ether], a class of chemical compounds formed by the bonding of an alcohol and one or more organic acids, with the loss of a water molecule for each ester group formed. Fats are esters, produced by the bonding of fatty acids with the alcohol glycerol.

esterase /es′tərās/, any enzyme that splits esters.

esterification, the process of combining an organic acid (RCOOH) with an alcohol (ROH) to form an ester (RCOOR) and water.

esterified estrogen /ester′ifīd/, an ester of natural estrogen.

■ INDICATIONS: It is prescribed for menstrual irregularities, contraception, and menopausal symptoms.

■ CONTRAINDICATIONS: It should not be used in anticipation of cardiovascular benefits because results from a clinical trial (HERS) found that its use was associated with an increased risk of unstable angina and myocardinal infarction. Pregnancy, known or suspected breast cancer, thrombophlebitis, vaginal bleeding of unknown origin, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are gallbladder disease, thromboembolic disease, and a possible increase in risk of cancer.

esterify, to convert into an ester.

ester local anesthetic, a class of local anesthetics with an ester chemical group that differentiates it from the amide group of local anesthetics. Ester local anesthetics include **benzocaine, chloroprocaine, cocaine hydrochloride, procaine hydrochloride, Nesacaine**, and **tetracaine** and are metabolized primarily by pseudocholinesterase. Because of rapid metabolism, most ester local anesthetics have a relatively short duration of action with the exception of tetracaine.

esthesia /esthē′zhə/, **1.** capacity for perception. **2.** sensitivity or feeling. **3.** any disorder of the nervous system that affects perception or sensitivity. Also spelled **aesthesia.**

esthesio-, prefix meaning “feeling or perceptive faculties”: *esthesiogenic, esthesioneure, esthesioscopy.*

esthesiophysiology /esthē′zē·ōfiz′ē·ol′əjē/, the study of sense organ function.

-esthetic, -esthetical, -esthes, -aesthetic, -aesthetical, suffix meaning “a person’s consciousness of a sensation or something”: *anesthesia, cenesthetic, photoesthetic.*

esthetics /esthet′iks/ [Gk, *aisthetikos,* sensitivity], the branch of philosophy dealing with the forms and psychological effects of beauty. In medicine, esthetics may be applied to dental reconstruction and plastic surgery. Also spelled **aesthetics.**

estimated hepatic blood flow (EHBF), an estimate of the rate of blood flow through the liver in a liver function test, such as by calculating indocyanine green clearance.

Estimated Safe and Adequate Daily Dietary Intake (ESADDI), nutrient intake recommendations, made by the National Academy of Sciences’ Food and Nutrition Board, that give what is considered a safe range of intake for some nutrients because not enough information is available to set recommended dietary allowance values for them.

Estinyl, a trademark for an estrogen **(ethinyl estradiol).**

estr-, prefix for the name of an estrogen, a female hormone.

Estrace, a trademark for an estrogen **(estradiol).**

estradiol /es′trədī′ôl/, the most potent naturally occurring human estrogen.

estramustine /es′trämus′tēn/, an antineoplastic agent containing estradiol joined to mechlorethamine, administered orally for palliative treatment of metastatic or progressive carcinoma of the prostate. It is used as **estramustine phosphate sodium.**

estramustine phosphate sodium /es′trəmus′tēn/, an antineoplastic agent.

■ INDICATIONS: It is prescribed for palliative treatment of metastatic or progressive carcinoma of the prostate.

■ CONTRAINDICATIONS: Thromboembolytic disorders or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effects are cerebrovascular accident, myocardial infarction, thrombophlebitis, pulmonary emboli, and congestive heart failure.

estrangement /estrānj′mənt/ [L, *extraneus,* not belonging], **1.** a psychological effect of the separation of a mother from her newborn required when the infant is ill or premature or has a congenital defect, thereby diverting the mother from establishing a normal relationship with her child. **2.** the feeling that external objects have a strange, unfamiliar, or unreal quality, caused by a failure of cathexis of the external ego boundary, one of whose functions is to identify external objects as real and familiar.

Estratab, a trademark for esterified estrogens.

estrin. See **estrogen.**

estriol /es′trē·ôl/, a relatively weak, naturally occurring human estrogen found in high concentrations in urine. Also spelled **oestriol.** See also **estrogen.**

estrogen /es′trojən/ [Gk, *oistros,* gadfly, *genein,* to produce], one of a group of hormonal steroid compounds that promote the development of female secondary sex characteristics. Human estrogen level is elaborated in the ovaries, adrenal cortices, testes, and fetoplacental unit. During the menstrual cycle, estrogen renders the female genital tract suitable for fertilization, implantation, and nutrition of the early embryo. Pharmaceutic preparations of estrogen are used in oral contraceptives to prevent pregnancy, palliate certain types of postmenopausal breast cancer and prostatic cancer, inhibit lactation, and treat threatened abortion and ovarian disease. Estrogen replacement therapy may be prescribed to relieve the vasomotor symptoms of menopause. Its long-term continued use increases the risk of endometrial carcinoma. Kinds of estrogen are **conjugated estrogen, esterified estrogen, estradiol, estriol,** and **estrone.** Also spelled **oestrogen.** Formerly called **estrin. —estrogenic,** *adj.*

estrogen fractions test, a 24-hour urine or blood test that measures levels of the three major estrogens. Test results aid in the evaluation of menopausal status, sexual maturity, gynecomastia or feminization syndromes, certain ovarian tumors, and placental function and fetal normality in high-risk pregnancies.

estrogen receptor assay, a microscopic examination of breast tumor tissue used to determine the probable response of a tumor to endocrine therapy.

estrogen replacement therapy, administration of an estrogen to treat estrogen deficiency, such as that occurring after menopause. There are a number of indications, including the prevention of postmenopausal osteoporosis and coronary artery disease and the prevention and treatment of vasomotor symptoms, such as hot flashes, and of thinning of the skin and vaginal epithelium, atrophic vaginitis, and vulvar atrophy. In women with a uterus, a progestational agent is usually included to prevent endometrial hyperplasia. Also called **hormone replacement therapy**.

estrone /es′trōn/, a relatively potent endogenous estrogen. Also spelled **oestrone.**

estropipate /es′trəpip′āt/, an estrogen.

■ INDICATIONS: It is prescribed in the treatment of vasomotor symptoms of menopause, atrophic vaginitis, kraurosis vulvae, female hypogonadism, female castration, and primary ovarian failure. Estrogens should be used topically whenever possible for treating symptoms of menopause (e.g., vaginal atrophy).

■ CONTRAINDICATIONS: Should not be used to prevent coronary vascular disease. Known or suspected cancer of the breast or estrogen-dependent neoplasia, pregnancy, thrombophlebitis or thromboembolic disorders, undiagnosed abnormal genital bleeding, or complications of previous administration of estrogen prohibit its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are a possible increased risk of cancer, gallbladder disease, and thromboembolic disorders.

estrus /es′trəs/, the cyclic period of sexual receptivity in mammals other than primates, marked by intense sexual urge and coinciding with the time that fertilization can take place.

estrus cycle [Gk, *oistros,* gadfly, *kyklos,* circle], the periodic changes in the female body that occur under the influence of sex hormones.

ESWL, abbreviation for **extracorporeal shock-wave lithotripsy.**

ET, abbreviation for **endothelin.**

eta /ē′tə, ā′tə/, H, η, the seventh letter of the Greek alphabet.

etanercept, a biological agent.

■ INDICATION: It is used to treat acute, chronic rheumatoid arthritis that has not responded to other treatments.

■ CONTRAINDICATIONS: Known hypersensitivity and sepsis prohibit its use.

■ ADVERSE EFFECTS: Adverse effects include abdominal pain, dyspepsia, headache, asthenia, dizziness, injection site reaction, cough, upper respiratory infection, non-upper respiratory infection, and sinusitis. Common side effects include rash, pharyngitis, and rhinitis.

-etanide. See **-eridine.**

état criblé /ātä′ krēblā′/ [Fr, sievelike state], a condition or state of multiple sievelike perforations in swollen lymphatic nodules in the intestine. It is a frequently fatal complication of untreated typhoid fever.

etching /ech′ing/, the cutting of a hard surface, such as metal or glass, by a corrosive chemical, usually an acid, to create a design.

ETEC, abbreviation for **enterotoxigenic *Escherichia coli.***

ETF, abbreviation for **electron transfer flavoprotein.**

ethacrynate sodium. See **ethacrynic acid.**

ethacrynic acid /eth′əkrin′ik/, a loop diuretic.

■ INDICATIONS: It is prescribed as a treatment for severe edema, such as nephrotic syndrome, hepatic cirrhoses, and ascites of malignancy. Unlike many other diuretics, ethacrynic acid is not a sulfonamide derivative and can therefore be tolerated by some people who develop hypersensitivity reactions to other diuretics.

■ CONTRAINDICATIONS: Pregnancy, anuria, or known hypersensitivity to this drug prohibits its use. It is not given to infants.

■ ADVERSE EFFECTS: Among the more serious adverse effects are tetany, muscle weakness, cramps, and excessive diuresis. Hearing loss may occur.

ethambutol /etham′butol/, an antibacterial agent specifically effective against *Mycobacterium tuberculosis*. It is administered orally as the hydrochloride salt, in conjunction with one or more other antituberculous drugs, in the treatment of pulmonary tuberculosis.

ethambutol hydrochloride /eth′əmbyo͞o′təl/, a tuberculostatic antibiotic.

■ INDICATION: It is prescribed in the treatment of pulmonary tuberculosis in combination with other drugs.

■ CONTRAINDICATIONS: Optic neuritis or known hypersensitivity to this drug prohibits its use. It is not recommended for small children.

■ ADVERSE EFFECTS: Among the most serious adverse effects are diminished visual acuity and allergic reactions, such as rashes.

ethanedioic acid. See **oxalic acid.**

ethanoic acid. See **acetic acid.**

ethanol /eth′ənol/, ethyl alcohol. See also **alcohol.**

ethanolamine, an amino alcohol formed by the decarboxylation of serine. It is a component of certain cephalins and phospholipids and is used as a surfactant in pharmaceutic products. Also called **monoethanolamine.**

ethanol test, a blood, urine, gastric, or breath test usually performed to evaluate alcohol-impaired drivers or those with alcohol overdose.

ethaverine hydrochloride /eth′əver′ēn/, a smooth muscle relaxant.

■ INDICATIONS: It is prescribed to relieve spasm of the GI or genitourinary tract, arterial vasospasm, cerebral insufficiency, and peripheral and cerebrovascular insufficiency.

■ CONTRAINDICATIONS: Liver disease, atrioventricular dissociation, or known hypersensitivity to this drug prohibits its use. It is prescribed with caution to patients who have glaucoma.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, abdominal distress, cardiac arrhythmia, and headache.

ethene. See **ethylene.**

ether /ē′thər/ [Gk, *aither,* air], **1.** any of a class of organic compounds in which two hydrocarbon groups are linked by an oxygen atom. **2.** a nonhalogenated volatile liquid no longer used in clinical practice as a general anesthetic. Also called **diethyl ether, ethyl oxide.**

ethereal /ithir′ē·əl/ [Gk, *aither,* air], pertaining to or resembling ether.

ether screen. See **anesthesia screen.**

ethics /eth′iks/ [Gk, *ethikos,* moral duty], the science or study of moral values or principles, including ideals of autonomy, beneficence, and justice. **—ethical,** *adj.*

Ethics in Patient Referrals Act, a federal law, the Stark Law, enacted in 1989, that prohibits referrals by a physician to a clinical laboratory in which the physician has a financial interest. A 1994 amendment includes other services and equipment such as physical and occupational therapy; radiology and other diagnostic services; radiation therapy; parenteral and enteral nutrients, equipment, and supplies; and home health services.

ethinyl estradiol /eth′inil/, an estrogen.

■ INDICATIONS: It is prescribed in the treatment of postmenopausal breast cancer, menstrual cycle irregularities, prostatic cancer, and hypogonadism and for contraception and relief of menopausal vasomotor symptoms.

■ CONTRAINDICATIONS: Thrombophlebitis, abnormal genital bleeding, known or suspected pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are thrombophlebitis, embolism, and hypercalcemia. See also **estrogen.**

ethionamide /eth′ē·ənam′īd/, a tuberculostatic antibacterial.

■ INDICATION: It is prescribed for the treatment of tuberculosis in conjunction with other drugs when frontline therapy has failed.

■ CONTRAINDICATIONS: Existing liver damage or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are skin rash, jaundice, mental depression, and GI side effects.

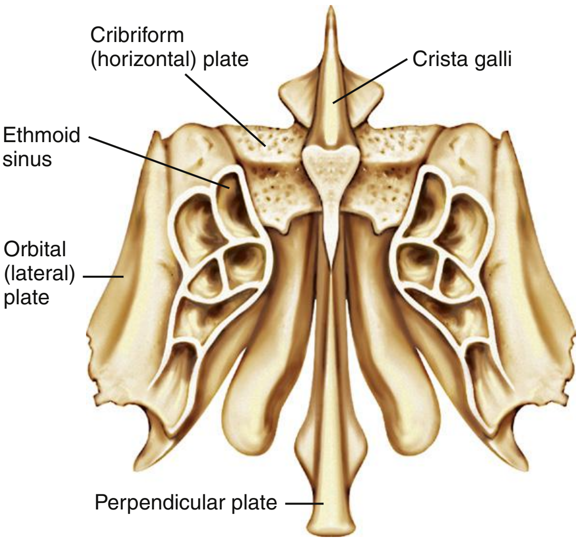
ethmocarditis /eth′mōkärdī′tis/, a chronic inflammation of the cardiac connective tissue.

ethmoid /eth′moid/ [Gk, *ethmos,* sieve, *eidos,* form], **1.** pertaining to the ethmoid bone. **2.** having a large number of sievelike openings.

ethmoidal air cell /ethmoi′dəl/ [Gk, *ethmos,* sieve, *eidos,* form], one of the numerous small thin-walled cavities in the ethmoid bone of the skull. The cavities are lined with mucous membrane continuous with that of the nasal cavity and lie between the upper part of the nasal cavities and the orbits. Compare **frontal sinus, maxillary sinus, sphenoidal sinus.**

ethmoidal process, an outgrowth on the superior border of the inferior concha that articulates with the uncinate process of the ethmoid.

ethmoid bone, the very light, sievelike, and spongy bone at the base of the cranium, also forming the roof and most of the walls of the superior part of the nasal cavity. It consists of four parts: a horizontal plate, a perpendicular plate, and two lateral labyrinths.



Ethmoid bone

ethmoid cells, paranasal sinuses occurring in groups within the ethmoid bone and communicating with the ethmoidal infundibulum and bulla and the superior and highest meatus. They are often subdivided into anterior, middle, and posterior ethmoid cells, groups of air cells named according to where they open into the nasal meatus. Also called *ethmoid sinuses*. Compare **frontal sinus, maxillary sinus, sphenoidal sinus.**

ethmoidectomy. See **sinus surgery.**

ethmoidofrontal suture /ethmoi′dōfron′təl/, a line in the skull between the cribriform plate of the ethmoid and the orbital plate and posterior margin of the nasal process. Also called **frontoethmoidal suture.**

ethmoidolacrimal suture /-lak′riməl/, a line in the skull between the orbital plate of the ethmoid and the posterior margin of the lacrimal bone.

ethmosphenoid suture /eth′mōsfē′noid/, a line in the skull between the crest of the sphenoid bone and the perpendicular and cribriform plates of the ethmoid. Also called **sphenoethmoidal suture.**

ethnic group /eth′nik/, a population of individuals organized on the basis of an assumed common cultural origin.

ethnocentrism /eth′nōsen′trizm/ [Gk, *ethnos,* nation, *kentron,* center], **1.** a belief in the inherent superiority of the "race" or group to which one belongs. **2.** a proclivity to consider other ethnic groups in terms of one's own racial origins.

ethnography /ethnog′rəfē/ [Gk, *ethnos,* nation, *graphein,* to record], a branch of anthropology that is concerned with the history of nations and ethnic populations.

ethoheptazine /eth′o-hep′tah-zēn/, an analgesic used as the citrate salt to control mild to moderate pain, administered orally.

ethology /ethol′əjē/ [Gk, *ethos,* character, *logos,* science], **1.** (in zoology) the scientific study of the behavioral patterns of animals, specifically in their native habitat. **2.** (in psychology) the empiric study of human behavior, primarily social customs, manners, and mores. **—ethologic, ethological,** *adj*., **ethologist,** *n*.

ethosuximide /eth′ōsuk′simīd/, an anticonvulsant.

■ INDICATION: It is prescribed in the treatment of absence seizures.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any succinimide medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blood dyscrasias, GI disturbance, and hematopoietic complications.

ethotoin /eth′ōtō′in/, an anticonvulsant.

■ INDICATIONS: It is prescribed in the treatment of generalized tonic-clonic and complex-partial seizures.

■ CONTRAINDICATIONS: Liver disease, hematologic disorders, or known hypersensitivity to this drug or to any hydantoin prohibits its use. It is not recommended for use during pregnancy or lactation.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blood disorders, nausea, fatigue, skin rash, alopecia, erythema multiforme, exfoliative dermatitis, and chest pain.

Ethrane, a trademark for an inhalational general anesthetic **(enflurane).**

ethyl alcohol. See **alcohol.**

ethyl aminobenzoate. See **benzocaine.**

ethyl chloride /eth′il/, a topical anesthetic used in short operations.

■ INDICATIONS: It is prescribed in the treatment of skin irritations and in minor skin surgery; the skin is sprayed until the surface turns white with frost.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not used on broken skin or on mucous membrane.

■ ADVERSE EFFECTS: Among the more serious adverse effects are pain, muscle spasm, and, as a result of excessive use, frostbite.

■ NOTE: It is highly flammable.

ethylene /eth′əlēn/ [Gk, *aither,* air, *hyle,* stuff], a colorless flammable gas that is just lighter than air and has a slightly sweet odor and taste. It was previously used as an inhaled general anesthetic and is slightly more potent than nitrous oxide. It is now used in the food industry for control of fruit ripening, flower opening, and the shedding of leaves. Also called **ethene, olefiant gas.**

ethylenediamine /eth′ələndi·am′ēn/, a clear thick liquid having the odor of ammonia. It is used as a solvent, an emulsifier, and a stabilizer with aminophylline injections.

ethylene dibromide (EDB), a volatile liquid used as an insecticide and gasoline additive. Because it has been found to be a cause of cancer in animals, the Environmental Protection Agency has restricted the use of EDB to control insect pests in grains and fruits intended for human use.

ethylene dichloride poisoning, the toxic effects of exposure to ethylene dichloride, a hydrocarbon solvent, diluent, and fumigant, which is one of the most abundant of all chlorinated organic chemicals. It is an eye, ear, nose, throat, and skin irritant and has produced cancers in laboratory animals. Inhalation or ingestion can lead to serious illness or death. The compound is metabolized into 2-chloroethanol and monochloroacetic acid, both more toxic than the original chemical.

ethylene glycol poisoning, the toxic reaction to ingestion of ethylene glycol or diethylene glycol, chemicals used in automobile antifreeze preparations. Symptoms in mild cases may resemble those of alcohol intoxication but without the breath odor produced by alcoholic beverages. Vomiting, carpopedal spasm, lumbar pain, renal failure, respiratory distress, convulsions, and coma may also occur.

ethylene oxide (CH_2CH_2O), a highly flammable gas used to sterilize surgical instruments and other supplies; the simplest epoxide.

ethylestrenol, an anabolic steroid.

ethyl oxide. See **ether.**

ethyne. See **acetylene.**

ethynodiol diacetate and ethinyl estradiol, an oral estrogen-progestin combination contraceptive.

■ INDICATION: It is prescribed for prevention of pregnancy.

■ CONTRAINDICATIONS: Thrombophlebitis, cardiovascular disease, breast or reproductive organ cancer, or known hypersensitivity to either ingredient prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are thrombophlebitis, uterine fibroma, gallbladder disease, embolism, and hepatic lesions.

-etic, suffix used as the equivalent of *-ic* in forming adjectives: *enuretic, genetic, kinetic*.

etidocaine, an amide local anesthetic that has fallen out of use because it is more likely to block motor nerves than sensory nerves. See also **amide local anesthetic.**

etidronate disodium /etid′rənāt/, a regulator of calcium metabolism. Also called **sodium etidronate.**

■ INDICATIONS: It is prescribed in the treatment of Paget's disease and heterotopic ossification caused by injury to the spinal cord and after total hip replacement.

■ CONTRAINDICATION: There are no known contraindications.

■ ADVERSE EFFECTS: Among the more serious adverse effects are bone pain both at pagetic sites and at previously asymptomatic sites, GI disturbances, and elevated serum phosphate concentrations.

etio-, prefix meaning "causation": *etiology*.

etiology /ē′tē·ol′əjē/ [Gk, *aitia*, cause, *logos*, science], **1.** the study of all factors that may be involved in the development of a disease, including the susceptibility of the patient, the nature of the disease agent, and the way in which the patient's body is invaded by the agent. **2.** the cause of a disease. Compare **pathogenesis. —etiological,** *adj*.

etodolac /etodo′lak/, a nonsteroidal antiinflammatory drug used as an analgesic and antiinflammatory agent, especially to treat arthritis. It is administered orally.

etomidate /etom′idāt/, a short-acting, hypnotic nonbarbiturate IV agent used for induction of general anesthesia. It has minimal adverse cardiovascular and respiratory effects, thus providing a greater margin of safety in patients with or at risk for heart disease. Adverse effects include transient reduction in adrenal gland cortisol release, pain on injection, and involuntary muscle movements.

etoposide, an antineoplastic or chemotherapeutic agent and mitotic inhibitor.

■ INDICATIONS: It is prescribed in the treatment of several forms of cancer, including lymphomas, cancer of the testicles and prostate, and small-cell lung cancer, to prevent tumor cells from dividing and spreading.

■ CONTRAINDICATIONS: It should not be used if there is an allergy to etoposide or podophyllum. There is a potential adverse effect to the fetus if used by a pregnant patient, and the drug should not be used if breastfeeding.

■ ADVERSE EFFECTS: The side effects most often reported include chills, rapid heartbeat, painful or difficult breathing, decreased blood pressure, hair loss, rash, itching, skin discoloration, and digestive disorders.

etoposide phosphate, the phosphate salt of etoposide, having the same actions and uses as the base, administered intravenously.

Etrafon, a trademark for a central nervous system fixed-combination drug containing an antipsychotic **(perphenazine)** and an antidepressant (amitriptyline hydrochloride).

etretinate /etret′ināt/, a synthetic derivative of vitamin A used as an oral drug to treat psoriasis.

■ INDICATIONS: It is prescribed for severe recalcitrant psoriasis, including generalized pustular and erythrodermic psoriasis.

■ CONTRAINDICATIONS: It is contraindicated for women who are of childbearing age unless a pregnancy test within 2 weeks of the start of therapy has negative results. Because of the risk of hyperostosis, the drug should not be given to children unless all alternative therapies have been exhausted. Intolerance to vitamin A derivative is another contraindication.

■ ADVERSE EFFECTS: Adverse effects may include benign intracranial hypertension, hepatitis, visual abnormalities including corneal damage, skeletal hyperostosis, peeling skin, alopecia, muscle cramps, and headache.

etymology [Gk, *etymos*, base; L, *logos*, words], the study of the origin and development of words.

etymon (*pl*. **etyma**), an earlier form of a word. See also **etymology.**

Eu, symbol for the element **europium.**

eu-, prefix meaning "well, easily, good, true": *euangiotic, eucrasia, euthyroid*.

Eubacterium /yo͞o′baktir′ē·əm/, a large genus of nonsporulating gram-positive anaerobic rod-shaped bacteria normally found in soil and water. The organisms are also found in the skin and cavities of humans and other mammals, where they may cause soft-tissue infections. One species has been found in dental tartar; another synthesizes vitamin B_{12}. *Eubacterium* is susceptible to penicillin, cliridamycin, and metronidazole.

eubiotics /yo͞o′bī·ot′iks/ [Gk, *eu*, well, *bios*, life], the science of healthy living.

eucalyptol /yo͞o′kəlip′tol/, a substance with an aromatic odor obtained from the volatile oil of *Eucalyptus* and used in nasal emollients. Also called **cajeputol.**

eucaryocyte. See **eukaryocyte.**

eucaryon. See **eukaryon.**

eucaryosis. See **eukaryosis.**

eucaryote, eucaryotic. See **eukaryote.**

eucholia /yo͞okō′lyə/ [Gk, *eu*, well, *chole*, bile], the normal state of the bile as to the quantity secreted and the condition of the constituents.

euchromatin /yo͞okrō′mətin/ [Gk, *eu* + *chroma*, color], the part of a chromosome that is active in gene expression. It stains most deeply during mitosis, when it is in a coiled, condensed state during each repetition of the cell cycle, it alternates between condensation and dispersion. Compare **heterochromatin.** See also **chromatin. —euchromatic,** *adj*.

euchromosome. See **autosome.**

eugamy /yo͞o′gəmē/ [Gk, *eu* + *gamos*, marriage], the union of gametes that contain the same haploid number of chromosomes. **—eugamic,** *adj*.

eugenics /yo͞ojen′iks/ [Gk, *eu* + *genein*, to produce], the study of methods for controlling the characteristics of populations through selective breeding.

euglobulin /yo͞oglob′yəlin/ [Gk, *eu* + L, *globulus,* small sphere], that fraction of serum globulin that is insoluble in distilled water but soluble in saline solutions. This is one of a number of different properties used to classify proteins. Compare **albumin, cryoglobulin.** See also **electrophoresis, plasma protein.**

euglobulin lysis time test, a blood test used to identify primary and secondary systemic fibrinolysis and to monitor streptokinase or urokinase therapy in patients with acute myocardial infarction.

eugnathia /yo͞ona′thē·ə/ [Gk, *eu,* well + *gnathos,* jaw], an abnormality of the oral cavity that is limited to the teeth and their immediate alveolar supports and does not include the jaws. Compare **dysgnathic anomaly.**

eugnathic anomaly /yo͞onath′ik/ [Gk, *eu* + *gnathos,* jaw; *anomalia,* irregularity], an abnormality of the teeth and their alveolar supports. Compare **dysgnathic anomaly.**

eukaryocyte /yo͞oker′ē·ōsīt′/ [Gk, *eu* + *karyon,* nut, *kytos,* cell], a cell that has a true nucleus, found in all organisms except bacteria. Also spelled **eucaryocyte.**

eukaryon /yo͞oker′ē·on/ [Gk, *eu,* good, *karyon,* nut], a cell nucleus that is highly complex and organized and is surrounded by a double membrane. Also spelled **eucaryon.** Compare **prokaryon.**

eukaryosis /yo͞oker′i·ō′sis/ [Gk, *eu* + *karyon,* nut, *osis,* condition], the state of having a eukarykon. Compare **prokaryosis.**

eukaryote /yo͞oker′ē·ot/ [Gk, *eu* + *karyon,* nut], an organism whose cells contain a true nucleus. All organisms except bacteria are eukaryotes. Also spelled **eucaryote. Eukaryotic,** *adj.*

eukaryotic cell, a cell with a true nucleus. See also **cell.**

Eulexin, a trademark for an antiandrogen antineoplastic agent **(flutamide).**

eunuch /yo͞o′nək/ [Gk, *eune,* couch, *echein,* to guard], a male whose testicles have been destroyed or removed. If this occurs before puberty, secondary sex characteristics fail to develop, and symptoms such as a feminine voice and absence of facial hair can result from the reduced level of male hormones in the blood. See also **secondary sex characteristic.**

eunuchism /yo͞o′nəkiz′əm/, the condition of being a eunuch, with the lack of male hormones caused by castration.

eunuchoidism /yo͞o′nəkoidiz′əm/, a condition resulting from a deficiency in the production or effectiveness of male hormones. The deficiency leads to sterility, abnormal tallness, small testes, and impaired development of secondary sexual characteristics, libido, and sexual potency.

euphoretic /yo͞o′fəret′ik/ [Gk, *eu* + *pherein,* to bear], **1.** *adj,* (of a substance or event) tending to produce a condition of well-being or elation. **2.** *n,* a substance tending to produce a feeling of well-being or elation, such as lysergic acid diethylamide, mescaline, marijuana, and other hallucinogenic drugs.

euphoria /yo͞ofôr′ē·ə/ [Gk, *eu* + *pherein,* to bear], **1.** a feeling or state of well-being or elation. **2.** an exaggerated or abnormal sense of physical and emotional well-being not based on reality or truth, disproportionate to its cause, and inappropriate to the situation, as commonly seen in the manic stage of bipolar disorder, some forms of schizophrenia, organic mental disorders, and toxic and drug-induced states. Compare **ecstasy.**

euploid /yo͞o′ploid/ [Gk, *eu* + *ploos,* multiple], **1.** *n,* an individual, organism, strain, or cell whose chromosome number is an integral multiple of the normal haploid number characteristic of the species. Euploids may be as diploid, triploid, tetraploid, or polyploid. **2.** *adj,* pertaining to such an individual, organism, strain, or cell. **—euploidy,** *n.* Compare **aneuploid.**

euploidy /yo͞o′ploidē/, the state or condition of having a variation in chromosome number that is an exact multiple of the characteristic haploid number. Compare **aneuploidy.**

eupnea /yo͞op·nē′ə/ [Gk, *eu,* well, *pnein,* to breathe], normal, quiet breathing at a rate of 12 to 20 breaths per minute in adults.

Eurax, a trademark for a scabicide **(crotamiton).**

European blastomycosis. See **cryptococcosis.**

European typhus. See **epidemic typhus.**

europium (Eu) /yo͞orō′pē·əm/ [Europe], a metallic rare earth element. Its atomic number is 63; its atomic mass is 151.96.

eury-, prefix meaning “wide, broad”: *eurycephalic, eurygnathic, euryopia.*

Eustachian cushion. See **torus tubarius.**

eustachian salpingitis, an inflammation of the eustachian tube.

eustachian tube /yo͞ostā′shən/ [Bartolomeo Eustachio, Italian anatomist, 1524–1574; L, *tubus*], a tube lined with mucous membrane that joins the nasopharynx and the middle ear cavity. It is normally closed but opens during yawning, chewing, and swallowing to allow equalization of the air pressure in the middle ear with atmospheric pressure.

eustress /yo͞o′stres/, **1.** a positive form of stress. **2.** a balance between selfishness and altruism through which an individual develops the drive and energy to care for others.

euthanasia /yo͞o′thənā′zhə/ [Gk, *eu,* good; *thanatos,* death], **1.** also called **mercy killing,** the deliberate causing of the death of a person who is suffering from an incurable disease or condition. It may be active, such as by administration of a lethal drug, or passive, such as by withholding of treatment. Legal authorities, church leaders, philosophers, and commentators on ethics and morality usually distinguish passive euthanasia from active euthanasia. **2.** an easy, quiet, painless death.

euthenics /yo͞othen′iks/ [Gk, *eu* + *tithenai,* to place], the science that deals with improvement of the human species through the control of environmental factors, such as pollution, malnutrition, disease, and drug abuse. Compare **eugenics.**

euthymia, **1.** a pleasant, relaxed state of tranquility. **2.** stable mood.

euthymic, pertaining to a normal mood in which the range of emotions is neither depressed nor highly elevated.

euthymism /yo͞othī′mizəm/ [Gk, *eu* + *thymos,* thyme flowers], the characteristic of normal mood responses.

euthyroid /yo͞othī′roid/ [Gk, *eu,* well, *thyreos,* oblong shield], pertaining to a normal thyroid gland and normal thyroid gland function.

eV, abbreviation for **electron volt.**

evacuant /ivak′yo͞o·ənt/ [L, *evacuare,* to empty], any medicine or other agent that causes an organ to discharge its contents, such as an emetic or laxative.

evacuate /ivak′yo͞o·āt/ [L, *evacuare,* to empty], **1.** *v,* to discharge or to remove a substance from a cavity, space, organ, or tract of the body. **2.** *n,* a substance discharged or removed from the body, such as evacuation of stool. **—evacuation,** *n.*

evacuator /ivak′yo͞o·ā′tər/, an instrument for emptying a cavity, such as removing a calculus from the urinary bladder.

evagination /ēvaj′inā′shən/, the turning inside out or protrusion of a body part or organ.

evaluating /ival′yo͞o·ā′ting/ [L, *ex,* away, *valare,* to be strong], (in five-step nursing process) a category of nursing behavior in which the extent to which the established goals of care have been met is determined and recorded. To make this judgment, the nurse estimates the degree of success in meeting the goals, evaluates the implementation of nursing interventions, investigates the patient’s adherence to therapy, and records the patient's response to therapy. The nurse evaluates effects of the interventions used, the need for change in goals of care, the accuracy of the implementation of nursing interventions, and the need for change in the patient's environment or in the equipment or procedures used. The impact of the care or treatment on the patient, the patient's family, and the staff is evaluated; the accuracy of tests and measurements is checked; and the patient's and family's understanding of the information given them is evaluated. The patient's expressed and observed response to care is recorded. Although evaluation is considered the final step of the five-step nursing process, in practice it is integral to effective nursing practice at all steps of the process. See also **analyzing, assessing, implementing, nursing process, planning.**

evaluation, assessment of performance against an established set of goals or objectives.

Evans blue [Herbert Evans, American anatomist, 1882–1971], a nontoxic blue-green dye used to determine blood and plasma volumes.

evaporate. See **evaporation.**

evaporated milk /ivap′ərā′tid/, homogenized whole milk from which 50% to 60% of the water content has been evaporated. It is fortified with vitamin D, canned, and sterilized. When it is diluted with an equal amount of water, its nutritional value is comparable to that of fresh whole milk.

evaporation /ivap′ərā′shən/ [L, *ex* + *vapor,* steam], the change of a substance from a liquid state to a gaseous state. The process of evaporation is hastened by an increase in temperature and a decrease in atmospheric pressure. See also **boiling point. —evaporate,** *v.*

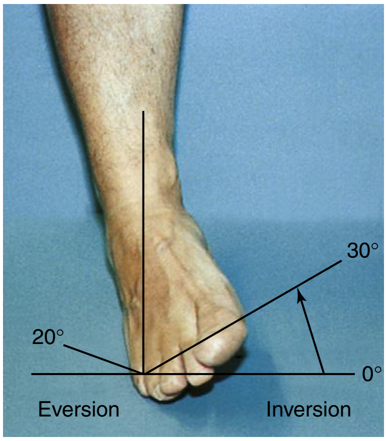
evening primrose oil, an oil produced by cold extraction from the ripe seeds of *Oenothera biennis,* the evening primrose, used internally in the treatment of mastalgia, premenstrual syndrome, and atopic eczema.

eventration /ē′vəntrā′shən/, the protrusion of the intestines from the abdomen.

event-related potential (ERP) [L, *evenire,* to happen, *relatus,* carry back, *potentia,* power], a type of brain wave that is associated with a response to a specific stimulus, such as a particular wave pattern observed when a patient hears a clicking sound. See also **evoked potential.**

evergreen contract, a health care contract that is automatically renewed for the term of the contract unless it is renegotiated. Not applicable in Canada.

eversion /ivur′zhən/, a turning outward or inside out, such as a turning of the foot outward at the ankle.



Eversion and inversion of the foot
(Seidel et al, 2011/Courtesy Patrick Watson)

evidence-based dentistry, a systematic practice of dentistry in which the dentist finds, assesses, and implements methods of diagnosis and treatment on the basis of the best available current research, the dentist's clinical expertise, and the needs and preferences of the patient.

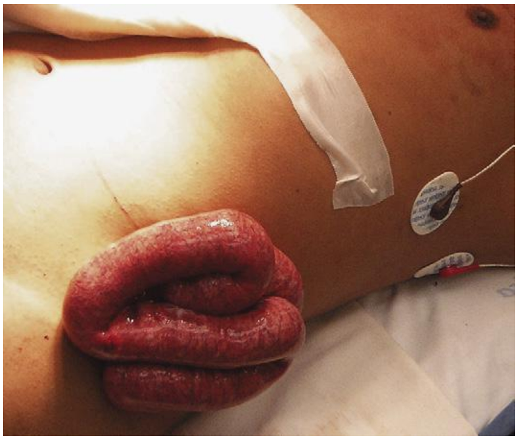
evidence-based medicine, the practice of medicine in which the physician finds, assesses, and implements methods of diagnosis and treatment on the basis of the best available current research, the physician's clinical expertise, and the needs and preferences of the patient.

evidence-based nursing, the practice of nursing in which the nurse makes clinical decisions on the basis of the best available current research evidence, the nurse's clinical expertise, and the needs and preferences of the patient.

evidence-based pharmacy, the practice of pharmacy in which the pharmacist makes decisions, taking into account the best available current research evidence, the pharmacist's expertise, and the needs and preferences of the patient.

evidence-based practice, the practice of health care in which the practitioner systematically finds, appraises, and uses the most current and valid research findings as the basis for clinical decisions. The term is sometimes used to denote evidence-based medicine specifically but can also include other specialties, such as evidence-based nursing, pharmacy, and dentistry.

evisceration /ivis′ərā′shən/ [L, *ex* + *viscera,* entrails], **1.** the removal of the viscera from the abdominal cavity; disembowelment. **2.** the removal of the contents from an organ or an organ from its cavity. **3.** the protrusion of an internal organ through a wound or surgical incision, especially in the abdominal wall. **—eviscerate,** *v.*



Small bowel evisceration *(NAEMT, 2011)*

evocation /ev′ōkā′shən/ [L, *evocare,* to call forth], a specific morphogenetic change within a developing embryo that results from the action of a single hormone or other chemical. See also **induction.**

evocator /ev′ōkā′tər/ [L, *evocare,* to call forth], a specific chemical substance or hormone that is emitted from the organizer part of the embryonic tissue and acts as a morphogenetic stimulus in the developing embryo.

evoked potential (EP) /ivōkt′/ [L, *evocare,* to call forth, *potentia,* power], an electrical response in the brainstem or cerebral cortex that is elicited by a specific stimulus. The stimulus may affect the visual, auditory, or somatosensory pathway, producing a characteristic brain wave pattern. The activity and function of the system may be monitored during surgery while the patient is unconscious. The surgeon is thus able to prevent damage to the nerves during operative procedures. Evoked potentials are also used to diagnose multiple sclerosis and various disorders of hearing and of sight. Kinds of evoked potentials include **brainstem auditory evoked response, somatosensory evoked potential,** and **visual-evoked potential.** See also **brain electric activity map.**

evoked potential (EP) studies, an electrodiagnostic test indicated for patients with suspected sensory deficit who are unable to indicate or unreliable in indicating stimulus recognition. Evoked potential studies are used to evaluate areas of the cortex that receive incoming stimulus from the eyes, ears, and lower/upper extremity sensory nerves; to monitor natural progression or treatment of deteriorating neurological diseases; and to identify histrionic or malingering patients with sensory deficit complaints. These studies include visual evoked responses, auditory brainstem evoked potentials, and somatosensory evoked responses.

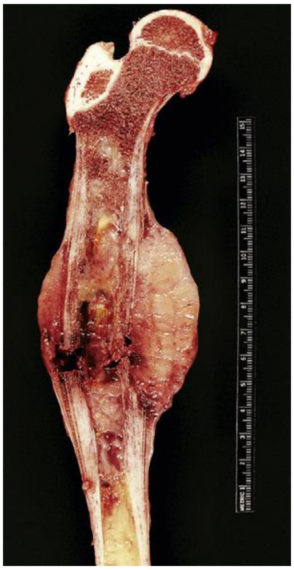
evoked response audiometry, a method of testing hearing ability at the level of the brainstem and auditory cortex. Evoked response audiometry is useful in diagnosing possible defects in the vestibulocochlear nerve and brainstem auditory pathways.

evolution /ev′əlo͞o′shən/ [L, *evolvere,* to roll forth], **1.** a gradual, orderly, and continuous process of change and development from one condition or state to another. It encompasses all aspects of life, including physical, psychological, sociological, cultural, and intellectual development, and involves a progressive advancement from a simple to a more complex form or state through the processes of modification, differentiation, and growth. **2.** a change in the genetic composition of a population of organisms over time. **3.** the appearance over long periods of time of new taxonomic groups of organisms from preexisting groups. Kinds of evolution are **convergent evolution, determinant evolution, emergent evolution, organic evolution, orthogenic evolution,** and **saltatory evolution. —evolutionist,** *n.*

evolution of infarction, the normal healing process after a myocardial infarction, as demonstrated on successive electrocardiograms.

evulsed tooth. See **avulsed tooth.**

Ewing's sarcoma /yo͞o′ingz/ [James Ewing, American pathologist, 1866–1943], a malignant tumor that develops from bone marrow, usually in long bones or the pelvis. It occurs most frequently in adolescent boys and is characterized by pain, swelling, fever, and leukocytosis. The tumor, a soft, crumbly grayish mass that may invade surrounding soft tissues, may be difficult to distinguish histologically from a neuroblastoma or a lymphoma. Surgery, chemotherapy, and radiotherapy are often used in treatment. Also called **endothelial myeloma,** *Ewing's tumor.* See also **neuroblastoma, histiocytic malignant lymphoma.**



Ewing's sarcoma *(Fletcher, 2007)*

ex-, prefix meaning "away from, outside, without": *excoriation, exfoliatio, exocrinous.*

exa-, prefix of a Standard International unit that indicates 10^{18}.

exacerbation /igzas′ərbā′shən/ [L, *exacerbare,* to provoke], an increase in the seriousness of a disease or disorder as marked by greater intensity in the signs or symptoms of the patient being treated.

examination, a critical inspection and investigation, usually following a particular method, performed for diagnostic or investigational purposes.

examination assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing assistance to the patient and another health care provider during a procedure or exam. See also **Nursing Interventions Classification.**

exanthem /ig′zan′thəm/ [Gk, eruption], a rapidly erupting rash that may have specific diagnostic features of an infectious disease. Chickenpox, measles, roseola infantum, and rubella are usually characterized by a particular type of exanthem. Also called **exanthema.** Compare **enanthema. —exanthematous,** *adj.*

exanthema subitum. See **roseola infantum.**

exanthematous /ig′zənthem′ətəs/ [Gk, *ex,* out, *anthema,* blossoming], pertaining to an eruptive disease (such as measles) or the skin rash that accompanies it.

exanthem subitum, exanthema subitum. See **roseola infantum.**

excavatio rectouterina. See **Douglas's cul-de-sac.**

excavator /eks′kəvāt′ər/ [L, *ex,* out + *cavus,* hollow], **1.** an instrument for hollowing out something by removing the center or inner part, or for making a hole or cavity such as the removal of caries or granulation tissue. **2.** a scoop, spoon, or gouge for surgical use.

exceptional education need, the determination that a disability or condition exists and interferes with the child's or adolescent's ability to participate in an educational program.

excess /ek′ses/, an amount more than is normal or necessary.

excessive sweat /ikses′iv/ [L, *excedere,* to go out; AS, *swaeaten*], perspiration greater than normal for the ambient environment. It is usually a sign of septic fever, pulmonary tuberculosis, hyperthyroidism, chronic renal disease, or malaria. Abnormal sweating of the hands and feet is often a sign of nervous irritability or other emotional stress.

excess mortality /ikses′/ [L, *excedere,* to go out, *mortalis,* mortal], a premature death, or one that occurs before the average life expectancy for a person of a particular demographic category.

Exchange Lists for Meal Planning, a grouping of foods in which the carbohydrates, fats, proteins, and calories are similar for the serving sizes listed. The lists, published by the American Dietetic Association and the American Diabetes Association, are used in meal planning for various diseases as well as for weight reduction. Foods are divided into three different groups or lists: carbohydrates, meat and meat substitutes, and fats. The carbohydrate group is subdivided into lists of starch, fruit, milk, other carbohydrates, and vegetables. A dietitian can create an appropriate dietary program prescribing the number of calories and units of each exchange category to be consumed daily, as well as a plan for when they should be eaten. The patient selects preferred foods from the lists. Other countries such as Canada use similar lists, for example, Food Choices.

exchange transfusion, the removal of all or most of a patient's diseased blood and its simultaneous replacement with an equal volume of normal blood.

exchange transfusion in the newborn /iks·chāngʹ/ [L, *ex* + *cambire,* to change], the introduction of whole blood in exchange for 75% to 85% of an infant's circulating blood that is repeatedly withdrawn in small amounts and replaced with equal amounts of donor blood. The procedure is performed to improve the oxygen-carrying capacity of the blood in the treatment of erythroblastosis fetalis by removing Rh and ABO antibodies, sensitized erythrocytes that produce hemolysis, and accumulated bilirubin.

■ METHOD: A radiant heat warmer, a pacifier, and cardiac and respiratory monitors are prepared, and resuscitative equipment and drugs, including oxygen, a mask, a bag, suction apparatus, glucose, calcium, and sodium bicarbonate, are made readily available. The results of laboratory studies of the infant's bilirubin, hemoglobin, and calcium levels; hematocrit; blood culture; random blood glucose test; and the donor blood culture are checked. The donor blood is checked to make certain that it is not more than 48 hours old. If fresh whole blood is not used, stored blood is mixed in amounts as ordered with frozen plasma or human plasma protein fraction (Plasmanate). Before exchange transfusion nothing is administered by mouth for 3 to 4 hours or the contents of the infant's stomach are aspirated. The baby's extremities are restrained; the blood is warmed as ordered, and the physician is assisted with the insertion of an umbilical venous line, if one is not in place. The physician may administer albumin with the donor blood. The procedure may be carried out under phototherapy lights. Unless contraindicated, the infant's parents may be present. During the procedure the young patient is observed for bradycardia with less than 100 beats a minute, cyanosis, hypothermia, vomiting, aspiration, apnea, an air embolus, abdominal distension, or cardiac arrest. The respiratory and cardiac rates are checked every 5 minutes; the axillary temperature is checked every 15 to 30 minutes. The integrity of all blood tubing connections is inspected periodically. The amount of blood withdrawn and infused is recorded, and the physician is notified when each 100 mL of blood has been exchanged. A repetition of laboratory studies is requested as ordered for the last amount of blood removed from the infant. After the procedure the infant is observed for signs of tachycardia or bradycardia, tachypnea or bradypnea, hypothermia, lethargy, jitteriness, increasing jaundice, cyanosis, edema, dark urine, bleeding from the cord, convulsions, or complications, such as hemorrhage, hypocalcemia, heart failure, hypoglycemia, sepsis, acidosis, hyperkalemia, thrombus formation, or shock. The infant is maintained in a neutral thermal environment and is handled gently and minimally for the next 2 to 4 hours. The cardiac and respiratory rates are monitored every 15 minutes for 4 hours, then every 30 to 60 minutes for 24 to 48 hours or as ordered. The axillary temperature is checked every 1 to 3 hours for 48 hours, and the cord is observed for bleeding every 5 to 15 minutes for 1 to 2 hours after the procedure. Feeding by gavage or a bottle with a soft nipple with a large enough hole to ensure adequate intake is initiated 4 to 6 hours after the transfusion, as ordered. The infant is fed slowly and repositioned after each feeding. Fluid intake and output are measured, and ongoing care is provided as for all high-risk infants.

■ INTERVENTIONS: The nurse prepares the equipment and infant for the exchange transfusion, assists the physician in the insertion of the umbilical venous line, and monitors the baby during and after the procedure.

■ OUTCOME CRITERIA: An exchange transfusion is usually administered only to a high-risk infant, but the procedure often effectively counteracts the hemolytic anemia and hyperbilirubinemia associated with erythroblastosis neonatorum.

excimer laser /ekʹsimər/, one of a class of lasers with output in the ultraviolet range of the electromagnetic spectrum. The name is derived from the symbol formed by the combination of xenon atoms (Xe) and halogen atoms (X) to yield xenon-halide compounds as XEX.

excision /iksishʹən/ [L, *ex* + *caedere,* to cut], **1.** the process of cutting out or off. **2.** (in molecular genetics) the process by which a genetic element is removed from a strand of deoxyribonucleic acid. Compare **resection. —excise,** *v.*

excitability /iksīʹtəbilʹitē/ [L, *excitare,* to arouse], the property of a cell that enables it to react to irritation or stimulation, such as the ability of a nerve or muscle cell to react to an electric stimulus.

excitant /eksīʹtənt/, a drug or other agent that arouses the central nervous system or other body system in a particular manner. Excitants may be drugs or other substances, such as caffeine, or visual or auditory stimuli.

excitation /ekʹsitāʹshən/ [L, *excitare,* to arouse], nerve or muscle action as a result of impulse propagation; a state of mental or physical excitement.

excitatory amino acids /eksīʹtətôrʹē/, one of a group of amino acids that affect the central nervous system by acting as neurotransmitters and in some cases as neurotoxins. Examples include glutamate and aspartate, which cause depolarization but may also trigger the death of neurons. Some excitatory amino acids are produced by plants and fungi and may be responsible for hypoxic or hypoglycemic brain damage.

excitatory impulse, a sudden force that stimulates activity.

excited state /eksīʹtid/ [L, *excitare,* to rouse, *status*], (in chemistry and physics) an energy level of a system that is higher than the ground state. The system decays to the ground state and emits the energy difference, usually in the form of photons.

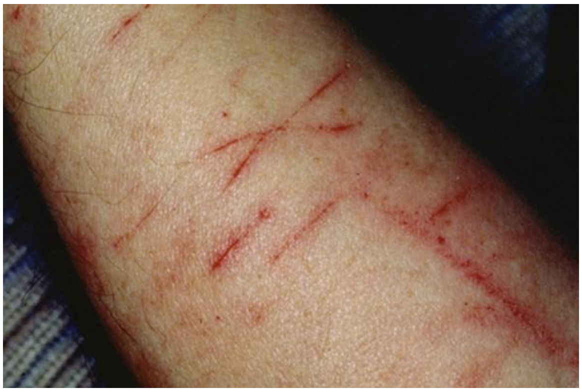
excitement /eksītʹmənt/, (in psychiatry) a pathological state marked by emotional intensity, impulsive behavior, anticipation, and arousal. Excitement in schizophrenic patients tends to result from blocked communications and hostile feelings between the patients and the hospital staff.

exciting eye, (in sympathetic ophthalmia) the eye that sustains a penetrating injury and causes an inflammatory reaction in the fellow eye. Also called **inciting eye.**

exclusion from base price, a health care contract provision in which high-cost variable items beyond the control of the provider, such as organ procurement costs, are excluded from the base price. Not applicable in Canada.

Exclusive Provider Organization (EPO), a type of managed health care organization in which no coverage is typically provided for services received outside the EPO. However, some EPOs incorporate the primary care physician gatekeeper concept along with prospective approval of referrals to specialists of providers outside the EPO.

excoriation /ekskôrʹē·āʹshən/ [L, *excoriare,* to flay], an injury to a surface of the body caused by trauma, such as scratching, abrasion, or a chemical or thermal burn.



Excoriations from tree branch scratches
(Lemmi and Lemmi, 2000)

excrement /eks′krəment/, any waste matter, particularly feces, discharged from the body.

excreta /ekskrē′tə/ [L, *excernere,* to separate], any waste matter discharged from the body.

excrete /ekskrēt′/ [L, *excernere,* to separate], to evacuate a waste substance from the body, often via a normal secretion; for example, a drug that may be excreted in breast milk.

excretion /ekskrē′shən/, the process of eliminating, shedding, or getting rid of substances by body organs or tissues, as part of a natural metabolic activity. Excretion usually begins at the cellular level, where water, carbon dioxide, and other waste products of cellular life are emptied into the capillaries. The epidermis excretes dead skin cells by shedding them daily.

excretory /eks′krətôr′ē/ [L, *excernere,* to separate], relating to the process of excretion, often used in combination with a term to identify an object or procedure associated with excretion, such as **excretory urography.**

excretory duct, a duct that is conductive but not secretory.

excretory organ, an organ that is concerned primarily with the production and discharge of body wastes.

excretory urography [L, *excernere,* to separate; Gk, *ouron,* urine, *graphein,* to record], the radiographic examination of the urinary tract. It is accomplished with the use of contrast medium that is injected into the blood, filtered by the kidneys, and passed through the tract. Also called **intravenous pyelography (IVP).**

excursion /ikskur′zhən/ [L, *ex,* out, *currere,* to run], a departure or deviation from a direct or normal course.

execute /ek′səkyo͞ot/, (of a computer) to follow a set of instructions to complete a program or specified function.

executive physical /iksek′yətiv/, a physical examination that includes extensive laboratory, radiographic, and other tests that may be provided periodically to management level personnel at employer expense. Such examinations may be detailed, expensive, and overly complete.

exemestane, an antineoplastic.

■ INDICATION: It is used to treat advanced breast cancer in postmenopausal patients whose cancer is unresponsive to other therapies.

■ CONTRAINDICATIONS: Its use is prohibited in premenopausal women, pregnant women, and clients with known hypersensitivity to this drug.

■ ADVERSE EFFECTS: Adverse effects include fatigue, diarrhea, constipation, abdominal pain, increased appetite, hypertension, depression, insomnia, anxiety, cough, and dyspnea. Common side effects include nausea, vomiting, hot flashes, and headache.

exenatide, an antidiabetic drug.

■ INDICATIONS: This drug is given in combination with metformin or a sulfonylurea to treat type 2 diabetes mellitus.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include feeling jittery, restlessness, weakness, nausea, vomiting, diarrhea, dyspepsia, anorexia, gastroesophageal reflux, and weight loss. A life-threatening side effect is hypoglycemia. Common side effects include headache and dizziness.

exencephaly /ek′sənsef′əlē/ [L, *ex,* out + Gk, *enkephalos,* brain], a developmental anomaly characterized by lack of all or part of the skull, so that the brain is exposed.

exenteration /eksen′tera′shun/, **1.** surgical removal of the inner organs; evisceration. **2.** in ophthalmology, removal of the entire contents of the orbit.

exercise /ek′sərsiz/ [L, *exercere,* to exercise], **1.** *n,* the performance of any physical activity for the purpose of conditioning the body, improving health, or maintaining fitness or as a means of therapy for correcting a deformity or restoring the organs and body functions to a state of health. **2.** *n,* any action, skill, or maneuver that causes muscle exertion and is performed repeatedly to develop or strengthen the body or any of its parts. **3.** *v,* to use a muscle or part of the body in a repetitive way to maintain or develop its strength. Exercise has a beneficial effect on each of the body systems, although in excess it can lead to the breakdown of tissue and cause injury. Kinds of exercise are **active assisted exercise, active exercise, active resistance exercise, aerobic exercise, anaerobic exercise, isometric exercise, isotonic exercise, muscle-setting exercise, passive exercise, progressive resistance exercise, range of motion exercise, therapeutic exercise,** and **underwater exercise.**

exercise amenorrhea, a suppression of ovulation and thus menstration that affects some women who participate in high-intensity athletics. See also **stress amenorrhea.**

exercise electrocardiogram (ECG), a record of the electrical activity of the heart taken during graded increases in the rate of exercise. It is important in the diagnosis of coronary artery disease. Abnormal changes in cardiac function that are absent during rest may occur with exercise. See also **stress test.**

exercise-induced anaphylaxis, a rare severe allergic reaction brought on by strenuous exercise. Cessation of physical activity usually results in immediate improvement. See also **anaphylaxis.**

exercise-induced asthma /-indyo͞ost′/, a form of asthma that produces symptoms after strenuous exercise. The condition usually occurs in persons who already have asthma, hay fever, or related hypersensitivity reactions. The effect may be acute but is reversible.

exercise prescription [L, *exercere* + *prae* + *scribere,* to write], an individualized schedule for physical fitness exercises.

exercise promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the facilitation of regular physical activity to maintain or advance to a higher level of fitness and health. See also **Nursing Interventions Classification.**

exercise promotion: strength training, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating regular resistive muscle training to maintain or increase muscle strength. See also **Nursing Interventions Classification.**

exercise promotion: stretching, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of systematic slow-stretch-hold muscle exercises to induce relaxation, to prepare muscles/joints for more vigorous exercise, or to increase or maintain body flexibility. See also **Nursing Interventions Classification.**

exercise therapy: ambulation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion and assistance with walking to maintain or restore autonomic and voluntary body functions during treatment and recovery from illness or injury. See also **Nursing Interventions Classification.**

exercise therapy: balance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the use of specific activities, postures, and movements to maintain, enhance, or restore balance. See also **Nursing Interventions Classification.**

exercise therapy: joint mobility, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of active or passive body movement to maintain or restore joint flexibility. See also **Nursing Interventions Classification.**

exercise therapy: muscle control, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of specific activity or exercise protocols to enhance or restore controlled body movement. See also **Nursing Interventions Classification.**

exercise tolerance, the level of physical exertion an individual may be able to achieve before reaching a state of exhaustion. Exercise tolerance tests are commonly performed on a treadmill under the supervision of a health professional who can stop the test if signs of distress are observed.

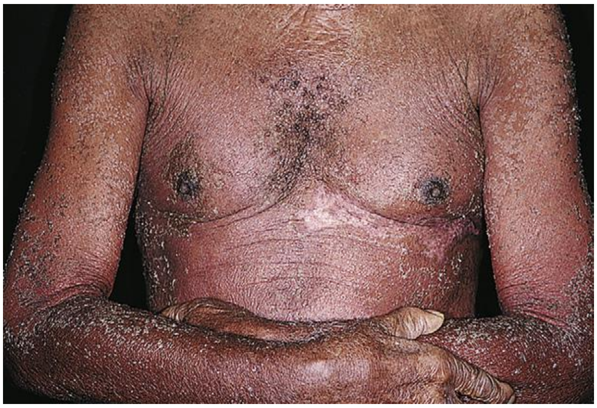
exeresis /ekser′əsis/ [Gk, *ex* + *eresis,* removal], the surgical excision of a part, organ, or body structure.

exertional headache /igzur′shənəl/ [L, *exserere,* to stretch out; AS, *heafod* + *acan,* headache], an acute headache that occurs during strenuous exercise. It usually recedes when the level of effort is reduced, when an analgesic medication is taken, or both.

exfoliation /eksfō′lē·ā′shən/ [L, *ex* + *folium,* leaf], peeling and sloughing off of tissue cells. This is a normal process that may be exaggerated in certain skin diseases or after a severe sunburn or may be be done deliberately, such as with **microdermabrasion.** See also **desquamation, exfoliative dermatitis. —exfoliative,** *adj.*

exfoliative cytology /eksfō′lē·ətiv/, the microscopic examination of desquamated cells for diagnostic purposes. The cells are obtained from lesions, sputum, secretions, urine, and other material by aspiration, scraping, a smear, or washings of the tissue. Compare **aspiration biopsy cytology.**

exfoliative dermatitis, any inflammatory skin disorder characterized by excessive peeling or shedding of skin. The cause is unknown in about half of cases. Known causes include drug reactions, scarlet fever, leukemia, lymphoma, and generalized dermatitis. Treatment is individualized, but care is essential to prevent secondary infection, avoid further irritation, maintain fluid balance, and stabilize body temperature.



Exfoliative dermatitis *(Callen et al, 2000)*

exhalation. See **expiration.**

exhale. See **expire.**

exhaustion /igzôs′chən/ [L, *exhaurire,* to drain away], a state of extreme loss of physical or mental abilities caused by fatigue or illness.

exhaustion delirium, a delirium that may result from prolonged physical or emotional stress, fatigue, or shock associated with severe metabolic or nutritional problems. See also **delirium.**

exhaustion psychosis [L, *exhaurire,* to drain out; Gk, *psyche,* mind, *osis,* condition], an abnormal mental condition attributable to physical exhaustion. The main symptom, a delirious state, may develop in some explorers, mountain climbers, persons lost in the wilderness, and terminally ill patients. See also **exhaustion delirium.**

exhibitionism /ek′sibish′əniz′əm/ [L, *exhibere,* to exhibit], **1.** the flaunting of oneself or one's abilities to attract attention. **2.** (in psychiatry) a psychosexual disorder that occurs primarily in men in which the repetitive act of exposing the genitals in socially unacceptable situations is the preferred means of achieving sexual excitement and gratification. See also **paraphilia, scopophilia. —exhibitionist,** *n.*

eximer laser /ek′simir/, a small laser designed to break up organic molecules, such as cholesterol deposits, without producing intense heat.

existential humanistic psychotherapy. See **humanistic existential therapy.**

existential psychiatry /eg′zisten′shəl/ [L, *existere,* to spring forth; Gk, *psyche,* mind, *iatreia,* medical care], a school of psychiatry based on the philosophy of existentialism that emphasizes an analytic, holistic approach in which mental disorders are viewed as deviations within the total structure of an individual's existence rather than as results of any biologically or culturally related factors.

existential therapy, a kind of psychotherapy that emphasizes the development of a sense of self-direction through choice, awareness, and acceptance of individual responsibility.

exit block [L, *exire,* to depart; Fr, *bloc*], the failure of an expected impulse to emerge from its focus of origin and cause depolarization of cardiac muscle.

exit dose, the amount of radiation at the surface of the body opposite that to which the radiation is directed.

Exjade, a trademark for **deferasirox.**

exo-, prefix meaning "outside, outward": *exocataphoria, exohysteropexy, exotoxin.*

exocoelom. See **extraembryonic coelom.**

exocrine /ek′səkrin/ [Gk, *exo,* outside, *krinein,* to secrete], pertaining to the process of secreting outwardly through a duct to the surface of an organ or tissue or into a vessel. See also **exocrine gland.** Compare **endocrine system.** See also **eccrine.**

exocrine gland, a gland that discharges its secretions through ducts opening on internal or external surfaces of the body. An example is the **lacrimal gland.** See also **gland.**

exocytosis /ek′sōsītō′sis/ [Gk, *exos,* outside + *kytos,* a hollow vessel], discharge from a cell of particles that are too large to diffuse through the wall. Compare **endocytosis.**

exodondist. See **dental surgeon.**

exoenzyme /ek′sō·en′zīm/, an enzyme that does not function within the cells from which it is secreted.

exogenous /igzoj′ənəs/ [Gk, *exo* + *genein,* to produce], **1.** outside the body. **2.** originating outside the body or an organ of the body or produced from external causes, such as a disease caused by a bacterial or viral agent foreign to the body. Compare **endogenous. —exogenic,** *adj.*

exogenous hypertriglyceridemia. See **hyperlipidemia type I.**

exogenous infection [Gk, *exo,* outside, *genein,* to produce; L, *inficere,* to infect], an infection that develops from bacteria normally outside the body that have gained access to the body.

exogenous obesity, obesity caused by a caloric intake greater than needed to meet the metabolic needs of the body. Compare **endogenous obesity.** See also **obesity.**

exogenous uric acid [Gk, *exo,* outside, *genein,* to produce, *ouron,* urine; L, *acidus*], the accumulation of uric acid in the body produced by the metabolism of purine-rich foods.

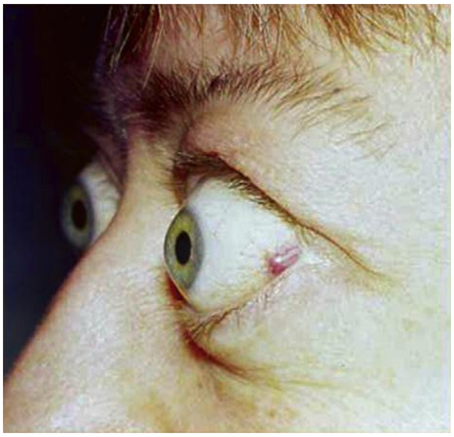
exon /ek′son/ [Gk, *exo* + *genein,* to produce], the part of a DNA molecule that contains the code for the final messenger RNA. Compare **intron.**

exonuclease /ek′sōno͞o′klē·ās/ [Gk, *exo* + L, *nucleus,* nut; *ase,* enzyme], an enzyme that digests DNA or RNA from the ends of the strands. Compare **endonuclease.**

Exophiala /ek′sofī′ə·lə/, a widespread genus of saprobic Fungi Imperfecti. *E. jeanselmei* is commonly found in soil and sewage and causes mycetoma and opportunistic infections in humans. *Hortae werneckii* (formerly classified as *E. werneckii*) is the cause of tinea nigra. Because it is so variable, some authorities have proposed dividing it into more than one species. Infection usually results from traumatic implantation and is associated with local or systemic immunosuppression.

exophoria /ek′səfôr′ē·ə/ [Gk, *exo* + *pherein,* to bear], the latent lateral deviation of the visual axis of one eye outward. It occurs in the absence of visual stimuli for fusion. Also called **divergent strabismus.** Compare **exotropia.** **—exophoric,** *adj.*

exophthalmia /ek′softhal′mē·ə/ [Gk, *exo* + *ophthalmos,* eye], an abnormal condition characterized by a marked protrusion of the eyeballs (**exophthalmos,** *exophthalmus*), usually resulting from the increased volume of the orbital contents caused by a tumor; swelling associated with cerebral, intraocular, or intraorbital edema or hemorrhage; paralysis of or trauma to the extraocular muscles; or cavernous sinus thrombosis. It may also be caused by endocrine disorders such as hyperthyroidism and Graves' disease, varicose veins within the orbit, or injury to orbital bones. Visual acuity may be impaired in exophthalmia; keratitis, ulceration, infection, and blindness may also occur. Treatment depends on the underlying cause. Acute advanced exophthalmia is often irreversible. Also called **protrusio bulbi.** See also **proptosis.** **—exophthalmic,** *adj.*



Exophthalmia *(Goldman et al, 2012)*

exophthalmic goiter /ek′softhal′mik/, exophthalmos that occurs in association with goiter, as in Graves' disease.

exophthalmometer /ek′səfthalmom′ətər/ [Gk, *exo* + *ophthalmos,* eye, *metron,* measure], an instrument used for measuring the degree of forward displacement of the eye in exophthalmos. The device allows measurement of the forward distance of the lateral orbital rim to the front of the cornea.

exophthalmos. See **exophthalmia.**

exophthalmos-macroglossia-gigantism syndrome. See **EMG syndrome.**

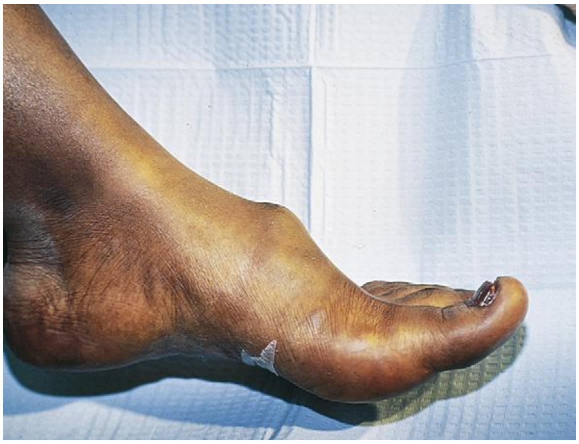
exophytic /ek′səfit′ik/ [Gk, *exo* + *phyton,* plant], pertaining to the tendency to grow outward, such as a tumor that grows into the lumen of a hollow organ rather than into the wall.

exophytic carcinoma, a malignant epithelial neoplasm that resembles a papilloma or wart.

exoskeletal prosthesis /ek′səskel′ətəl/ [Gk, *exo* + *skeletos,* dried up, *prosthesis,* addition], a prosthetic device in which support is provided by an outside structure (not an implant), such as an artificial limb. See also **prosthesis.**

exoskeleton /ek′səskel′ətən/ [Gk, *exo,* outside, *skeletos,* dried up], the hard outer covering of many invertebrates, such as crustaceans, which lack the bony internal skeleton of vertebrates. Compare **endoskeleton.**

exostosis /ek′sostō′sis/ [Gk, *exo* + *osteon,* bone], an abnormal benign growth on the surface of a bone. Also called **hyperostosis.** **—exostosed, exostotic,** *adj.*



Exostosis *(Swartz, 2009)*

exostosis cartilaginea [Gk, *ex,* out, *osteon,* bone; L, *cartilago,* cartilage], an outgrowth of cartilage at the ends of long bones. Also called **cartilage capped exostosis.**

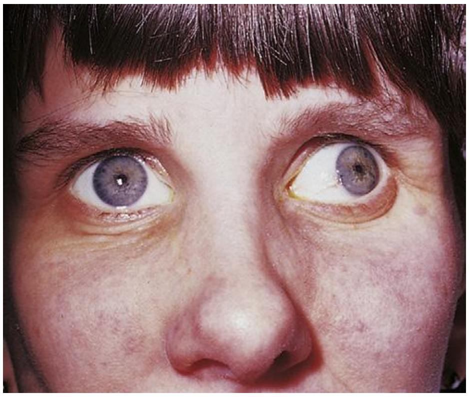
exostotic. See **exostosis.**

exoteric /ek′səter′ik/ [Gk, *exoterikos,* external], lying outside an organism.

exothermic, indicating a chemical process accompanied by the release of heat, such as the loss of body surface heat.

exotoxin /ek′sətok′sin/ [Gk, *exo* + *toxikon,* poison], a toxin that is secreted or excreted by a living microorganism. Compare **endotoxin.**

exotropia /ekstrō′fēə/, a deviation of the lines of sight between the two eyes in which the nonfixating eye is pointed outward. The eye has defective vision. Also called **divergent squint, divergent strabismus.**



Exotropia *(Albert et al, 2008/ Courtesy David Walton, MD)*

expanded function dental assistant, a dental assistant with training beyond basic dental assisting, who has passed a competency examination, and who has state-granted permission to perform certain dental procedures other than the removal, altering, or shaping of human tissue. Examples of some expanded functions are placement of post-extraction and sedative dressings; placing periodontal dressings; sizing stainless steel crowns; placing and condensing amalgam for Class I, V, and VI restorations; carving amalgam; placing composite for Class I, V, and VI restorations; polishing the coronal surfaces of teeth; minor palliative care of dental emergencies (placing sedative filling); preliminary bending of archwire; removal of orthodontic bands and bonds; final cementation of any permanent appliance or prosthesis; minor palliative care of orthodontic emergencies (bend/clip wire, remove broken appliance); making impressions for the fabrication of removable prosthesis; placement of temporary soft liners in a removable prosthesis; place retraction cord in preparation for fixed prosthodontic impressions; making impressions for the fabrication of fixed prosthesis; extra-oral adjustment of fixed prosthesis; extra-oral adjustment of removable prosthesis during and after insertion; and placement and cementation of orthodontic brackets and/or bands.

expanded role [L, *expandere,* to spread out; OFr, *rolle,* an assumed character], the functions of a nurse that are not specified in the traditional limits of nursing practice legislation. Common roles are primary nurse and nurse practitioner, necessitating legal coverage through the establishment of standardized procedures or amendments or changes in nursing practice acts.

expansion /ekspanʹshən/ [L, *expandere,* to spread out], **1.** the process or state of being increased in extent, surface, or bulk. **2.** a region or area of increased bulk or surface.

expectant treatment /ekspek′tənt/ [L, *exspectare,* to wait for; Fr, *traitment*], application of therapeutic measures to relieve symptoms as they arise in the course of a disease, rather than treatment of the cause of illness. Some kinds of expectant treatment are amputations for gangrene in a patient with diabetes, coronary bypass procedures in a patient with generalized atherosclerosis, and transplantation of tendons in a patient with severe rheumatoid arthritis. Compare **definitive treatment, palliative treatment, treatment.**

expectation /eksʹpektā′shən/ [L, *exspectare,* to wait for], **1.** (in nursing) anticipation by the staff of a patient's behavior that is based on a knowledge and understanding of the person's abilities and problems. **2.** anticipation of the performance of the nursing staff in defined roles, as role expectation.

expectation of life. See **life expectancy.**

expected date of delivery (EDD), the predicted date of a pregnant woman's delivery. Pregnancy lasts approximately 266 days, or 38 weeks from the day of fertilization, but is considered clinically to last 280 days, or 40 weeks, or 10 lunar months, or 9⅓ calendar months from the first day of the last menstrual period (LMP). The EDD is usually calculated on the basis of 9⅓ calendar months, but if a woman is certain that coitus occurred only once during the month and if she knows the date on which it occurred, the EDD may be calculated as 38 weeks from that date. In the absence of a special calendar or device for calculating the EDD, it is arrived at by counting back 3 months from the first day of the LMP and then adding 7 days and 1 year; thus, if the first day of a woman's LMP was July 18, 1997, one counts back 3 months to April 18, 1997, then adds 7 days and 1 year to arrive at an EDD of April 25, 1998 (Nägele's rule). Because calendar months differ in length, this calculation may give a date that is a few days more or less than 280 days from the first day of the LMP, but it provides a very close approximation, and a trivial error will not be of clinical significance because of the variability of the actual durations of normal pregnancies. The expectant mother is advised that the EDD is only an estimate and that the chances are that she will give birth within 2 weeks before or, more commonly, after the calculated date. Also called **expected date of birth, expected date of confinement.**

expectorant /ikspek′tərənt/ [Gk, *ex,* out, *pectus,* breast], **1.** pertaining to a substance that promotes the ejection of mucus or other exudates from the lung, bronchi, and trachea. **2.** an agent that promotes expectoration by reducing the viscosity of pulmonary secretions or by decreasing the tenacity with which exudates adhere to the lower respiratory tract. Expectorant drugs include acetylcysteine, guaifenesin, and terpin hydrate. Also called **mucolytic. —expectorate,** *v.*

expectoration /ekspekʹtərā′shən/, the ejection of mucus, sputum, or fluids from the trachea and lungs by coughing or spitting.

experience rating /ikspir′ē·əns/ [L, *experientia,* testing, *rata,* proportion], a system used by insurance companies in the United States to set the premium to be paid by the insured on the basis of the risk to the company of providing the insurance. Experience rating may lead to very high malpractice premiums in some medical specialties, for the insurance company calculates the premium on the basis of settlements made in related malpractice cases during a specified period. Experience rating is also used to set annual membership health maintenance fees in organizations in which the cost of providing the services in a previous accounting period is used to determine the premiums for the next fiscal year.

experiment, an investigation in which one or more variables may be altered under controlled circumstances to study the effects of altering variables.

experimental design /eksperʹimen′təl/ [L, *experimentum* + *designare,* to mark out], (in research) a study design used to test cause-and-effect relationships between variables. The classic experimental design specifies an experimental group and a control group. The independent variable is administered to the experimental group and not to the control group, and both groups are measured on the same dependent variable. Subsequent experimental designs have used more groups and more measurements over longer periods. True experiments must have control, randomization, and manipulation.

experimental embryology, the study and analysis through experimental techniques of the factors, mechanisms, and relationships that determine and influence prenatal development.

experimental epidemiology, a type of epidemiological investigation that uses an experimental model for studies to confirm a causal relationship suggested by observational studies.

experimental group, a set of items or people under study to determine the effect of an event, a substance, or a technique. Compare **control group.**

experimental medicine, a branch of the practice of medicine in which new drugs or treatments are evaluated for safety and efficacy in a clinical laboratory setting by using animals or, in certain cases, human subjects.

experimental pathology, the study of diseases deliberately induced in laboratory animals.

experimental physiology, a branch of the study of physiology in which the functions of various body systems are evaluated in a clinical laboratory setting by using animals or, in some cases, human subjects.

experimental psychology, the study of mental processes and phenomena by observation in a controlled environment using various tests, manipulations, and experiments. Compare **analytic psychology.**

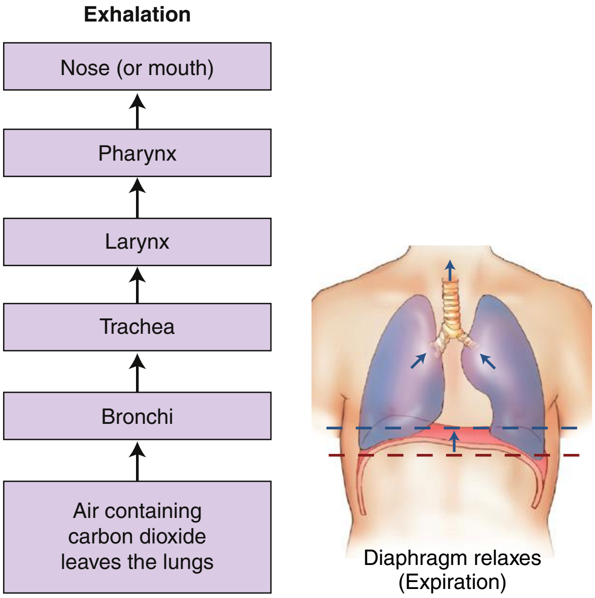
experimental variable. See **independent variable.**

expertise /eks′pərtēz′/ [L, *experiri,* to try], special skills or knowledge acquired by a person through education, training, or experience.

expert panel, a group convened for the purpose of providing specialized expertise related to a specific topic or area of interest.

expert witness /ikspurt′, ek′spərt/ [L, *experiri,* to try; AS, *witnes,* knowledge], a person who has special knowledge of a subject about which a court requests testimony. Special knowledge may be acquired by experience, education, observation, or study but is not possessed by the average person. An expert witness provides testimony or informed opinions on evidence. This evidence often serves to educate the court and the jury in the subject under consideration.

expiration /ik′spirā′shən/ [L, *expirare,* to breathe out], **1.** also called **exhalation.** breathing out, normally a passive process, depending on the elastic qualities of lung tissue and the thorax. Compare **inspiration. 2.** termination or death. **—expiratory,** *adj.*



Exhalation
Nose (or mouth)
Pharynx
Larynx
Trachea
Bronchi
Air containing carbon dioxide leaves the lungs
Diaphragm relaxes (Expiration)

Expiration *(LaFleur Brooks and LaFleur Brooks, 2012, and Leonard, 2009)*

expiratory center [L, *expirare,* to breath out; Gk, *kentron,* center], one of several regions of the medulla, responsible for control of respiration. It is a subregion specifically involved in carrying out the activity of expiration.

expiratory phase, the portion of the respiratory cycle that involves exhalation, or moving air out of the lungs. In normal circumstances, it is passive. In a ventilated patient the expiratory phase may be passive, depending on the recoil of elastic tissues in the lung to move air out, or active, applying positive pressure to the abdominal area or negative pressure to the upper airway.

expiratory reserve volume (ERV), the maximum volume of gas that can be exhaled after a resting volume exhalation. See also **vital capacity.**

expiratory retard, (in respiratory care) a mode of mechanical ventilation that mimics the prolonged expiratory phase and pursed-lip breathing of emphysema. The method adds some resistance to expiration. Low levels of positive end-expiratory pressure may produce a similar effect. Also called *expiratory resistance.*

expire /ikspī′ər/ [L, *expirare,* to breathe out], **1.** also called **exhale,** to breathe out. **2.** to die.

expired gas (E), any gas exhaled from the lungs.

explantation /ex-plan-ta′shun/, the removal of an implant.

exploratory /iksplôr′ətôr′ē/ [L, *explorare,* to search out], pertaining to investigation, as in exploratory surgery.

exploratory operation [L, *explorare,* to search out, *operari,* to work], surgical intervention to find the cause of a disorder by opening a body cavity or organ and examining the interior.

explosion, 1. a sudden and violent decomposition of a chemical compound. **2.** a sudden radical breakout.

explosive personality /iksplō′siv/ [L, *ex,* out, *plaudere,* to clap], behavior characterized by episodes of uncontrolled rage and physical abusiveness in reaction to relatively minor stressors.

explosive speech, abnormal speech characterized by slow, jerky articulation interspersed with sudden loud enunciation of words, often seen in brain disorders. The term is less often used by speech-language pathologists.

exponent /ikspō′nənt/, a superscript on a number that indicates how many times a number is to be multiplied by itself (for example, $3^4 = 3 \times 3 \times 3 \times 3 = 81$). In medical or scientific reports, powers of 10 are commonly used to indicate very large or very small numbers, such as in the examples 10^6 representing 1,000,000 or 10^{-6} representing 1/1,000,000. Exponents also are indicated by prefixes, such as mega- for 10^6 and micro- for 10^{-6}.

exposed pulp [L, *exponere,* to lay out, *pulpa,* flesh], dental pulp that becomes exposed to the oral environment and potential bacterial infection. Causes include fracture of the crown through trauma and loss of a tooth crown, the advance of dental caries to the pulp chamber, or penetration through the dentin during restorative preparation or caries excavation.

exposure /ikspō′zhər/ [L, *exponere,* to lay out], **1.** a measure of the ionization of air produced by a beam of radiation. It is expressed as coulombs per kilogram of air. **2.** a state of being in the presence of or subjected to a force or influence (e.g., viral exposure, heat exposure).

exposure angle, the angle of the arc described by the movement of a radiographic tube and film during a tomographic exposure. It is usually less than the tomographic angle. The exposure angle influences the thickness of the tomographic section: smaller angles produce thicker sections.

exposure switch, (in radiology) a control device designed to interrupt the power automatically when pressure by the operator's hand or foot is released. The purpose is to prevent accidental continuing exposure of the patient to radiation. A common exposure switch is a foot pedal.

exposure unit, any of the conventional or SI units used to measure radiation exposure: roentgen, rad, rem, curie, gray, sievert, and becquerel.

expression /ikspresh′ən/ [L, *exprimere,* to express], **1.** the indication of a physical or emotional state through facial appearance or vocal intonation. **2.** the act of pressing or squeezing to expel something, such as milk from the breast when lactating or the fetus from the uterus by exertion of pressure on the abdominal wall. **3.** (in genetics) the detectable effect or appearance in the phenotype of a particular trait or condition. See also **expressivity. —express,** *v.*

expressive aphasia. See **motor aphasia.**

expressive language disorder, a communication disorder in children and adults, characterized by problems with expression of language, either oral or signed. It includes difficulties such as limited speech or vocabulary, vocabulary errors, difficulty or hesitation in word selection, oversimplification of grammatical or sentence structure, omission of parts of sentences, unusual word order, and slowed acquisition of language skills. Two types are recognized, *acquired* and *developmental.*

expressivity /eks′presiv′itē/ [L, *exprimere,* to make clear], the variability with which basic patterns of inheritance are modified, both in degree and in variety, by the effect of a given gene in people of the same genotype. For example, polydactyly may be expressed as extra toes in one generation and extra fingers in another.

expulsive stage of labor /ikspul′siv/ [L, *expellere,* to drive out, *stare,* stand, *labor,* work], the second stage of labor, during which the mother's uterine contractions are accompanied by a bearing-down reflex. It begins after full dilation of the cervix and continues to the complete birth of the infant.

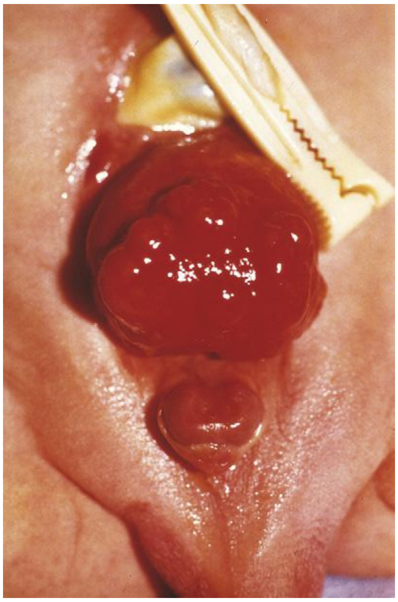
exsanguinate /eksang′gwināt/ [L, *ex, sanguis,* blood], to drain away or deprive an organ of blood.

exsanguination /eksang′gwinā′shən/, a massive loss of blood.

exsiccant. See **desiccant.**

exsiccate. See **desiccate.**

exstrophy /ek′strōfē/ [Gk, *ekstrephein,* to turn inside out], a congenital malformation in which a hollow organ has its wall turned inside-out, establishing a communication with the exterior. An example is exstrophy of the bladder with eversion of the posterior bladder wall, which causes urine to drain to the exterior.



Exstrophy of the bladder *(Kumar, Abbas, and Fausto, 2005/ Courtesy Dr. Hardy Hendren, Surgeon-in-Chief, Children's Hospital)*

exstrophy-epispadias complex, a group of congenital defects of the anterior abdominal wall, including exstrophy of the bladder, exstrophy of cloaca, and epispadias, under the theory that they are all expressions of the same developmental anomaly.

exstrophy of the bladder, a developmental anomaly marked by absence of part of the lower abdominal wall and the anterior wall of the urinary bladder, with eversion of the posterior wall of the bladder through the defect, as well as an open pubic arch and widely separated ischia connected by a fibrous band.

extended arm. See **reacher.**

extended care facility (ECF) [L, *extendere,* to stretch], an institution devoted to providing medical, nursing, or custodial care for an individual over a prolonged period, such as during the course of a chronic disease or the rehabilitation phase after an acute illness. Kinds of extended care facilities are **intermediate care facility** and **skilled nursing facility.** Also called **convalescent home, nursing home.**

extended family, a family group consisting of the biological or adoptive parents, their children, the grandparents, and other family members. The extended family is the basic family group in many societies. Among its characteristics are exchange of information from experienced older members to less experienced younger ones, care of the older family members in the home by the younger ones, and care of younger members' children by older members. Compare **nuclear family.**

extended insulin-zinc suspension, a long-acting insulin that is slowly absorbed and slow to act.

extended-wear contact lens, a refractive index device that fits over the cornea, designed to permit air permeation. Oxygen may pass between the lens and the cornea, thereby reducing the risk of corneal irritation.

extender, something that causes an increase in time or size, such as a substance added to a medication to stretch the time required for the drug to be absorbed, such as a **plasma volume extender.**

Extendryl, a trademark for a fixed-combination nasal decongestant drug containing an adrenergic **(phenylephrine hydrochloride),** an antihistaminic **(chlorpheniramine maleate),** and an anticholinergic (methscopolamine nitrate).

extension /iksten′shən/ [L, *extendere,* to stretch], a "straightening" movement allowed by certain joints of the skeleton that increases the angle between two adjoining bones, such as extending the leg, which increases the posterior angle between the femur and the tibia. Compare **flexion.**

extension partial denture. See **partial denture.**

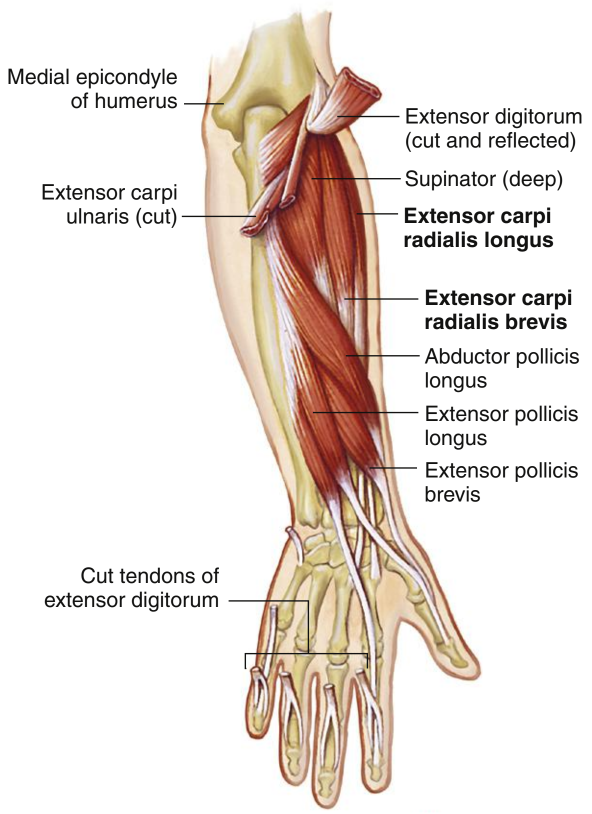
extensor /iksten′sər/ [L, *extendere,* to stretch out], any muscle that extends a body part, such as the **extensor indicis,** which extends the index finger.

extensor carpi radialis brevis [L, *extendere* + Gk, *karpos,* wrist; L, *radius,* ray, *brevis,* short], one of the muscles of the posterior forearm. It inserts into the dorsal surface of the third metacarpal bone and functions to extend the hand and forearm.

extensor carpi radialis longus, one of the seven superficial muscles of the posterior forearm. It inserts into the dorsal surface of the second metacarpal bone and serves to extend the hand and flex the forearm.

extensor carpi ulnaris, one of the muscles of the lateral forearm. It inserts by a tendon into the ulnar side of the fifth metacarpal bone and functions to extend and adduct the hand.

extensor digiti minimi, an extensor muscle of the posterior forearm. It is a slender muscle that arises from the common extensor tendon and joins the expansion of the extensor digitorum tendon on the back of the first phalanx of the little finger. It functions to extend the little finger and hand.



Medial epicondyle of humerus
Extensor carpi ulnaris (cut)
Cut tendons of extensor digitorum
Extensor digitorum (cut and reflected)
Supinator (deep)
Extensor carpi radialis longus
Extensor carpi radialis brevis
Abductor pollicis longus
Extensor pollicis longus
Extensor pollicis brevis

Extensor carpi radialis *(Patton and Thibodeau, 2010)*

extensor digitorum, a muscle of the posterior forearm. It divides distally into four tendons that pass under the extensor retinaculum and diverge on the back of the hand, inserting into the second and third phalanges of the medial four fingers. It functions to extend the phalanges and, by continued action, the wrist. Also called *extensor digitorum communis*.

extensor digitorum brevis, a muscle that flexes the three middle toes and the proximal metatarsophalangeal joint of the great toe.

extensor digitorum longus, a penniform muscle located at the lateral part of the anterior leg. It is one of four anterior crural muscles. It extends the proximal phalanges of the four small toes and dorsiflexes the foot.

extensor hallucis longus, a muscle that extends the great toe and dorsiflexes the foot at the ankle joint.

extensor indicis. See **extensor.**

extensor lag, the amount of drooping at a weakened joint that can extend only passively, no longer actively.

extensor pollicis brevis, a muscle that extends the metacarpophalangeal and carpometacarpal joints of the thumb.

extensor pollicis longus, a muscle that extends all the joints of the thumb.

extensor retinaculum of the ankle, either of two thick layers of fascia holding dorsiflexor tendons in place in the ankle.

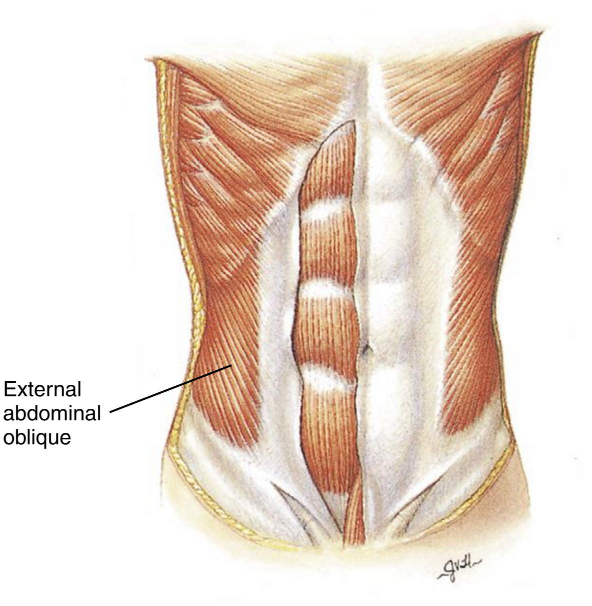
extensor retinaculum of the hand, the thick band of antebrachial fascia that wraps tendons of the extensor muscles of the forearm at the distal ends of the radius and the ulna. Also called **retinaculum extensorum manus, superficial dorsal carpal ligament.**

extensor thrust, a spinal-level reflex present in a human in the first 2 months of life. It is an exaggeration of the positive support reflex and consists of an uncontrolled extension of a flexed leg when the sole of the foot is stimulated.

extern /eks′turn/ [L, *externus,* outward], a medical or dental student who lives outside the institution but provides medical or dental care to patients as an extracurricular activity under the professional supervision of hospital staff members. Compare **intern.**

external /ikstur′nəl/ [L, *externus,* outward], **1.** being on the outside or exterior of the body or an organ. **2.** acting from the outside, such as an external influence or exogenous factor. **3.** pertaining to the outward or visible appearance. Compare **internal.**

external abdominal oblique muscle, one of a pair of muscles that are the largest and the most superficial of the five anterolateral muscles of the abdomen. It is a broad, thin four-sided muscle that acts to compress the contents of the abdomen and assists in micturition, defecation, emesis, parturition, and forced expiration. Both sides acting together serve to flex the vertebral column, drawing the pubis toward the xiphoid process. One side alone functions to bend the vertebral column laterally and to rotate it, drawing the shoulder of the same side forward. Also called **obliquus externus abdominis.** Compare **internal abdominal oblique muscle.**



External abdominal oblique muscle
(Thibodeau and Patton, 2003)

external abdominal region. See **lateral region.**

external absorption, the taking up of substances through the mucous membranes or the skin.

external acoustic meatus, the canal of the external ear, composed of bone and cartilage, extending from the auricle to the tympanic membrane. Also called **external auditory canal.**

external aperture of aqueduct of vestibule, an external opening for the small canal extending from the vestibule of the inner ear, located on the internal surface of the petrous part of the temporal bone lateral to the opening for the internal acoustic passage.

external aperture of canaliculus of cochlea, an external opening of the cochlear channel on the margin of the jugular opening in the temporal bone.

external aperture of tympanic canaliculus, the lower opening of the tympanic channel on the inferior surface of the petrous part of the temporal bone.

external auditory canal, external auditory meatus. See **external acoustic meatus.**

external beam radiotherapy, treatment by radiation emitted from a source located at a distance from the body. Also called **beam therapy,** *external beam therapy.*

external carotid artery, one of a pair of arteries with eight major temporal or maxillary branches, rising from the common carotid arteries. It supplies various parts and tissues of the head and neck.

external carotid plexus, a network of nerves around the external carotid artery, formed by the external carotid nerves from the superior cervical ganglion. It supplies sympathetic fibers associated with branches of the external carotid artery. Compare **common carotid plexus, internal carotid plexus.**

external cervical os, an external opening of the uterus that leads into the cavity of the cervix. Compare **internal cervical os.**

external conjugate, the distance measured with obstetric calipers from the depression below the lowest lumbar vertebra posteriorly to the upper border of the symphysis anteriorly (usually about 21 cm). Also called **Baudelocque's diameter.**

external counterpulsation, a noninvasive technique for providing counterpulsation (assisted heart pumping). In one technique the limbs are placed in inflatable trousers. Inflation and deflation are synchronized with the cardiac cycle, generating augmented blood flow during diastole and assisted ejection during systole.

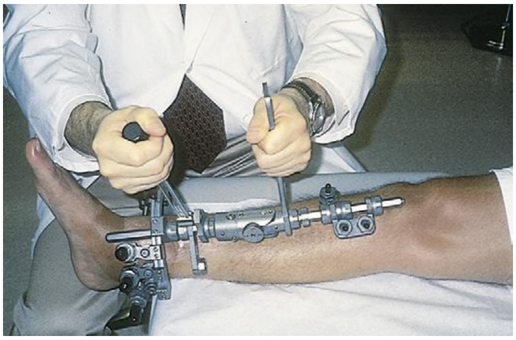
external cuneiform bone. See **lateral cuneiform bone.**

external ear, the outer structure of the ear, consisting of the auricle and the external acoustic meatus. Sound waves are funneled through the external ear to the middle ear. Compare **internal ear, middle ear.**

external fertilization, the union of male and female gametes outside the bodies from which they originated, such as occurs in frogs and most fish.

external fistula, an abnormal passage between an internal organ or structure and the cutaneous surface of the body. It can be surgically created or caused by delayed wound healing or necrotizing tumors.

external fixation, a method of holding together the fragments of a fractured bone by using transfixing metal pins through the fragments and a compression device attached to the pins outside the skin surface. Nursing care includes regular cleansing of the skin around the pins and, in certain cases, application of antibiotic solutions or ointments. The pins are removed in a later procedure when the fracture is healed. Compare **internal fixation.**



External fixation *(Courtesy Zimmer, Inc.)*

external iliac artery, the larger, more superficial division of the common iliac artery, which descends into the thigh and becomes the femoral artery. The external iliac supplies the lower limb. Compare **internal iliac artery.**

external iliac node, a node in one of the seven groups of parietal nodes serving the lymphatic system in the abdomen and the pelvis. Compare **common iliac node, iliac circumflex node, internal iliac node.** See also **lymph, lymphatic system, lymph node.**

external iliac vein, one of a pair of veins in the lower body that join the internal iliac veins to form the two common iliac veins. Compare **internal iliac vein.**

external jugular vein, the more superficial and lateral of a pair of large vessels on each side of the neck that receive most of the blood from the exterior of the cranium and the deep tissues of the face. Compare **internal jugular vein.**

external locus of control. See **locus of control.**

external malleolus /maleʹōlas/ [L, *externus,* outward, *malleolus,* little hammer], a rounded bony prominence on either side of the ankle joint. Also called **malleolus fibulae.**

external occipital crest, a ridge extending downward from the external occipital protuberance.

external occipital protuberance, a midline projection of the occipital bone with curved lines extending laterally from it.

external pacemaker [L, *externus,* outward, *passus,* step; ME, *maken,* to make], **1.** a device used to stimulate the heartbeat electrically by means of impulses conducted through the chest wall, as used in emergency care of significant bradyarrhythmias. **2.** a device in which the impulse generator is outside the chest but is connected with the heart by wires that pass under the skin. The wires are placed during open-heart surgery and are removed after surgery, when the risk of bradycardia has diminished.

external perimysium. See **epimysium.**

external phase. See **continuous phase.**

external pin fixation, a method of holding together the fragments of a fractured bone by means of pins that are attached to the bone and that protrude from the skin. See also **skeletal fixation.**

external pterygoid muscle, one of the four short, thick, somewhat conical muscles of mastication that function to open the jaws, protrude the mandible, and move the mandible from side to side. Also called **pterygoideus lateralis.**

external radiation therapy (ERT), the therapeutic application of ionizing radiation from an external beam of a kilovoltage radiographic machine; a megavoltage cobalt 60 machine; or a supervoltage linear accelerator, cyclotron, or betatron. ERT is used most frequently in the treatment of cancer but also in the therapy of keloids and some dermatological conditions and in counteracting the body's physiological rejection of transplanted organs.

external resorption, dissolving of the tooth structures progressing from the outside of the tooth to the inside of the tooth, not related to caries and often idiopathic in nature.

external respiration, the part of the respiratory process that involves the exchange of gases in the alveoli of the lungs.

external rotation, turning outwardly or away from the midline of the body, such as when a leg is externally rotated with the toes turned outward or away from the body's midline.

external secretion. See **exocrine gland.**

external shunt, a device for the passage of body fluid from one compartment to another. It consists of a tube or catheter (or a series of such containers) that passes from one compartment or cavity to another over the body surface rather than inside the body. See also **hemodialysis, hydrocephalus.**

external sphincter of female urethra, a sphincter muscle that compresses the central part of the urethra in females. It originates in the ramus of the pubis and is innervated by the perineal nerves.

external sphincter of male urethra, a sphincter muscle that compresses the membranous part of the urethra in males. It originates in the ramus of the pubis and is innervated by the perineal nerves.

external urethral orifice. See **urinary meatus.**

external ventricular drain, a ventricular catheter connected to a drainage system and a closed collection bag. It allows the clinician to control fluid flow and, to some extent, pressure in the cranial vault.

external version, an obstetric procedure in which a fetus is turned, usually from a breech to a vertex presentation, by external manipulation through the abdominal wall. Compare **version and extraction.**

exteroceptive /ek′stərōsep′tiv/ [L, *externus,* outside, *recipere,* to receive], pertaining to stimuli that originate from outside the body or to the sensory receptors that they activate. Compare **interoceptive, proprioception.**

exteroceptor /ek′stərōsep′tər/ [L, *externus,* outside, *recipere,* to receive], any sensory nerve ending, such as those located in the skin, mucous membranes, or sense organs, that responds to stimuli originating outside the body, such as touch, pressure, or sound. Compare **interoceptor, proprioceptor.** See also **chemoreceptor.**

extinction /iksting′shən/, a state of being lost or destroyed.

extirpation /ek′stərpā′shən/ [L, *extirpare,* to root out], the total removal of a diseased organ or body part.

extra-, extro-, prefix meaning “outside, beyond, in addition to”: *extrabronchial, extradural, extramarginal.*

extraarticular /ek′strə·ärtik′yələr/ [L, *extra,* outside, *articulare,* to divide into joints], pertaining to the area outside a joint or within the joint.

extra beat [L, *extra,* outside; AS, *beatan*], an extra heart contraction. It is indicated by a premature atrial, junctional, or ventricular complex on an electrocardiogram.

extracapsular /-kaps′yələr/ [L, *extra,* outside, *capsula,* little box], pertaining to something outside a capsule, such as the articulare capsule of the knee joint.

extracapsular ankylosis. See **false ankylosis.**

extracapsular dendrite [L, *extra* + *capsula* + Gk, *dendron,* tree], pertaining to dendrites of some autonomic nerves that penetrate the capsule boundary and extend some distance from the cell body.

extracapsular fracture [L, *extra* + *capsula,* little box], any fracture that occurs near a joint but does not directly involve the joint capsule. This type of fracture is extremely common in the hip.

extracellular /-sel′yələr/ [L, *extra* + *cella,* storeroom], occurring outside a cell or cell tissue or in cavities or spaces between cell layers or groups of cells. See also **cell, edema, interstitial.**

extracellular fluid (ECF), the portion of the body fluid comprising the interstitial fluid and blood plasma. The adult body contains about 11.2 L of interstitial fluid, constituting about 16% of body weight, and about 2.8 L of plasma, constituting about 4% of body weight. Plasma and interstitial fluid are very similar chemically and, in conjunction with intracellular fluid, help control the movement of water and electrolytes throughout the body. Some of the important ionized components of extracellular fluid are protein, magnesium, potassium, chlorine, calcium, and certain sulfates.

extracellular matrix, a substance containing collagen, elastin, proteoglycans, glycosaminoglycans, and fluid, produced by cells and in which the cells are embedded. The matrix secreted by chondroblasts, for example, is responsible for the properties of cartilage.

extracellular space. See **extracellular.**

extrachromosomal /-krō′məsō′məl/, occurring without direct involvement of the chromosomes. See **epigenesis.**

extracoronal /eks′trəkor′ənəl/ [L, *extra* + *corona,* crown], outside the crown of a tooth.

extracoronal retainer /-kôr′ənəl/ [L, *extra* + *corona,* crown, *retinere,* to hold], **1.** a dental anchor that incorporates a cast restoration lying largely external to the coronal portion of a tooth and complements the contour of the tooth crown. Resistance to displacement is developed between the inner surfaces of the casting and the external walls of the prepared tooth. The restoration incorporating an extracoronal retainer may be a complete or partial crown. **2.** a direct clasp-type retainer that engages an abutment tooth on its external surface, used to retain and stabilize a removable partial denture. **3.** a manufactured direct retainer, the protruding portion of which is attached to the external surface of a cast crown on an abutment tooth.

extracorporeal /ek′strakôr′pôr′ē·əl/ [L, *extra* + *corpus,* body], something that is outside the body, such as extracorporeal circulation in which venous blood is diverted outside the body to a heart-lung machine and returned to the body through a femoral or other artery.

extracorporeal membrane oxygenator (ECMO), a device that oxygenates a patient’s blood outside the body and returns the blood to the patient’s circulatory system. The technique may be used to support an impaired respiratory system.

extracorporeal oxygenation, the use of an artificial membrane outside the body to provide for oxygenation of the blood in a patient with severe lung disease.

extracorporeal photochemotherapy, a procedure for treating pemphigus vulgaris by treating the patient’s blood outside the body. Certain drugs are first administered to the patient. Some of the patient’s blood is then removed temporarily for exposure to ultraviolet light outside the body. The blood, after treatment, is returned to the patient. See also **photochemotherapy.**

extracorporeal shock-wave lithotripsy (ESWL) [L, *extra,* outside, *corpus,* body; Fr, *choc* + AS, *wafian* + Gk, *lithos,* stone, *tribein,* to wear away], use of vibrations of powerful sound waves to break up calculi in the urinary tract or gallbladder. Also called **shock wave lithotripsy.**

extracorporeal technician. See **perfusion technologist.**

extracranial /-krā′nē·əl/ [L, *extra,* outside; Gk, *kranion,* skull], pertaining to something outside or unconnected with the skull.

extract [L, *ex,* out, *trahere,* to draw], **1.** /ek′strakt/ *n,* a substance, usually a biologically active ingredient, prepared by the use of solvents or evaporation to separate the substance from the original material. **2.** a concentrated form of an herb that is derived when the crude herb is mixed with water, alcohol, or another solvent and distilled or evaporated. Extracts may be either fluid or solid. **3.** /ikstrakt′/ *v,* to remove a tooth from the oral cavity by means of elevators or forceps or both. **—extraction,** *n.*

extractor /ikstrak′tər/, a medical instrument, such as a forceps, used to remove a foreign body, tissue sample, or medical device placed in a body cavity.

extradural /ek′trədo͞or′əl/ [L, *extra* + *dura,* hard], outside the dura mater.

extradural anesthesia, anesthetic nerve block achieved by the injection of a local anesthetic solution into the space in the spinal canal outside the dura mater of the spinal cord, as in **caudal anesthesia, epidural anesthesia/analgesia,** or **paravertebral block.**

extradural hemorrhage. See **epidural hemorrhage.**

extradural space, the space between the cranial cavity and the outer layer of dura mater.

extraembryonic blastoderm /-em′brē·on′ik/ [L, *extra* + Gk, *en,* in, *bryein,* to grow], the area of the blastoderm outside the embryo that gives rise to the membranes that surround the embryo during gestation. Compare **embryonic blastoderm.** See also **allantois, amnion, chorion, yolk sac.**

extraembryonic coelom, a cavity external to the developing embryo that forms between the mesoderm of the chorion and that covers the amniotic cavity and yolk sac. Also called **exocoelom.**

extraembryonic mesoderm [L, *extra,* outside; Gk, *en* + *bryein,* to grow, *mesos,* middle, *derma,* skin], any mesoderm in the uterus that is not involved with the embryo itself. Included are mesoderms in the amnion, chorion, yolk sac, and connecting stalk.

extrahepatic cholestasis, cholestasis occurring outside the liver, caused by blockage of a bile duct or ducts. It may be caused by a tumor or stricture, a gallstone or other damage in the duct, pancreatitis, or other causes.

extramammary Paget's disease /-mam′ərē/ [L, *extra,* outside, *mamma,* breast; James Paget, English surgeon, 1814–1899; L, *dis* + Fr, *aise,* ease], a gradually spreading red, scaly, and crusted lesion resembling that of Paget's disease but not occurring on the breast. A common area is the vulva. The lesions give rise to carcinoma in approximately 50% of the cases.

extramarital /-mer′itəl/, happening outside a marriage, such as an extramarital affair.

extramedullary /-med′yəler′ē/ [L, *extra* + *medulla,* marrow], pertaining to something outside or unrelated to any medulla.

extramedullary myeloma [L, *extra* + *medulla,* marrow], a plasma cell tumor that occurs outside the bone marrow, usually affecting the visceral organs or the nasopharyngeal and oral mucosa. Also called **extramedullary plasmacytoma, peripheral plasma cell myeloma, plasma cell tumor.**

extramedullary myelopoiesis, the formation and development of myeloid tissue outside the bone marrow. Also called **ectopic myelopoiesis.**

extramedullary plasmacytoma. See **extramedullary myeloma.**

extraneous /exstrā′nē·əs/ [L, strange], originating or entering from outside the organism.

extraocular /-ok′yo͝olər/ [L, *extra* + *oculus,* eye], outside the eye.

extraocular movement. See **cardinal position of gaze.**

extraocular muscle palsy, an abnormal condition characterized by paralysis of the extrinsic muscles of the eye, such as the superior, inferior, medial, and lateral rectus muscles, and the superior and the inferior oblique muscles. See also **strabismus.**

extraocular muscles (EOMs), the six sets of muscles that control movements of the eyeball. They are the superior rectus and inferior rectus, which move the eye up and down; the medial rectus and the lateral rectus, which move the eye to either side; and the superior oblique and inferior oblique, which move the eye downward and inward, and upward and inward, respectively.

extraoral anchorage /-ôr′əl/ [L, *extra* + *oralis,* mouth, *ancora,* hook], an orthodontic holding device outside the mouth, typically linking dental attachments to a wire bow or to hooks extending between the lips and attached by elastic to a cap, neck strap, or other device outside the mouth. Also called extraoral orthodontic appliance.

extraperitoneal /-per′itənē′əl/ [L, *extra* + Gk, *peri,* near, around, *teinein,* to stretch], occurring or located outside the peritoneal cavity.

extraperitoneal cesarean section, a method for surgically delivering a baby through an incision in the lower uterine segment without entering the peritoneal cavity. The uterus is approached through the paravesical space. This procedure is performed most often to prevent spread of infection from the uterus into the peritoneal cavity. It takes longer to perform than the low cervical or classic cesarean operation. Compare **classic cesarean section, low cervical cesarean section.** See also **cesarean section.**

extrapleural /-plo͝or′əl/, outside the pleural cavity.

extrapleural pneumothorax, a condition in which a pocket of air or gas forms between the endothoracic fascia-pleura layer and the adjacent chest wall. See also **pneumothorax.**

extrapsychic conflict /-sī′kik/ [L, *extra* + Gk, *psyche,* mind; L, *confligere,* to strike together], an emotional conflict that usually occurs when one's inner needs and desires do not coincide with the restrictions of the environment or society. Compare **intrapsychic conflict.** See also **conflict.**

extrapulmonary /-pul′məner′ē/, outside of or unrelated to the lungs.

extrapulmonary small cell carcinoma, a primary small cell cancer with a histological diagnosis of small cell carcinoma but located in body areas outside the lungs. It occurs most frequently around the head and neck; in the pancreas, colon, and rectum; and in the genitourinary tract.

extrapyramidal /ek′strəpiram′ədəl/ [L, *extra* + Gk, *pyramis,* pyramid], **1.** pertaining to the tissues and structures outside the cerebrospinal pyramidal tracts of the brain that are associated with movement of the body, excluding motor neurons, the motor cortex, and the corticospinal and corticobulbar tracts. **2.** pertaining to the function of these tissues and structures.

extrapyramidal disease, any of a large group of conditions affecting the extrapyramidal tracts and characterized by involuntary movement, changes in muscle tone, and abnormal posture. Examples include tardive dyskinesia, chorea, athetosis, and Parkinson's disease.

extrapyramidal side effects, side effects that mimic extrapyramidal disease and are caused by drugs that block dopamine receptor sites in the extrapyramidal system tract. See also **parkinsonism.**

extrapyramidal system, the part of the nervous system that includes the basal nuclei (substantia nigra, subthalamic nucleus, etc.), part of the midbrain, and the motor neurons of the spine. See also **extrapyramidal tracts.**

extrapyramidal tracts, the uncrossed tracts of motor nerves from the brain to the anterior horns of the spinal cord, except the crossed fibers of the pyramidal tracts. Within the brain, extrapyramidal pathways comprise various relays of motoneurons between motor areas of the cerebral cortex, the basal nuclei, the thalamus, the cerebellum, and the brainstem. The extrapyramidal pathways are functional rather than anatomical units, comprising the nuclei and the fibers and excluding the pyramidal tracts. They especially control and coordinate the postural, static, supporting, and locomotor mechanisms and cause contractions of muscle groups sequentially or simultaneously. The extrapyramidal pathways include the corpus striatum, the subthalamic nucleus, the substantia nigra, and the red nucleus, together with their interconnections with the reticular formation, the cerebellum, and the cerebrum. Compare **pyramidal tract.**

extrarenal uremia. See **prerenal uremia.**

extrasensory /-sen′sərē/ [L, *extra* + *sentire,* to feel], pertaining to alleged awareness of events that cannot be observed by any of the five basic senses. It includes telepathy, clairvoyance, and psychokinesis.

extrasensory perception (ESP) [L, *extra* + *sentire,* to feel, *percipere,* to perceive], alleged awareness or knowledge acquired without using the physical senses. See also **clairvoyance, parapsychology, telepathy.**

extrasystole. See **ectopic beat.**

extrauterine /-yo͞o′tərin/ [L, *extra* + *uterus,* womb], occurring or located outside the uterus, as an ectopic pregnancy.

extravasation /ikstrav′əsā′shən/ [L, *extra* + *vas,* vessel], **1.** a passage or escape into the tissues, usually of blood, serum, lymph or infusion. Compare **bleeding. 2.** passage or escape into tissue of antineoplastic chemotherapeutic drugs. Signs and symptoms may be sudden onset of localized pain at an injection site, sudden redness or extreme pallor at an injection site, or loss of blood return in an IV needle. Tissue slough and necrosis may occur if the condition is severe. Treatment depends on the causative agent. Nursing responsibilities include maintaining the patient IV line, elevating the affected area, applying ice packs, and notifying the physician of the need for antidote injections, if applicable. See also **exudate, transudate. —extravasate,** *v.*

extravascular fluid /-vas′kyələr/ [L, *extra,* outside, *vasculum,* small vessel, *fluere,* to flow], fluid in the body that is outside the blood vessels. Examples include lymph and cerebrospinal fluid.

extraventricular hydrocephalus. See **hydrocephalus.**

extraversion. See **extroversion.**

extravert. See **extrovert.**

extraverted personality. See **extroverted personality.**

extremity /ikstrem′itē/ [L, *extremitas*], a limb or appendage. The arm may be identified by the layperson as an upper extremity and the leg as a lower extremity.

extrinsic /ikstrin′sik/ [L, *extrinsecus,* on the outside], pertaining to anything external or originating outside a structure or organism, including parts of an organ that are not wholly contained within it, as an extrinsic muscle.

extrinsic allergic alveolitis. See **hypersensitivity pneumonitis.**

extrinsic allergic pneumonia. See **diffuse hypersensitivity pneumonia.**

extrinsic asthma. See **allergic asthma.**

extrinsic factor. See **cyanocobalamin.**

extrinsic muscle (em) [L, *extrinsecus,* on the outside], **1.** a muscle that is outside the organ it controls, as the extraocular muscles that control eye movements. **2.** a muscle that links a limb to the trunk of the body.

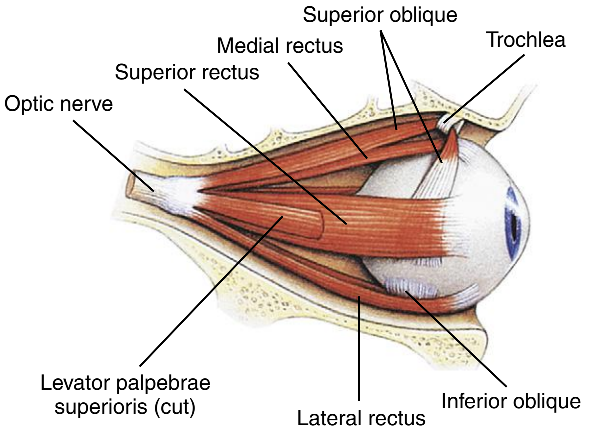
extrinsic pathway of coagulation, the mechanism that produces fibrin after tissue injury, beginning with formation of an activated complex between tissue factor and activated factor VII and leading to activation of factor X, which induces the reactions of the common pathway of coagulation. Compare **intrinsic pathway of coagulation.** See also **coagulation cascade, common pathway of coagulation.**

extro-. See **extra-.**

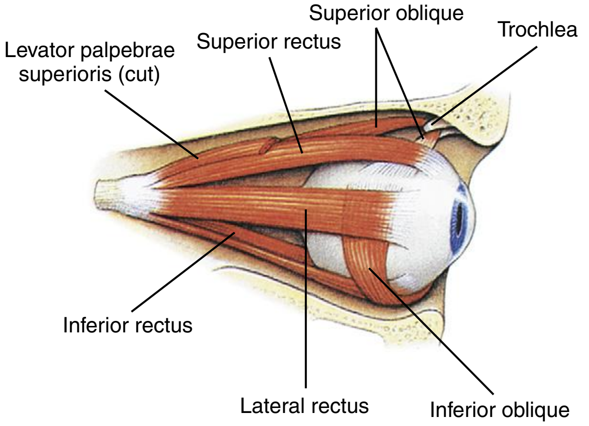
extroversion /-vur′zhən/ [L, *extra* + *vertere,* to turn], **1.** the tendency to direct one's interests and energies toward external values or things outside the self. **2.** the state of being totally or primarily concerned with what is outside the self. Also spelled **extraversion.** Compare **introversion.**

extrovert /ik′strəvurt′/, **1.** a person whose interests are directed away from the self and concerned primarily with external reality and the physical environment rather than with inner feelings and thoughts. This person is usually highly sociable, outgoing, impulsive, and emotionally expressive. **2.** a person characterized by extroversion. Also spelled **extravert.** Compare **introvert.**

extroverted personality /-vur′tid/ [L, *extra,* outside, *vertere,* to turn, *personalis,* of a person], a persona that is directed to a greater degree toward the outer world of people and events rather than the subjective inner world experience. Also called **extraverted personality.**



Superior view



Inferior view

Extrinsic muscles of the eye *(Patton and Thibodeau, 2010)*

extrude /ekstrōod′/ [L, *extrudere,* to push out], to thrust out from a surface or from alignment.

extrusion /ek·stro͞o′zhən/ [L, *extrudere,* to push out], **1.** thrusting or pushing out; expulsion by force. **2.** the overeruption or movement of a tooth beyond its normal occlusal plane in the absence of opposing occlusal force. **3.** an orthodontic technique for the elongation or elevation of a tooth. Compare **intrusion.**

extrusion reflex /ekstro͞o′zhən/ [L, *extrudere,* to push out, *reflectere,* to bend back], a normal response in infants to force the tongue outward when it is touched or depressed. The reflex begins to disappear by about 3 or 4 months of age. Constant protrusion of a large tongue may be a sign of Down syndrome.

extubation /iks′t(y)o͞obā′shən/ [L, *ex,* out, *tuba,* tube], the process of withdrawing a tube from an orifice or cavity of the body. **—extubate,** *v.*

exuberant callus. See **heterotopic ossification.**

exudate /eks′yo͝odāt/ [L, *exsudare,* to sweat out], fluid, cells, or other substances that have been slowly exuded, or discharged, from cells or blood vessels through small pores or breaks in cell membranes. Perspiration, pus, and serum are sometimes identified as exudates.

exudation /eks′yədā′shən/ [L, *exudare*], the oozing of fluid, pus, or serum. The exudate may or may not contain fibrous or coagulated material.

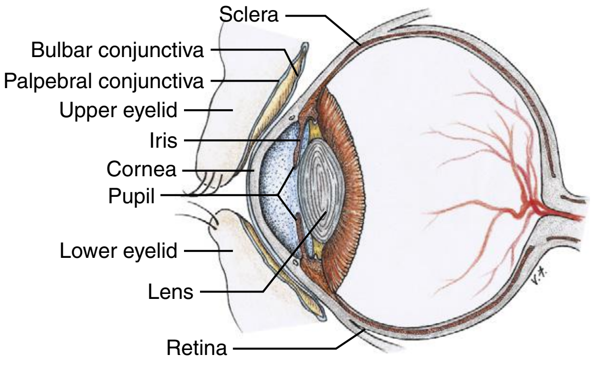
exudative /igzo͞o′dətiv/, relating to the oozing of fluid and other materials from cells and tissues, usually as a result of inflammation or injury.

exudative enteropathy, diarrhea that occurs in diseases characterized by inflammation or destruction of intestinal mucosa. Crohn's disease, ulcerative colitis, tuberculosis, and some lymphomas cause an increased amount of plasma, blood, mucus, and protein to accumulate in the intestine, adding to fecal bulk and frequency. See also **diarrhea.**

exudative inflammation [L, *exudare,* to sweat out, *inflammare,* to set afire], an inflammation of a serous or raw cavity in which fluid is released from the inflamed surface.

exudative retinopathy, a condition marked by masses of white or yellowish exudate in the posterior part of the fundus oculi, with deposits of cholesterol and blood debris from retinal hemorrhage, that leads to destruction of the macula and blindness. Also called **Coats' disease, Coats' retinitis,** *exudative retinitis*.

eye [AS, *eage*], one of a pair of organs of sight, contained in a bony orbit at the front of the skull, with retrobulbar fat, and innervated by four cranial nerves: optic, oculomotor, trochlear, and abducens. Associated with the eye are certain accessory structures, such as the muscles, the fasciae, the eyebrow, the eyelids, the conjunctiva, and the lacrimal gland. The bulb of the eye is composed of segments of two spheres with nearly parallel axes that constitute the outside tunic and one of three fibrous layers enclosing two internal cavities separated by the crystalline lens. The smaller cavity anterior to the lens is divided by the iris into two chambers, both filled with aqueous humor. The posterior cavity is larger than the anterior cavity and contains the jellylike vitreous body that is divided by the hyaloid canal. The outside tunic of the bulb consists of the transparent cornea anteriorly, constituting one fifth of the tunic, and the opaque sclera posteriorly, constituting five sixths of the tunic. The intermediate vascular, pigmented tunic consists of the choroid, the ciliary body, and the iris. The internal tunic of nervous tissue is the retina. Light waves passing through the lens strike a layer of rods and cones in the retina, creating impulses that are transmitted by the optic nerve to the brain. The transverse and the anteroposterior diameters of the eye bulb are slightly greater than the vertical diameter; the bulb in women is usually smaller than the bulb in men. Eye movement is controlled by six muscles: the superior and inferior oblique muscles and the superior, inferior, medial, and lateral rectus muscles. Also called **bulbus oculi,** *eyeball*.



Cross section of the eye *(Potter et al, 2011)*

eye bank [AS, *eage* + It, *banca,* bench], a facility for collecting and storing corneas and other ocular tissues for transplantation to recipients.

eyebrow [AS, *eage* + *bru*], **1.** the supraorbital arch of the frontal bone that separates the orbit of the eye from the forehead. **2.** the arch of hairs growing along the ridge formed by the supraorbital arch of the frontal bone.

eye care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention or minimization of threats to eye or visual integrity. See also **Nursing Interventions Classification.**

eye-closure reflex. See **wink reflex.**

eyecup, a small vessel or cup that is shaped to fit over the eyeball and used to bathe the exposed surface of the eye.

eye deviation [AS, *eage* + L, *deviare,* to turn aside], **1.** a movement of one or both eyes, singly or jointly, from the median line or from the original direction of fixation. **Manifest deviation** is the number of degrees by which the visual axis of one eye deviates from that of the other in cases of squint, when both eyes are open. **2.** (in strabismus) the departure of the foveal line of sight of one eye from the point of fixation.

eye dominance, an unconscious preference to use one eye rather than the other for certain purposes, such as sighting a rifle or looking through a telescope.

eyedrops, a liquid medicine that is administered by allowing it to fall in drops onto the conjunctival surface.

Eyedrop administration *(Potter et al, 2011)*

eye glasses, transparent lenses held in metal or plastic frames in front of the eyes to correct refractive errors or to protect the eyes from harmful electromagnetic waves or flying objects.

eyeground, the fundus of the eye as revealed by ophthalmoscopic examination.

eyelash [AS, *eage* + ME, *lasche*], one of many stiff hairs like cilia growing in double or triple rows along the border of the eyelids in front of a row of ciliary glands that are in front of a row of meibomian glands.

eyelid [AS, *eage* + *hlid*], one of two movable folds of protective thin skin over the eye, with eyelashes and ciliary and meibomian glands along its margin. It consists of loose connective tissue containing a thin plate of fibrous tissue lined with mucous membrane (conjunctiva). The orbicularis oculi muscle and the oculomotor nerve control the opening and closing of the eyelid. The upper and lower eyelids are separated by the palpebral fissure. Also called **palpebra** /pal′-pəbrə/.

eye memory. See **visual memory.**

eye patching, **1.** placement of a soft patch over a closed eye to restrict lid movement during corneal reepithelialization or a similar healing procedure in progress. **2.** occlusion of the better eye by patch placement in young patients with amblyopia to force greater use of the amblyopic eye. **3.** patching used in cases of diplopia (double vision).

eye reanimation, microsurgical restoration of function of a paralyzed eye sphincter.

eye shielding, protection of an injured eye by securing a metal or plastic eye shield or a disposable cup to prevent further injury.

eye wash, an apparatus for irrigating the eyes after exposure to dust or other debris or chemical contamination. The shower directs one or two streams of water so that they flush over the eyes and lids. The patient should blink the eyes and move the head in different directions with the eyes open, continuing the irrigation as needed.

eye worm. See ***Loa loa.***

ezetimibe, an antilipemic agent used to treat hypercholesterolemia, homozygous low-density lipoprotein receptor disorder, and homozygous sitosterolemia.

F

f, **1.** symbol for *breaths per unit time*. **2.** symbol for *respiratory frequency*.

F, **1.** abbreviation for **Fahrenheit.** **2.** abbreviation for **farad.** **3.** symbol for **fluorine.** **4.** abbreviation for **frequency.**

F_1, the symbol for **first filial generation.**

F_2, the symbol for **second filial generation.**

F_{ab}, the fragment of an antibody molecule that contains the antigen-binding site, consisting of a light chain and part of a heavy chain. Such fragments are produced when antibodies are digested by enzymes, such as the protease papain. F_{ab} fragments are used as an antidote for treating toxicity caused by digoxin, digitoxin, and oleander tea. See also **F_c, Digibind.**

F_c, a part of a molecule of an antibody that has been split by a proteolytic enzyme. It represents the relatively constant region, as distinguished from the F_{ab} portion, that contains the binding sites. The F_c portion is sometimes identified as the crystallizable fragment.

FA, **1.** abbreviation for **fatty acid.** **2.** abbreviation for **femoral artery.** **3.** abbreviation for **folic acid.**

FAAN, abbreviation for **Fellow of the American Academy of Nursing.**

Fab [*f*ragment, *a*ntigen-*b*inding], originally, either of two identical fragments, each containing an antigen combining site, obtained by papain cleavage of the IgG molecule. Now it is generally used as an adjective in terms such as Fab *fragment* or *region*, referring to an “arm” of any immunoglobulin monomer, i.e., one light chain and the adjoining heavy chain V_H and C_H1 domains.

FAB classification, *(French-American-British)* a classification of acute leukemia produced by a three-nation joint collaboration. Acute lymphoblastic leukemia is subdivided into three types and acute myelogenous leukemia is subdivided into eight types.

fabere, abbreviation for *f*lexion, *ab*duction, *e*xternal *r*otation, then *e*xtension. See also **Patrick test.**

fabere sign. See **Patrick test.**

Fabrazyme, a trademark for **agalsidase beta.**

fabrication /fab′rikā′shən/, a psychological reaction in which false statements are contrived to mask memory defects. It is a clinical feature of Korsakoff’s syndrome and other disorders. See also **confabulation.**

Fabry’s disease. See **angiokeratoma corporis diffusum.**

Fabry’s syndrome. See **angiokeratoma corporis diffusum.**

FAC, an anticancer drug combination of fluorouracil, DOXOrubicin, and cyclophosphamide.

F.A.C.C.P., abbreviation for *Fellow of the American College of Chest Physicians*.

F.A.C.D., abbreviation for *Fellow of the American College of Dentists*.

face [L, *facies*], **1.** *n,* the front of the head from the chin to the brow, including the skin and muscles and structures of the forehead, eyes, nose, mouth, cheeks, and jaw. **2.** *n,* the visage or countenance. **3.** *v,* to direct the face toward something. See also **en face. —facial,** *adj.*

face-bow [L, *facies* + AS, *boga*], a device resembling a caliper for measuring the relationship of the maxilla to the temporomandibular joints. The measurement is used in the fabrication of denture casts and major restorative procedures involving natural teeth. See also **articulator.**

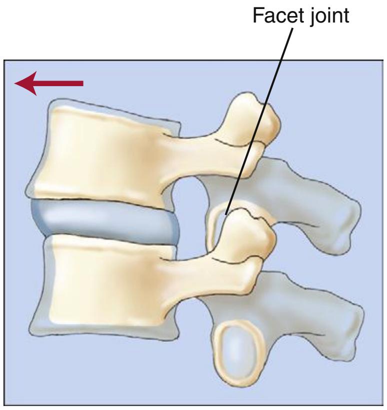
face lift, a plastic surgery procedure in which wrinkles and other signs of aging skin are eliminated. Also called **rhytidectomy, rhytidoplasty.**

face presentation [L, *facies*, face, *praesentare*, to show], an obstetric presentation in which the chin of the fetus is the first feature to appear in labor.

facet /fas′it/ [Fr, *facette*, little face], **1.** (in dentistry) a flattened, highly polished wear pattern on a tooth. **2.** a small, smooth-surfaced process for articulation.

facetectomy /fas′itek′təmē/, surgical removal of a facet, particularly the articular facet of a vertebra.

facet joint, synovial joint between articular processes (zygapophytes) of the vertebrae. Also called **zygapophyseal joint.**



Facet joint *(Muscolino, 2011)*

facial. See **face.**

facial angle /fāshəl/ [L, *facies* + *angulus*, a corner], the degree of protrusion of the lower face, assessed by measuring the inclination of the facial plane relative to the horizontal reference plane.

facial artery, one of a pair of tortuous arteries that arise from the external carotid arteries, divide into four cervical and five facial branches, and supply various organs and tissues in the head. The cervical branches of the facial artery are the ascending palatine, tonsillar, glandular, and submental. The facial branches are the inferior labial, superior labial, lateral nasal, angular, and muscular.

facial bones, the 14 bones that form the face of the skull. They include two each of the nasal, palatine, inferior nasal concha, maxilla, lacrimal, and zygomatic bones, plus the mandible and vomer.

facial diplegia, a rare neuromuscular condition characterized by bilateral paralysis of various muscles of the face. See also **Möbius’ syndrome.**

facial hemiplegia, paralysis of the muscles of one side of the face, usually causing a facial droop and associated with a stroke.

facial hemispasm. See **Bell's spasm.**

facial muscle, one of numerous muscles of the face that seldom remains distinct over its entire length because of a tendency to merge with a neighboring muscle at its termination or its attachment. The five groups of facial muscles are the muscles of the scalp, the extrinsic muscles of the ear, the muscles of the nose, the muscles of the eyelid, and the muscles of the mouth. The platysma is one of the facial group but is classified among the muscles of the neck. Also called **muscle of expression.**

facial nerve, either of a pair of mixed sensory and motor cranial nerves that arise from the brainstem at the base of the pons and divide immediately in front of the ear into six branches, innervating the scalp, forehead, eyelids, muscles of facial expression, cheeks, and jaw. Also called **seventh cranial nerve.**

facial nerve paralysis, a loss of voluntary control of the muscles of the face, usually on one side. The condition may be caused by a lesion involving the facial muscles or a nerve peripheral to the nucleus or by damage elsewhere in the brainstem or cerebrum. Weakness may be limited to the lower portion of the face, depending on the site of the lesion and the tracts involved.

facial neuralgia, the occurrence of pain in the middle ear and auditory canal caused by inflammation of the otic ganglion.

facial palsy [L, *facies,* face; Gk, *paralyein,* to be palsied], a loss of motor nerve function in the muscles of the face. See also **Bell's palsy.**

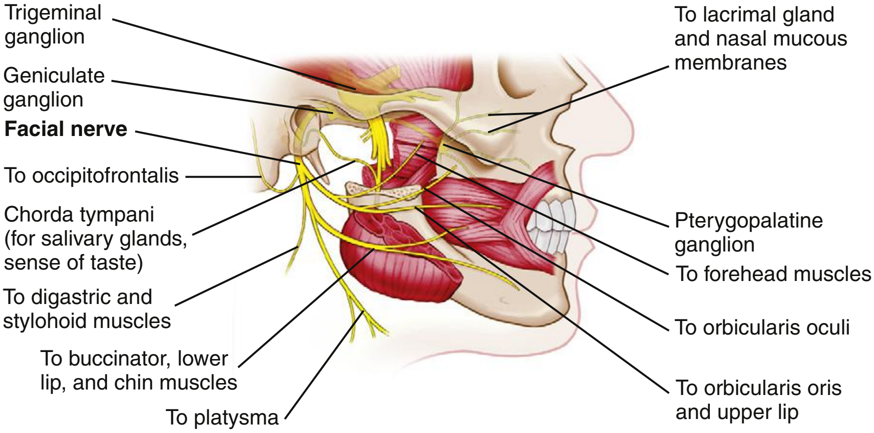
facial paralysis, an abnormal condition characterized by the partial or total loss of the functions of the facial muscles or the loss of sensation in the face. It may be caused by disease or by trauma. The degree of paralysis depends on the nerves affected. Brain injury above the facial nerve nucleus usually does not block the innervation of the brow and the forehead muscles. Injury to the nucleus of the facial nerve or injury to its peripheral neurons paralyzes all the ipsilateral facial muscles. See also **Bell's palsy.**

facial perception, the ability to judge the distance and direction of objects through the sensation felt in the skin of the face. The phenomenon is commonly experienced by those who are blind and is rarely experienced in the dark by those with sight. Also called **facial vision.**

facial reanimation, the use of surgical procedures to improve facial appearance and motion in facial paralysis.

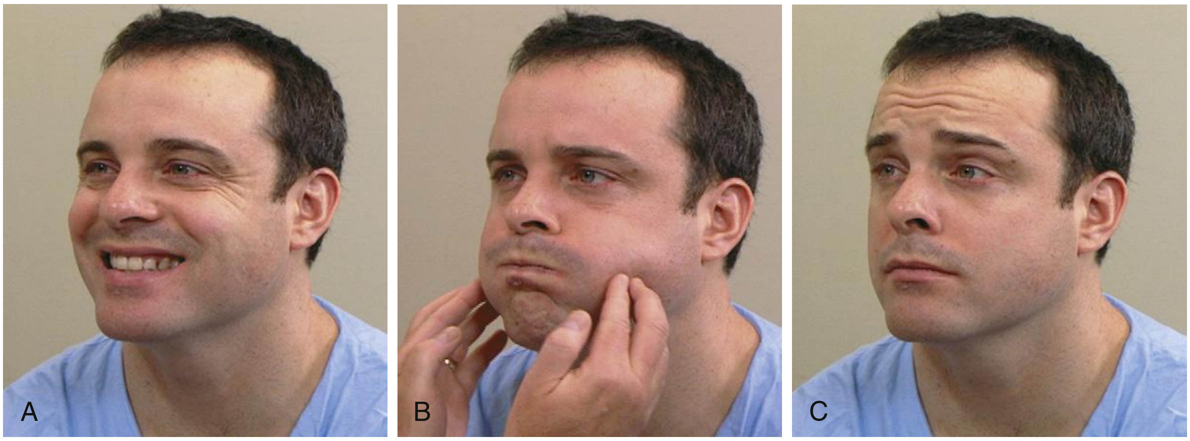
facial tic [L, *facies,* face; Fr, *tic,* twitching], any repetitive, spasmodic, and involuntary contraction of groups of facial muscles. See also **tic douloureux, trigeminal neuralgia.**

facial vein, one of a pair of superficial veins that drain deoxygenated blood from the superficial structures of the face. The facial vein anastomoses with the cavernous sinus through various veins, such as the angular, the supraorbital,



Trigeminal ganglion
Geniculate ganglion
Facial nerve
To occipitofrontalis
Chorda tympani (for salivary glands, sense of taste)
To digastric and stylohoid muscles
To buccinator, lower lip, and chin muscles
To platysma
To lacrimal gland and nasal mucous membranes
Pterygopalatine ganglion
To forehead muscles
To orbicularis oculi
To orbicularis oris and upper lip

Facial nerve assessment *(Swartz, 2009)*



Facial nerve

and the superior ophthalmic. Because the vein has no valves that prevent the backflow of blood, infections of the skin near the nose and mouth may progress into deeper tissues and lead to meningitis. Blood-borne organisms can reach the cavernous sinus through the anastomoses.

facial vision. See **facial perception.**

facies /fā′shē·ēs/ *pl.* **facies** [L, face], **1.** the face. **2.** the surface of any body structure, part, or organ. **3.** facial expression or appearance.

facilitation /fəsil′itā′shən/ [L, *facilitas,* easiness], **1.** the enhancement or reinforcement of any action or function so that it can be performed more easily. Compare **inhibition. 2.** (in neurology) the phenomenon whereby two or more afferent impulses that individually are not strong enough to elicit a response in a neuron can collectively produce a reflex discharge greater than the sum of the separate responses. See also **summation.**

facilitation/excitation, planned, graded physical guidance techniques used to improve movement coordination by increasing inadequate muscle tone, altering sensory responsiveness, and/or altering behavioral states (e.g., hands-on facilitation techniques that are targeted key postural points such as the shoulders, trunk, and hips).

facilitory casting /fəsil′itôr′ē/, a method of making prosthetic casts with materials that increase muscle tone in a specific group while increasing or decreasing range of motion.

facio-, prefix meaning "face": *faciocervical, faciolingual, facioplegia*.

faciodigitogenital syndrome, faciogenital dysplasia. See **Aarskog's syndromes.**

faciolingual /fā′shōling′gwəl/, pertaining to the face and tongue.

F.A.C.O.G., abbreviation for *Fellow of the American College of Obstetricians and Gynecologists*.

F.A.C.P., abbreviation for *Fellow of the American College of Physicians*.

F.A.C.S., abbreviation for *Fellow of the American College of Surgeons*.

facsimile (fax), a method of transmitting images or printed matter by electronic means. Images are scanned, converted into electronic signals, and sent over telephone lines to a fax receiver, which reconverts the electronic data into a duplicate of the original image.

F.A.C.S.M., abbreviation for *Fellow of the American College of Sports Medicine*.

-faction, suffix meaning a "process of making": *bilifaction, chylifaction, liquefaction*.

factitial /fakti′shəl/ [L, *facticius,* artificial], artificial or self-induced, such as a factitial dermatitis.

factitial dermatitis, self-induced skin lesions resulting from habitual rubbing, scratching, hair pulling, malingering, or mental disturbance.

factitious diarrhea, diarrhea caused by something the patient is doing to his or her own body, usually surreptitious laxative abuse.

factitious disorder /faktish′əs/, a *DSM-IV* diagnosis marked by disease symptoms caused by deliberate efforts of a person to gain attention. Such actions may be repeated, even when the individual is aware of the hazards involved. See also **Münchausen's syndrome.**

Factive, a trademark for **gemifloxacin.**

-factive, -fying, suffix meaning "making": *liquefactive, stupefactive, vasofactive*.

factor, **1.** one of a number of elements contributing to a whole. **2.** a number by which another number is exactly divisible. **3.** one of a number of elements that affect a specific result.

factor I. See **fibrinogen.**

factor II. See **prothrombin.**

factor IIa. See **thrombin.**

factor III, obsolete designation for a membrane protein found normally in subendothelial tissue. When exposed to blood, it forms a complex with factor VIIa to activate extrinsic coagulation. Now called **tissue factor.**

factor IV, a designation for calcium that is involved in the process of blood coagulation.

factor V, coagulation cofactor to factor Xa; forms complex that converts prothrombin rapidly to thrombin. Also called **proaccelerin.**

factor VII, a serine protease procoagulant present in the plasma and synthesized in the liver in the presence of vitamin K. Also called **proconvertin.**

factor VIII, a coagulation factor present in normal plasma but deficient from the blood of persons with hemophilia A. Acts as a cofactor to factor IX in intrinsic coagulation. Also called antihemophilic factor.

factor IX, a serine protease coagulation factor present in normal plasma but deficient from the blood of persons with hemophilia B. Factor IX forms a complex with its cofactor, factor VIII to activate factor X. Also called **Christmas factor.**

factor IX complex, a hemostatic containing factors II, VII, IX, and X.

■ INDICATION: It is prescribed in the treatment of hemophilia B. It is a vitamin K–dependent protein synthesized in the liver.

■ CONTRAINDICATION: Liver disease with associated intravascular coagulation and fibrinolysis is the only contraindication.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hepatitis, intravascular coagulation, circulatory collapse, and hypersensitivity reaction.

factor X, a serine protease coagulation factor in normal plasma that forms a complex with its cofactor, factor V, to convert prothrombin to thrombin. Also called **Stuart-Prower factor.**

factor XI, a serine protease coagulation factor present in normal plasma that activates factor IX. Deficiency results in Rosenthal disease.

factor XII, a serine protease coagulation factor present in normal plasma that activates factor XI in the presence of prekallikrein and high molecular weight kininogen. Factor XII is activated in vitro by contact with negatively charged surfaces, such as glass, kaolin, or ellagic acid. Deficiencies of XII do not cause clinical bleeding disorders, but may prolong laboratory coagulation tests. Also called **Hageman factor.**

factor XIII, a transamidase coagulation factor present in normal plasma that crosslinks fibrin polymer to produce a stable fibrin clot. Also called **fibrin stabilizing factor.**

factor-searching study, (in nursing research) a study design that produces a qualitative narrative description that includes categories or classifications of phenomena. It may be used to describe various aspects of nursing practice, characteristics of a population, or both. Factor searching is often a preliminary step in a study at a higher level of inquiry.

factor V–Leiden (FVL) test, a blood test for FVL, a genetic mutation of factor V, used to diagnose the risk of venous thrombosis.

factor Xa, a serine endopeptidase that catalyzes the conversion of prothrombin to active thrombin.

facultative /fak′əltā′tiv/ [L, *facultas,* capability], not obligatory; having the ability to adapt to more than one condition, such as a facultative anaerobe. Compare **obligate.**

facultative aerobe, an organism that is able to grow under anaerobic conditions but that develops most rapidly in an aerobic environment. Compare **obligate aerobe.** See also **aerobe.**

facultative anaerobe, an organism that is able to grow under aerobic conditions but that develops most rapidly in an anaerobic environment. Compare **obligate anaerobe.** See also **anaerobe, anaerobic infection.**

facultative parasite. See **parasite.**

faculty /fak′əltē/ [L, *facultas,* capability], **1.** any normal physiological function or natural ability of a living organism, such as the digestive faculty or the ability to perceive and distinguish sensory stimuli. **2.** an ability to do something specific, such as learn languages or remember names. **3.** any mental ability or power, such as memory or thought. **4.** a department in an institution of learning or the people who teach in a department of such an institution.

FAD, abbreviation for **fetal activity determination.** See **nonstress test.**

fading assistance, a method of grading an activity by gradually reducing the level of support given until the individual performs the activity independently.

fading time, the time required for a constant stimulus applied to a fixed area of the peripheral visual field to stop.

faecal. See **fecal.**

faeces, faex. See **feces.**

Faget's sign /fazhāz′/ [Jean C. Faget, French physician, 1818–1884], a falling pulse rate associated with a constant temperature, or a constant pulse associated with a rising temperature. It is an unusual sign found in yellow fever. Also called *Faget's law.*

fagicladosporic acid /faj′iklad′ōspôr′ik/, a toxin produced by *Cladosporium epiphyllum,* a member of a genus of fungi that cause "black spot" in stored meat, tinea nigra, and black degeneration of the brain.

Fahrenheit (F) /fer′ənhīt/ [Daniel G. Fahrenheit, German physicist, 1686–1736], a scale for the measurement of temperature in which the boiling point of water is 212°F and the freezing point of water is 32°F at sea level. To convert to Celsius, subtract 32, then divide by 1.8. Compare **Celsius.**

failed forceps, an attempted midforceps operation that is abandoned because there is a greater degree of resistance to rotation or traction than anticipated, as a result of cephalopelvic disproportion. Cesarean section is performed to deliver the infant. Compare **trial forceps.** See also **cephalopelvic disproportion.**

failure to thrive (FTT) /fāl′yər/ [L, *fallere,* to deceive; ME, *thriven,* to grasp], the abnormal retardation of growth and development of an infant resulting from conditions that interfere with normal metabolism, appetite, and activity. Causative factors include chromosomal abnormalities, as in Turner's syndrome and the various trisomies; major organ system defects that lead to deficiency or malfunction; systemic disease or acute illness; physical deprivation, primarily malnutrition; and various psychosocial factors, as in severe cases of maternal deprivation syndrome. Metabolic disturbances of short duration, as occur during acute illness, usually have no long-term effects on development and are usually followed by a period of rapid growth. Prolonged nutritional deficiency may cause permanent and irreversible retardation of physical, mental, or social development.

faint [OFr, *faindre,* to feign], *nontechnical,* **1.** *v,* to lose consciousness, often causing a fall, as in a syncopal attack. **2.** *n,* a syncopal attack. See also **syncope.**

fainting. See **syncope.**

faith healing [L, *fidere,* to trust; AS, *hoelen,* to make whole], alleged healing through the power to cause a cure or recovery from an illness or injury without the aid of conventional medical treatment. The healer is believed to have been given that power by a supernatural force.

falciform body. See **sporozoite.**

falciform ligament /fal′sifôrm/, a triangular or sickle-shaped ligament of the body, such as the broad ligament of the liver.

falciform ligament of liver. See **broad ligament of the liver.**

falcine herniation, a herniation of the brain beneath the falx cerebri, caused by focal cerebral edema.

falciparum malaria /falsip′ərəm/ [L, *falx,* sickle, *forma,* form; It, *mal,* bad *aria,* air], the most severe form of malaria, caused by the protozoon *Plasmodium falciparum.* The condition is characterized by extremely grave systemic symptoms, mild jaundice, mental confusion, enlarged spleen and liver, increased respiratory rate, edema, GI symptoms, and anemia. The parasite replicates so rapidly in erythrocytes that cerebral vessels may be obstructed. Falciparum malaria episodes do not last as long as other forms of malaria; if treatment is begun promptly, the disease may be mild and the recovery uneventful. Relapses are uncommon, but death may result from dehydration and anemia. The usual treatment is chloroquine, but patients known to have contracted malaria in an area that harbors drug-resistant *P. falciparum* are often treated with a combination of quinine, pyrimethamine, and mefloquine. Compare **quartan malaria, tertian malaria.** See also **algid malaria, blackwater fever, malaria.**

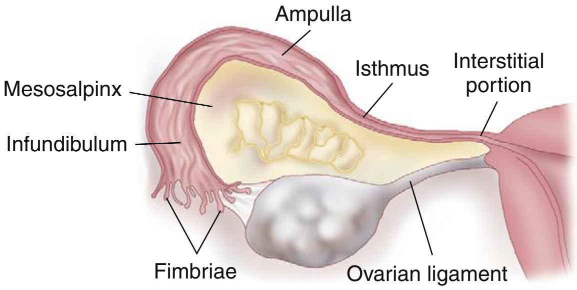
fall /fawl/, a coming down freely, usually under the influence of gravity.

fallectomy /fəlek′təmē/. See **salpingectomy.**

fallen arch, a flattened foot arch, which often results in a flat deformity or splayfoot. The condition may involve the longitudinal arch, the transverse arch, or both. When the longitudinal arch is involved, the condition is called **flatfoot.**

fallopian canal [Gabriello Fallopio, Italian anatomist, 1523–1562; L, *canalis*], a passageway for the facial nerve through the petrous bone.

fallopian tube /fəlō′pē·ən/ [Gabriello Fallopio], one of a pair of ducts opening at one end into the uterus and at the other end into the peritoneal cavity, over the ovary. Each tube serves as the passage through which an ovum is carried to the uterus and through which spermatozoa move out toward the ovary. The tube lies in the upper border of the broad ligament (the mesosalpinx). Each tube has four parts: the fimbriae, the infundibulum, the ampulla, and the isthmus. The fimbriae drape in fingerlike projections from the infundibulum over the ovary. Immediately proximal to the infundibulum is the ampulla, the widest portion of the tube. The ampulla is connected to the fundus of the uterus by the isthmus. Also called **oviduct, uterine tube.** See also **tubal ligation.**



Parts of the fallopian tube *(Hagen-Ansert, 2006)*

Fallot's syndrome. See **tetralogy of Fallot.**

fallout [AS, *feallan,* to fall, *ut*], the deposition of radioactive debris after a nuclear explosion. The waste products of an atmospheric explosion of an atomic bomb may travel thousands of miles in the atmosphere and be deposited over a large geographic area.

fall prevention, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instituting special precautions with patients at risk for injury from falling. See also **Nursing Interventions Classification.**

fall prevention behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal or family caregiver actions to minimize risk factors that might precipitate falls in the personal environment. See also **Nursing Outcomes Classification.**

falls occurrence, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the number of times an individual falls. See also **Nursing Outcomes Classification.**

false ankylosis [L, *fallere,* to deceive; Gk, *agkylosis,* joint stiffness], a type of joint immobility that results from abnormal inflexibility of body parts outside the joint. Also called **extracapsular ankylosis.**

false anorexia. See **pseudoanorexia.**

false cyst. See **pseudocyst.**

false diverticulum [L, *fallere,* to deceive, *diverticulare,* to turn aside], a protrusion of mucous membrane through a muscular coat defect of a hollow organ.

false glottis, the triangular opening between the two adjacent vestibular folds at the entrance to the middle chamber of the laryngeal cavity. Also called **glottis spuria,** *rima respiratoria, rima vestibule.*

false imprisonment [L, *falsus,* deceptive; ME, *imprisonen*], (in law) an intentional tort; the intentional unjustified, nonconsensual detention or confinement of a person within fixed boundaries for any length of time. Restraint may be physical, chemical, or emotional (e.g., intimidation or threat).

false joint [L, *fallere,* to deceive, *jungere,* to join], a joint that develops at the site of a former fracture. Also called **non-union, pseudoarthrosis.**

false labor. See **preterm contractions.**

false negative, an incorrect result of a diagnostic test or procedure that falsely indicates the absence of a finding, condition, or disease. The rate of occurrence of false-negative results varies with the diagnostic accuracy and specificity of the test or procedure. As the accuracy and specificity of a test increase, the rate of false-negatives decreases. Certain tests are known to yield false negative results at a certain rate; in all tests a small number will occur by chance alone. False-negative results are more common than false-positive results, because the person conducting the test is more likely to fail to observe a finding than to imagine seeing something that does not exist. Compare **false positive.**

false-negative rate [L, *fallere,* to deceive, *negare,* to deny, *ratum,* calculate], the rate of occurrence of negative test results in subjects known to have the disease or behavior for which an individual is being tested.

false neuroma. **1.** a neoplasm that does not contain nerve elements. **2.** See **cystic neuroma.**

false nucleolus. See **karyosome.**

false pelvis, the part of the pelvis superior to a plane passing through the linea terminalis.

false personification, (in psychiatry) the labeling and prejudgment of others without validating evidence.

false positive, a test result that wrongly indicates the presence of a disease or other condition the test is designed to reveal. Compare **false negative.**

false-positive rate [L, *fallere,* to deceive, *positivus* + *ratum,* calculate], the rate of occurrence of positive test results in subjects known to be free of a disease or disorder for which an individual is being tested.

false pregnancy. See **pseudocyesis.**

false rib. See **rib, vertebrocostal rib.**

false suture, an immovable fibrous joint in which rough articulating surfaces form the connection between certain bones of the skull. Two kinds of false sutures are **sutura plana** and **sutura squamosa.** Compare **true suture.**

false transactions, (in transactional analysis), transactions in which communication is stopped or distorted when one individual relates from a different ego state than what is expected.

false twins. See **dizygotic twins.**

false vertebra, one of the vertebral segments that form the sacrum and the coccyx. Also called **fixed vertebra.**

false vocal cord, either of two thick folds of mucous membrane in the larynx separating the ventricle from the vestibule. Each fold encloses a narrow band of fibrous tissue (the ventricular ligament). Also called **vestibular fold.** Compare **vocal cord.**

falx /falks, fôlks/ *pl.* **falces** [L, sickle], **1.** *n,* a sickle-shaped structure. **2.** *adj,* sickle-shaped.

falx cerebelli. See **cerebellar falx.**

falx cerebri. See **cerebral falx.**

falx inguinalis. See **inguinal falx.**

falx ligamentosa, the broad ligament of the liver.

FAM, an anticancer drug combination of fluorouracil, DOXOrubicin, and mitomycin.

famciclovir, an antiviral drug.

■ INDICATIONS: It is prescribed in the treatment of acute herpes zoster and recurrent genital herpes.

■ CONTRAINDICATIONS: It should not be given to patients with kidney disease or an allergy to famciclovir. The safety of the drug in children or in women who are pregnant or breastfeeding has not been established.

■ ADVERSE EFFECTS: The side effects most often reported include fatigue, fever, pain, chills, headache, dizziness, nausea, diarrhea, vomiting, and constipation.

familial /fəmil′yəl/ [L, *familia,* household], pertaining to a characteristic, condition, or disease that is present in some families and not others or that occurs in more family members than would be expected by chance. It is usually but not always hereditary. Compare **acquired, congenital, hereditary.**

familial adenomatous polyposis (FAD), an inherited disorder characterized by the development of myriad polyps in the colon, beginning in late adolescence or early adulthood. Untreated, the condition nearly always leads to colon cancer. See also **adenomatous polyposis coli.**

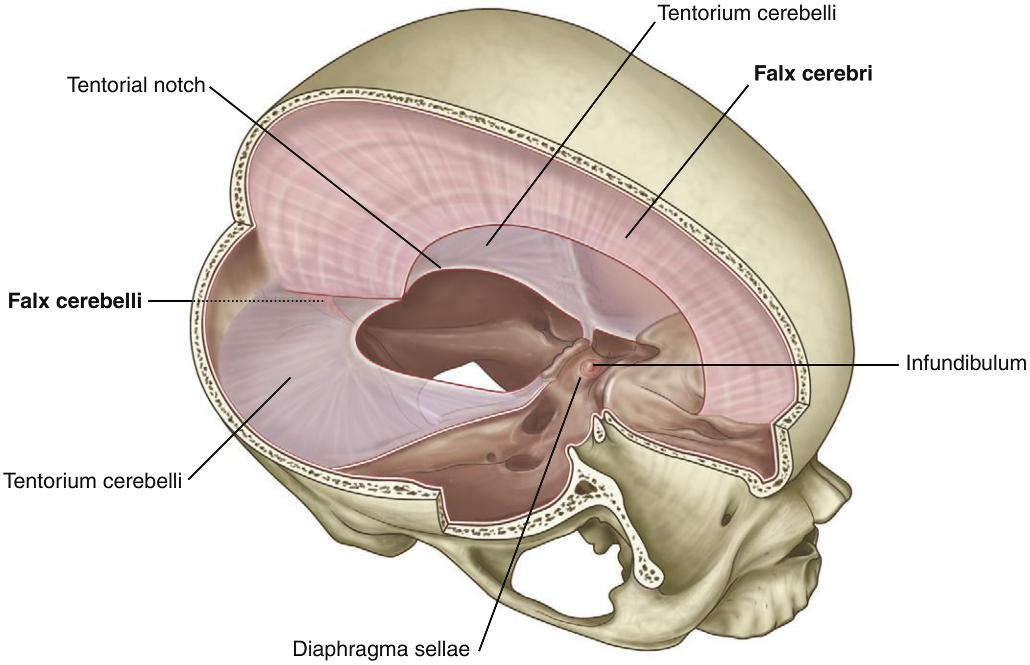
familial autonomic dysfunction. See **dysautonomia.**

familial centrolobar sclerosis. See **Pelizaeus-Merzbacher disease.**

familial cretinism, a rare genetic disorder caused by an inborn error of metabolism resulting from an enzyme deficiency that interferes with thyroid hormone biosynthesis. Clinical manifestations include lethargy, stunted growth, and mental retardation. The condition is transmitted as an autosomal-recessive trait and is treated by early administration of thyroid hormone, if possible in utero, to reduce the abnormalities of mental development. See also **cretinism.**

familial dysautonomia. See **dysautonomia.**

familial hemophagocytic lymphohistiocytosis [L, *familia,* household; Gk, *histion,* web, *kytos,* cell; L, *reticulum,* little net; Gk, *osis,* condition], an autosomal-recessive disease, characterized by anemia, granulocytopenia, and



Falx cerebelli and falx cerebri *(Drake, Vogl, and Mitchell, 2010)*

thrombocytopenia. Phagocytosis of blood cells and infiltration of bone marrow by macrophages commonly cause death in childhood. Also called *familial hemophagocytic reticulosis*.

familial Hibernian fever, a periodic syndrome associated with a mutation in a receptor for tumor necrosis factor. This defect causes recurrent high fevers, rash, and abdominal pain. Mean age of first episode is 3 years but varies from patient to patient.

familial hypercholesterolemia. See **low-density lipoprotein receptor disorder.**

familial hyperglyceridemia. See **hyperlipidemia type I.**

familial iminoglycinuria. See **iminoglycinuria.**

familial juvenile nephronophthisis. See **medullary cystic disease.**

familial lipoprotein lipase deficiency. See **hyperchylomicronemia.**

familial Mediterranean fever, an autosomal-recessive intestinal disorder usually occurring in people of Mediterranean descent, characterized by short recurrent attacks of fever with pain in the abdomen, chest, or joints and erythema resembling that seen in erysipelas. It is sometimes complicated by secondary amyloidosis. The age of onset is usually between 5 and 15 years. Also called **benign paroxysmal peritonitis, familial recurrent polyserositis, periodic peritonitis, periodic polyserositis, recurrent polyserositis.**

familial multiple endocrine. See **multiple endocrine adenomatosis.**

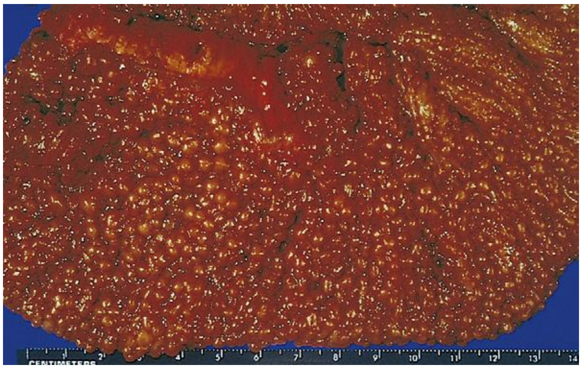
familial nonhemolytic jaundice. See **Gilbert's syndrome.**

familial osteochondrodystrophy. See **Morquio's disease.**

familial periodic fever, a rare autosomal-dominant syndrome that includes an abnormality on the cell receptor for tumor necrosis factor, characterized by periodic fever with any of various skin disorders lasting for 4 days to 3 weeks and mild systemic manifestations, such as abdominal pain, headache, and chest pain. Also called **tumor necrosis factor receptor–associated periodic syndrome (TRAPS)**.

familial periodic paralysis [L, *familia,* household; Gk, *peri,* near, *hodos,* way, *paralysein,* to be palsied], a rare inherited disorder in which clients suffer attacks of general flaccid paralysis after attacks of hypokalemia (potassium depletion). The episodes may follow administration of glucose and are relieved by administration of potassium chloride.

familial polyposis, an abnormal condition characterized by multiple polyps in the colon and rectum. The disease has high malignancy potential and is inherited as a heterozygous, autosomal-dominant trait. Total proctocolectomy eliminates the risk of cancer, which, if untreated, occurs before 40 years of age. Genetic counseling is advised. A kind of familial polyposis is **Gardner's syndrome.** See also **polyposis.**



Familial polyposis *(Kumar, Abbas, and Fausto, 2005)*

familial recurrent polyserositis. See **familial Mediterranean fever.**

familial spinal muscular atrophy. See **Werdnig-Hoffmann disease.**

familial tremor. See **essential tremor.**

familial visceral amyloidosis, a rare autosomal-dominant type of amyloidosis characterized by nephropathy, arterial hypertension, hepatosplenomegaly, albuminuria, hematuria, and pitting edema. Affected patients usually die within 10 years of onset of clinical manifestations. Also called *Ostertag* or *Ostertag type a*.

family [L, *familia,* household], a group of people related by heredity, such as parents, children, and siblings. The term sometimes is broadened to include persons related by marriage or those living in the same household, who are emotionally attached, interact regularly, and share concerns for the growth and development of the group and its individual members.

family Apgar, a family therapy rating system in which the name Apgar contains the first letters of five words—*a*daptability, *p*artnership, *g*rowth, *a*ffection, and *r*esolve—that represent the questionnaire categories. Each family member indicates a degree of satisfaction in each of the five categories on a scale of 0 to 2. The system is used most frequently in studies of families with a geriatric member. See also **Apgar score.**

family care leave, absence from a job that is permitted for an employee to care for a family member who is ill, disabled, or pregnant. The U.S. Family and Medical Leave Act of 1993 provides 12 weeks of unpaid leave per year from a job for the birth or adoption of a child; for the care of a seriously ill child, spouse, or parent; or for a serious illness affecting the employee. The law applies only to companies with 50 or more employees. Employers must guarantee that a worker can return to the same or a comparable job.

family-centered care, primary health care that includes an assessment of the health of an entire family, identification of actual or potential factors that might influence the health of its members, and implementation of interventions needed to maintain or improve the health of the unit and its members.

family-centered maternity care, a system for the delivery of safe, high-quality health care adapted to the physical and psychosocial needs of the patient, the patient's entire family, and the newly born offspring.

family-centered nursing care, nursing care directed to improving the potential health of a family or any of its members by assessing individual and family health needs and strengths, by identifying problems influencing the health care of the family as a whole and those influencing the individual members, by using family resources, by teaching and counseling, and by evaluating progress toward stated goals.

family coping, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as family actions to manage stressors that tax family resources. See also **Nursing Outcomes Classification.**

family counseling, a program of providing information and professional guidance to members of a family concerning specific health matters, such as the care of a severely retarded child or the risk of transmitting a known genetic defect.

family disorganization, a breakdown of a family system. It may be associated with parental overburdening or loss of significant others who served as role models for children or support systems for family members. Family disorganization can contribute to the loss of social controls that families usually impose on their members.

family dynamics, the forces at work within the family that produce particular behaviors or symptoms.

family functioning, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the capacity of the family system to meet the needs of its members through developmental transitions. See also **Nursing Outcomes Classification.**

family functions, processes by which the family operates as a whole, including communication and manipulation of the environment for problem solving.

family health. See **family history.**

family health status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as overall health and social competence of family unit. See also **Nursing Outcomes Classification.**

family history, an essential part of a patient's medical history in which he or she is asked about the health of members of the immediate family in a series of specific questions to discover any disorders to which the patient may be particularly vulnerable, such as "Has anyone in your family had tuberculosis? Diabetes mellitus? Breast cancer?" Hereditary and familial diseases are especially noted. The age and health of each person, age at death, and causes of death are charted. Often a genogram is developed for pictoral documentation. The **family health** history is obtained from the patient or family in the initial interview and becomes a part of the permanent record. Other questions, such as those concerning the age, sex, relationships of others in the household, and marital history of the patient, may also be asked if the information has not already been secured.

family integrity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as family members' behaviors that collectively demonstrate cohesion, strength, and emotional bonding. See also **Nursing Outcomes Classification.**

family integrity promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of family cohesion and unity. See also **Nursing Interventions Classification.**

family integrity promotion: childbearing family, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of the growth of individuals or families who are adding an infant to the family unit. See also **Nursing Interventions Classification.**

family involvement promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating participation of family members in the emotional and physical care of the patient. See also **Nursing Interventions Classification.**

family medicine, the branch of medicine that is concerned with the diagnosis and treatment of health problems in people of either sex and any age. Practitioners of family medicine are often called family practice physicians, family physicians, or, formerly, general practitioners. They often act as the primary health care providers, referring complex disorders to a specialist.

family mobilization, a nursing intervention from the Nursing Interventions Classification (NIC) defined as utilization of family strengths to influence patient's health in a positive direction. See also **Nursing Interventions Classification.**

family myths, myths that are constructed to deny the reality or idealize an aspect of family situations.

family normalization, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as capacity of the family system to develop strategies for optimal functioning when a member has a chronic illness or disability. See also **Nursing Outcomes Classification.**

family nurse practitioner (FNP), a nurse practitioner possessing skills necessary for the detection and management of acute self-limiting conditions and management of chronic stable conditions. An FNP provides primary ambulatory care for families in collaboration with primary care physicians. The FNP gives direct health care and guides or counsels families as required. Consultation, copractice, and referral to associated physicians are aspects of the FNP's practice.

family of origin, the family into which a person is born.

family of procreation, the family a person forms through marriage and/or childbearing.

family participation in professional care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as family involvement in decision-making, delivery, and evaluation of care provided by health care personnel. See also **Nursing Outcomes Classification.**

family physician. **1.** a medical practitioner of the specialty of family medicine. **2.** *(formerly)* practitioner. **3.** See **family practice physician.** See also **family medicine.**

family planning. See **contraception.**

family planning: contraception, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of pregnancy prevention by providing information about the physiology of reproduction and methods to control conception. See also **Nursing Interventions Classification.**

family planning: infertility, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management, education, and support of the patient and significant other undergoing evaluation and treatment for infertility. See also **Nursing Interventions Classification.**

family planning, natural, methods of preventing conception without the use of artificial contraceptive means. Also called **fertility awareness methods**. See also **contraception.**

family planning: unplanned pregnancy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of decision-making regarding pregnancy outcome. See also **Nursing Interventions Classification.**

family practice [L, *familia,* household; Gk, *praktikos,* ready for action], a medical specialty that encompasses several branches of medicine, including internal medicine, preventive medicine, pediatrics, surgery, psychiatry, and obstetrics and gynecology. It includes client management, counseling, problem solving, and coordination of total health care delivery to all members of a family, regardless of sex or age.

family practice physician, a practitioner of family medicine, usually one who has completed a residency program in the specialty. See also **family medicine.**

family presence facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of the family's presence in support of an individual undergoing resuscitation and/or invasive procedures. See also **Nursing Interventions Classification.**

family processes, the psychosocial, physiological, and spiritual functions and relationships within the family unit.

family process maintenance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as minimization of family process disruption effects. See also **Nursing Interventions Classification.**

family resiliency, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as positive adaptation and function of the family system following significant adversity or crisis. See also **Nursing Outcomes Classification.**

family social climate, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as supportive milieu as characterized by family member relationships and goals. See also **Nursing Outcomes Classification.**

family structure, the composition and membership of the family and the organization and patterning of relationships among individual family members. In planning health care for a family member or the entire family, an awareness of that family's structure may be important.

family support, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of family values, interests, and goals. See also **Nursing Interventions Classification.**

family support during treatment, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as family presence and emotional support for an individual undergoing treatment. See also **Nursing Outcomes Classification.**

family therapy[1], (in psychiatry) a therapy modality that focuses treatment on the process between family members that supports and perpetuates symptoms; a way of conceptualizing human relationship problems that focuses on the context in which an emotional problem is generated.

family therapy[2], a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting family members to move their family toward a more productive way of living. See also **Nursing Interventions Classification.**

famine fever. See **relapsing fever.**

famotidine /famot′idēn/, an oral and parenteral antiulcer drug; an H_2-receptor antagonist.

■ INDICATIONS: It is prescribed in treatment of duodenal ulcer and pathological hypersecretory conditions, and for stress-ulcer prophylaxis.

■ CONTRAINDICATIONS: Famotidine should be used with caution in patients with impaired kidney function.

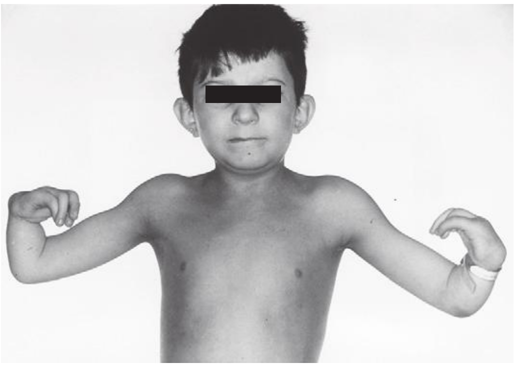
■ ADVERSE EFFECTS: Among adverse effects reported are headache, dizziness, constipation, diarrhea, and temporary irritation of the injection site.

Famvir, a trademark for an antiviral drug **(famciclovir).**

fan beam, a geometric pattern produced by collimating a spatially extended x-ray beam with a long, narrow slit. Also called *fan x-ray beam*.

FANCAP, (United States) a mnemonic device for helping student nurses learn to assess, provide, and evaluate direct patient care. It stands for *f*luids, *a*eration, *n*utrition, *c*ommunication, *a*ctivity, and *p*ain. Occasionally a variant, FANCAS, in which S represents stimulation, is substituted.

Fanconi's anemia /fankō′nēs/ [Guido Fanconi, Swiss pediatrician, 1892–1979], a rare, usually congenital disorder transmitted as an autosomal-recessive trait, characterized by aplastic anemia in childhood or early adult life, bone abnormalities, chromatin breaks, and developmental anomalies. Children begin to show symptoms between 4 and 12 years of age. Also spelled *Fanconi's anaemia*. Also called **congenital pancytopenia, pancytopenia-dysmelia.**



[redacted]

Classic phenotype of Fanconi's anemia
(Hoffman et al, 2009)

Fanconi's syndrome [Guido Fanconi], a group of disorders that includes pancytopenia, renal tubular dysfunction, glycosuria, phosphaturia, and bicarbonate wasting. The condition is often marked by osteomalacia, acidosis, rickets, and hypokalemia. Two main types of the syndrome have been differentiated. Idiopathic Fanconi's syndrome is an inherited autosomal-recessive disorder and usually accompanies other genetic disorders such as Wilson's disease, galactosemia, or glycogen storage disease. Acquired Fanconi's syndrome is usually the result of toxicity from various sources, including ingestion of outdated tetracycline, heavy metal poisoning, or vitamin D deficiency. Because of numerous variations of the syndrome, different alleles are believed responsible for the different recessively inherited factors expressed as signs and symptoms of the group of disorders.

fango /fän′gō/ [It, mud], mud taken from thermal springs at Battaglia, Italy, and used to treat gout and other rheumatic diseases.

fan lateral projection, a technique for making a radiographic image of the hand without superimposition of the phalanges. The patient places the fingers around a sponge wedge shaped so that each finger appears separately, in a fan-like pattern, on the x-ray film.

Fansidar, a trademark for a fixed-combination antimalarial agent **(pyrimethamine** and **sulfadoxine).**

fantasy /fan′təsē/ [Gk, *phantasia,* imagination], **1.** the unrestrained free play of the imagination; fancy. **2.** a mental image, which may be distorted or grotesque, that is often the result of the action of drugs or a disease of the central nervous system. **3.** the mental process of transforming undesirable experiences into imagined events or into a sequence of ideas in order to fulfill an unconscious wish, need, or desire or to give expression to unconscious conflicts, such as a daydream.

F.A.O.T.A., abbreviation for *Fellow of the American Occupational Therapy Association.*

FAP, abbreviation for **familial adenomatous polyposis.** See **adenomatous polyposis coli.**

F.A.P.T.A., abbreviation for *Fellow of the American Physical Therapy Association.*

farad (F) /fer′əd/ [Michael Faraday, English scientist, 1791–1871], a unit of capacitance that increases the potential difference between the plates of a capacitor by 1 volt with a charge of 1 coulomb.

Faraday cage /fer′ədā/, a wire-mesh cage that surrounds a magnetic resonance (MR) scanner and shields it from stray radiofrequency waves. Such waves would otherwise distort the results of MR imaging.

Farber's disease, Farber's lipogranulomatosis /fär′bərz/ [Sidney Farber, American pediatrician, 1903–1973], a lysosomal storage disease of ceramide metabolism resulting from defective ceramidase, marked by hoarseness; aphonia; a brownish desquamating dermatitis that begins at about 3 months of age; foam cell infiltration of bones and joints that causes deformations; granulomatous reaction in lymph nodes, heart, lungs, and kidneys; and psychomotor retardation. Also called **ceramidase deficiency.**

Farber test, a microscopic examination of newborn meconium for lanugo and squamous cells. The fetus normally swallows amniotic fluid containing these large proteins, which then pass through the digestive system to be excreted, usually after birth, in the first stools. The absence of hair or skin cells is suggestive of intestinal obstruction or atresia and requires further evaluation.

Far Eastern hemorrhagic fever, a form of epidemic hemorrhagic fever, indigenous to Asia, that is transmitted by a virus carried by Asian rodents and causes hemorrhagic fever with renal syndrome. The infection is characterized by four phases: febrile phase, hypotensive phase, oliguric phase, and polyuric phase. Hypotensive shock may occur as the fever subsides. Thirst continues into the second week, oliguria develops, and the blood pressure returns to normal. Blood urea nitrogen levels increase hyperphosphatemia and hypercalcemia, and other complications occur. Diuresis follows the oliguric phase, generating an output of as much as 8 L a day of urine and causing electrolyte imbalance. The mortality rate may be as high as 33%. There is no specific treatment.

far field. See **Fraunhofer zone.**

farmer's lung [L, *firmare,* to make firm], an allergy-related respiratory disorder caused by the inhalation of actinomycetes or other microbes in dusts from moldy crops. It is a form of hypersensitivity pneumonitis that affects individuals in whom antibodies to the mold spores have developed. It exists in acute, subacute, and chronic forms. It is characterized by coughing, dyspnea, cyanosis, tachycardia, nausea, chills, and fever. Lengthy exposure to dust from moldy crops can lead to permanent lung damage, physical disability, and in some cases death. There is no cure; once a hypersensitivity develops, it persists for years and possibly the entire life-span of the individual. Treatment may include cromolyn sodium and a corticosteroid.

far point [ME, *farr* + L, *punctus,* pricked], **1.** the farthest distance from the eye at which an object can be seen clearly when the eye is at rest and accommodation is fully relaxed. **2.** the point at which the visual axes of the two eyes meet when at rest.

farsightedness. See **hyperopia.**

F^{2}ARV, abbreviation for *F*ear/*F*rustration (F^2), *A*nger, *R*age, and *V*iolence, a highly volatile emotional reaction that escalates from fear or frustration and proceeds sequentially through anger and rage to violence.

FAS, abbreviation for **fetal alcohol syndrome.**

fasci-, prefix meaning "band or bundle of fibrous tissue": *fasciagram, fascicular, fasciitis.*

fascia /fash′ē·ə/ *pl.* **fasciae** [L, band], the fibrous connective membrane of the body that may be separated from other specifically organized structures, such as the tendons, the aponeuroses, and the ligaments, and that covers, supports, and separates muscles. It varies in thickness and density and in the amounts of fat, collagenous fiber, elastic fiber, and tissue fluid it contains. Kinds of fasciae are **deep fascia, subcutaneous fascia,** and **subserous fascia. —fascial,** *adj.*

fascia bulbi. See **Tenon's capsule.**

fasciae, fascial. See **fascia.**

fascia lata, deep fascia in the thigh and gluteal region.

fascial cleft /fash′ē·əl/ [L, *fascia* + ME, *clift*], a place of cleavage between two contiguous fascial surfaces, such as the deep fasciae and the subcutaneous fasciae. A fascial cleft is rich in fluid but poor in traversing fibers. Thus two fascial surfaces may move or be separated easily. Compare **fascial compartment, fascial membrane lamination.**

fascial compartment, a part of the body that is walled off by fascial membranes, usually containing a muscle or group of muscles or an organ, just as the heart is contained by the mediastinum. Compare **fascial cleft, fascial membrane lamination.**

fascial membrane lamination, a pad of connective tissue that contains fat and an occasional blood vessel or lymph node. It is found where a fascial membrane splits into two sheets, such as at the division of the outer cervical fascia above the sternum. Compare **fascial cleft, fascial compartment.**

fascia of piriform muscle, an extension of the parietal pelvic fascia that surrounds the piriform muscle. Also called **piriform fascia.**

fascicle. See **fasciculus.**

fascicular /fəsik′yələr/ [L, *fasciculus,* little bundle], pertaining to something arranged as a bundle of rods, such as groups of nerve or muscle fibers.

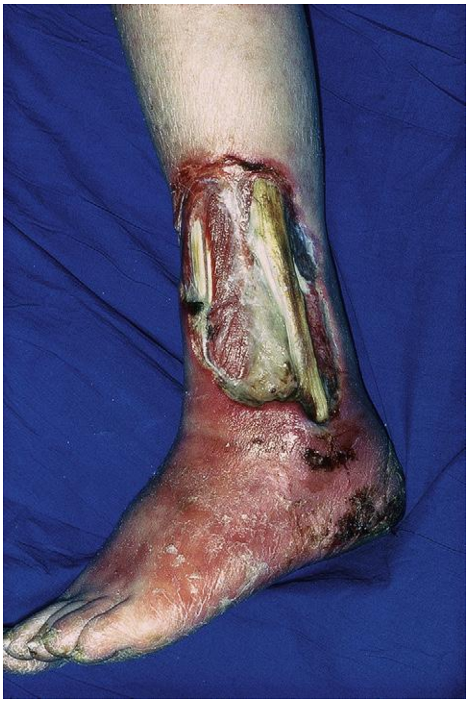
fascicular neuroma, a neoplasm composed of myelinated nerve fibers. Also called **medullated neuroma.**

fascicular twitching. See **twitching.**

fasciculation /fasik′yo͝olā′shən/ [L, *fasciculus,* little bundle, *atio,* process], a localized uncoordinated, uncontrollable twitching of a single muscle group innervated by a single motor nerve fiber or filament that may be palpated and seen under the skin. In anesthesia it refers to muscle twitches that occur with administration of the depolarizing muscle relaxant succinylcholine. It also may be symptomatic of a number of disorders, including dietary deficiency, cerebral palsy, fever, neuralgia, polio, rheumatic heart disease, sodium deficiency, tic, or uremia. Fasciculation of the heart muscle is known as fibrillation. **—fascicular,** *adj.,* **fasciculate,** *v.*

fasciculus /fəsik′yələs/ *pl.* **fasciculi** [L, little bundle], a small bundle of muscle, tendon, or nerve fibers wrapped by a layer of connective tissue called the perimysium (muscle) or perineurium (nerve fiber). The arrangement of fasciculi in a muscle is correlated with the power of the muscle and its range of motion. The patterns of muscular fasciculi are penniform, bipenniform, multipenniform, and radiated. Also called **fascicle. —fascicular,** *adj.*

fasciitis /fas′ē·ī′tis/, **1.** an inflammation of the connective tissue that may be caused by streptococcal or other types of infection, an injury, or an autoimmune reaction. **2.** an abnormal benign growth (pseudosarcomatous fasciitis) resembling a tumor that develops in the subcutaneous oral tissues, usually in the cheek. Commonly growing rapidly and then regressing, it consists of young fibroblasts and many capillaries and may be mistaken for fibrosarcoma. Also spelled **fascitis** /fasī′tis/.



Necrotizing fasciitis

(Ferri, 2009/Courtesy Dr. R. A. Marsden)

fasciodesis /fā′sē·ōdē′sis/, a surgical procedure in which a fascia is attached to another fascia or to a tendon.

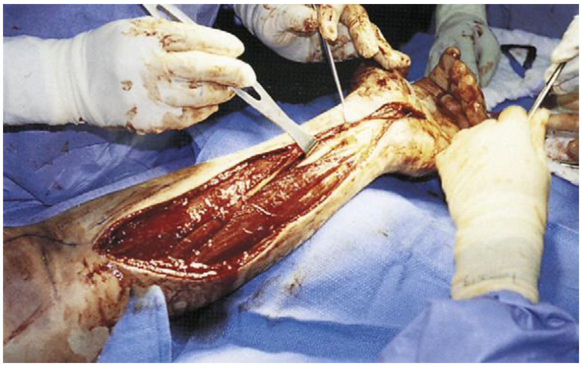
fascioliasis /fas′ē·ōlī′əsis/ [L, *fasciola,* little band; Gk, *osis,* condition], infection by a liver fluke of the species *Fasciola hepatica* or *F. gigantica*. It is characterized by epigastric pain, fever, hepatomegaly, jaundice, eosinophilia, urticaria, and diarrhea. Fibrosis of the liver is a consequence of prolonged infection. It is acquired by ingestion of encysted forms of the fluke found on aquatic plants, such as raw watercress grown in water contaminated by sheep or cattle dung. The disease is prevalent in many parts of the world, including the southern and western United States. Incidence of infection has increased over the last 20 years. Bithionol or triclabendazole, given orally, is the usual treatment.

fasciolopsiasis /fas′ē·ōlopsī′əsis/ [L, *fasciola,* little band; Gk, *opsis,* appearance, *osis,* condition], an intestinal infection of humans and pigs, prevalent in Asia. It is characterized by abdominal pain, diarrhea, constipation, eosinophilia, ascites, and sometimes edema. It is caused by the fluke ***Fasciolopsis buski,*** the largest intestinal fluke affecting humans. The disease is usually acquired by eating contaminated water plants such as raw water chestnuts but is also possibly acquired by drinking untreated water. Most infections are light and asymptomatic. Symptomatic infection is easily treated with anthelmintics, such as praziquantel.

Fasciolopsis buski /fas′ē·əlop′sis bus′kē/, a species of large fluke that is an important intestinal parasite endemic in Asia and the tropics. In the United States and other countries, it is occasionally found in imported food products such as water chestnuts and other vegetation contaminated with infective metacercariae. See also **fasciolopsiasis.**

fascioscapulohumeral muscular dystrophy /fas′ē·ō-skap′yəlōhyo͞o′mərəl/ [L, *fasciculus,* little bundle, *scapula,* shoulderblade, *humerus,* shoulder], an abnormal congenital condition that is one of the main types of muscular dystrophy. It is characterized by progressive symmetric wasting of the skeletal muscles, especially the muscles of the face, the shoulders, and the upper arms, without any associated neural or sensory disorders. This disease is not usually fatal but spreads to all the voluntary muscles and commonly produces a pendulous lower lip and the absence of the nasolabial fold. It is an autosomal-dominant disease that may be transmitted to males and females. Also called **Landouzy-Dejerine muscular dystrophy.** Compare **Duchenne's muscular dystrophy.**

fasciotomy /fas′ē·ot′əmē/, a surgical incision into an area of fascia.



Fasciotomy *(Auerbach, 2012/Courtesy Dr. Robert Norris)*

fascitis. See **fasciitis.**

F.A.S.R.T., abbreviation for *Fellow of the American Society of Radiologic Technologists*.

fast, **1.** *adj,* resistant to change, especially to the action of a specific medication or chemical, as a staining agent. **2.** *n,* abstinence from all or certain foods. See also **fasting.** **3.** *adj,* occurring quickly and in a short span of time.

fast-acting insulin. See **short-acting insulin.**

fast brushing, the use of a battery-powered brush to stimulate C fibers (group IV afferent neurons), which send many collaterals to the reticular activating system.

fast channel, a protein channel, such as a sodium channel, that becomes activated relatively quickly. A fast voltage-gated channel has a much lower activation potential than does the slow type. See also **slow channel**.

fastigial nucleus /fastij′ē·əl/, one of a group of deep cerebellar nuclei that receive input from the medial zone of the cerebellum. It is involved in the control of posture and equilibrium.

fastigium /fastij′ē·əm/ [L, ridge], **1.** the highest point in the course of a fever, or the most symptomatic point in the course of an illness. **2.** the angle at the top of the roof of the fourth ventricle in the brain. **3.** the highest point.

fasting [AS, *foestan,* to observe], **1.** the act of abstaining from food for a specific period, usually for therapeutic or religious purposes. **2.** the elimination of foods with the addition of fluids such as mineral water, herbal and fruit teas, broth, and fruit juices for a limited period of time. This therapy requires the supervision of a health professional experienced in this form of therapy.

fasting blood sugar, a determination of blood glucose levels after an 8 hour period of fasting.

fasting plasma glucose (FPG), a measurement of the concentration of glucose in the plasma after the patient has not eaten for at least 8 hours. See also **blood glucose test.**

fasting serum gastrin, measurement of the levels of gastrin in blood serum after the patient has fasted for 12 hours, so that presence of food is not a factor. It is markedly increased in certain conditions such as **Zollinger-Ellison syndrome** and **G cell hyperplasia.**

fast neutron therapy, a radiotherapeutic technique used in the treatment of certain soft tissue sarcomas.

fast pain, a localized sensation of discomfort felt immediately after a noxious stimulus is delivered. It usually disappears when the stimulus ceases.

fast smear, a cytological sample of tissue scrapings from the vaginal-cervical area, smeared on a microscope slide and fixed immediately for routine screening of female reproductive function.

fast spin-echo (FSE), a magnetic resonance imaging technique that uses multiple spin-echoes to reduce imaging times in comparison to spin-echo imaging. See also **spin-echo.**

fast-twitch (FT) fiber, a muscle fiber that can develop high tension rapidly. It is usually innervated by a single alpha neuron and has low fatigue resistance, low capillary density, low levels of aerobic enzymes, and low oxygen availability. FT fibers are used in such activities as sprinting, jumping, and weight-lifting. Also called *fast-twitch muscle fiber.* See also **slow-twitch fiber.**

fat [AS, *faett*], **1.** a substance composed of lipids or fatty acids and occurring in various forms or consistencies ranging from oil to tallow. **2.** a type of body tissue composed of cells containing stored fat (depot fat). Stored fat is usually identified as white fat, which is found in large cellular vesicles, or brown fat, which consists of lipid droplets. Stored fat contains more than twice as many calories per gram as sugars and serves as a source of body energy. In addition, stored fat helps cushion and insulate vital organs. See also **adipose, obesity.**

fatal /fā′təl/ [L, *fatum,* what has been spoken], causing death.

fatality /fātal′itē/ [L, *fatalis,* preordained], **1.** an individual case of death. **2.** a condition, disease, accident, or disaster resulting in death.

fatality rate, the death rate observed in a specified group of people involved in a simultaneous event such as a disaster.

fat cell lipoma. See **hibernoma.**

fat embolism, a circulatory condition characterized by the blocking of an artery by a plug of fat. The plug enters the circulatory system after the fracture of a long bone or, less commonly, after traumatic injury to adipose tissue or to a fatty liver. Fat embolism usually occurs suddenly 12 to 36 hours after an injury and is characterized by symptoms related to the site occluded, such as severe chest pain, pallor, dyspnea, tachycardia, delirium, prostration, and in some cases coma. Anemia and thrombocytopenia are common. Systemic fat embolism may occur after extensive trauma, since lipid metabolism is altered by the injury and free fatty acids are released, resulting in vasculitis with obstruction of many small pulmonary and cerebral arteries. Classic signs of systemic fat embolism are petechial hemorrhages on the neck, shoulders, axillae, and conjunctivae that appear 2 or 3 days after the injury. Radiographic findings include patchy diffuse opacities throughout the lungs. There is no specific therapy for systemic fat embolism. The patient is placed in a high Fowler's position and given oxygen, corticosteroids, blood transfusion, respiratory assistance, or other supportive care as needed. Compare **air embolism, gas embolism.**

FA test, abbreviation for **fluorescent antibody test.**

father complex [L, *pater* + *complecti,* to embrace], *nontechnical,* a repressed desire for an incestuous relationship with one's father.

father fixation, an arrest in psychosexual development characterized by an abnormally persistent, close, and often paralyzing emotional attachment to one's father. Compare **mother fixation.** See also **freudian fixation.**

fatigability /fat′igəbil′itē/, a tendency to become tired or exhausted quickly or easily. It may occur in certain types of cells that undergo periods of excessive activity.

fatigue /fətēg′/ [L, *fatigare,* to tire], **1.** a state of exhaustion or a loss of strength or endurance, such as may follow strenuous physical activity. **2.** loss of ability of tissues to respond to stimuli that normally evoke muscular contraction or other activity. Muscle cells generally require a refractory or recovery period after activity, when cells restore their energy supplies and excrete metabolic waste products. **3.** an emotional state associated with extreme or extended exposure to psychic pressure, as in battle or combat fatigue.

fatigue fever, a benign episode of fever and muscle pain after overexertion. The symptoms are caused by an accumulation of the metabolic waste products of muscle contractions and may persist for several days.

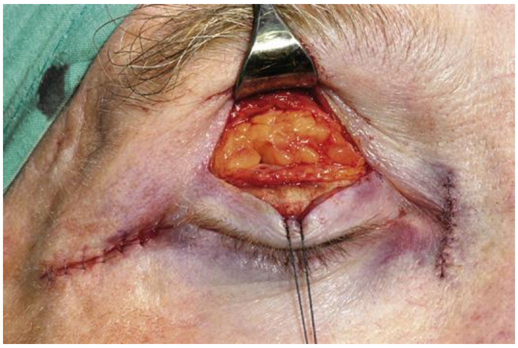
fatigue fracture, any fracture that results from excessive physical activity and not from any specific injury, as commonly occurs in the metatarsal bones of runners. See also **stress fracture.**

fatigue level, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of observed or reported prolonged generalized fatigue. See also **Nursing Outcomes Classification.**

fatigue state [L, *fatigare,* to tire, *status,* condition], the state of lowest energy of a system. See also **ground state.**

fat-induced hyperlipidemia. See **hyperlipidemia type I.**

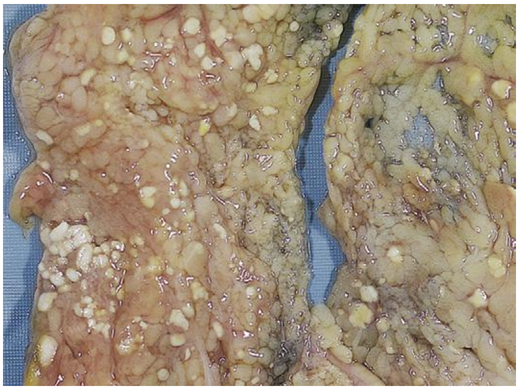
fat injection, transplantation of a patient's own fat to other areas on the body, as to the face to minimize wrinkles or to the lips or penis to augment size. The procedure is discouraged in breast augmentation, because it can hamper the detection of early breast cancer, causing false-positive test results.



Fat graft to the upper eyelid *(Tyers and Collin, 2008)*

fat metabolism, the biochemical process by which fats are broken down, incorporated, and used by the cells of the body. Fats provide more food energy (9 kcal/g) than carbohydrates (4.1 kcal/g). Fat catabolism begins with the hydrolysis of fats (triglycerides) into glycerol and fatty acids. Glycerol is converted into a compound that can enter the citric acid cycle. Catabolism of fatty acids continues by beta-oxidation to produce acetylcoenzyme A, which also enters the citric acid cycle. The body synthesizes fats from fatty acids and glycerol or from compounds derived from excess glucose or from amino acids. The body can synthesize only saturated fatty acids; essential unsaturated fatty acids can be supplied only by diet. Fat metabolism is controlled by hormones such as insulin, growth hormone, adrenocorticotropic hormone, and glucocorticoids. The rate of fat catabolism is inversely related to the rate of carbohydrate catabolism, and in some conditions, such as diabetes mellitus, the secretion of these hormones increases to counter a decrease in carbohydrate catabolism.

fat necrosis [AS, *faett* + Gk, *nekros,* dead, *osis,* condition], a condition caused by trauma or infection in which neutral tissue fats are broken down into fatty acids and glycerol. Fat necrosis occurs most commonly in the breasts and subcutaneous areas. It also may develop in the abdominal cavity after an episode of pancreatitis causes a release of enzymes from the pancreas.



Fat necrosis *(Kumar et al, 2007)*

fat overload syndrome, a condition of hepatosplenomegaly, anemia, GI disturbances, and very high triglyceride levels resulting from IV administration of fat emulsion.

fat pad, a mass of closely packed fat cells surrounded by fibrous tissue septa. Fat pads may be generously supplied with capillaries and nerve endings. Intraarticular fat pads are also covered by a layer of synovial cells. An example is the buccal pad of fat seen in nursing babies.

fat solvent. See **nonpolar solvent.**

fatty acid (FA) [AS, *faett* + L, *acidus,* sour], any of several organic acids produced by the hydrolysis of neutral fats and consisting of a long hydrocarbon chain ending in a carboxyl group. The hydrocarbon chains may be fully saturated or contain varying degrees of unsaturation (exhibited by C=C bonds). In cells, fatty acids usually occur in combination with another molecule rather than in a free state. Essential fatty acids, including **linoleic acid** and **linolenic acid,** are unsaturated molecules that cannot be produced by the body and must therefore be included in the diet. See also **saturated fatty acid, unsaturated fatty acid.**

fatty alcohol, a hydroxy derivative of a hydrocarbon from the paraffin series.

fatty ascites. See **chylous ascites.**

fatty cirrhosis [AS, *faett* + Gk, *kirrhos,* yellow-orange, *osis,* condition], a form of cirrhosis that develops over a long period of poor nutrition resulting in fatty infiltration of the liver. See also **cirrhosis.**

fatty degeneration [AS, *faett* + L, *degenerare,* to deviate], the abnormal deposition of fat within cells or the invasion of organs by fatty tissue. Also called **adipose degeneration.**

fatty diarrhea, the excretion of fatty, foul-smelling stools that float on water. The condition is associated with chronic pancreatic disease and other malabsorption disorders. Also called **pimelorrhea.**

fatty infiltration, a normal phase of breast development, characterized by accumulation of increased amounts of fat around the parenchymal breast tissue. It is normally followed later in life by involution.

fatty infiltration of heart [AS, *faett* + L, *in* + *filtrare* + AS, *heorte*], an accumulation of large amounts of fat within the cells of the heart. The heart muscle may be marked by irregular, pale streaks representing areas of fatty infiltration. The condition is sometimes associated with severe and prolonged anemia.

fatty liver, an accumulation of triglycerides in the liver. The causes include obesity, diabetes, excessive consumption of alcohol, IV administration of drugs such as tetracycline and corticosteroids, and exposure to toxic substances such as carbon tetrachloride and yellow phosphorus. Fatty liver is also seen in kwashiorkor and is a rare complication of unknown origin in late pregnancy. The symptoms are anorexia, hepatomegaly, and abdominal discomfort. Fat cells can be seen under the microscope after liver biopsy. The condition is usually reversible after the underlying condition is corrected or the offending drug is withdrawn. See also **cirrhosis.**

fatty stool [AS, *faett* + *stol,* seat], feces containing an abnormally large amount of fat, as indicated by their floating on water. See also **celiac disease, steatorrhea.**

fatty tissue [AS, *faett* + OFr, *tissu*], loose connective tissue with many cells that contain fat vacuoles. Also called **adipose tissue.**

faucial isthmus /fô′shəl/, the aperture of the mouth into the pharynx. The anterior pillars of the fauces form the glossopalatine arch; the posterior pillars form the pharyngopalatine arch. Also called **oropharyngeal isthmus.**

faulty restoration /fôl′tē/ [L, *fallere,* to deceive, *restaurare,* to renew], any dental filling or fabrication that contains flaws, such as overhanging or incomplete fillings, voids, or incorrect anatomical characteristics of occlusal and marginal ridge areas. Such flaws may mar individual tooth fillings and fixed bridges or clasps of removable prosthetics and may cause inflammatory and dystrophic diseases of the teeth and periodontium. See also **restoration.**

favism /fā′vizəm/ [It, *fava,* bean], an acute hemolytic anemia caused by ingestion of the beans or inhalation of the pollen from the *Vicia faba* (fava) plant. Sensitive individuals have a genetic deficiency of glucose-6-phosphate dehydrogenase, usually the result of a hereditary biochemical abnormality of the erythrocytes. Symptoms include dizziness, headache, vomiting, fever, jaundice, eosinophilia, and often diarrhea. The condition occurs primarily in persons of southern Italian extraction and is treated by blood transfusion and avoidance of fava beans and pollen. See also **glucose-6-phosphate dehydrogenase deficiency.**

favus /fā′vəs/ [L, honeycomb], a fungal infection of the scalp, skin, or nails, more common in children than adults. It is caused by *Trichophyton* fungi. Favus is characterized by thick yellow crusts with suppuration, a honeycomb appearance, a distinct "mousy" odor, permanent scars, and alopecia. It is rarely seen in North America but is common in the Middle East and Africa.

fax, abbreviation for **facsimile.**

FBS, abbreviation for *fasting blood sugar.* See **blood glucose test.**

F.C.A.P., abbreviation for *Fellow of the College of American Pathologists.*

FCC, abbreviation for **Federal Communications Commission.**

FDA, abbreviation for **Food and Drug Administration.**

FDI numbering system [Fr, Féderation Dentaire Internationale], an internationally used two-digit system for identifying and referring to teeth, established through the FDI, headquartered in Paris, France. See also **Palmer notation, universal tooth coding system.**

Fe, symbol for the element **iron.**

fear level, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of manifested apprehension, tension, or uneasiness arising from an identifiable source. See also **Nursing Outcomes Classification.**

fear level: child, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of manifested apprehension, tension, or uneasiness arising from an identifiable source in a child from 1 year through 17 years of age. See also **Nursing Outcomes Classification.**

fear self-control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to eliminate or reduce disabling feelings of apprehension, tension, or uneasiness from an identifiable source. See also **Nursing Outcomes Classification.**

fear-tension-pain syndrome, a concept formulated by Grantly Dick-Read, MD, (1890–1959), to explain the pain commonly expected and reported in childbirth. The concept proposes that attitudes induce anxiety before labor and cause fear in labor. This fear causes muscular and psychological tension that interferes with the natural processes of dilation and delivery, resulting in pain. He advocated education, exercise, and warm emotional and physical support in labor to counteract the syndrome and coined the term **natural childbirth** for a labor or delivery in which the well-trained woman joyfully, comfortably, and with a calm, cooperative attitude participates in a natural experience. Elements of his method of psychophysical preparation for childbirth are incorporated into most other methods of natural childbirth. See also **Bradley method, Lamaze method, Read method.**

febri-, prefix meaning "fever": *febricant, febrifugal, febriphobia.*

febrifacient /feb′rifā′shənt/, an agent that induces a fever.

febrifuge. See **antipyretic.**

febrile /fē′bril, feb′ril/ [L, *febris,* fever], pertaining to or characterized by an elevated body temperature, such as a febrile reaction to an infectious agent. A body temperature above 100° F (37.8° C), or 99.6° F (37.6° C) rectally, is commonly regarded as febrile. Compare **afebrile. —febrility,** *n.*

-febrile, suffix meaning "fever": *afebrile, nonfebrile, subfebrile.*

febrile/cold agglutinins test, blood tests used to diagnose infectious diseases and some neoplastic diseases. The febrile agglutinins serological studies are used to diagnose salmonellosis, rickettsial diseases, brucellosis, tularemia, and some leukemias and lymphomas, whereas cold agglutinins are found in patients infected by *Mycoplasma pneumoniae,* **influenza, mononucleosis, rheumatoid arthritis,** and **lymphomas.**

febrile delirium [L, *febris,* fever, *delirare,* to rave], a symptom of disordered central nervous system function, with excitement, restlessness, and disorientation accompanying some acute fevers.

febrile response. See **fever.**

febrile seizure, a seizure associated with a febrile illness. Treatment depends on the age of the patient and the number of seizures. Generalized recurrent febrile seizures in children may be treated as grand mal epilepsy.

febrile state [L, *febris,* fever, *status,* condition], a significant increase in body temperature accompanied by increased pulse and respiration rates, anorexia, constipation, insomnia, headache, pains, and irritability.

febrile urine, a deep orange-colored, strong smelling urine of a patient with a fever, usually caused by concentration of the urine as a result of dehydration.

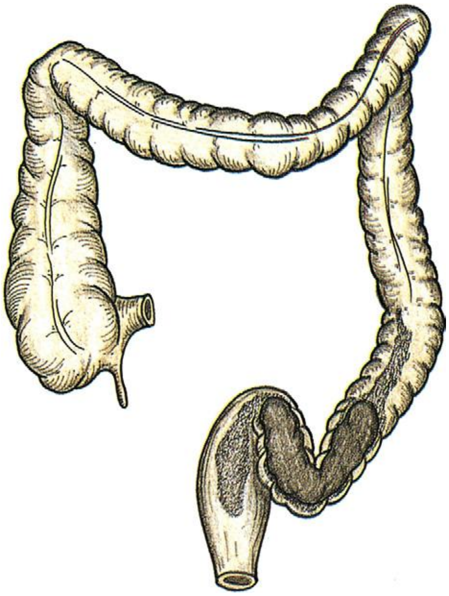
febrility. See **febrile.**

fecal. See **feces.**

fecal fat test, a stool test performed to confirm the diagnosis of steatorrhea.

fecal fistula [L, *faex,* waste matter, *fistula,* pipe], an abnormal passage from the colon to the external surface of the body, for discharging feces. Fistulas of this kind are usually created surgically in operations involving the removal of malignant or severely ulcerated bowel segments. See also **colostomy.**

fecal impaction, an accumulation of hardened or inspissated feces in the rectum or sigmoid colon that the individual is unable to move. Diarrhea may be a sign of fecal



Fecal impaction *(Potter and Perry, 2003)* impaction, since only liquid material is able to pass the obstruction. Occasionally fecal impaction may cause urinary incontinence through pressure on the bladder. Treatment includes oil and cleansing enemas and manual breaking up and removal of the stool by a gloved finger. Persons who are dehydrated; nutritionally depleted; on long periods of bed rest; receiving constipating medications such as iron or opiates; or undergoing barium radiographic studies are at risk of developing fecal impaction. Prevention includes adequate ingestion of bulk food, fluids, exercise, regular bowel habits, privacy for defecation, and occasionally stool softeners or laxatives. See also **constipation, obstipation.**

fecalith /fē′kəlith/ [L, *faex* + Gk, *lithos*, stone], a hard, impacted mass of feces in the colon. To allow evacuation, an oil retention enema is usually administered. If it is ineffective, manual removal can be performed. See also **atonic constipation, constipation.**

fecal softener, a drug that lowers the surface tension of the fecal mass, allowing the intestinal fluids to penetrate and soften the stool. Also called **stool softener.**

feces /fē′sēz/ *sing*. **faex** [L, *faex*, waste matter], waste or excrement from the digestive tract that is formed in the intestine and expelled through the rectum. Feces consist of water, food residue, bacteria, and secretions of the intestines and liver. Gross examination of feces for color, odor, quantity, and consistency and microscopic examination for the presence of blood, fat, mucus, or parasites are common diagnostic procedures. Also spelled **faeces.** Also called **stool.** See also **defecation. —fecal,** *adj*.

fecund. See **fecundity.**

fecundation /fē′kəndā′shən, fek′-/ [L, *fecundare*, to make fruitful], impregnation or fertilization; the act of fertilizing. See also **artificial insemination. —fecundate,** *v*.

fecundity /fikun′ditē/, the ability to produce offspring, especially in large numbers and rapidly; fertility. **—fecund** /fek′ənd, fē′kənd/, *adj*.

Federal Communications Commission (FCC), a U.S. federal agency that regulates interstate and international communications by radio, television, wire, satellite, cable, and 911.

federally qualified heath center, a designation provided by the Department of Health and Human Services, Centers for Medicare and Medicaid Services. The main purpose of the FQHC Program is to enhance the provision of primary care services in underserved areas.

***Federal Register*,** a document published by the U.S. government each working day to inform the public of executive regulations, presidential orders, hearings and meeting schedules of various federal agencies, and related matters. The *Federal Register* contains announcements of the Food and Drug Administration, the Environmental Protection Agency, and other government bureaus that regulate matters of health and safety.

Federal Tort Claims Act, a statute passed in 1946 that allows the U.S. federal government to be sued for the wrongful action or negligence of its employees. The act, for most purposes, eliminates the doctrine of governmental immunity, which formerly prohibited the bringing of a suit against the federal government.

Federal Trade Commission (FTC), an agency in the executive branch of the U.S. federal government created to promote trade and to prevent practices that restrain free enterprise and competition. In the area of health care the commission successfully challenged the American Medical Association's ban on physician advertising. The FTC held that competition among physicians and the free choice of the consumer were impaired by the antiadvertising policy.

Fede's disease. See **Riga-Fede disease.**

feedback [AS, *faedan* + *baec*], (in communication theory) **1.** information produced by a receiver and perceived by a sender that informs the sender of the receiver's reaction to the message. Feedback is a cyclic part of the process of communication that regulates and modifies the content of messages. **2.** the return of some of the output so as to exert some control in the process.

feedback loop, the circular path seen in a system that has feedback, such that the output of the system participates in the control of the system. It can be positive or negative.

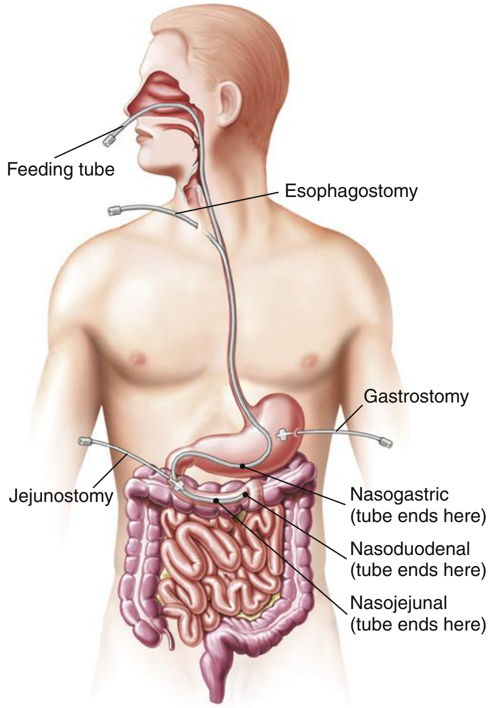
Feed backward, reflective movements in response to stimuli (e.g., throwing a ball at a target and reflecting on where it hit).

feedforward control, an anticipatory correction in motor behavior. During movement, various brain centers depend on feedback from receptors to control motor behavior. If the actual and intended motor behaviors do not match, an error signal is generated and alterations are made. In some instances the control system anticipates an error and makes the corrective change in advance of the start of movement.

feeding[1] [AS, *faedan*], the act or process of taking or giving food or nourishment. Kinds of feeding include **breastfeeding** and **tube feeding.** See also **alimentation, parenteral nutrition.**

feeding[2]**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing nutritional intake for a patient who is unable to feed self. See also **Nursing Interventions Classification.**

feeding tube, a tube for introducing fluids of high caloric value into the stomach. See also **tube feeding.**



Feeding tube
Esophagostomy
Gastrostomy
Jejunostomy
Nasogastric (tube ends here)
Nasoduodenal (tube ends here)
Nasojejunal (tube ends here)

Types of feeding tubes

(Harkreader, Hogan, and Thobaben, 2007)

fee-for-service [AS, *feoh*, property; L, *servitum*, slavery], **1.** a charge made for a professional activity, such as a physical examination, the fitting of a contraceptive diaphragm, or the monitoring of a person's blood pressure. **2.** a system for the payment of professional services in which the practitioner is paid for the particular service rendered, rather than receiving a salary for providing professional services as needed during scheduled hours of work or time on call.

fee-for-service equivalent, (in U.S. managed care) a specialty capitation method in which a fee schedule is developed for service and providers are paid a percentage of the fee schedule. Periodically the overall value of services provided is compared with payments received and the balance is distributed proportionately to participating providers.

feeling, **1.** a quality of mood. **2.** a subjective experience caused by stimulation of a sensory nerve.

Feer's disease. See **acrodynia.**

FEES, service mark for **fiberoptic endoscopic evaluation of swallowing.**

fee schedule, (in U. S. managed care) the specific dollar amount to be charged for each service offered.

fee screen system, a method of establishing payment for physician services that is based on the usual, customary, or reasonable charge according to a regional evaluation. It allows physicians to establish their own reimbursement level for units of service.

feet. See **foot.**

FEF, abbreviation for **forced expiratory flow.**

Fehling's solution /fā′lingz/ [Hermann C. von Fehling, German chemist, 1812–1885], a solution containing cupric sulfate and sodium hydroxide and potassium sodium tartrate, used for testing for the presence of glucose and other reducing substances in the urine. Also called *Fehling's reagent*.

Feingold diet /fīn′gōld/ [Benjamin Feingold, American pediatrician, 1900–1982], a diet developed to treat hyperactive children that excludes foods manufactured with synthetic colorings, flavorings, and preservatives and limits the intake of fruits and vegetables that contain salicylates, such as oranges, apricots, peaches, cucumbers, and tomatoes. Research studies have not supported the efficacy of this diet.

felbamate /fel′bämāt′/, an anticonvulsant used in treatment of epilepsy; administered orally.

Feldene, a trademark for an antiinflammatory agent (piroxicam).

FeldenKrais method /fel′dənkrīs/, **1.** (in psychiatry) a proprietary system that uses an exploratory technique to enable patients to relearn dysfunctional movement patterns. Therapy takes two forms: awareness through movement, in which the patient is guided verbally through increasingly complex structured movements, and functional integration, in which the practitioner introduces new motion patterns to the patient by gentle manipulation. **2.** a bodywork technique that integrates principles of physics, judo, and yoga. The practitioner directs sequences of movement using verbal or hands-on techniques or teaches a system of self-directed exercises to treat physical impairments through the learning of new movement patterns.

feldspar /feld′spär/ [Ger, *feld*, field, *spath*, spar], a crystalline mineral of aluminum silicate with potassium, sodium, barium, and calcium. It melts over a range of 593.5° C to 1093° C (1100° F to 2000° F) and is an important component of dental porcelain.

F element. See **F factor.**

fellatio /fəlā′shē·ō/, oral stimulation of the male genitalia.

fellow [AS, *feolaga*, friendly association], **1.** a member of a learned society. **2.** a graduate student who holds a position in a university or college. **3.** a peer, associate, or person of the same class or rank.

Fellow of the American Academy of Nursing (FAAN), a member of the American Academy of Nursing. The Academy was established in 1966 by the House of Delegates of the American Nurses Association to recognize significant contributions of individuals to the nursing profession. See also **American Academy of Nursing.**

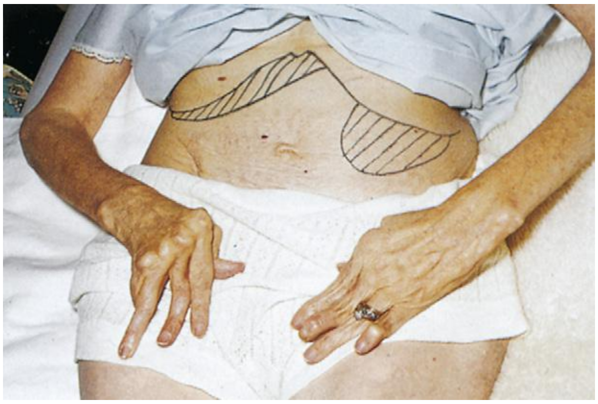
fellowship /fel′ōship/ [As, *feolaga*, friendly association], a grant given to a person to pay for study or training or to allow payment for work on a special project. It provides a stipend and in some cases the miscellaneous expenses involved in the study, training, or project.

felon /fel′ən/ [L, *fel*, venom], a suppurative abscess on the distal phalanx of a finger.

felonious assault. See **felony.**

felony /fel′ənē/, (in criminal law) a crime declared by statute to be more serious than a misdemeanor and deserving of a more severe penalty. Conviction usually requires imprisonment in a penitentiary for longer than 1 year. Crimes of murder, rape, burglary, and arson are tried as felonies in most cases. In many states there is current, pending, or new legislation that essentially bars applicants from taking the nursing licensure exam NCLEX-RN or PN if certain felonies exist in their history. Criminal background checks, state and federal, are required of all graduate nurses and, in some states, of nursing students before clinical rotations.

Felty's syndrome /fel′tēz/ [Augustus R. Felty, American physician, 1895–1963], a group of pathological changes that occurs with adult rheumatoid arthritis, characterized by splenomegaly, leukopenia, frequent infections, and sometimes thrombocytopenia and anemia. The cause of the syndrome is unknown. Surgical resection of the spleen offers temporary improvement in about one half of the cases. See also **hypersplenism.**



Felty's syndrome *(Moll, 1997)*

female [L, *femella*, young woman], **1.** *adj*, pertaining to the sex that has the ability to become pregnant and bear children; feminine. **2.** *n*, a female person.

female catheterization, a procedure for removing urine by means of a urinary catheter introduced through the urinary meatus and urethra into the bladder. The procedure is performed for relief of distension if voluntary micturition is not possible (such as after trauma or surgery), as a preparation for and during anesthesia, or if a specimen of urine from the bladder is required or medication is to be instilled into the bladder. A straight catheter or a retention catheter with a balloon may be used. A French size 12 to 16 catheter is usually selected for straight drainage. See also **catheterization, male catheterization.**

■ METHOD: The necessary sterile equipment is usually available in a sterile catheterization kit and includes cotton swabs, a bowl for collecting urine, a disposable catheter, a sponge stick for holding the swabs, a disinfectant for washing the urinary meatus and the perineal area adjacent to it, gloves, a lubricant

for the catheter tip, and a drape. Often a preassembled kit of disposable sterile equipment is available, leaving only the separately packaged catheter to be selected. The patient is positioned on her back, with knees flexed and legs abducted, and is then draped. A bright light is directed at the perineum. The nurse then scrubs the hands, dries them well, and opens the catheterization kit or tray carefully, not touching the inside of the wrapper or the contents. Sterile gloves are put on, and the tray is lifted and placed between the patient's legs. The small sterile drape in the kit is placed over the patient so that the window in it allows access to the urinary meatus. With the thumb and the forefinger of the nurse's nondominant hand, the labia are separated and the tissues are retracted, exposing the meatus. The area is cleansed from the front to the back, using one pledget or swab for each stroke. Each pledget is discarded before beginning another stroke. Three or more strokes are made, and the location of the meatus is verified while the area is cleaned. The catheter is picked up approximately 1.5 inches from its tip with the sterile hand, the tip is lubricated, and the end is placed in the basin. The catheter is inserted approximately 3 inches until the urine begins to flow. When the urine stops flowing, the catheter is slowly withdrawn or left indwelling as ordered. A sterile sponge is gently pressed to the meatus to remove any lubricant and to dry the area. The urine is measured, and the odor, color, and any abnormal precipitate are noted. A specimen for bacteriological culture and antibiotic sensitivity is often secured, labeled, and sent to the laboratory.
■ INTERVENTIONS: Catheterization is ordered by a physician for an individual patient, or the conditions under which a catheterization is to be performed are stated in written standing orders. Careful explanation of the procedure ensures the patient's cooperation. Having the woman take a deep breath through the mouth may cause the meatus to open slightly, revealing its presence, and asking her to bear down slightly may minimize the momentary discomfort that commonly accompanies the insertion of the catheter into the bladder. Voluntary micturition is almost always preferable, and the nurse encourages the woman to try to void spontaneously. Signs of infection are carefully observed. If a woman is to be catheterized more than twice, an indwelling catheter is usually preferred to a third catheterization.
■ OUTCOME CRITERIA: Catheterization predisposes the urinary tract to infection, and traumatic catheterization further increases the risk. Care, gentleness, and asepsis are essential. If the bladder is distended with urine, it may cause damage to the bladder, chills, and shock. Certain conditions, including radical vulvectomy, postoperative swelling, or structural anomalies, may obscure the urinary meatus. The indication for catheterization, the age of the patient, and the condition and size of the urethra affect the choice of catheter style and size.

female circumcision. See **clitoridectomy.**

female condom, a sheath worn inside the vagina, also extending outward to cover the vulva. It is used to prevent pregnancy or transmission of infection.

female factor infertility, infertility of a couple because of a problem in the female's reproductive system. Types include cervical factor infertility and tubal factor infertility.

female genital mutilation, the ritual practice in some cultures of excising the entire clitoris without anesthetic, sometimes as part of a maturity initiation rite. The procedure may be performed in support of a mistaken belief that the absence of a clitoris will prevent a woman from experiencing orgasm or control masturbation and nymphomania. Also called **clitoridectomy.**

female pseudohermaphroditism, a form of the congenital gonadal disorder in which ovaries are present, irrespective of the condition of the external genitals. See also **pseudohermaphroditism.**

female reproductive system assessment, an evaluation of a patient's genital tract and breasts with an investigation of past and present disorders that may be factors in the individual's current gynecological condition. See also **pelvic examination.**
■ METHOD: In a relaxed professional interview the procedures to be conducted are explained and the patient is reassured that her privacy will be scrupulously maintained. The patient is interviewed to determine whether she has lower abdominal pain, cramps, vaginal bleeding, itching, swelling, redness, or a vaginal discharge that is mucoid, watery, frothy, or thick in consistency and white, yellow, greenish, bloody, or brown, or that has an odor. She is asked whether she experiences pain on intercourse and pain or burning on urination. Observations are recorded of her general appearance; vital signs; weight; breast symmetry, texture, and lumps or bumps; nipple color; and the presence of a serous, bloody, or purulent nipple discharge. The abdomen is examined for contour, symmetry, stretch marks, scars, lesions, and visible pulsations and peristaltic waves and is auscultated for bowel sounds in each quadrant. Carefully noted are edema or redness of the external genitalia, cervix, and perineum; lumps or lesions on the labia majora; the size of the urethral orifice; the presence or absence of the hymenal ring, hymenal tags, and perineal scars or excoriation; and a bloody, purulent, or odoriferous discharge. The normal mucoid secretion is distinguished from the thick, white, cheesy discharge typical of candidiasis; the frothy, yellow-green, watery liquid characteristic of trichomoniasis; and the thick, yellow-green or brown, and bloody drainage typical of upper genital tract infection. The patient's age at onset of menses; the duration, spacing, and regularity of cycles; the amount and character of the flow; the date of the last menstrual period; and associated symptoms such as pain and menorrhagia are investigated. The complications and outcome of each of the patient's pregnancies, the kind of delivery, the incidence and outcome of any abortion, and the date of menopause and associated symptoms, such as hot flashes and dry vaginal mucosa, are explored. It is determined whether the patient suffers from a sexually transmitted disease, constipation, hemorrhoids, hypothyroidism or hyperthyroidism, polycystic ovary syndrome, hypertension, or blood dyscrasias or has a history of gynecological or other major abdominal surgery or a serious illness, especially one related to the endocrine system. The patient's smoking habits, sexual activity, use of oral contraceptives or an intrauterine device; her experience with estrogen therapy; and family history of gynecological diseases and deaths are reported in the assessment. Diagnostic procedures indicated by the history may include a manual examination, Papanicolaou's (Pap) test, basal body temperature determination, culture of vaginal discharge, punch biopsy, endometrial biopsy, dilation and curettage, cold-knife conization, laparoscopy, ultrasound study, and tubal insufflation. Laboratory studies that may be performed include determinations of levels of human chorionic gonadotropin, serum luteinizing and follicle-stimulating hormones, 17-ketosteroids, and corticosteroids; tests for sexually transmitted diseases; and thyroid function tests such as the basal metabolic rate and protein-bound iodine level.
■ INTERVENTIONS: The nurse conducts the interview, records observations of the patient, and collects the pertinent background information and the results of diagnostic procedures and laboratory studies. Throughout the assessment the nurse recognizes that the patient may be reluctant to discuss her symptoms and activities and may be sensitive about the necessary procedures.
■ OUTCOME CRITERIA: A careful assessment of the patient's reproductive system is essential in establishing early diagnosis providing prompt treatment of abnormalities.

female sexual dysfunction, impaired or inadequate ability of a woman to engage in or enjoy satisfactory sexual intercourse and orgasm. Symptoms, usually psychological in origin, include dyspareunia, vaginismus, persistent inability to reach orgasm, and inhibition in sexual arousal, so that congestion and vaginal lubrication are minimal or absent. Causes may include anxiety, fear, negative emotions associated with sexual arousal and intercourse, and interpersonal problems. Neurological dysfunction may also be present. Treatment is focused on eliminating physical problems and sexual anxieties and on enhancing erotic sensitivities. Compare **male sexual dysfunction.** See also **sexual dysfunction.**

female sterility [L, *femella,* young woman, *sterilis,* barren], a condition of being an infertile woman. The inability to reproduce may result from congenital defects in the reproductive system, such as failure of the uterus to develop normally, or disease, injury, or corrective surgery that affects functioning of the ovaries, fallopian tubes, uterus, cervix, or vagina.

female urethra, a canal about 3.7 cm long, extending from the neck of the bladder above the anterior vaginal wall to the urinary meatus.

feminist therapy, an alternative therapy that is both a philosophic approach to the conduct of therapy and a specific type of therapy. The focus of both types is a consciousness raising that focuses on the presence of sexism and sex role stereotyping in society.

feminization /fem′inīzā′shən/ [L, *femina,* woman], **1.** the normal development or induction of female secondary sex characteristics. **2.** the induction of female sex characteristics in a genotypic male. Testicular feminization may be caused by the inability of target tissues to respond to endogenous or administered androgen. Some cases seem related to an absent or inadequate conversion of testosterone to dihydrotestosterone, which is the active form of the androgen. Testicular feminization in males with an X and a Y chromosome and a female phenotype may be caused by fetal hypogonadism and is often familial. Individuals with this defect usually have undescended or labial testes, a short blind vaginal pouch; no uterus, well-developed breasts, sparse or absent axillary and pubic hair, normal plasma levels of testosterone and follicle-stimulating hormone, and increased concentrations of estradiol and luteinizing hormone. Treatment consists of orchiectomy because of the risk of cancer in gonads of these patients. Feminization may also be caused by adrenocortical estrogen-secreting tumor, failure of the liver to inactivate endogenous estrogens such as in advanced alcoholism, or the administration of estrogen therapy for androgen-dependent neoplasms. Some testicular tumors may produce feminizing symptoms, and gynecomastia may be caused by Klinefelter's syndrome and by certain drugs, such as reserpine, digitalis, meprobamate, and cimetidine. Compare **virilization.** See also **pseudohermaphroditism.**

feminizing adrenal tumor /fem′inī′zing/, a rare neoplasm of the adrenal cortex, characterized in males by gynecomastia, hypertension, diffuse pigmentation, a high level of estrogen in urine, and loss of potency. Testicular atrophy frequently occurs, but the prostate and penis are usually normal in size. The tumor may be large enough to be palpated or to be diagnosed by IV urography or arteriography. In most cases it is a carcinoma. Treatment includes surgical resection and chemotherapy with mitotane. In women these tumors, which are extremely rare, are associated with precocious puberty.

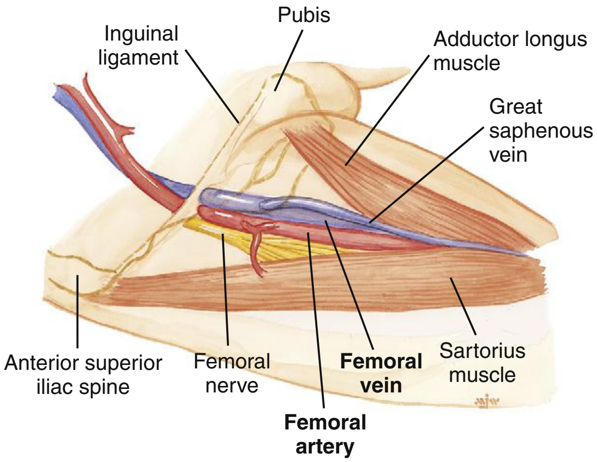
femora. See **femur.**

femoral /fem′ərəl/ [L, *femur,* thigh], pertaining to the femur or the thigh.

femoral angle. See **neck shaft angle.**

femoral anteversion, inward twisting of the femur so that the knees and feet turn inward, usually seen in children or in persons with osteoarthritis of the hip.

femoral artery (FA), an extension of the external iliac artery into the lower limb, starting immediately distal to the inguinal ligament and ending at the junction of the middle and lower thirds of the thigh. It divides into seven branches, continuing as the popliteal artery, and supplies various parts of the lower limb and trunk, such as the groin and its organs.



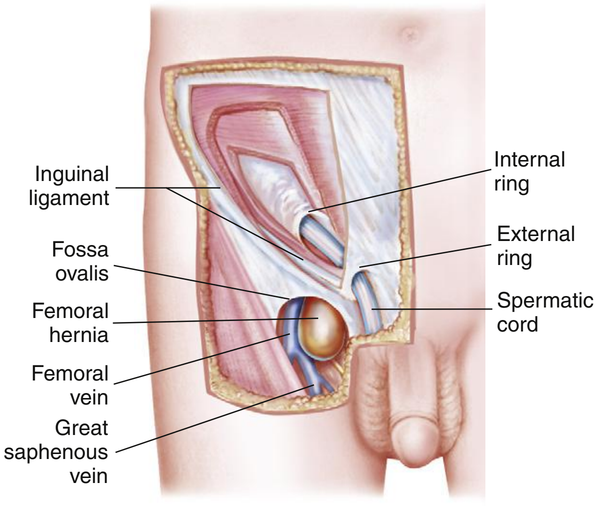
Femoral artery and femoral vein *(Sanders et al, 2007)*

femoral catheter, a central venous catheter inserted through the femoral vein.

femoral condyle, one of a pair of large flared prominences on the distal end of the femur. Identified as lateral and medial femoral condyles, they are covered with a thick layer of hyaline cartilage and articulate with the patella and the tibia at the knee joint.

femoral epiphysis, a secondary bone-forming center of the femur, separated from the main part of the bone by cartilage during the period of bone immaturity. In overweight adolescents, there may be bone slippage along the femoral capital epiphysis, marked by pain and loss of range of motion.

femoral hernia, a hernia in which a loop of intestine descends through the femoral canal into the groin. Surgical repair, herniorrhaphy, is the usual treatment. See also **hernia.**



Femoral hernia *(Seidel et al, 2011)*

femoral nerve, the largest of the seven nerves stemming from the lumbar plexus and the main nerve of the anterior part of the thigh. Also called **anterior crural nerve.**

femoral pulse, the pulse of the femoral artery, palpated in the groin.

Palpation of femoral pulse *(Potter et al, 2011)*

femoral reflex [L, *femur,* thigh, *reflectere,* to bend back], an extension of the knee and a plantar flexion of the toes of the foot that occurs when the skin on the upper anterior third of the thigh is stimulated.

femoral stem, in arthroplasty of the hip or knee, the part of the prosthesis that inserts into the end of the trimmed and prepared femur.

femoral-to-popliteal artery bypass, grafting with a saphenous vein or straight synthetic graft to bypass an occluded section of the femoral artery and restore blood flow to the leg. Surgery is performed with the patient in a supine position, with the hip externally rotated and abducted and the knee flexed. An in situ femoral-to-popliteal bypass uses the patient's saphenous vein, which stays in place. Contraindications for this procedure are varicose veins or previous saphenous vein ligation and stripping.

femoral torsion, an extreme lateral or medial twisting rotation of the femur on its longitudinal axis, which may be caused by the action of the gluteal or other muscles. Compare **tibial torsion.**

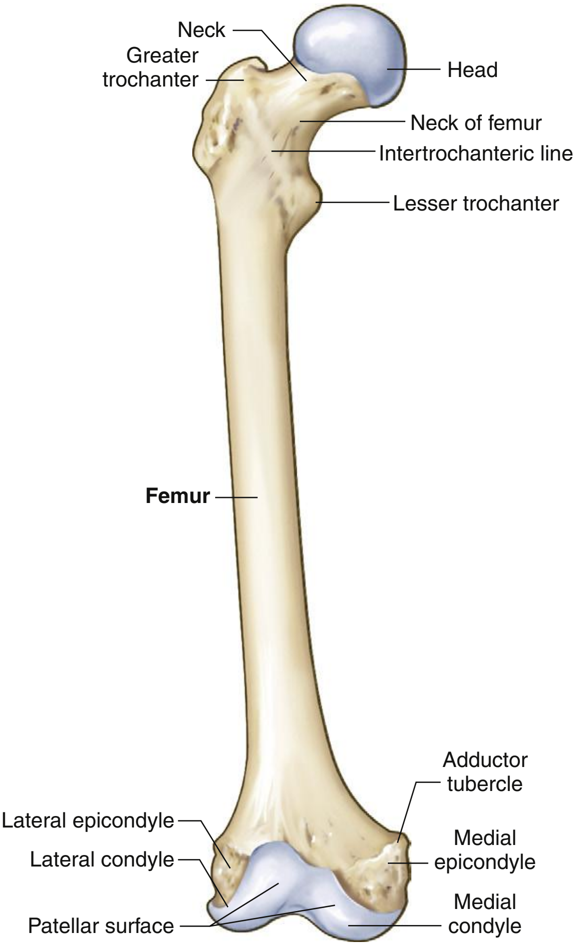
femoral triangle, a wedge-shaped depression formed by the muscles in the upper thigh at the junction between the anterior abdominal wall and the lower limb through which the femoral nerve, artery, and vein and lymphatic vessels pass.

femoral vein, a large vein in the thigh that is a continuation of the popliteal vein and that accompanies the femoral artery in the proximal two thirds of the thigh. Its distal portion lies lateral to the artery, and its proximal portion lies deeper to the artery. Near its termination, it is joined by the great saphenous vein. At the inguinal ligament it becomes the external iliac vein.

femoro-, a prefix meaning relationship to the femur.

Femstat, a trademark for an antifungal drug **(butoconazole nitrate).**

femur /fē′mər/ *pl.* **femora, femurs** [L, thigh], the **thigh bone**, which extends from the pelvis to the knee. It is largely cylindric and is the longest and strongest bone in the body. It has a large round head that fits the acetabulum of the hip, and it displays a large neck and several prominences and ridges for muscle attachments. In an erect posture it inclines medially, drawing the knee joint near the line of gravity of the body.



Femur *(Patton and Thibodeau, 2010)*

FE_{Na}, abbreviation for **fractional excretion of sodium.**

fenestra /fines′trə/ *pl.* **fenestrae** [L, window], **1.** an aperture, as in a bandage or cast, that is cut out to relieve pressure or to administer regular skin care. **2.** a microscopic opening in certain capillaries specialized in filtration, as in the glomerular capillaries of the kidney often covered by membrane.

fenestra cochlea. See **round window.**

fenestrae. See **fenestra.**

fenestra rotunda. See **round window.**

fenestrate. See **fenestration.**

fenestrated drape, a drape with a round or slitlike opening in the center.

fenestration /fen′əstrā′shən/ [L, *fenestra,* window], **1.** a surgical procedure in which an opening is created to gain access to the cavity within an organ or a bone. **2.** an opening created surgically in a bone or organ of the body. **3.** (in dentistry) a procedure to expose a root tip of a tooth to permit drainage of exudate. Also called **window. —fenestrate,** *v.*

fenofibrate /fen′ofi′brāt/, an agent chemically related to clofibrate used to treat hyperlipidemia, administered orally.

fenoldopam, an antihypertensive.

■ INDICATIONS: It is used to treat hypertensive crisis when an urgent decrease of pressure is required, including malignant hypertension.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug and sulfite sensitivity prohibit its use.

■ ADVERSE EFFECTS: Life-threatening effects are hypotension, myocardial infarction, ischemic heart disease, and leukocytosis. Other adverse effects include anxiety, dizziness, ST-T wave changes, angina pectoris, palpitations, nausea, vomiting, constipation, diarrhea, bleeding, and increased levels of blood urea nitrogen, glucose, lactic dehydrogenase, creatinine, and hypokalemia. Headache is a common side effect.

fenoprofen calcium /fē′nəprō′fen/, a nonsteroidal antiinflammatory agent and analgesic.

■ INDICATIONS: It is prescribed in the treatment of arthritis and other painful inflammatory conditions.

■ CONTRAINDICATIONS: Renal dysfunction, upper GI disease, or known hypersensitivity to this drug, to aspirin, or to nonsteroidal antiinflammatory medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, gastric or duodenal ulceration, dizziness, skin rash, and tinnitus.

fenoterol /fen′ōter′ol/, a beta$_2$-adrenergic receptor agonist used as a bronchodilator for the treatment and prophylaxis of reversible bronchospasm, administered by inhalation as the hydrobromide salt.

fentanyl citrate, a general anesthetic. See also **buccal fentanyl.**

■ INDICATIONS: It is prescribed as an adjunct to general anesthesia, as a preoperative and postoperative analgesic, and as a component in neuroleptanesthesia and analgesia.

■ CONTRAINDICATIONS: Myasthenia gravis, use of a monoamine oxidase inhibitor within 14 days, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are drug dependence, hypotension, pruritus, respiratory depression, and laryngospasm.

fenugreek, an annual herb found in Europe and Asia.

■ USES: It is used for loss of appetite, skin inflammation, water retention, cancer, constipation, diarrhea, high cholesterol, high blood glucose, and calcium oxalate stones. It may be effective at lowering blood glucose (slow intestinal absorption) and as a poultice for local inflammation, but there are insufficient reliable data on its efficacy for other uses.

■ CONTRAINDICATIONS: It should not be used during pregnancy because it can cause premature labor. It is also contraindicated during lactation, in children, and in those with known hypersensitivity to this herb.

Feosol, a trademark for a **ferrous sulfate,** an iron supplement prescribed to help increase hemoglobin production.

-fer, suffix meaning "producing or carrying something specified": *parasitifer, sonifer, vaccinifer.*

Fergon, a trademark for ferrous gluconate, an iron supplement prescribed to help increase hemoglobin production.

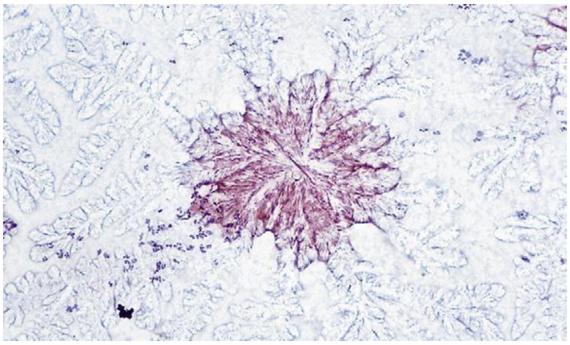
Ferguson's reflex, a contraction of the uterus after the cervix is stimulated. The reflex is an important function of labor.

fermentation /fur′məntā′shən/ [L, *fermentare,* to cause to rise], a chemical change that is brought about in a substance by the action of an enzyme or microorganism, especially the anaerobic conversion of foodstuffs to certain products. Kinds of fermentation are **acetic fermentation, alcoholic fermentation, ammoniacal fermentation, amylic fermentation, butyric fermentation, caseous fermentation, dextran fermentation, diastatic fermentation, lactic acid fermentation, propionic fermentation,** *storing fermentation,* and **viscous fermentation.**

fermentative dyspepsia /fərmen′tətiv/, an abnormal condition characterized by impaired digestion associated with the fermentation of digested food. See also **dyspepsia.**

fermium (Fm) /fur′mē·əm/ [Enrico Fermi, Italian physicist, 1901–1954], a synthetic transuranic metallic element. Its atomic number is 100; the mass of its longest-lived, best-known isotope is 257. Fermium was first detected in the debris from a hydrogen bomb explosion and later produced in a reactor.

ferning test /fur′ning/ [AS, *faern,* fern; L, *testum,* crucible], a technique used to determine the presence of estrogen in the uterine cervical mucus. It is often used to test for ovulation. High levels of estrogen cause the cervical mucus to dry in a fernlike pattern on a slide. Also called **arborization test.**



Ferning *(McKee, 1997)*

-ferous, suffix meaning "producing or carrying" something specified: *lactiferous, sebiferous, tubiferous.*

ferr-, ferri-. See **ferro-.**

ferredoxin, a nonheme protein containing equal amounts of iron and sulfur. Ferredoxins are involved in electron transport in photosynthesis and nitrogen fixation.

ferric /fer′ik/, pertaining to a cation of iron in which the metal is trivalent, as in ferric chloride and ferric hydroxide. Also called *iron (III).*

ferritin /fer′itin/ [L, *ferrum,* iron], an iron compound formed in the intestine and stored in the liver, spleen, and bone marrow for eventual incorporation into hemoglobin. Serum ferritin levels are used as an indicator of the body's iron stores. Normal adult blood levels are 12 to 300 ng/mL for males and 10 to 150 ng/mL for females.

ferritin test, a blood test used to determine available iron stores in the body. It is used to diagnose iron deficiency anemia, and when combined with the serum iron level and total iron-binding capacity tests, can differentiate and classify various kinds of anemias.

ferro-, ferr-, ferri-, prefix meaning "iron": *ferrocyanide, ferropectic, ferrosilicon.*

ferrokinetics /fer′ōkinet′iks/, the study of iron metabolism.

ferromagnetic /fer′ōmagnet′ik/, pertaining to substances, such as iron, nickel, and cobalt, that are strongly affected by magnetism and may become magnetized by exposure to a magnetic field.

ferrotherapy /fer′ōther′əpē/, the use of iron and iron compounds in the treatment of illness.

ferrous /fer′əs/, pertaining to a compound of iron in which the metal is divalent, such as ferrous ammonium sulfate. See also **iron.**

ferrous sulfate, an antianemia (hematinic) agent. See also **iron.**

■ INDICATION: It is prescribed in the treatment of iron deficiency anemia.

■ CONTRAINDICATIONS: Hemochromatosis, hemosiderosis, hemolytic anemias, and hypersensitivity to any of the ingredients prohibit its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are GI irritation, diarrhea, and constipation.

fertile /fur′təl/ [L, *fertilis,* fruitful], **1.** capable of reproducing or bearing offspring. **2.** (of a gamete) capable of inducing fertilization or being fertilized. **3.** prolific; fruitful; not sterile. **—fertility,** *n.,* **fertilize,** *v.*

fertile eunuch syndrome, a hypogonadotropic hormonal disorder of males in which the levels of testosterone and follicle-stimulating hormone are inadequate to induce spermatogenesis and the development of secondary sexual characteristics. If supplemental hormones are not prescribed, the affected person acquires the appearance of a eunuch.

fertile period, the time in the menstrual cycle during which fertilization may occur. Spermatozoa can survive for 5 days; the ovum lives for 24 hours. Thus the fertile period begins up to 6 days before ovulation and lasts for 1 day afterward. It may be identified by observation of the changes in the quantity and character of the cervical mucus or changes in the basal body temperature, or it may be determined from a calendar record of six or more menstrual cycles, applying the knowledge that ovulation usually occurs 14 days before menstruation.

fertility /fərtil′itē/, the ability to reproduce.

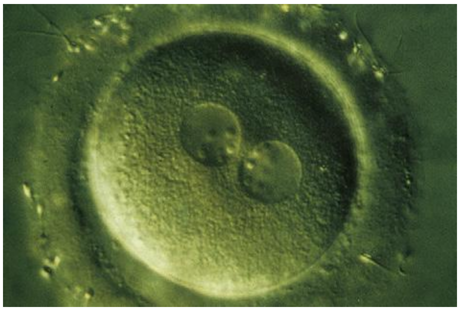
fertility awareness methods. See **natural family planning method.**

fertility factor. See **F factor.**

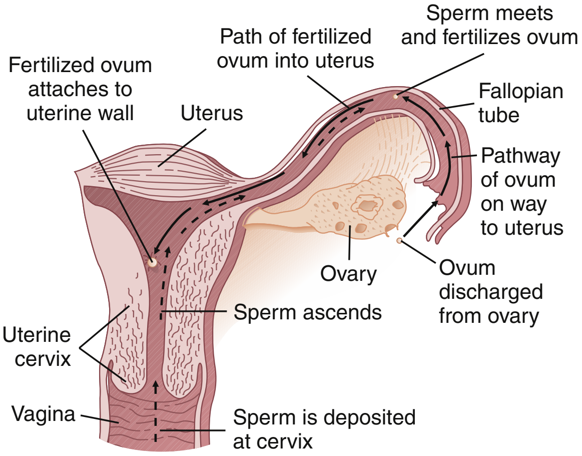
fertility preservation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing information, counseling, and treatment that facilitate reproductive health and the ability to conceive. See also **Nursing Interventions Classification.**

fertility rate, the number of live births divided by the number of females aged 15 through 44 years of age. It is usually expressed as the number per 1000 women.

fertilization /fur′tilīzā′shən/ [L, *fertilis,* fruitful], the union of male and female gametes to form a zygote from which the embryo develops. The process usually takes place in the outer one third of the fallopian tube of the female when a spermatozoon, carried in the seminal fluid discharged during coitus, comes in contact with and penetrates the ovum. Rapid chemical changes in the membrane of the ovum prevent the entrance of additional spermatozoa. Penetration by the spermatozoon stimulates the completion of the second meiotic division and formation of the pronucleus in the ovum. Fusion and synapsis of the male and female pronuclei restore the diploid number of chromosomes to the germ cell, thereby determining the sex of the zygote and the characteristics inherited from each parent and stimulating the initiation of development through cleavage. Kinds of fertilization include **cross-fertilization, external fertilization,** and **internal fertilization.** See also **in vitro fertilization, oogenesis, spermatogenesis.**



Fertilized human egg *(Greer et al, 2001)*



Sperm meets and fertilizes ovum
Path of fertilized ovum into uterus
Fertilized ovum attaches to uterine wall
Uterus
Fallopian tube
Pathway of ovum on way to uterus
Ovary
Ovum discharged from ovary
Uterine cervix
Sperm ascends
Vagina
Sperm is deposited at cervix

Fertilization cycle *(Black and Hawks, 2009)*

fertilization age. See **fetal age.**

fertilization membrane, a viscous membrane surrounding a fertilized ovum that prevents penetration of additional spermatozoa. It is formed by granules that are released by the fertilized ovum and adhere to the vitelline membrane.

fertilize. See **fertile.**

fertilizin /fərtil′izin/, a glycoprotein found on the plasma membrane of the ovum in various species. See also **acrosomal reaction.**

Festal, a trademark for a fixed-combination GI drug that contains a group of digestive enzymes and bile constituents.

fester, **1.** to become superficially inflamed and pus-producing. **2.** to become increasingly virulent.

festinant /fes′tinənt/, pertaining to a gait pattern that accelerates involuntarily as a result of a nervous system disorder. The increased rate of walking represents an automatic attempt by the body to overtake a displaced center of gravity. See also **extrapyramidal disease, festinating gait.**

festinating gait /fes′tinā′ting/ [L, *festinare,* to hasten], a manner of walking in which a person's speed increases in an unconscious effort to "catch up" with a displaced center of gravity. It is a common characteristic of Parkinson's disease.

festoon [Fr, *feston,* scallop], a carving in the base material of a denture that simulates the contours of the external root curvatures as seen in natural gingival tissues. See also **gingival festoon, McCall's festoon.**

FET, abbreviation for **forced expiratory time.**

fetal /fē′təl/ [L, *fetus,* fruitful], pertaining to the final stage of development of a prenatal mammal. In humans the fetal period extends from the first day of the ninth week of intrauterine life until birth.

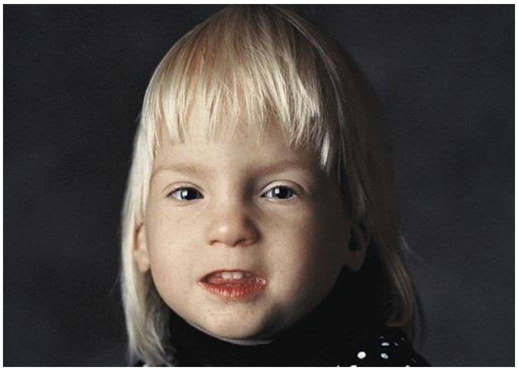
fetal abortion [L, *fetus*], termination of pregnancy after the twentieth week of gestation but before the fetus has developed enough to live outside the uterus. Compare **embryonic abortion.**

fetal activity determination. See **nonstress test.**

fetal advocate, a person who regards the health and well-being of the fetus as a matter of top priority.

fetal age, the age of the conceptus computed from the time elapsed since fertilization. Also called **fertilization age.** Compare **gestational age.**

fetal alcohol syndrome (FAS) [L, *fetus* + Ar, *alkohl,* essence; Gk, *syn,* together, *dromos,* course], a set of congenital psychological, behavioral, and physical abnormalities that tend to appear in infants whose mothers consumed alcohol during pregnancy. It is characterized by typical craniofacial and limb defects, cardiovascular defects, intrauterine growth retardation, and retarded development. The most serious cases have involved infants born to mothers who were chronic alcoholics and drank heavily during pregnancy. Women who drank less reportedly gave birth to infants with less serious malformations, or *fetal alcohol effects (FAEs),* but it is not known whether there is a lower limit to alcohol consumption during pregnancy or a particular period in embryonic life when the offspring is most vulnerable to effects of alcohol.



Fetal alcohol syndrome *(Fortinash and Holoday Worret, 2008)*

fetal alveoli, the terminal pulmonary sacs of a fetus, which are filled with fluid before birth. The fluid is a transudate of fetal plasma.

fetal asphyxia, a condition of hypoxemia, hypercapnia, and respiratory and metabolic acidosis that may occur in the uterus. Among possible causes are uteroplacental insufficiency, abruptio placentae, placenta previa, uterine tetany, maternal hypotension, and compression of the umbilical cord.

fetal attitude, the relationship of the fetal parts to each other. An example is the "military" attitude, in which the fetal head is not flexed and the chin is not on the chest as usual but is held straight up. Compare **fetal position, fetal presentation.**

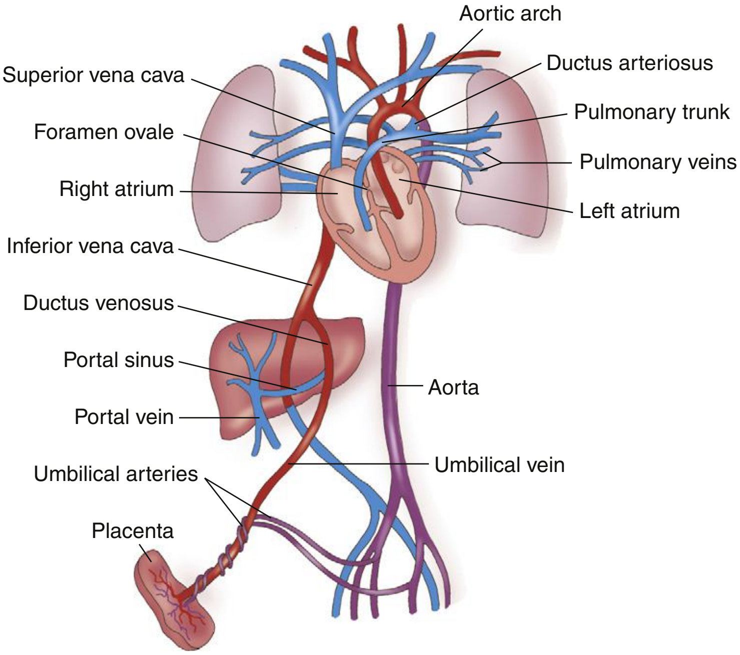
fetal biophysical profile, an ultrasound method of evaluating fetal status during the antepartal period based on five variables originating within the fetus: fetal heart rate, breathing movement, gross movements, muscle tone, and amniotic fluid volume. It is indicated in cases of postdate pregnancy, maternal hypertension, diabetes mellitus, vaginal bleeding, maternal Rh sensitization, maternal history of stillbirth, and premature membrane rupture.

fetal bradycardia, an abnormally slow fetal heart rate, usually below 100 beats/min.

fetal circulation, the pathway of blood circulation in the fetus. Oxygenated blood from the placenta travels through the umbilical vein to the heart. The blood enters the right atrium at a pressure sufficient to direct most of the flow across the atrium and through the foramen ovale into the left atrium; thus oxygenated blood is available for circulation through the left ventricle to the head and upper extremities. The blood returning from the head and arms enters the right atrium via the superior vena cava. It flows through the atrium at a relatively low pressure. Passing the tricuspid valve, it falls into the right ventricle, from which most of it is pumped through the pulmonary artery and the ductus arteriosus into the descending aorta for circulation to the lower parts of the body. A small amount of blood in the pulmonary artery is not shunted through the ductus and is carried to the lungs. The blood is returned to the placenta through the umbilical arteries.

fetal death, the intrauterine death of a fetus, or the death of a fetus weighing at least 500 g or after 20 or more weeks of gestation.

fetal distress, a compromised condition of the fetus, usually discovered during labor, characterized by a markedly abnormal rate or rhythm of myocardial contraction. Some



Fetal circulation *(Hagen-Ansert, 2006)* patterns, such as late decelerations of the fetal heart rate seen on records of electronic fetal monitoring, are indicative of fetal distress. If possible, the cause of the situation is identified and corrected and the acid-base balance of the fetal blood is tested. Labor is allowed to continue if the pH is within normal range and if the abnormal pattern does not recur or persist. Cesarean section may be necessary if the fetus is markedly alkalotic or acidotic or if the cause of the problem cannot be corrected. If possible, the condition of the baby is stabilized before delivery by giving the mother oxygen; increased fluids; or a narcotic antagonist, a vasopressor, or an agent to relax the uterus. A pediatrician or neonatologist is required to attend the birth of a distressed baby to manage resuscitation and care immediately after delivery.

fetal dose, the estimated amount of radiation received by a fetus during a radiographic examination of a pregnant woman. It is expressed in millirad per 1000 milliroentgens of skin exposure and varies from less than 1 when an extremity is being examined to nearly 300 when the beam is directed toward the pelvis.

fetal face syndrome. See **Robinow's syndrome.**

fetal fibronectin test, an analysis of vaginal secretions of a pregnant woman to determine the risk of preterm delivery.

fetal heart rate (FHR), the number of heartbeats in the fetus that occur in a given unit of time. The FHR varies in cycles of fetal rest and activity and is affected by many factors, including maternal fever, uterine contractions, maternal-fetal hypotension, and many drugs. The normal FHR is between 110 beats/min and 160 beats/min. In labor the FHR is monitored with a fetoscope, an electronic fetal monitor for detecting abnormal alterations in the heart rate, especially recurrent decelerations that continue past the end of uterine contractions.

fetal heart sound [L, *fetus,* fruitful; AS, *heorte* + L, *sonus,* sound], a sound produced by the heart of a fetus, as detected by auscultation or by electronic fetal monitoring. The heart begins beating at about 14 days of intrauterine life.

fetal hemoglobin, hemoglobin F, the major hemoglobin present in the blood of a fetus and neonate. Hemoglobin F is present in only trace amounts in the blood of normal adults.

fetal hemoglobin test, a test of maternal blood to detect leakage of fetal cells into the maternal circulation, an indication of fetal-maternal hemorrhage.

fetal hydantoin syndrome (FHS), a complex of birth defects associated with prenatal maternal ingestion of hydantoin derivatives. Symptoms of FHS include microcephaly, hypoplasia or absence of nails on the fingers or toes, abnormal facies, mental and physical retardation, and cardiac defects. The syndrome occurs to some degree in 10% to 40% of infants born of mothers who use this anticonvulsant. Hydantoin is sometimes associated with hemorrhage and, more rarely, with neural crest tumors in the newborn.

fetal hydrops. See **hydrops fetalis.**

fetal lie, the relationship of the long axis of the fetus to the long axis of the mother. See also **fetal presentation.**

fetal lipoma. See **hibernoma.**

fetal membranes, the structures that protect, support, and nourish the embryo and fetus, including the yolk sac, allantois, amnion, chorion, placenta, and umbilical cord.

fetal microchimerism, persistence in the mother's circulation after pregnancy of a low number of fetal cells. It may play a role in some autoimmune disorders.

fetal monitor. See **electronic fetal monitor.**

fetal mortality rate, the number of fetal deaths per 1000 births, or per live births.

fetal movements [L, *fetus* + *movere,* to move], muscular motions produced by the fetus in utero beginning around the fifth month of life. The early fetal movements can be felt by the mother.

fetal nonstress test, an electrodiagnostic test to evaluate the viability of a fetus. It documents the function of the placenta in its ability to supply adequate blood to the fetus.

fetal oxygen saturation monitoring. See **fetal scalp blood pH test.**

fetal placenta [L, *fetus* + *placenta,* flat cake], the portion of the placenta that is formed from the shaggy chorion frondosum, the villi of which invade the decidua basalis. Also called *pars fetalis.*

fetal position, the relationship of the part of the fetus that presents in the pelvis to the four quadrants of the maternal pelvis, identified by initial L (left), R (right), A (anterior), and P (posterior). The presenting part is also identified by initial O (occiput), M (mentum), and S (sacrum). If a fetus presents with the occiput directed to the posterior aspect of the mother's right side, the fetal position is right occiput posterior (ROP). Compare **fetal attitude, fetal presentation.**

fetal presentation, the part of the fetus that lies closest to or has entered the true pelvis. Cephalic presentations are vertex, brow, face, and chin. Breech presentations include frank breech, complete breech, incomplete breech, and single or double footling breech. Shoulder presentations are rare and require cesarean section or turning before vaginal birth. Compound presentation involves the entry of more than one part in the true pelvis, most commonly a hand next to the head. See also **fetal attitude, fetal lie, fetal position.**

fetal respiration, the exchange of gases between the blood of the mother and that of the fetus through the placenta.

fetal rest. See **embryonic rest.**

fetal rickets. See **achondroplasia.**

fetal rotation [L, *fetus* + *rotare,* to rotate], the turning of the head of the fetus as it begins the descent through the birth canal. The fetal head may be rotated by hand or with forceps if needed to guide the body in a proper position for delivery.

fetal scalp blood pH test, a measurement of fetal scalp blood pH used to diagnose fetal distress. Also called **fetal oxygen saturation monitoring.**

fetal stage, (in embryology) the interval from the end of the embryonic stage, at the end of the seventh or eighth week of gestation, to birth, 38 to 42 weeks after the first day of the last menstrual period.

fetal status: antepartum, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which fetal signs are within normal limits from conception to the onset of labor. See also **Nursing Outcomes Classification.**

fetal status: intrapartum, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which fetal signs are within normal limits from onset of labor to delivery. See also **Nursing Outcomes Classification.**

fetal tachycardia, a fetal heart rate that continues at 160 beats/min or more for more than 10 minutes.

fetal viability. See **viable infant.**

feti-, feto-, foeti-, foeto-, prefix meaning "fetus or fetal": *feticide, fetochorionic, fetoscope.*

feticide. See **embryoctony.**

fetid /fet′id, fē′tid/ [L, *fetere,* to stink], pertaining to something that has a foul or putrid odor.

fetish [Fr, *fetiche,* artificial], **1.** any object or idea given unreasonable or excessive attention or reverence. **2.** (in psychology) any inanimate object or any body part not of a sexual nature that arouses erotic feelings or fixation. The erotic symbolism is unique to the fetishist and results from unconscious associations. See also **paraphilia. —fetishism,** *n.*

fetishist /fet′ishist/, a person who believes in or receives erotic gratification from fetishes.

feto- [L. *fetus*, q.v.], a prefix meaning "relationship to the fetus."

fetochorionic /fē′tōkôr′ē·on′ik/ [L, *fetus*, fruitful; Gk, *chorion*, skin], pertaining to the fetus and the chorion.

fetofetal transfusion. See **twin-to-twin transfusion.**

fetoglobulins /fē′tōglob′yəlinz/, proteins found in fetal blood and normally in small amounts in adult blood. The group includes alpha-fetoprotein. In certain diseases, fetoglobulins may be present in adult blood in larger concentrations.

fetography /fētog′rəfē/ [L, *fetus* + Gk, *graphein*, to record], roentgenography of the fetus in utero. See also **fetometry.**

fetology /fētol′əjē/ [L, *fetus* + Gk, *logos*, science], the branch of medicine that is concerned with the fetus in utero, including the diagnosis of congenital anomalies, the prevention of teratogenic influences, and the treatment of certain disorders. Also called **embryatrics.**

fetometry /fētom′ətrē/ [L, *fetus* + Gk, *metron*, measure], the measurement of the size of the fetus, especially the diameter of the head and circumference of the trunk. A kind of fetometry is **roentgen fetometry.**

fetoplacental /-pləsen′təl/ [L, *fetus* + *placenta*, flat cake], pertaining to the fetus and the placenta.

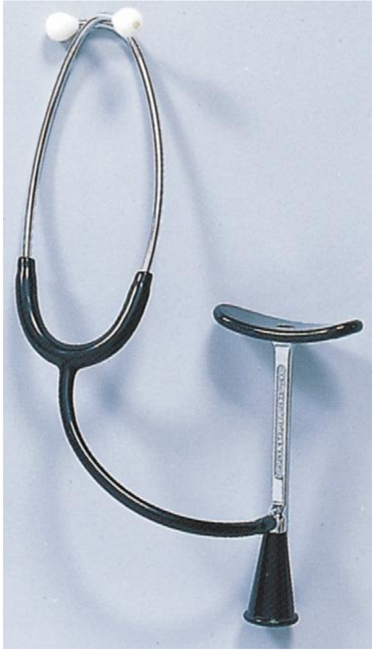
fetoprotein /-prō′tēn/ [L, *fetus* + Gk, *proteios*, first rank], an antigen that occurs naturally in fetuses and occasionally in adults as the result of certain diseases. An increased amount of **alpha-fetoprotein** in the fetus is diagnostic for neural tube defects. The presence of **beta-fetoprotein** in the blood of adults is associated with leukemia, hepatoma, sarcoma, and other neoplasms.

fetor ex ore. See **halitosis.**

fetor hepaticus [L, stench, *hēpar*, liver], foul-smelling breath associated with severe liver disease. Also called **liver breath.**

fetor oris. See **halitosis.**

fetoscope /fē′təskōp′/ [L, *fetus* + Gk, *skopein*, to look], a stethoscope for monitoring the fetal heartbeat through the mother's abdomen.



Fetoscope *(Seidel et al, 2011)*

fetoscopy /fētos′kəpē/, a procedure in which a fetus may be directly observed in utero, using a fetoscope introduced through a small incision in the abdomen under local anesthesia. Photographs may be taken, and amniotic fluid, fetal cells, or blood may be sampled for prenatal diagnosis of many congenital anomalies or genetic defects.

fetotoxic /-tok′sik/ [L, *fetus* + Gk, *toxikon*, poison], pertaining to anything that is poisonous to a fetus.

fetus /fē′təs/ [L, fruitful], the unborn offspring of any viviparous animal after it has attained the particular form of the species; more specifically the human being in utero after the embryonic period and the beginning of the development of the major structural features, from the ninth week after fertilization until birth. Kinds of fetal anomalies include **anideus, lithopedion, mummified fetus, parasitic fetus,** and **sirenomelia.** Also spelled **foetus.** Compare **embryo.** See also **prenatal development. —fetal, foetal,** *adj.*

fetus acardiacus, fetus acardius. See **acardia.**

fetus amorphus, a shapeless conceptus that has no formed or recognizable parts.

fetus anideus. See **anideus.**

fetus in fetu /infē′to͞o/, a fetal anomaly in which a small, imperfectly formed twin, incapable of independent existence, is contained within the body of the normal twin, the autosite.

fetus papyraceus, a twin fetus that has died in utero early in development and has been pressed flat against the uterine wall by the living fetus. Also called **paper-doll fetus, papyraceous fetus.**

fetus sanguinolentis /sang′gwinəlen′tis/, a darkly colored, partly macerated fetus that has died in utero.

FEV, abbreviation for **forced expiratory volume.**

FEVC, abbreviation for **forced expiratory vital capacity.**

fever [L, *febris*], an elevation of body temperature above the normal circadian range as a result of an increase in the body's core temperature. Fever is a temperature above 37.2° C (98.9° F) in the morning or above 37.7° C (99.9° F) in the evening. Fever results from an imbalance between the elimination and the production of heat. Exercise, anxiety, and dehydration may increase the temperature of healthy people. Infection, neurological disease, malignancy, pernicious anemia, thromboembolic disease, paroxysmal tachycardia, congestive heart failure, crushing injury, severe trauma, and many drugs may cause fever. No single theory explains the mechanism whereby the temperature is increased. Fever has no recognized function in conditions other than infection. It increases metabolic activity by 7% per degree Celsius, requiring a greater intake of food. Convulsions may occur in children whose fevers tend to rise abruptly, and delirium is seen with high fevers in adults and in children. Very high temperatures, as in heatstroke, may be fatal. The course of a fever varies with the cause, the condition of the patient, and the treatment given. The onset may be abrupt or gradual, and the period of maximum elevation, called the stadium or fastigium, may last for a few days or up to 3 weeks. The fever may resolve suddenly, by crisis, or gradually, by lysis. Certain diseases and conditions are associated with fevers that begin, rise, and fall in such characteristic curves that diagnosis may be made by studying a graphic record of the course of the fever. Kinds of hyperthermia include **habitual fever, intermittent fever,** and **relapsing fever.** Also called **febrile response.** See also **fever treatment, hyperpyrexia, quartan malaria, remittent fever, septic fever, tertian malaria.**

fever blister, a cold sore caused by herpesvirus 1. It generally appears around the mouth or nasal mucous membranes following a febrile episode or cold. See also **herpes simplex.**

feverfew, a perennial herb found throughout the world.

■ USES: It is used for migraines, cluster headaches, fever, psoriasis, and inflammation. It is probably safe and effective when used over short terms at recommended levels of migraine prophylaxis and possibly safe for long-term use; it does not abort migraine attacks. There are insufficient reliable data for other uses.

■ CONTRAINDICATIONS: Chewing the leaves, one of the traditional methods for ingesting the herb, can lead to mouth ulcerations. It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity to this herb.

fever of unknown origin (FUO), a febrile illness of at least 3 weeks' duration with a temperature of at least 38.3° C (100.9° F) on at least three occasions and failure to establish a diagnosis in spite of intensive inpatient or outpatient evaluation (three outpatient visits or 3 days' hospitalization). The duration of febrile illness required to establish a diagnosis of FUO varies among authorities and is sometimes given as shorter than 3 weeks.

fever treatment^1, the care and management of a person who has an elevated temperature.

■ METHOD: The patient is observed for symptoms of fever, such as tachycardia; a full, bounding pulse or a weak, thready pulse; rapid breathing; hot, dry, hyperemic skin; chills; headache; diaphoresis; restlessness; delirium; dehydration; tremors; convulsions; and coma. Diagnostic studies such as blood, urine, and sputum cultures and visualization procedures may be ordered to determine fever causation. Treatment may include the administration of antibiotic, antipyretic, and sedative drugs. If the temperature is extremely high, a cooling tub bath, cold wet sheet, ice packs, or hypothermia blanket may be ordered. The patient's temperature is checked every 2 to 4 hours or as condition and protocol indicate. Antipyretic and sedative therapy is continued as ordered, and, if necessary, cooling measures are reinstituted; the room temperature is reduced, and air currents are increased by a fan. Increased amounts of fluids are given orally or parenterally, physical activity is reduced, and the skin is exposed to air, with care taken to prevent chilling.

■ INTERVENTIONS: The nurse observes and records the symptoms accompanying fever, administers the ordered medication and cooling measures, reassures the patient, and explains the importance of therapy and adequate fluid intake.

■ OUTCOME CRITERIA: Antipyretic drugs and cooling measures usually reduce the temperature, but the patient may require additional fluids and treatment for the underlying cause of the fever.

fever treatment^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a patient with hyperpyrexia caused by nonenvironmental factors. See also **Nursing Interventions Classification.**

Fèvre-Languepin syndrome. See **popliteal pterygium syndrome** (def. 2).

fexofenadine, an antihistamine.

■ INDICATIONS: It is used to treat rhinitis and allergy symptoms.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug and severe hepatic disease prohibit its use. Its use is also contraindicated in lactating women and in newborn or premature infants.

■ ADVERSE EFFECTS: Life-threatening effects are hemolytic anemia, thrombocytopenia, leukopenia, agranulocytosis, pancytopenia, and arrhythmias (rare). Other adverse effects are urinary frequency, dysuria, urinary retention, impotence, thickening of bronchial secretions, dry nose and throat, nausea, diarrhea, abdominal pain, vomiting, constipation, headache, stimulation, drowsiness, sedation, fatigue, confusion, blurred vision, tinnitus, restlessness, tremors, paradoxical excitation in children or the elderly, rash, eczema, photosensitivity, urticaria, hypotension, palpitations, bradycardia, and tachycardia.

FFA, abbreviation for **free fatty acid.**

F factor, an extrachromosomal segment of DNA that is present in conjugating male bacteria but absent in females. Also called **F element, fertility factor, sex factor.**

^{18}F-FDG, symbol for [^{18}F],-2-fluoro-2-deoxy-D-glucose, a sugar analog used in positron emission tomography to determine the local cerebral metabolic rate of glucose as a measure of neural activity in the brain.

FG syndrome [FG, initials of family names of patients in whom it was first observed], an X-linked recessive syndrome of mental retardation, megalencephaly, imperforate anus and other GI defects, delayed motor development, congenital hypotonia, characteristic facies and personality, short stature, skeletal anomalies, and congenital cardiac defects.

FGT cytological smear, abbreviation for *female genital tract cytological smear,* any sample of tissues from the female reproductive tract smeared on a microscope slide for examination.

FHR, abbreviation for **fetal heart rate.**

FHS, abbreviation for **fetal hydantoin syndrome.**

FI, abbreviation for *fixed interval*.

fiber /fī′bər/, **1.** a long, filmlike, threadlike, acellular structure found in plant and animal tissues. Plant fibers usually consist of structural carbohydrates such as cellulose in cell walls. Composed of repeating glucose units in long, single strands, cellulose cannot be digested by enzymes in the human intestine. Other plant fiber components include hemicellulose and pectin. Animal fibers are composed mainly of the protein collagen, which forms elastic threads of loose connective tissue in skin and other organs. See also **dietary fiber. 2.** a skeletal muscle cell. **3.** the axon of a nerve cell.

fiberglass dermatitis, a pruritic papular skin disease produced by mechanical irritation from glass fibers. Body folds and areas covered by tight-fitting clothing are among common sites of the pruritic dermatitis. Hardening of the sites usually occurs after several weeks.

fiber modified diet, a diet that contains more or less fiber than a normal diet.

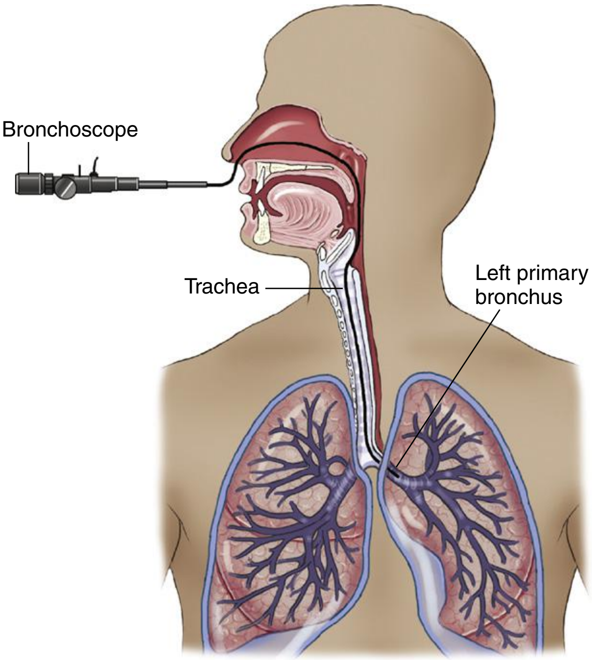
fiberoptic bronchoscopy /-op′tik/ [L, *fibra* + Gk, *optikos,* sight], the visual examination of the tracheobronchial tree through a fiberoptic bronchoscope. Also called **bronchofibroscopy.** See also **bronchoscopy, fiberoptics.**

fiberoptic colonoscope, a colonoscope that uses fiberoptic technology. Also called *fibercolonoscope*.

fiberoptic duodenoscope, an instrument for visualizing the interior of the duodenum, consisting of an eyepiece, a flexible tube incorporating bundles of coated glass or plastic fibers with special optic properties, and a terminal light. When the duodenoscope is introduced into the patient's mouth and threaded through the upper digestive tract to the duodenum, the light illuminates the internal structures and any lesions present, and the fiberoptic bundles transmit the image to the observer's eyepiece.

fiberoptic endoscopic evaluation of swallowing (FEES), diagnosis and treatment of swallowing disorders by means of a flexible fiberoptic endoscope introduced transnasally into the hypopharynx. It allows direct observation of the pharyngeal and laryngeal structures during swallowing and enables the examiner to suggest swallowing maneuvers and posture changes to improve function.

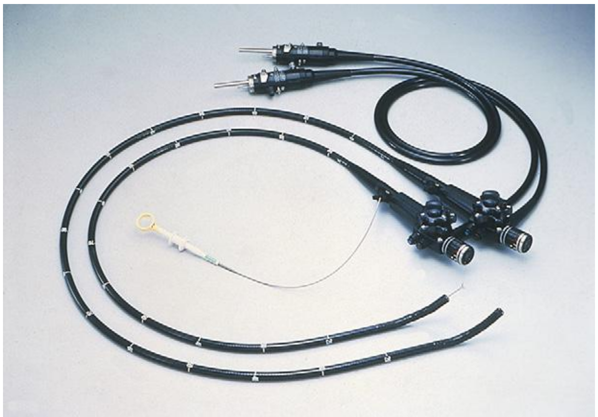
fiberoptics /-op′tiks/, the technical process by which an internal organ or cavity can be viewed, using glass or plastic fibers



Fiberoptic bronchoscopy
(LaFleur Brooks and LaFleur Brooks, 2012)

to transmit light through a specially designed tube and reflect a magnified image. Also spelled **fibreoptics. —fiberoptic,** *adj.*

fiberscope /fī′bərskōp/ [L, *fibra* + Gk, *skopein,* to look], a flexible fiberoptic instrument having an inner shaft coated with light-conveying glass or plastic fibers for visualization of internal structures. Fiberscopes are specially designed for the examination of particular organs and cavities of the body and are used in bronchoscopy, endoscopy, and gastroscopy.



Flexible colon fiberscopes
(Courtesy Olympus America, Inc., Mehlville, New York)

-fibrate, suffix for clofibrate-type compounds.

fibrates /fi′brāts/, a general term for fibric acid derivatives, such as gemfibrozil.

fibreoptics. See **fiberoptics.**

fibril /fī′bril/ [L, *fibrilla,* small fiber], a small filamentous fiber that often is a component of a cell, as in a mitotic spindle or a myofibril. **—fibrillary,** *adj.*

fibrillation /fī′brilā′shən/ [L, *fibrilla,* small fiber, *atio,* process], involuntary recurrent contraction of a single muscle fiber or of an isolated bundle of nerve fibers. Fibrillation of a chamber of the heart results in inefficient random contraction of that chamber and disruption of the normal sinus rhythm of the heart. Fibrillation is usually described by the part that is contracting abnormally, such as atrial fibrillation or ventricular fibrillation.

fibrillin /fibri′lin/ [L, *fibrilla,* small fiber], a major component of elastin-associated microfibrils. It is linked to **Marfan's syndrome** by findings of immunohistochemical studies and is associated with **arachnodactyly,** a disease similar to Marfan's syndrome.

fibrin /fī′brin/ [L, *fibra,* fiber], a stringy insoluble protein produced by the action of thrombin on fibrinogen in the clotting process. Fibrin is responsible for the semisolid character of a blood clot. Compare **fibrinogen.** See also **blood clotting, coagulation, fibrinolysis, thrombin.**

fibrinocellular /fī′brinōsel′yələr/, composed of fibrin and cells, as occurs in some exudates that result from inflammation.

fibrinogen /fībrin′əjən/ [L, *fibra,* fiber; Gk, *genein,* to produce], a plasma protein that is converted into fibrin by thrombin in the presence of calcium ions. Also called **factor I.** Compare **fibrin.** See also **afibrinogenemia, blood clotting, fibrinolysis, thrombin.**

fibrinogenic. See **fibrinogenous.**

fibrinogenopenia /fī′brinōjen′ōpē′nē·ə/ [L, *fibra* + Gk, *genein,* to produce, *penia,* poverty], a deficiency of fibrinogen in the blood.

fibrinogenous /fī′brinoj′ənəs/ [L, *fibra,* fiber; Gk, *genein,* to produce], pertaining to the characteristics or properties of fibrinogen or the production of fibrin. Also spelled **fibrogenous.** Also called **fibrinogenic.**

fibrinogen test, a blood test that evaluates the blood clotting mechanism. Increased concentrations of fibrinogen may indicate tissue inflammation or necrosis and may predict increased risk of coronary artery or cerebrovascular disease. Low levels are seen with liver disease, malnutrition, and consumptive coagulopathy.

fibrinokinase /fī′brinōkī′nās/ [L, *fibra* + Gk, *kinesis,* motion], a non–water-soluble enzyme in animal tissue that activates plasminogen. Also called **tissue kinase, tissue plasminogen activator.**

fibrinolysin /fī′brinol′isin/ [L, *fibra* + Gk, *lysein,* to loosen], a proteolytic enzyme that dissolves fibrin. It is formed from plasminogen in the blood plasma. Also called **plasmin.** See also **fibrinolysis.**

fibrinolysis /fī′brinol′isis/, the process of fibrin digestion by plasmin that is the normal mechanism for the removal of fibrin clots. It is stimulated by adhesion of plasmin and tissue plasminogen activator to fibrin. **—fibrinolytic,** *adj.*

fibrinopeptide /fī′brinōpep′tīd/ [L, *fibra* + Gk, *peptein,* to digest], either of two peptides (A and B) split off from fibrinogen by the action of thrombin. See also **fibrinogen, thrombin.**

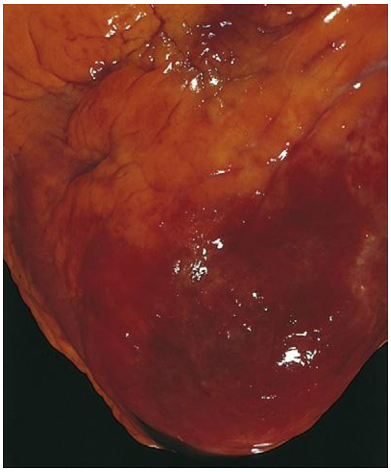
fibrinoscopy /fi′brinos′käpe/. See **inoscopy.**

fibrinous pericarditis [L, *fibra,* fiber; Gk, *peri,* near, *kardia,* heart, *itis,* inflammation], a condition in which a lymphoid exudate accumulates on the pericardium and coagulates. The coagulated exudate may acquire a thick, buttery appearance.

fibrin-stabilizing factor. See **factor XIII.**

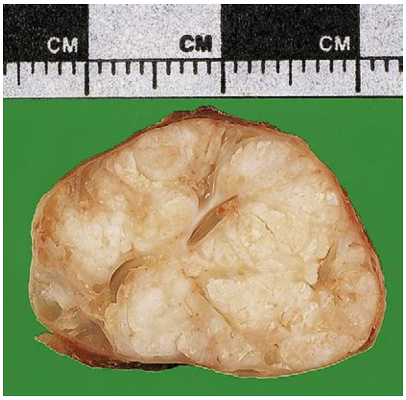
fibro-, prefix meaning "fiber": *fibroadipose, fibroblast, fibroelastosis.*

fibroadenoma /fī′brō·ad′inō′mə/ *pl.* **fibroadenomas, fibroadenomata** [L, *fibra* + Gk, *aden,* gland, *oma*], a benign tumor composed of dense epithelial and fibroblastic tissue. A fibroadenoma of the breast is nontender, encapsulated, round, movable, and firm. It is usually located in the upper



Fibrinous pericarditis *(Kumar et al, 2010)*

outer quadrant of the breast and occurs most frequently in women younger than 30 years of age. Surgical excision is usually performed to ensure that it is not cancerous.



Fibroadenoma *(Fletcher, 2007)*

fibroangioma. See **angiofibroma.**

fibroareolar tissue. See **areolar tissue.**

fibroblast /fī′brəblast/ [L, *fibra* + Gk, *blastos,* germ], a flat, elongated undifferentiated cell in the connective tissue that gives rise to various precursor cells, such as the chondroblast, collagenoblast, and osteoblast, which form the fibrous, binding, and supporting tissue of the body. Also called **desmocyte, fibrocyte.** **—fibroblastic,** *adj.*

fibroblastoma /-blastōma/ *pl.* **fibroblastomas, fibroblastomata** [L, *fibra* + Gk, *blastos,* germ, *oma*], a tumor derived from a fibroblast, now differentiated as a fibroma or a fibrosarcoma.

fibrocarcinoma. See **scirrhous carcinoma.**

fibrocartilage /-kär′tilij/ [L, *fibra* + *cartilago*], cartilage that consists of a dense matrix of white collagenous fibers. Of the three kinds of cartilage in the body, fibrocartilage has the greatest tensile strength. Fibrocartilaginous disks between the vertebrae help cushion the jolts to which the vertebral column is continually subjected. See also **hyaline cartilage.** **—fibrocartilaginous,** *adj.*

fibrocartilaginous joint. See **symphysis,** def. 1.

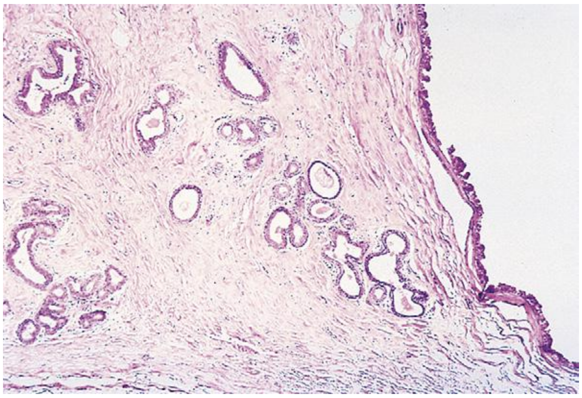
fibrochondritis /-kondrī′tis/, an inflammation of fibrocartilage.

fibrochondroma /-kondrō′mə/, a tumor composed of mixed fibrous and cartilaginous tissues.

fibrocyst /fī′brəsist/, **1.** any cystic lesion within a fibrous connective tissue. **2.** a cystic fibroma.

fibrocystic /-sis′tik/, pertaining to a fibrocyst or cystic fibroma.

fibrocystic disease of the breast /-sis′tik/ [L, *fibra* + Gk, *kystis,* bag], the presence of single or multiple cysts that are palpable in the breasts. The cysts are benign and fairly common, yet must be considered potentially malignant and observed carefully for growth or change. The client may report unilateral or bilateral breast pain and tenderness that frequently begin 7 to 10 days before menses and resolve as the menses progresses. The cysts can be aspirated and a biopsy performed. In most cases no treatment is required. Decreasing caffeine in the diet and taking supplemental vitamin E have been effective in helping to alleviate breast tenderness. Women should be taught how to perform frequent breast examinations. A woman is shown any cysts present and is taught palpation, and the importance of any change is emphasized. Reassurance should also be given that the condition is very common and generally not associated with cancer. Only about 5% of fibrocystic conditions could be considered a risk factor for later development of cancer. Also called **chronic cystic mastitis.** See also **cystic fibrosis.**



Fibrocystic disease of the breast *(Kumar et al, 2007/ Courtesy Dr. Kyle Molberg, Department of Pathology, University of Texas Southwestern Medical School)*

fibrocystic disease of the pancreas. See **cystic fibrosis.**

fibrocyte. See **fibroblast.**

fibrodysplasia ossificans progressiva. See **myositis ossificans progressiva.**

fibroelastic membrane of larynx, a membrane linking the laryngeal cartilages that is composed of a lower cricothyroid ligament and an upper quadrangular ligament.

fibroelastic tissue. See **fibrous tissue.**

fibroepithelial papilloma /-ep′ithē′lē·əl/ [L, *fibra* + Gk, *epi,* above, *thele,* nipple; L, *papilla,* nipple; Gk, *oma,* tumor], a benign epithelial tumor containing extensive fibrous tissue. Also called **fibropapilloma.**

fibroepithelial polyp. See **acrochordon.**

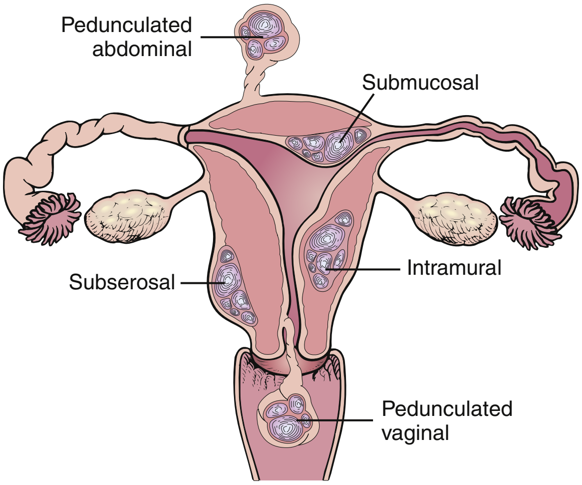
fibroepithelioma /fī′brō·ep′ithē′lē·ō′mə/ *pl.* **fibroepitheliomas, fibroepitheliomata** [L, *fibra* + Gk, *epi,* above, *thele,* nipple, *oma,* tumor], a neoplasm consisting of fibrous and epithelial components.

fibrofolliculoma /-folik′yəlō′mə/, a benign tumor derived from the dermal part of a hair follicle. It may appear as a dome-shaped yellowish papule on the skin, accompanied by strands of follicular epithelium.

fibrogenous. See **fibrinogenous.**

fibrogliosis /-glī·ō′sis/, the formation of scar tissue in the brain in reaction to a penetrating injury. The scar is produced by fibroblasts and astrocytes, a type of glial cell.

fibroid /fī′broid/ [L, *fibra* + Gk, *eidos,* form], **1.** having fibers. **2.** *(informal)* a fibroma or myoma, particularly of the uterus.



Common locations of fibroids *(Damjanov, 2012)*

fibroidectomy /fī′broidek′təmē/ [L, *fibra,* fiber; Gk, *eidos,* form, *ektomē,* excision], the surgical removal of a fibrous tumor, such as a uterine fibromyoma.

fibroid tumor. See **fibroma.**

fibrolipoma /fī′brōlipō′mə/, a fibrous tumor that also contains fatty material. Also called **lipofibroma.**

fibroma /fībrō′mə/ *pl.* **fibromas, fibromata** [L, *fibra* + Gk, *oma,* tumor], a benign neoplasm consisting largely of fibrous or fully developed connective tissue.

Cardiac fibroma *(Fletcher, 2007)*

fibroma cavernosum, a tumor that contains large vascular spaces, an excessive amount of fibrous tissue, and blood or lymph vessels.

fibroma cutis, a fibrous tumor of the skin.

fibroma durum. See **hard fibroma.**

fibroma molle. See **soft fibroma.**

fibroma mucinosum, a fibrous tumor in which degenerating mucoid material is present.

fibroma myxomatodes. See **myxofibroma.**

fibroma of the breast [L, *fibra,* fiber; Gk, *oma,* tumor; AS, *braest*], a connective tissue tumor of the breast. It is usually benign and painless.

fibroma pendulum, a pendulous fibrous tumor of the skin.

fibroma sarcomatosum. See **fibrosarcoma.**

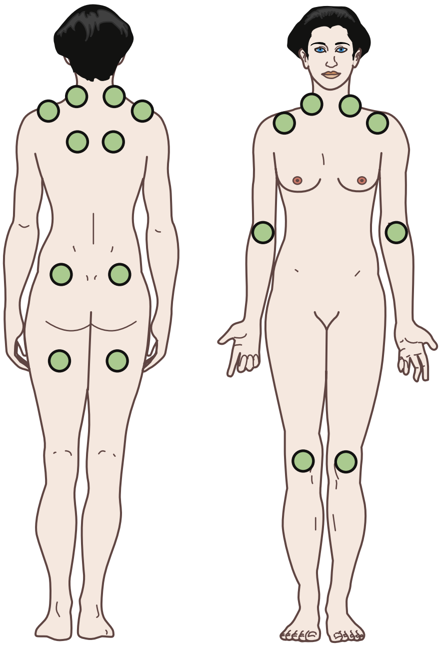
fibromata. See **fibroma.**

fibroma thecocellulare xanthomatodes. See **theca cell tumor.**

fibromatosis /-mətō′sis/ [L, *fibra* + Gk, *oma,* tumor, *osis,* condition], a gingival enlargement believed to be hereditary or idiopathic, manifested in the secondary dentition. It is characterized by a firm hyperplastic tissue that covers the surfaces of the teeth. Differentiation between this condition and phenytoin hyperplasia is based on a history of phenytoin ingestion. The gums consist of fibrous lesions that demonstrate an infiltrative growth pattern and aggressive clinical behavior. Histologically, it presents as dense hypocellular and hypovascular collagenous tissue which forms interlacing bundles running in all directions. See **gingival hyperplasia.** Not to be confused with **neurofibromatosis.**

fibromuscular dysplasia (FMD) /-mus′kyələr/, an arterial disorder sometimes associated with strokes or transient ischemic attacks (TIAs). The condition, which may appear as either fibromuscular hyperplasia or perimuscular fibrosis, is characterized by intraluminal folds of fibrous endothelial tissue. They appear as vertical bars on angiography and become the originating site of platelet adherence aggregation and thrombus formation. The condition commonly involves the renal arteries and is associated with hypertension.

fibromyalgia, a form of nonarticular rheumatism characterized by musculoskeletal pain, spasms, stiffness, fatigue, and severe sleep disturbance. Common sites of pain or stiffness include the lower back, neck, shoulder region, arms, hands, knees, hips, thighs, legs, and feet. These sites are known as trigger points. Physical therapy, nonsteroidal antiinflammatory drugs, and muscle relaxants provide temporary relief. Also called **fibrositis, soft tissue rheumatism.**



Fibromyalgia tender points *(Young-Adams and Proctor, 2011)*

fibromyoma uteri. See **leiomyoma uteri.**

fibromyomectomy /fī′brōmī′ōmek′təmē/, a surgical procedure for removing a uterine fibroma or other type of fibromyoma.

fibromyositis /fī′brōmī′əsī′tis/ [L, *fibra* + Gk, *mys,* muscle, *itis,* inflammation], any one of a large number of disorders characterized by stiffness and joint or muscle pain, accompanied by localized inflammation of muscle and fibrous connective tissues. The condition may develop after climatic change, infection, or physical or emotional trauma. It may recur and become chronic. Treatment includes rest, heat, massage, salicylates, and, in severe cases, intraarticular injections of a corticosteroid and procaine. Kinds of fibromyositis include **lumbago, pleurodynia,** and **torticollis.** See also **rheumatism.**

fibropapilloma. See **fibroepithelial papilloma.**

fibroplasia /-plā′zhə/, the formation of a scar during the fibroblastic repair phase of healing.

fibrosarcoma /-särkō′mə/ *pl.* **fibrosarcomas, fibrosarcomata** [L, *fibra* + Gk, *sarx,* flesh, *oma,* tumor], a sarcoma that contains fibrous connective tissue.

fibrosing alveolitis /fī′brōsing/ [L, *fibra* + *alviolus,* small hollow; Gk, *itis,* inflammation], a severe form of alveolitis characterized by dyspnea and hypoxia. It occurs in advanced rheumatoid arthritis and other autoimmune diseases. X-ray films show thickening of the alveolar septa and diffuse pulmonary infiltrates. See also **alveolitis.**

fibrosis /fībrō′sis/ [L, *fibra* + Gk, *osis,* condition], **1.** a proliferation of fibrous connective tissue that occurs normally in the formation of scar tissue to replace tissue lost through injury or infection. **2.** an abnormal condition in which fibrous connective tissue spreads over or replaces normal smooth muscle or other normal organ tissue. Fibrosis is most common in the heart, lung, peritoneum, and kidney. See also **cystic fibrosis, fibromyalgia.**

fibrosis of the lungs [L, *fibra* + Gk, *osis,* condition; AS, *lungen*], the formation of scar tissue in the connective tissue of the lungs as a sequel to any inflammation or irritation caused by tuberculosis, bronchopneumonia, or a pneumoconiosis. Localized fibrosis may be complicated by infarction, abscess, or bronchiectasis. Also called **pulmonary fibrosis.**

fibrositis. See **fibromyalgia.**

fibrothorax /-thôr′aks/, fibrosis of the pleural membranes.

fibrous /fī′brəs/ [L, *fibra,* fiber], consisting mainly of fibers or fiber-containing materials, such as fibrous connective tissue. See also **fibrosis.**

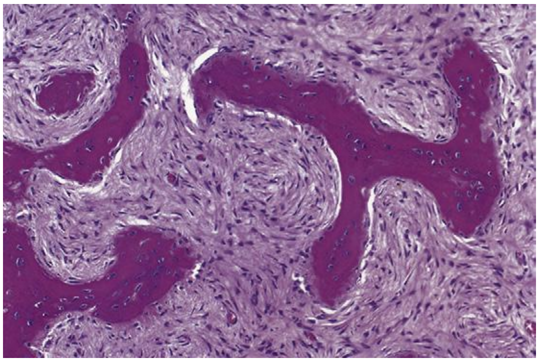
-fibrous, suffix meaning “composed of fibrous tissue”: *cellulofibrous, fibrofibrous, interfibrous.*

fibrous astrocyte, a glial cell with long, fibrous processes found in the white matter of the brain and spinal cord. Its cytoplasm contains bundles of glial filaments.

fibrous capsule, **1.** the external layer of an articular capsule. It surrounds the articulation of two adjoining bones. **2.** the external, tough membranous envelope surrounding some visceral organs, such as the liver. Compare **synovial membrane.**

fibrous connective tissue. See **connective tissue.**

fibrous dysplasia, an abnormal condition characterized by the fibrous displacement of the osseous tissue within the bones affected. The specific cause of fibrous dysplasia is unknown, but indications are that the disease is of developmental or congenital origin. The distinct kinds of fibrous dysplasia are monostotic fibrous dysplasia, polyostotic fibrous dysplasia, and polyostotic fibrous dysplasia with associated endocrine disorders. Any bone may be affected with monostotic fibrous dysplasia. The polyostotic type usually displays a segmental distribution of the involved bones, all of which show varying degrees of the characteristic fibrous replacement of the osseous tissue. The onset of fibrous dysplasia is usually during childhood, and the disorder progresses beyond puberty and through adulthood. The onset of symptoms is usually during childhood, although diagnosis may be delayed until adolescence or even early adulthood if symptoms are minimal. The initial signs may be a limp, a pain, or a fracture on the affected side. Girls affected may have an early onset of menses and breast development and early epiphyseal closure. Albright’s syndrome is usually diagnosed on the basis of a triad of symptoms, including the polyostotic type of fibrous dysplasia, café-au-lait patches on the skin, and precocious puberty. Pathological fractures are frequently associated with this process, and angulation deformities may follow. The involved extremity may be shortened, and the classic “shepherd’s crook” deformity is common. Radiographic examination usually reveals a well-circumscribed lesion occupying all or a portion of the shaft of the long bone involved. Pathological fractures in patients with fibrous dysplasia usually heal with conservative treatment, but residual deformities often remain. When symptoms are mild and limited, this disease usually progresses slowly. Radiation therapy is not used because it may provoke malignant degeneration. Biopsies are commonly performed if pain increases or if alterations are seen on radiographic examination.



Fibrous dysplasia *(Fletcher, 2007)*

fibrous goiter, an enlargement of the thyroid gland, characterized by hyperplasia of the capsule and connective tissue.

fibrous hamartoma of infancy, a benign, nonencapsulated tumor, sometimes present at birth but usually appearing during the first year of life, most frequently in the shoulder, axilla, or upper arm. It is a firm, painless, skin-colored nodule composed of well-defined fibrous trabeculae, immature mesenchymal tissue, and mature adipose cells; invasion of the surrounding subcutaneous tissue frequently occurs.

fibrous histiocytoma. See **dermatofibroma.**

fibrous joint, any one of many slightly movable joints, such as those of the skull segments, in which a fibrous tissue or sometimes a form of cartilage connects the bones. The three kinds of articulation associated with fibrous joints are syndesmosis, sutura, and gomphosis. Also called **junctura fibrosa, synarthrosis.** Compare **cartilaginous joint, synovial joint.**

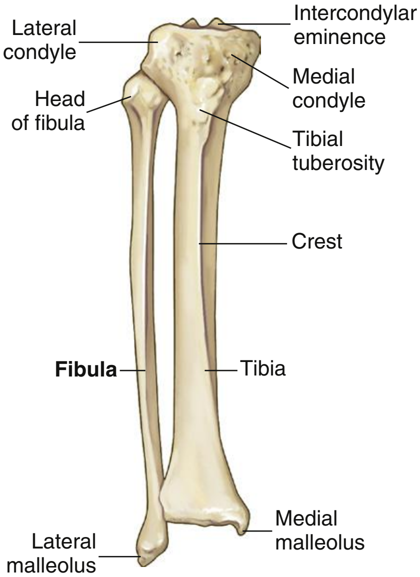
fibrous thyroiditis, a rare disorder characterized by slowly progressive fibrosis of an enlarged thyroid, with replacement of normal thyroid tissue by dense fibrous tissue. The gland eventually becomes fixed to the adjacent muscles, nerves, blood vessels, and trachea by means of this fibrous tissue. The disease occurs more frequently in women than in men and usually arises after 40 years of age. Obstructive symptoms are uncommon but can include a choking sensation, dyspnea, and dysphagia. Hypothyroidism may occur, but in most patients the gland functions normally. Treatment includes surgical excision and thyroid hormone administered postoperatively, as required. Also called **ligneous thyroiditis, Riedel's struma, Riedel's thyroiditis.**

fibrous tissue, the connective tissue of the body, consisting of closely woven elastic fibers and fluid-filled areolae. Also called **fibroelastic tissue.** Compare **areolar tissue.** See also **connective tissue.**

fibrous trigone, a thickened area of tissue between the aortic ring and the atrioventricular ring. The right fibrous trigone is between the aortic ring and the right atrioventricular ring. The left fibrous trigone is between the aortic ring and the left atrioventricular ring.

fibrovascular proliferation /-vas′kyələr/, the growth of new blood vessels and fibrous tissues on the surface of the retina and optic nerve in diabetic retinopathy. The growths can vary from barely visible vessels to dense sheets of avascular fibrous tissue.

fibula /fib′yələ/ [L, buckle], one of the two bones of the lower leg, lateral to and smaller in diameter than the tibia. In proportion to its length, it is the most slender of the long bones and presents three borders and three surfaces for attaching various muscles, including the peronei longus and brevis and the soleus longus. Also called **calf bone.**



Fibula *(Patton and Thibodeau, 2010)*

fibular /fib′yələr/ [L, *fibula,* clasp], pertaining to the fibula.

fibular collum, neck of fibula; the portion of the fibula between the head and shaft.

fibularis brevis, a muscle that assists in eversion of the foot. It is innervated by the superficial fibular nerve.

fibularis longus, a muscle that everts and plantarflexes the foot and helps to support the arches of the foot, mainly the lateral and transverse arches. It is innervated by the superficial fibular nerve.

fibularis tertius, a part of the extensor digitorum longus that assists in dorsiflexion and possibly eversion of the foot. It is innervated by the deep fibular nerve.

fibular notch, a depression on the lateral surface of the lower end of the tibia, which articulates with the lower end of the fibula.

Fick's law [Adolf E. Fick, German physiologist, 1829–1901], **1.** (in chemistry and physics) an observed law stating that the rate at which one substance diffuses through another is directly proportional to the concentration gradient of the diffusing substance. **2.** (in medicine) an observed law stating that the rate of diffusion across a membrane is directly proportional to the concentration gradient of the substance on the two sides of the membrane and inversely related to the thickness of the membrane.

Fick's principle, a method for making indirect measurements, based on the law of conservation of mass. It is used specifically to determine cardiac output, in which the amount of oxygen uptake of each unit of blood as it passes through the lungs is equal to the oxygen concentration difference between arterial and mixed venous blood. Cardiac output is calculated by measuring the uptake of oxygen for a given period, noted as milliliters per minute, then dividing that ratio by the difference in oxygen saturation of arterial and mixed venous blood samples in milliliters per 100 mL of blood and multiplying the total by 100.

F.I.C.S., abbreviation for *Fellow of the International College of Surgeons.*

fictive kin /fik′tiv/, people who are regarded as being part of a family even though they are not related by either blood or marriage bonds. Fictive kinship may bind people together in ties of affection, concern, obligation, and responsibility.

FID, abbreviation for **free-induction decay.**

field [AS, *feld*], **1.** a defined space, area, or distance. The field of vision represents the total area that can be seen with one fixed eye. The binocular field is the area that can be seen with both eyes. **2.** an area within a computer record where a specified type of data is stored.

field fever, a form of leptospirosis caused by *Leptospira grippotyphosa,* which primarily affects agricultural workers. It is characterized by fever, abdominal pain, diarrhea, vomiting, stupor, and conjunctivitis. Also called **canefield fever, harvest fever, mild fever, 7-day fever.** See also **leptospirosis.**

field of vision [AS, *feld* + L, *visio,* seeing], the area of space in which objects are visible at the same time when the eye is fixed and the face is turned so as to exclude the limiting effects of the orbital margins and nose.

fiery serpent. See **dracunculiasis, *Dracunculus medinensis.***

fièvre boutonneuse. See **African tick typhus.**

fifth cranial nerve. See **trigeminal nerve.**

fifth disease. See **erythema infectiosum.**

fight-or-flight. See **flight-or-fight reaction.**

FIGLU, abbreviation for **formiminoglutamic acid.**

FIGO staging system, a classification system for cancers of the uterine cervix established by the French Fédération Internationale de Gynécologie et d'Obstétrique. Tumors are classified by Roman numerals from I to IV, representing a range from precancerous or in situ to highly malignant. Classification subdivisions are represented by letters and numbers.

figure-eight bandage, a bandage with successive laps crossing over and around each other to resemble the numeric figure eight. See also **bandage.**

figure-eight suture [L, *sutura*], a suture that begins at the deepest layer on each side of a wound, then crosses over to pass through the superficial layers on the opposite side before being tied.

figure-four test. See **Patrick test.**

figure-ground relationship /fig′(y)ər/ [L, *figura,* form; AS, *grund* + L, *relatus,* carry back], a perceptual field that is divided into a figure, which is the object of focus, and a diffuse background. See also **ground.**

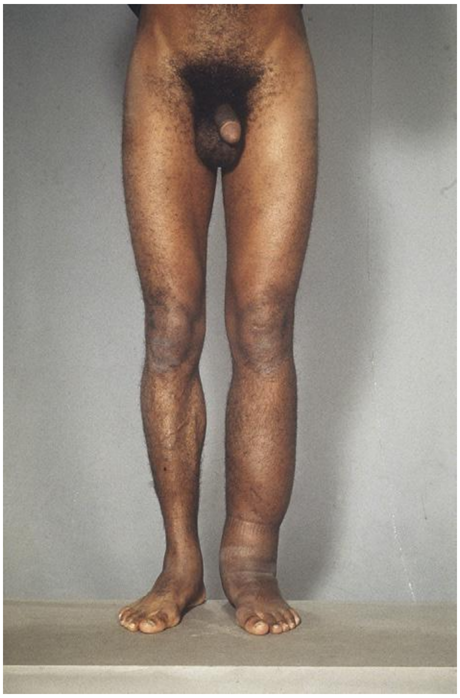
fila-, prefix meaning “thread or threadlike”: *filaceous, filamentous, filaria*.

filament /fil′əmənt/ [L, *filare,* to spin], a fine threadlike fiber. Filaments are found in most tissues and cells of the body and serve various morphological or physiological functions.

filamentous /fil′əmen′təs/ [L, *filare,* to spin], pertaining to something that is threadlike or capable of being drawn out into a threadlike structure.

Filaria /filarē·ə/pl. *filariae* [L, *filum,* thread], a genus of slender nematodes of the superfamily Filarioidea. There are many species, some of which are parasitic in animals.

filariasis /fil′ərī′əsis/ [L, *filum,* thread; Gk, *osis,* condition], a disease caused by the presence of filariae or microfilariae in body tissues. Filarial worms are round, long, and threadlike and are common in most tropic and subtropic regions. They tend to infest the lymph nodes, lymphatics, subcutaneous tissues, and skin after entering the body as microscopic larvae through the bite of a mosquito, blackfly, or midge. The infection is characterized by occlusion of the lymphatic vessels, with swelling and pain of the limb distal to the blockage. After many years the limb may become greatly swollen and the skin coarse and tough. Treatment is by oral administration of diethylcarbamazine, ivermectin, albendazole, or mebendazole. Apheresis, antihistamines, and corticosteroid therapy may be performed before the administration of antihelmenthic agents to reduce the risk of reaction associated with heavy worm burden. The most effective means of preventing infestation is flying insect control. See also **elephantiasis,** ***Loa loa, Mansonella,*** **onchocerciasis,** ***Wuchereria.***



Filariasis *(Conlon and Snydman, 2000)*

filariform /filer′ifôrm/, pertaining to a structure or organism that is threadlike.

Filarioidea /filar′ē·oi′dē·ə/ [L, *filum,* thread + Gk, *eidos,* form], the filariae, a superfamily or order of nematode parasites, the adults being threadlike worms that invade the tissues and body cavities where the female deposits its embryonated eggs (prelarvae) known as microfilariae. These microfilariae are ingested by blood-sucking insects in whom they pass their developmental stage and are returned to humans when the insects bite. Genera infecting humans include ***Brugia, Loa, Mansonella, Onchocerca,*** and ***Wuchereria.***

-filcon, suffix for hydrophilic contact lens material.

file, **1.** (in dentistry) a tool for scaling or removing plaque and calcified deposits from the teeth, or in the preparation of the root canal during endodontic therapy. **2.** a collection of related data or information, assembled for a specified purpose and stored as a unit.

filial generation /fil′ē·əl/ [L, *filius,* son, *generare,* to beget], the offspring produced from a given mating or cross. See also **first filial generation, second filial generation.**

filiform bougie /fil′ifôrm/ [L, *filum,* thread, *forma,* form; Fr, *bougie,* candle], an extremely thin device for passage through a narrow pathway, such as a sinus tract. See also **bougie.**

filiform catheter, a catheter with a slender, threadlike tip that allows the wider portion of the instrument to be passed through canals that are constricted or irregular because of an obstruction or an angulation in the canal. It may bypass obstructions or dilate strictures.

filiform papilla. See **papilla.**

filiform warts. See **digitate wart.**

filling, a dental restoration consisting of a silver amalgam, composite, glass ionomer, or other material that is inserted into a prepared tooth cavity to repair a carious lesion.

filling factor [AS, *fyllan,* filling; L, *factor,* a maker], a measure of the geometric relationship between a magnetic resonance (MR) imaging coil and the body. This relationship affects the MR signal-to-noise ratio and, ultimately, image quality. Achieving a high filling factor requires fitting the coil closely to the body, thus potentially decreasing patient comfort.

filling pressure. See **end-diastolic pressure.**

film [AS, *filmen,* membrane], **1.** a thin sheet or layer of any material, such as a coating of oil on a metal part. **2.** (in photography and radiography) a thin, flexible transparent sheet of cellulose acetate or polyester plastic material coated with a light-sensitive emulsion, used to record images, such as organs, structures, and tissues, that may be involved in disease and diagnosis.

film badge dosimeter, a photographic film packet, sensitive to ionizing radiation, used for estimating the exposure of personnel working with x-rays and other radioactive sources.

film development, the processing of photographic or x-ray films to manifest the latent image resulting from exposure of the chemically treated emulsion to electromagnetic radiation. Development involves wetting the film to loosen the emulsion, followed by a series of chemical baths that reduce the exposed silver ions to black metallic silver. The reducing agents for radiographic films generally contain hydroquinone to produce black tones slowly and phenidone to produce shades of gray rapidly.

film fault, a defect in a photograph or radiograph, usually caused by a chemical, physical, or electrical error in its production. See also **artifact.**

film on teeth, a collection of mucinous deposits that adheres to the teeth by means of acquired pellicle. The film contains microorganisms, desquamated tissue elements, blood cellular elements, and other debris. See also **biofilm, plaque.**

film screen mammography, a breast radiographic technique in which a special single-emulsion film and high-detail intensifying screens are used. The technique provides a fine image at radiation exposure levels of less than 1 rad, compared with older methods that generated radiation levels of as much as 16 rad.

filopressure, the temporary compression of a blood vessel by a ligature. The ligature is removed when the blood flow has stopped.

Filovirus, a genus of single-stranded negative-sense ribonucleic acid viruses in the Filoviridae family that targets primates and causes hemorrhagic fevers. It is one of the most destructive viruses known to man. The genus includes the Ebola and Marburg viruses.

filter [Fr, *filtrer,* to strain], **1.** a device or material through which a gas or liquid is passed to separate out unwanted matter. **2.** (in radiology) a device added to radiographic equipment that selectively removes low-energy x-rays that have no chance of reaching the film. Examples include bow-tie, compensating, and conic filters.

filtered back projection, a mathematical technique used in magnetic resonance imaging and computed tomography to create images from a set of multiple projection profiles.

filtration /filtrā′shən/ [Fr, *filtrer,* to strain], the addition of sheets of metal to a beam of x-rays for the purpose of altering the energy spectrum and thus the imaging characteristics and penetrating ability of the radiation. Filtration is generally accomplished with aluminum or copper at low to medium energy and with tin, copper, or aluminum at higher energy.

filtration angle. See **angle of iris.**

filum /fī′ləm/, a threadlike structure, as the filum terminale, which extends from the lower end of the spinal cord.

fimbria /fim′brē·ə/ [L, fringe], any structure that forms a border or edge or that resembles a fringe. Kinds of fimbria are **fimbria hippocampi, fimbria ovarica,** and *fimbriae tubae terminale (spinal cord).* See also **pilus,** def. 2.

fimbriae of uterine tube, the branched fingerlike projections at the distal end of each of the fallopian tubes. The projections are connected to the ovary and have epithelial cells with cilia that serve to move the ovum toward the uterus. Also called *fimbriae tubae.*

fimbria hippocampi, a band of efferent fibers formed by the alveus hippocampi that is continuous with the posterior pillar of the fornix.

fimbrial tubal pregnancy /fim′brē·əl/, a kind of tubal pregnancy in which implantation occurs in the fimbriated distal end of one of the fallopian tubes. See also **tubal pregnancy.**

fimbria ovarica, the longest of the fimbriae tubae. It extends from the infundibulum to the ovary. Also called **fimbriated extremity.**

fimbriated /fim′brē·ā′tid/ [L, *fimbria,* a fringe], having fimbria, or the fringelike projection of the ovaries or the nerve fibers along the border of the hippocampus.

fimbriated extremity. See **fimbria ovarica.**

fimbriated fold, a rough fold lateral to the lingual vein on either side of the frenulum of tongue.

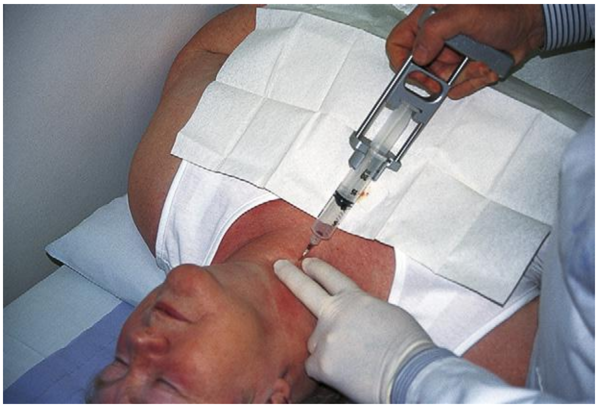
financial resource assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting an individual/family to secure and manage finances to meet health care needs. See also **Nursing Interventions Classification.**

finasteride /fin′əstərīd, finas′tərīd/, a drug used to treat benign prostatic hyperplasia by blocking the production of dihydrotestosterone, a major hormone stimulating prostate growth. It is also used as a hair growth stimulant in the treatment of androgenetic alopecia. It is administered orally.

finding, **1.** an observation made about a particular disease state, usually in relation to physical examination and laboratory tests. **2.** a conclusion drawn from an examination, study, or experiment.

fine motor skills [Fr, *fin,* thin; L, *movere* + ONor, *skilja,* to cut apart], the use of precise coordinated movements in such activities as writing, buttoning, cutting, tracing, or visual tracking.

fine-needle aspiration, a diagnostic technique that uses a very thin needle and gentle suction to obtain tissue samples, most commonly used for breast and thyroid biopsies. The needle is thinner than that used for venipuncture, and the procedure is less painful than drawing of blood. Usually the procedure is done on an outpatient basis, and no anesthetic is used. The aspirated tissue is examined by a pathologist.



Fine-needle aspiration of thyroid

(Belchetz and Hammond, 2003)

fineness /fīn′nes/ [Fr, *fin,* thin], a means of grading alloys in relation to their gold content. The fineness of an alloy is designated in parts per thousand of pure gold, which is 1000 fine. Gold alloys and pure gold may be used in dental restorations, such as tooth crowns and prepared tooth-cavity fillings. Compare **karat.**

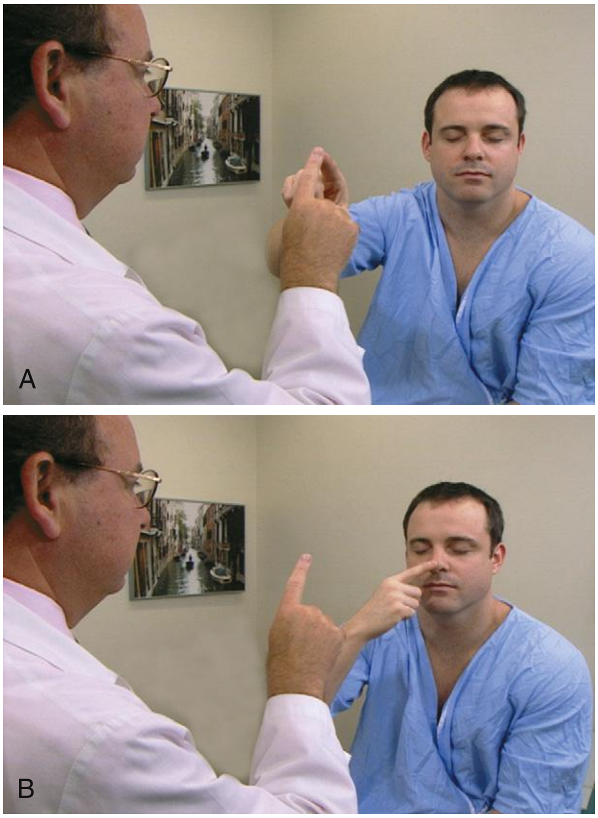
fine tremor [Fr, *fin,* thin; L, *tremor,* to tremble], a vibration that occurs after a voluntary movement or one that results from fatigue in the corresponding muscle group.

finger [AS, *fingar*], any of the digits of the hand. The fingers are composed of three bony phalanges. Some anatomists regard the thumb as a finger, since its metacarpal bone ossifies in the same way as a phalanx. Other anatomists regard the thumb as being composed of a metacarpal bone and two phalanges. The digits of the hand are anatomically numbered 1 to 5, starting with the thumb. See also **nail**, def. 1.

finger agnosia, a neurological disorder in which a patient is unable to distinguish between stimuli applied to two different fingers without visual clues; to recognize his or her own digits, for example, finger versus, thumb; or to recognize or identify another person's fingers. It is seen most often in **Gerstmann's syndrome.**

finger goniometer [AS, *finger* + Gk, *gonia,* angle, *metron,* meter], an instrument for measuring the angle of a finger joint.

finger-nose test [AS, *finger* + *nosu* + L, *testum,* crucible], a test of the coordination of the arms. The patient is asked to draw the tip of the index finger quickly to the nose, then to touch the examiner's finger, and then to go back and forth quickly. An inability to perform the test accurately may be an indication of cerebellar disease.



Finger-nose test *(Swartz, 2009)*

finger percussion. See **percussion.**

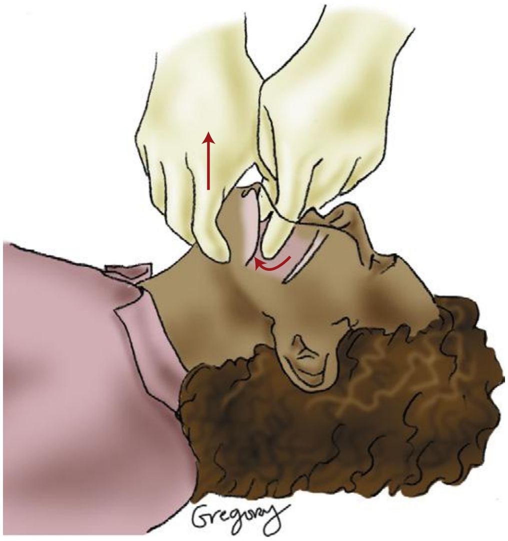
finger phenomenon, a diagnostic test for organic hemiplegia. With the patient's elbow on the table, the examiner grasps the patient's wrist and uses the thumb to put pressure on the radial side of the patient's pisiform bone. If the hemiplegia is organic, the patient's fingers spread fanwise.

fingerprint, an image left on a smooth surface by the pattern of the pad of a distal phalanx. The distinctive pattern of loops and whorls represents the fine ridges marking the skin. Because each individual's fingerprints are unique, a classification system of the patterns is useful in identifying individuals.

finger pulse therapy, a form of biofeedback therapy in which a sensor attached to the finger monitors cardiac activity, used in the treatment of anxiety, hypertension, and some cardiac arrhythmias.

finger stick, the act of puncturing the tip of the finger to obtain a small sample of capillary blood. In some procedures the hand may be first immersed in warm water for 10 minutes to "arterialize" the capillary blood or give it characteristics similar to those of arterial blood.

finger sweep, a technique for clearing a mechanical obstruction from the upper airway of an unconscious patient. The rescuer opens the victim's mouth by grasping the lower jaw and tongue between the thumb and fingers. The rescuer then attempts to sweep the foreign object out of the victim's mouth with a finger. Care must be taken to visualize the object before performing a finger sweep as the object can be pushed deeper into the airway.



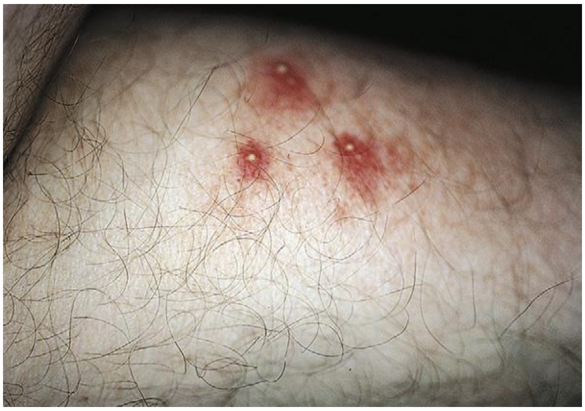
Finger sweep *(Shade et al, 2007)*

Finnish bath. See **sauna bath.**

FiO_2, abbreviation for **fraction of inspired oxygen.**

Fiorinal, a trademark for a group of fixed-combination drugs containing a sedative-hypnotic (butalbital); an analgesic, antipyretic, and antiinflammatory **(aspirin);** and a central nervous system stimulant **(caffeine).**

fire ant sting, a potentially lethal venomous injection of piperidine alkaloids by a fire ant. The ant attaches itself to the skin with its mandibles and injects venom through a stinger in the posterior part of its abdomen. The ant injects repeatedly as it rotates its body around the attachment site. All victims experience a local wheal and flare reaction that lasts up to an hour, followed by formation of a sterile pustule. The pustule sloughs off after about 48 hours but is followed by itching that may last for days. Fire ant stings are a common cause of anaphylaxis in the southern United States.



Fire ant sting *(Auerbach, 2012/Courtesy Cameron Smith)*

fire damp. See **damp.**

fireman's cramp. See **heat cramp.**

fire-setting precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention of fire-setting behaviors. See also **Nursing Interventions Classification.**

first aid^1 [AS, *fyrst* + Fr, *aider,* to help], the immediate care that is given to an injured or ill person before treatment by medically trained personnel. Attention is directed first to the most critical problems: evaluation of the patency of the airway, the presence of bleeding, and the adequacy of cardiac function. The patient is kept warm and as comfortable as possible. The conscious patient is reassured and queried for significant details of his or her medical history, such as diabetes, a known heart condition, or allergic reactions to drugs. If the patient is unconscious, a medical identification card, bracelet, or necklace is sought. The patient is moved as little as possible, particularly if there is a possibility of fracture. If vomiting occurs, the patient's head is moved to a position for the vomitus to exit easily to prevent aspiration. See also **cardiopulmonary resuscitation, control of hemorrhage, emergency medicine, emergency nursing.**

first aid^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing initial care for a minor injury. See also **Nursing Interventions Classification.**

first cranial nerve. See **olfactory nerve.**

first cuneiform. See **medial cuneiform bone.**

first-degree burn, a burn that affects the epidermis only, causing erythema and, in some cases, mild edema, without vesiculation.

first dentition. See **primary dentition.**

first-dollar coverage, an insurance plan under which the third-party payer assumes liability for covered services as soon as the first dollar of expense for such services is incurred, without requiring the insured to pay a deductible.

first filial generation (F_1), the heterozygous offspring produced by the crossing of a homozygous dominant strain with a homozygous recessive strain.

first-generation scanner, an early type of computed tomography device that used a finely collimated (pencil) x-ray beam and a single detector moving in a translate-rotate mode. It required 180 translations, each separated by a 1-degree rotation, and up to 5 minutes for one scan.

first intention. See **intention.**

first-line therapy. See **induction therapy.**

first metacarpal bone, the metacarpal bone of the thumb.

first-order change, a change within a system that itself remains unchanged.

first-order kinetics, a chemical reaction in which the rate of decrease in the number of molecules of a substrate is proportional to the concentration of substrate molecules remaining. In first-order reactions involving two substances, only one of the concentrations affects the rate. The rate of metabolism of most drugs follows the rule of first-order kinetics and is independent of the dose. Also called **first-order reaction.** See also **kinetics.**

first responder, the first emergency person to arrive at the scene of a traumatic or medical situation. This person is trained according to a national standard curriculum set up by the U.S. Department of Transportation.

first rib, the highest rib of the thoracic cage. It moves about the axis of its neck, raising and lowering the sternum. First rib movement during quiet breathing is negligible, but under conditions of stress it can increase the anteroposterior diameter of the chest.

first stage of labor [ME, *fyrst* + OFr, *estage* + L, *labor,* work], a period of 8 to 12 hours marked by the onset of regular contractions of the uterus with full dilation of the cervix and the appearance of a small amount of blood-tinged mucus. Danger signs of the first stage include abnormal bleeding, abnormal fetal heart rate, and abnormal fetal presentation and position.

first-state cementoma. See **periapical fibroma.**

fiscal resource management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as procuring and directing the use of financial resources to assure the development and continuation of programs and services. See also **Nursing Interventions Classification.**

FISH, abbreviation for **fluorescent in situ hybridization.**

Fishberg concentration test /fish′berg/, a test for renal function. The patient is given supper with not more than 200 mL of fluid and nothing thereafter. Urine voided during the night is discarded. The morning urine is saved, the patient is kept in bed, and the urine of 1 hour later and of 2 hours later is saved. If the specific gravity of any of these three specimens is less than 1.024, there is impairment of renal concentration.

fish-handler's disease. See **erysipeloid.**

fish poisoning, poisoning caused by ingestion of poisonous fish, some of which have the poison in their muscles, skin, or other organs, while others secrete poisons. It is marked by various gastrointestinal and neurological disturbances that sometimes can be fatal. The most common kinds are **ciguatera poisoning** and **tetraodon poisoning.**

fish skin disease. See **ichthyosis.**

fish tapeworm infection [AS, *fisc,* fish], an infection caused by the tapeworm ***Diphyllobothrium*** *latum* that is transmitted to humans when they eat contaminated raw or undercooked freshwater fish. Fish tapeworm infection is common in temperate zones throughout the world and is found in the Great Lakes region of the United States and Alaska. Endemic foci have been found among Eskimos in Alaska and Canada. Most infections are asymptomatic. However, persons may exhibit abdominal discomfort, vomiting, diarrhea, weight loss, and vitamin B_{12} deficiency. Treatment is praziquantel and vitamin B_{12}, if indicated, for deficiency. In severe cases intestinal obstruction may result. Also called **diphyllobothriasis.** See also ***Diphyllobothrium*, tapeworm infection.**

fiss-, prefix meaning "split or cleft": *fissile, fissiparous, fissula.*

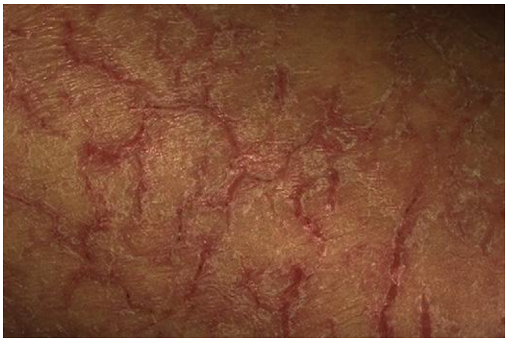
fission /fish′ən/ [L, *fissio,* splitting], **1.** the act or process of splitting or breaking up into two or more parts. **2.** a type of asexual reproduction common in bacteria, protozoa, and other simpler forms of life in which the cell divides into two or more equal components, each of which eventually develops into a complete organism. Kinds of fission are **binary fission** and **multiple fission. 3.** (in physics) the splitting of the nucleus of an atom and subsequent release of energy. Also called **nuclear fission.**

fissiparous /fisip′ərəs/, reproduced by fission.

fissura. See **fissure.**

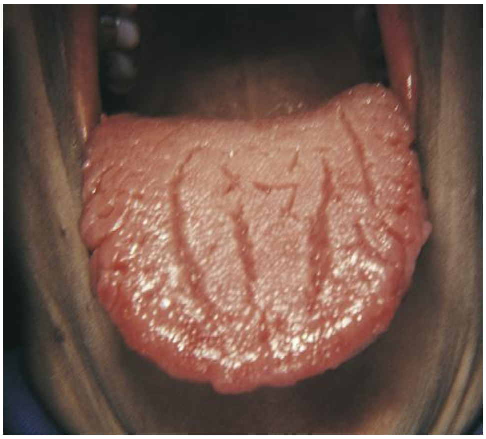
fissural angioma /fish′ərəl/ [L, *fissura,* cleft], a tumor composed of a cluster of dilated blood vessels found on the lip, face, or neck in an embryonal fissure.

fissure /fish′ər/ [L, *fissura,* cleft], **1.** a cleft or groove on the surface of an organ, often marking its division into parts, such as the lobes of the lung. **2.** a cracklike lesion of the skin, such as an anal fissure. **3.** a lineal fault on a bony surface that occurs during the development of a part, such as a fissure in the enamel of a tooth. A fissure is usually deeper than a **sulcus**, but in the terminology of anatomy *fissure* and *sulcus* are often used interchangeably. Also called **fissura. —fissured,** *adj.*



Fissures *(Lemmi and Lemmi, 2000)*

fissured tongue /fish′ərd/ [L, *fissura,* cleft; AS, *tunge*], a tongue with deep surface furrows that may radiate outward. The condition may be inherited as an autosomal-dominant trait.



Fissured tongue *(Ibsen and Phelan, 2009)*

fissure fracture, any fracture in which a crack extends into the cortex of the bone but not through the entire bone. See also **greenstick fracture.**

fissure-in-ano. See **anal fissure.**

fissure of Bichat. See **transverse fissure.**

fissure of Rolando. See **central sulcus.**

fissure of Sylvius. See **lateral cerebral sulcus.**

fistula /fis′cho͝olə, -chələ/ *pl.* **fistulae, fistulas** [L, pipe], an abnormal passage from an internal organ to the body surface or between two internal organs, such as a hepatopleural or pulmonoperitoneal fistula. Fistulas may occur in many sites from the gingiva to the anus. They may be caused by a congenital defect, injury, infection, spreading of a malignant lesion, surgery, radiotherapy of a cancerous growth, or trauma during childbirth. They also may be created to achieve therapeutic purposes or obtain body secretions for physiological studies. An arteriovenous fistula is commonly created to gain access to the patient's bloodstream for hemodialysis. Anal fistulas that result from rupture or drainage of abscesses may be treated by fistulectomy or fistulotomy; fistulas between the vagina and bladder, urethra, ureter, or rectum may be repaired surgically, but the results are not always successful. **—fistular, fistulate, fistulous,** *adj.*

fistula-in-ano. See **anal fistula.**

fistular, fistulas, fistulate. See **fistula.**

fistulectomy /fis′chəlek′təmē/ [L, *fistula,* pipe; Gk, *ektomē,* excision], the surgical removal of a fistula.

fistulous. See **fistula.**

fit, **1.** *nontechnical,* a paroxysm or seizure. **2.** the sudden onset of an episode of symptoms, such as a fit of coughing. **3.** the manner in which one surface is aligned to another, such as the alignment of a denture with the gingiva and jaw.

fitness, a measure of the ability of a person to perform certain tasks. See also **physical fitness.**

Fitzgerald factor, a high-molecular-weight kininogen that may be required for the interaction of factors XI and XII in the coagulation process.

Fitzgerald treatment. See **zone therapy.**

Fitz-Hugh–Curtis syndrome /fitz′-hyo͞o–kər′tis/ [Thomas Fitz-Hugh, Jr., American physician, 1894–1963; Arthur H. Curtis, American gynecologist, 1881–1955], perihepatitis occurring as a complication of gonorrhea or chlamydial infection in women, marked by fever, upper quadrant pain, tenderness and spasm of the abdominal wall, and occasionally by friction rub over the liver. This syndrome is characterized by adhesions between the liver and other sites in the peritoneum. Treatment used is that appropriate to gonorrhea or chlamydia infection.

Fitzpatrick, Joyce J., a nursing theorist who derived her Life Perspective Rhythm Model from Martha Rogers' conceptualization of unitary man. She began publishing in 1970. Fitzpatrick proposes that the process of human development is characterized by rhythms that occur within the context of continuous person-environment interaction. Nursing activity focuses on enhancing the developmental process toward health. Fitzpatrick believes a central concern of nursing science and the nursing profession is the meaning attributed to life as the basic understanding of human existence. The four major concepts in this model are expressed as nursing, person, health, and environment. The person is viewed as a unified open rhythmic system with temporal patterns, consciousness patterns, and motion and perceptual patterns. Health is a human dimension under continuous development, interacting with the environment. It is seen as a heightened awareness of the meaningfulness of life. See also **Rogers, Martha E.**

5-day fever. See **trench fever.**

five elements, in Ayurvedic tradition, the basic entities (earth, air, fire, water, and space) whose interaction gives rise to material existence.

five-in-one repair, medial meniscectomy, medial collateral ligament repair, vastus medialis advancement, semitendinosus advancement, and pes anserinus transfer. See **Nicholas procedure.**

five phases, in traditional Chinese medicine, a set of dynamic relations (designated earth, metal, water, wood, and fire) that can be used to categorize relationships among phenomena. They are sometimes called the five elements because of their superficial resemblance to the elements of alchemy.

five-step nursing process, a nursing process comprising five broad categories of nursing behaviors: **assessing, analyzing, planning, implementing,** and **evaluating**. The nurse gathers information about the patient, identifies his or her specific needs, develops a plan of care with the patient to answer these needs, implements the plan of care, and evaluates the effects of the implementation. The nurse involves the patient, the patient's family, and significant others in each step of the process to the greatest extent possible and compensates for and acknowledges the factors that may influence the provision of care by the nurse and staff. Implicit in the nursing process is the therapeutic and personal relationship of the nurse, the patient, the patient's family, and significant others. See also **nursing process.**

fixate, fixated. See **fixation.**

fixating eye /fik′sāting/ [L, *figere,* to fasten; AS, *eage*], in strabismus, the eye that is directed to a given object to position that object on the fovea. Compare **squinting eye.**

fixation /fiksā′shən/ [L, *figere,* to fasten, *atio,* process], (in psychoanalysis) an arrest at a particular stage of psychosexual development, such as anal fixation. **—fixate,** *v.,* **fixated,** *adj.*

fixational ocular movements /fiksā′shənəl/, rotation of the eyes during voluntary fixation on an object.

fixation muscle, a muscle that acts to hold a part of the body in appropriate position. Compare **antagonist, prime mover, synergist.**

fixative /fik′sətiv/ [L, *figere,* to fasten], **1.** any substance used to bind, glue, or stabilize. **2.** any substance used to preserve gross or histological specimens of tissue for later examination.

fixator, a device composed of rods and pins designed to provide stabilization of a body part. The external skeletal apparatus may be attached directly to the bone.

fixed anions /fikst/, anions that are not part of the body's buffer anions.

fixed bridgework, a dental prosthetic constructed to replace missing teeth that incorporates artificial teeth permanently attached to natural teeth or implants in the jaw.

fixed cantilever. See **partial denture.**

fixed cations, cations that are not part of the body's metabolic buffering system.

fixed-combination drug [L, *figere,* to fasten, *combinare,* to combine; Fr, *drogue*], any of a group of multiple-ingredient preparations that provide concomitant administration of specific amounts of two or more medications.

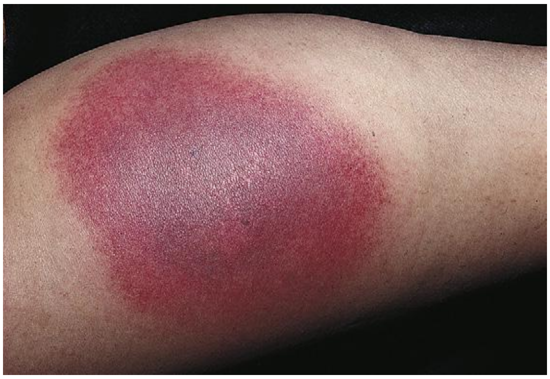
fixed coupling, the occurrence of a normal and an ectopic heartbeat with a constant interval between the two each time the ectopic beat occurs.

fixed delusion [L, *figere,* to fasten, *deludere,* to deceive], a delusion that is consistent, unaltered, and difficult to interrupt.

fixed-dose combination. See **fixed-combination drug.**

fixed dressing, a dressing usually made of gauze impregnated with a hardening agent, such as plaster of paris, sodium silicate, starch, or dextrin, applied to support or immobilize a part of the body. The dressing is soaked in water, applied to the part to be immobilized, and allowed to harden. See also **cast, splint.**

fixed drug eruption, well-defined red to purple lesions that appear at the same sites on the skin and mucous membranes each time a particular drug is used. The reaction occurs most commonly in patients who are using tetracycline or phenolphthalein.



Fixed drug eruption *(Callen et al, 2000)*

fixed fulcrum, a tomographic fulcrum that remains at a fixed height.

fixed idea. **1.** a persistent, obsessional thought or notion. **2.** also called **idée fixe.** In certain mental disorders, especially obsessive-compulsive disorder, an idea that dominates mental activity and persists despite contrary evidence or rational refutation.

fixed interval (FI) reinforcement, (in psychiatry) reinforcement given after a specific amount of time has elapsed.

fixed macrophage [L, *figere,* to fasten; Gk, *makros,* large, *pagein,* to eat], a nonmotile mononuclear phagocyte found in connective tissue, liver sinuses, spleen, lymph glands, and bone marrow.

fixed noncirculating phagocyte. See **phagocyte.**

fixed orthodontic appliance, a mechanical device cemented to the teeth or attached by adhesive material, for changing the relative positions of the teeth.

fixed partial denture, a partial denture permanently held in position by attachments to adjacent prepared natural teeth, roots, or implants.

fixed-performance oxygen delivery system. See **high-flow oxygen delivery system.**

fixed phagocyte. See **phagocyte.**

fixed pupil [L, *figere,* to fasten, *pupilla,* little girl], an abnormal condition in which the pupils fail to dilate or contract when stimulated. The cause is commonly adhesions binding the iris to the lens capsule or acute glaucoma causing interference with the nerve supply of the iris.

fixed rate pacemaker [L, *figere,* to fasten, *ratum,* calculate, *passus,* step; ME, *maken*], an electronic cardiac stimulator that delivers impulses to the cardiac muscle at a preset rate regardless of the heart's independent activity.

fixed ratio (FR) reinforcement, (in psychiatry) reinforcement given after a specific number of responses have occurred.

fixed torticollis [L, *figere,* to fasten, *tortus,* twisted, *collum,* neck], a condition in which neck muscles on one side are so short that the head is held continuously in the same position. See also **torticollis.**

fixed vertebrae. See **false vertebra.**

fixer, a chemical used in processing photographic or x-ray film. Applied after the developing phase, it neutralizes any developer remaining on the film, removes undeveloped silver halides, and hardens the emulsion.

flaccid /flak′sid/ [L, *flaccus,* flabby], weak, soft, and flabby; lacking normal muscle tone, such as flaccid muscles associated with peripheral neuritis, poliomyelitis, and early stroke. **—flaccidity, flaccidness,** *n.*

flaccid bladder, a bladder that is unable to contract sufficiently to empty. It may be secondary to neural deficiencies or chronic obstruction. The bladder can be emptied by pressure applied to the area or via catheterization. Also called **atonic bladder, autonomous bladder, nonreflex bladder.** Compare **spastic bladder.**

flaccid dysarthria. See **lower motor neuron dysarthria.**

flaccidity, flaccidness /flaksid′itē/. See **flaccid.**

flaccid paralysis, an abnormal condition characterized by the weakening or the loss of muscle tone. It may be caused by disease or by trauma affecting the nerves associated with the involved muscles. Compare **spastic paralysis.**

flagell-, prefix meaning "whiplike process, tapping": *flagellation, flagelliform, flagellospore.*

flagella. See **flagellum.**

flagellant /flaj′ələnt/, a person who receives sexual gratification from the practice of flagellation.

flagellate /flaj′əlāt′, -lit/ [L, *flagellum,* whip], a protozoon or alga that propels itself with flagella. Examples include

Giardia, Leishmania, Trichomonas, and ***Trypanosoma.*** See also **protozoon.**

flagellation /flaj′əlā′shən/, **1.** the act of whipping, beating, or flogging. **2.** a type of massage administered by tapping the body with the fingers. See also **massage. 3.** a type of sexual deviation in which a person is erotically gratified by being whipped or by whipping another. See also **masochism, sadism. 4.** the arrangement of flagella on an organism; exflagellation.

flagellum /flajel′əm/ *pl.* **flagella** [L, whip], a long, hairlike projection that extends from some unicellular organisms and from the sperm of animals, algae, and some plants. Flagellar motion is a complex, whiplike undulation that propels cells through a fluid environment.

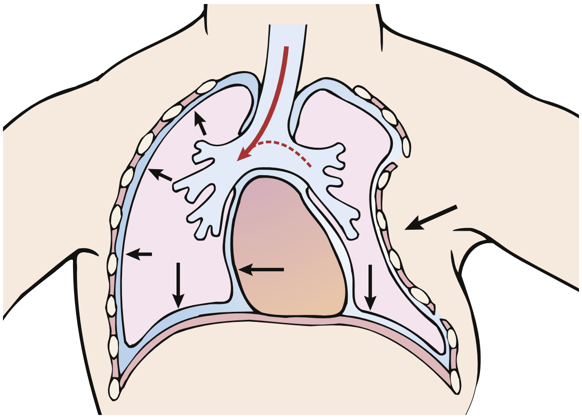
Flagyl, a trademark for an antibiotic and antiprotozoal **(metronidazole).**

flail chest /flāl/ [ME, *fleyl,* whip; AS, *cest,* box], a thorax in which there are two fractures on at least two adjacent ribs causing instability in part of the chest wall and paradoxic breathing, with the lung underlying the injured area contracting on inspiration and bulging on expiration. If it is uncorrected, hypoxia will result.

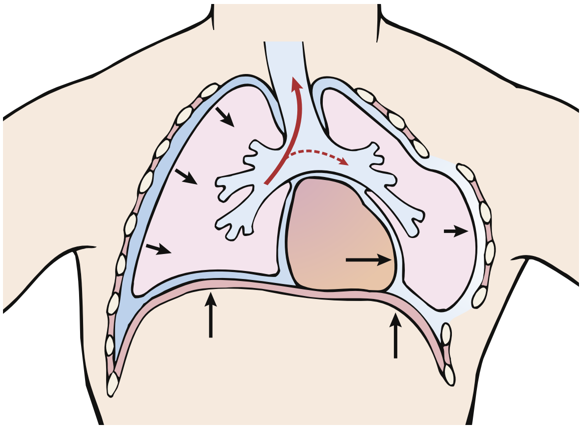
■ OBSERVATIONS: Flail chest is characterized by sharp pain; uneven chest expansion; shallow, rapid respirations; and decreased breath sounds. Tachycardia and cyanosis may be present. Potential complications include atelectasis, pneumothorax, hemothorax, cardiac tamponade, shock, and respiratory arrest. Often other traumatic injuries are present in a patient with a flail chest.

■ INTERVENTIONS: The treatment of choice is internal stabilization of the chest wall through the use of positive pressure. Bilevel positive pressure or mechanical ventilation may be used. If the patient breathes against the automatic ventilator, a sedative and muscle relaxant may be ordered to achieve ventilatory control. Chest tubes may be required to remove air or fluid that is preventing expansion of the affected lung, and a nasogastric tube may be ordered to provide food and fluids. The patient's vital signs and breath sounds are frequently evaluated, and arterial blood gases are monitored.

■ NURSING CONSIDERATIONS: The patient with flail chest usually requires a long period of care involving frequent repositioning, scrupulous attention to the patency and cleanliness of the tracheostomy or endotracheal tube, skin care, oral hygiene, pain management, and emotional support. Members of the health care team perform passive range-of-motion exercises involving the extremities, explain the various procedures, and provide a pad and pencil or a magic slate with which the patient can communicate.



Inspiration



Expiration

Flail chest *(Lewis et al, 2011)*

flame photometry [L, *flagrare,* to burn; Gk, *phos,* light, *metron,* measure], measurement of the wavelength of light rays emitted by excited metallic electrons exposed to the heat energy of a flame, used to identify characteristics in clinical specimens of body fluids. The intensity of the emitted light is proportional to the concentration of atoms in the fluid, and a quantitative analysis can be made on that basis. In the clinical laboratory, flame photometry was once used to measure sodium, potassium, and lithium levels but is no longer used routinely.

flammable, the property of igniting and burning easily and rapidly. Also **inflammable.**

flange /flanj/, **1.** the part of a denture base that extends from the cervical ends of the teeth to the border of the denture. It can be used for retention of the denture upon the residual alveolar ridge. **2.** a prosthesis with a lateral vertical extension designed to direct a resected mandible into centric occlusion.

flank, the posterior portion of the body between the ribs and the ilium. Flank pain is sometimes associated with the kidney.

flap, a layer of skin or other tissue surgically separated from deeper structures for transplantation, coverage of an area that has been injured, or examination of deeper tissues.

flapping tremor. See **asterixis.**

flap reconstruction, an alternative to skin expansion as a method of breast reconstruction after mastectomy. It involves creation of a skin flap using tissue from another part of the body, such as the back or abdomen. The flap is attached to the chest to create a pocket for implantation or to build a breast mound.

flap surgery, a type of breast reconstruction that is performed in a single stage, in some cases at the same time as a mastectomy.

flare /fler/, **1.** a red blush on the skin at the periphery of an urticarial lesion seen in immediate hypersensitivity reactions. **2.** an expanding skin flush, spreading from an infective lesion or extending from the principal site of a reaction to an irritant. **3.** the sudden intensification of a disease.

flaring of nostrils, nasal widening during inspiration, a sign of air hunger or respiratory distress.

flash, a sudden or intermittent brief burst of intense heat or light. See also **hot flash, rush.**

flashback, a phenomenon experienced by persons who have taken a hallucinogenic drug or had psychological trauma and unexpectedly reexperience its effects. This is also suffered by patients with **posttraumatic stress disorder.**

flash burn, a lesion caused by exposure to an extremely intense source of radiant energy or heat. Flash burn commonly occurs on the corneas of arc welders.

flashover phenomenon, an effect of a lightning strike or other intense electric discharge in which the electric current passes over the body instead of through it. The result is a red, featherlike branching pattern on the skin.

flask, **1.** a narrow-neck glass vessel used for heating liquids, distilling chemicals, or culturing fluid media. **2.** a small glass receptacle for holding liquids or powders.

flask closure [L, *vasculum,* small vessel, *claudere,* to close], the joining of two halves of a flask that encloses and forms a mold for a denture base.

flasking /flask′ing/ [L, *vasculum,* small vessel], **1.** the act of investing in a flask. **2.** the process of investing the cast and a wax denture in a flask preparatory to molding the denture base material into the form of the denture.

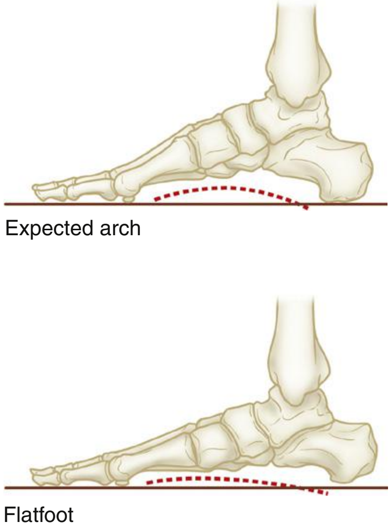
flat affect, the absence or near absence of emotional response to a situation that normally elicits emotion. It is observed in schizophrenia and some depressive disorders. Also called **flattened affect.**

Flatau-Schilder disease. See **Schilder's disease.**

flat bone [AS, *flet,* floor], any of the bones that provide structural contours of the skeleton. Examples include ribs and bones of the cranium.

flat electroencephalogram, a graphic chart on which no tracings are recorded during electroencephalography, indicating a lack of brain wave activity. Flat readings are indicative of brain death except in cases of profound hypothermia and central nervous system depression. Also called **isoelectric electroencephalogram.** See also **brain death.**

flatfoot, an abnormal but relatively common condition characterized by the flattening out of the arch of the foot. Also called **pes planus.** See also **fallen arch.**



Flatfoot *(Seidel et al, 2011)*

flat spring contraceptive diaphragm, a kind of contraceptive diaphragm in which the flexible metal spring that forms the rim is a thin, light, flat band made of stainless steel. The rubber dome is approximately 3.8 cm deep, and the diameter of the rubber-covered rim is between 55 and 100 mm. Seven sizes, in increments of 5 mm, allow the clinician to fit the diaphragm to a particular woman. This kind of diaphragm is prescribed for a woman whose vaginal musculature provides good support, whose uterus is in the normal position and not acutely retroflexed or anteflexed, and whose vagina, neither very long nor very short, has a shallow arch behind the symphysis pubis.

flattened affect. See **flat affect.**

flatulence /flach′ələns/ [L, *flatus,* a blowing], the presence of an excessive amount of air or gas in the stomach and intestinal tract, causing distension of the organs and in some cases mild to moderate pain.

flatulence reduction, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention of flatus formation and facilitation of passage of excessive gas. See also **Nursing Interventions Classification.**

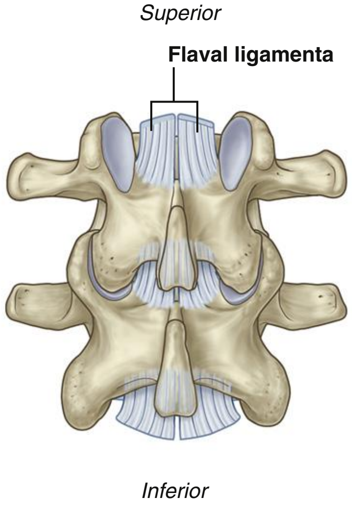
flatulent /flach′ələnt/ [L, *flatus,* a blowing], pertaining to gas or air in the digestive tract.

flatus /flā′təs/ [L, a blowing], air or gas in the intestine that is passed through the rectum. See also **aerophagy.**

flat wart. See **verruca plana.**

flav-, prefix meaning "yellow": *flavescens, flavin, flavism.*

flaval ligaments [L, *ligare* + *flavus,* yellow], the bands of yellow elastic tissue connecting the laminae of adjacent vertebrae from the axis to the first segment of the sacrum. They are thin, broad, and long in the cervical region, thicker in the thoracic region, and thickest in the lumbar region. They help hold the body erect.



Flaval ligamenta *(Drake, Vogl, and Mitchell, 2010)*

Flavivirus, a genus of a family of Flaviviridae single-stranded positive-sense ribonucleic acid viruses, including species that cause yellow fever, dengue, and St. Louis encephalitis. Most are arboviruses transmitted by mosquitoes or ticks. Also called ***group B arbovirus.***

flavocoxid, an oral nutritional supplement.

■ INDICATION: This drug is used for dietary management of osteoarthritis.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include hypertension, increase in varicose veins, psoriasis, and fluid accumulation in the knees.

flavone /flā′vōn/ [L, *flavus,* yellow], a colorless crystalline flavonoid derivative and component of bioflavonoid.

flavoprotein, a group of conjugated proteins that make yellow enzymes essential for cellular respiration. They also are involved in liberation of hydrogen from oxidation of fatty acids and function as electron acceptors in oxidative phosphorylation.

flavoxate hydrochloride /flavok′sāt/, a smooth muscle relaxant.

■ INDICATION: It is prescribed for spastic conditions of the urinary tract.

■ CONTRAINDICATIONS: GI hemorrhage or obstruction, urinary tract obstruction, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are nervousness, nausea, abdominal pain, fever, and tachycardia.

flax, a flowering annual herb found in the United States, Canada, and Europe.

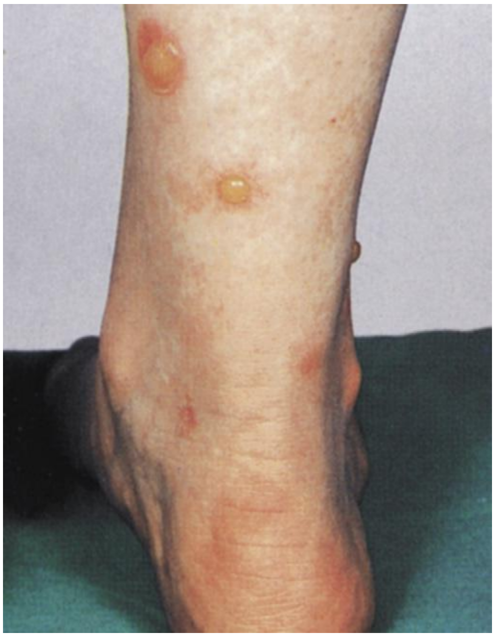
■ USES: The seeds are used for constipation and as a source of omega-3 fatty acids.

■ CONTRAINDICATIONS: It is contraindicated in people with bowel obstruction and dehydration. It is also not recommended during pregnancy and lactation, in children, or in those with known hypersensitivity to this product. It should not be used as a poultice on open wounds.

fl. dr, abbreviation for **fluid dram.**

flea [AS], a wingless, bloodsucking insect of the order Siphonaptera, some species of which transmit arboviruses to humans by acting as host or vector to the organism.

flea bite, a small puncture wound produced by a bloodsucking flea. Certain species of fleas transmit plague, murine typhus, and probably tularemia.



Flea bite *(du Vivier, 2002)*

flea-borne typhus. See **murine typhus.**

flecainide /flĕka′nīd/, a sodium channel-blocking agent that decreases the rate of cardiac conduction and increases the ventricular refractory period, used as the acetate salt in treatment of life-threatening arrhythmias.

flecainide acetate /flekā′nīd/, an oral antiarrhythmic drug.

■ INDICATIONS: It is prescribed for the treatment of ventricular arrhythmias (e.g., sustained ventricular tachycardia) and for treating supraventricular tachycardia in the absence of conduction defects when other drugs have failed.

■ CONTRAINDICATIONS: Preexisting second- or third-degree atrioventricular block, right bundle-branch block associated with a left hemiblock in the absence of a pacemaker, cardiogenic shock, and coronary artery disease prohibit its use. Concurrent therapy with disopyramide and verapamil is not recommended, and there is insufficient experience with concurrent use with nifedipine or diltiazem to recommend concurrent use. Should not be administered with other drugs that are highly dependent on CYP3A or CYP2D6 for metabolism such as ritonavir and amprenavir.

■ ADVERSE EFFECTS: Among adverse effects reported are new or increased arrhythmias or congestive heart failure, dizziness, visual disturbances, dyspnea, headache, nausea, fatigue, tremor, constipation, and edema.

fleck dystrophy of the cornea. See **speckled dystrophy of the cornea.**

-flect, -flex, suffix meaning "to bend": *anteflect, circumflect.*

Fleet Enema, a trademark for a manufactured enema formula containing 16 g sodium biphosphate and 6 g sodium phosphate per 100 mL solution. It is available in disposable plastic pouches fitted with prelubricated rectal tubes.

Fleischner method /flīsh′nər/ [Felix Fleischner, American radiologist, 1893–1969], a technique for producing lordotic x-ray projections of the lungs. The patient leans backward from the waist to a nearly 45-degree posterior inclination with his or her back against the x-ray film.

flesh, the soft, muscular tissues of the body. See also **muscle.**

Fletcher factor, a prekallikrein blood coagulation substance that interacts with both factor XII and Fitzgerald factor, activating both and accelerating thrombin formation.

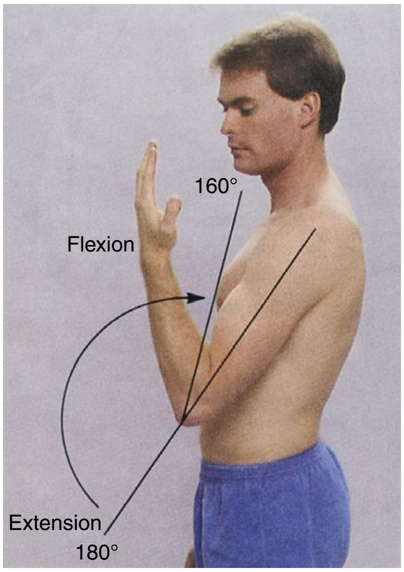
Flexeril, a trademark for a muscle relaxant **(cyclobenzaprine hydrochloride).**

Flex-Foot, a trademark for a stored-energy foot prosthesis containing a J-shaped plastic beam that acts like a spring when the wearer walks or runs. See also **stored-energy foot.**

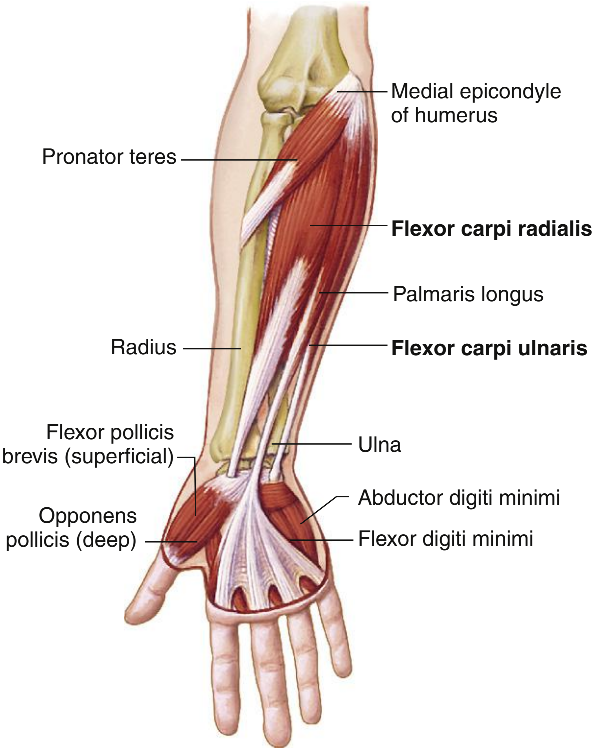
flexibilitas cerea. See **cerea flexibilitas.**

flexibility /flek′sibil′i·tē/ [L, *flectere,* to bend], the quality of being readily bent without breaking.

flexion /flek′shən/ [L, *flectere,* to bend], **1.** a movement allowed by certain joints of the skeleton that decreases the angle between two adjoining bones, such as bending the elbow, which decreases the angle between the humerus and the ulna. Compare **extension. 2.** a resistance to the descent of the fetus through the birth canal that causes the neck to flex so the chin approaches the chest. Thus the smallest diameter (suboccipitobregmatic) of the vertex presents.



Flexion and extension of the elbow *(Seidel et al, 2011)*



Medial epicondyle of humerus
Pronator teres
Flexor carpi radialis
Palmaris longus
Radius
Flexor carpi ulnaris
Flexor pollicis brevis (superficial)
Ulna
Abductor digiti minimi
Opponens pollicis (deep)
Flexor digiti minimi

Flexor carpi radialis and flexor carpi ulnaris
(Patton and Thibodeau, 2010)

flexion jacket, a corset designed to provide spinal immobility. It is typically fashioned of a rigid material and, like a Griswald brace, provides three-point fixation in opposite directions.

flexitime. See **flextime.**

flexor /flek′sər/ [L, bender], a muscle that flexes a joint.

flexor carpi radialis [L, *flexor,* bender], a slender, superficial muscle of the forearm that lies on the ulnar side of the pronator teres. It functions to flex and to help abduct the hand. Compare **flexor carpi ulnaris, palmaris longus.**

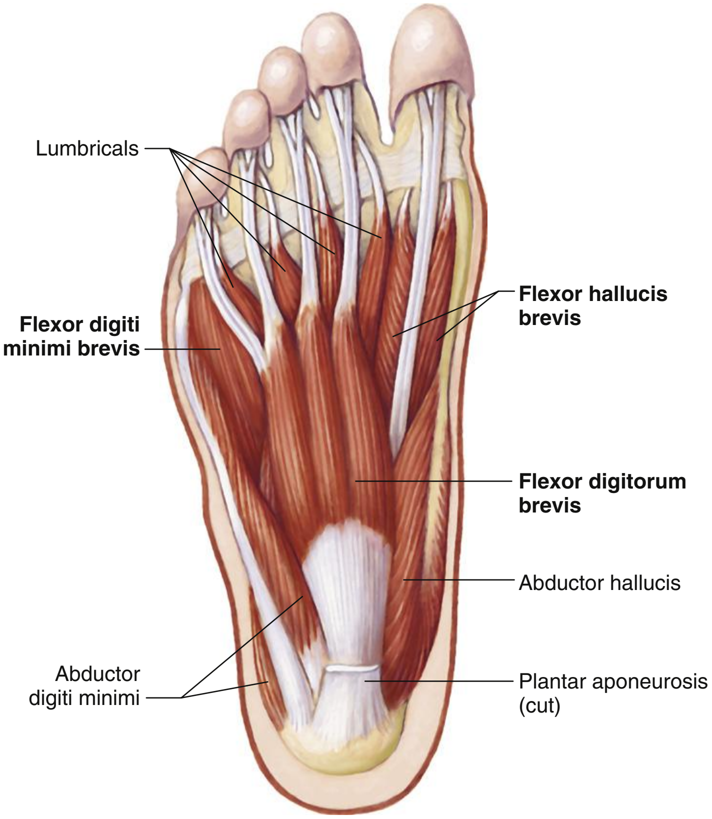
flexor carpi ulnaris, a superficial muscle lying along the ulnar side of the forearm. It functions to flex and adduct the hand. Compare **flexor carpi radialis, palmaris longus.**

flexor digiti minimi brevis, **1.** short flexor muscle of little finger; a muscle that inserts on the medial side of the proximal phalanx of the finger to flex it and is innervated by the ulnar nerve. **2.** short flexor muscle of little toe; a muscle that inserts on the lateral surface of the base of the proximal phalanx of the toe to flex it and is innervated by the lateral plantar nerve.

flexor digitorum brevis, short flexor muscle of toes; a muscle that inserts on the middle phalanges of the four lateral toes and flexes them. It is innervated by the medial plantar nerve.

flexor digitorum longus, the muscle that flexes the lateral four toes. It is involved with gripping the ground during walking and propelling the body forward off the toes at the end of the stance phase of gait. It is innervated by the tibial nerve.

flexor digitorum profundus, one of two deep flexor muscles of the fingers; a muscle that inserts on the distal

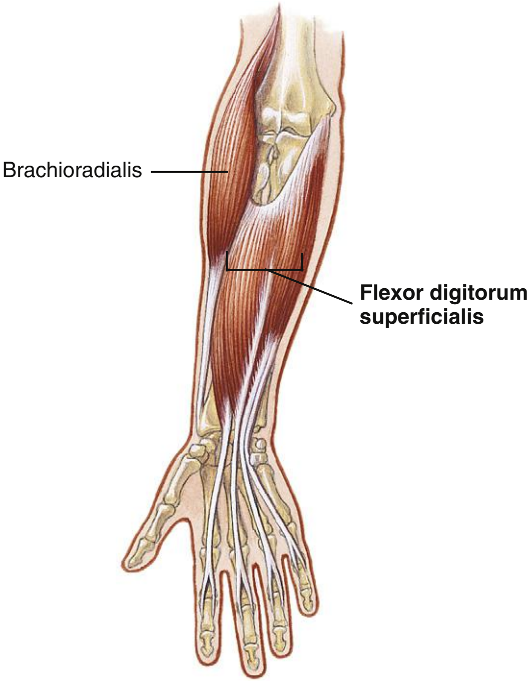


Lumbricals
Flexor hallucis brevis
Flexor digiti minimi brevis
Flexor digitorum brevis
Abductor hallucis
Abductor digiti minimi
Plantar aponeurosis (cut)

Flexor digiti minimi brevis, flexor digitorum brevis, and flexor hallucis brevis muscles of the foot
(Patton and Thibodeau, 2010)

phalanges of the fingers and flexes them. It is innervated by the ulnar and anterior interosseous nerves.

flexor digitorum superficialis, the largest superficial muscle of the forearm, lying in the second of four layers. The muscle flexes the second phalanx of each finger and, by continued action, the hand. Also called flexor digitorum sublimis. Compare **flexor carpi radialis, flexor carpi ulnaris, palmaris longus, pronator teres.**



Flexor digitorum superficialis *(Patton and Thibodeau, 2010)*

flexor hallucis brevis, short flexor muscle of great toe; a muscle that inserts in the base of the proximal phalanx of the great toe and flexes it. It is innervated by the medial plantar nerve.

flexor hallucis longus, the muscle that flexes the great toe. It is particularly active during the toe-off phase of walking when the body is propelled forward of the stance leg and the great toe is the last part of the foot to leave the ground. It can also contribute to plantarflexion of the foot at the ankle joint. It is innervated by the tibial nerve.

flexor pollicis brevis, a thenar muscle that flexes the thumb. It is innervated by the anterior interosseous nerve, a branch of the median nerve.

flexor pollicis longus, the muscle that flexes the metacarpophalangeal joint of the thumb.

flexor retinaculum of ankle [L, *flexor,* bender, *retinaculum,* halter; AS, *ancleow*], **1.** a strong band of fascia from the medial malleolus to the calcaneum, passing over the three long flexor tendons and blood vessels and nerves of the posterior leg. **2.** the roof of the tarsal tunnel.

flexor retinaculum of wrist [L, *flexor,* bender, *retinaculum,* halter; AS, *wrist*], a strong ligament across the front of the hollow of the carpus and over the flexor tendons of the fingers and median nerve.

flexor withdrawal reflex, a common cutaneous reflex consisting of a widespread contraction of physiological flexor muscles and relaxation of physiological extensor muscles. It is characterized by abrupt withdrawal of a body part in response to painful or injurious stimuli. A relatively innocuous stimulation of the skin may result in a weak contraction of one or more flexor muscles and a minimal withdrawal reflex.

FlexPen, trademark for a device to administer insulin that is prefilled and color-coded. It allows for accurate measurement by dialing the number of units to be administered.

flextime /fleks′tīm/ [L, *flectere,* to bend; AS, *tima*], a system of staffing that allows the individualization of work schedules. A person working days may choose to work from 7:00 to 3:00, 9:00 to 5:00, or other hours. Full staffing must be maintained, but within the group flextime can be arranged. Use of the system tends to improve morale and decrease turnover. Also called **flexitime.**

flexure /flek′shər/, a normal bend or curve in a body part, such as the colic flexure of the colon or the dorsal flexure of the spine.

flicks, rapid fixation involuntary movements of the eye.

flight into health [AS, *fleogan,* to fly], **1.** an abnormal but common reaction to an unpleasant physical sensation or symptom in which the person denies the feeling or observation, insisting that there is nothing wrong. See also **illness experience. 2.** voluntary and temporary suppression of mental or physical symptoms to prevent further analysis of the patient's emotional state.

flight of ideas, (in psychiatry) a continuous stream of talk in which the patient switches rapidly from one topic to another and each subject is incoherent and unrelated to the preceding one or is stimulated by some environmental circumstance. The condition is frequently a symptom of acute manic states and schizophrenia. Compare **circumstantiality.**

flight-or-fight reaction [AS, *fleogan,* to fly, *feohtan,* to fight; L, *reagere,* to act again], **1.** (in physiology) the reaction of the body to stress, in which the sympathetic nervous system and the adrenal medulla act to increase the cardiac output, dilate the pupils of the eyes, increase the rate of the heartbeat, constrict the blood vessels of the skin, increase the levels of glucose and fatty acids in the circulation, and induce an alert, aroused mental state. **2.** (in psychiatry) a person's reaction to stress by either fleeing from a situation or remaining and attempting to deal with it.

flight to illness, the effort of the patient to convince the therapist that he or she is too ill to terminate therapy and that continued support is needed.

flip angle, in magnetic resonance imaging, the degree of rotation of the macroscopic magnetization vector produced by a radiofrequency pulse with respect to the direction of the static magnetic field.

floater [AS, *flotian,* to float], a spot that appears to drift in front of the eye, caused by a shadow cast on the retina by vitreous debris. Most floaters are benign and represent remnants of a network of blood vessels that existed prenatally in the vitreous cavity. The sudden onset of several floaters may indicate serious disease. Hemorrhage into the vitreous humor may cause a large number of big and little shadows and a red discoloration of vision. The cause is often traumatic injury, but spontaneous intraocular hemorrhage is observed in proliferative diabetic retinopathy, hypertension, or increased intracranial pressure. Cancer, detachment of the retina, occlusion of a retinal vein, and other purely ocular diseases may also cause hemorrhage into the vitreous cavity. Inflammation of the retina resulting from chorioretinitis may cause entry of inflammatory cells into the vitreous humor. Inflammatory debris may adhere to the vitreous framework in netlike masses that are very disruptive of normal vision. Retinal detachment also causes a sudden appearance of flashes of light and/or floaters and a diminished field of vision as a shower of red cells and pigment is released into the vitreous humor. Careful ophthalmological examination through a well-dilated pupil is recommended for all people who experience a sudden occurrence of floaters because each of the pathological causes can be treated in the early stages and loss of vision can usually be prevented. Also called **musca volitans** and *musca volitantes*.

floating head [AS, *flotian,* to float, *heafod*], unengaged fetal head. See also **ballottement, engagement.**

floating kidney, a kidney that is not securely fixed in the normal anatomical location because of congenital malplacement or traumatic injury. Compare **ptotic kidney.**

floating patella [AS, *flotian* + L, *patella,* small pan], a patella that has been forced away from the femoral condyle by an effusion into the knee joint.

floating ribs. See **rib, vertebral rib.**

floating spleen, a spleen displaced and abnormally movable. Also called **wandering spleen.**

float nurse, a nurse who is available for assignment to duty on an ad hoc basis, usually to assist in times of unusually heavy workloads or to assume the duties of absent nursing personnel. A float nurse is recruited from a group of nurses called a float pool. Also called **contingent nurse.** See also **nurses' registry.**

flocculant /flok′yo͝olənt/, an agent or substance that causes flocculation.

flocculate, flocculation. See **flocculent.**

flocculation test /flok′yo͝olā′shən/ [L, *floccus,* flock of wool], a serological test in which a positive result depends on the degree of flocculent precipitation produced in the material being tested. Some tests for syphilis, including the Venereal Disease Research Laboratories slide test, are flocculation tests.

flocculent /flok′yo͝olənt/ [L, *floccus,* flock of wool], clumped or tufted, such as a cloud, or covered with a woolly, fuzzy surface. **—flocculate,** *v.,* **flocculation, floccule,** *n.*

flood fever. See **typhus.**

flooding [AS, *flod*], **1.** profuse bleeding from the uterus, especially after childbirth or prolonged menses. **2.** also called **implosive therapy,** a technique used in behavior therapy for the reduction of anxiety associated with various phobias. Exposure to a stimulus that usually provokes anxiety desensitizes a person to that stimulus, thereby reducing fear and anxiety. Compare **systemic desensitization.**

floor, the lower inner surface of any cavity or organ.

floppy, floppy disk. See **diskette.**

floppy-valve syndrome. See **Barlow's syndrome.**

flora /flôr′ə/, microorganisms that live on or within a body to compete with disease-producing microorganisms and provide a natural immunity against certain infections. Also called **normal flora.**

florid /flôr′id/ [L, *floridus,* flowery], in human skin complexion or wound appearance, a bright red color.

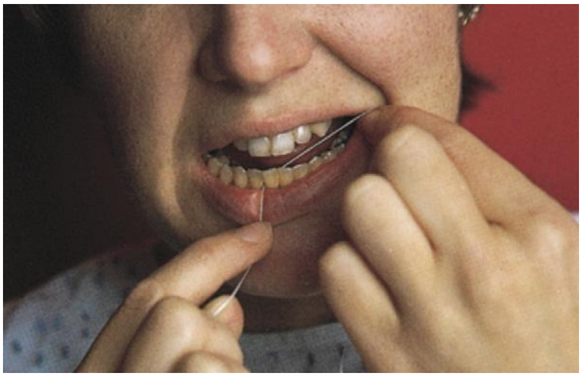
Florone, a trademark for a topical corticosteroid **(diflorasone diacetate).**

Floropryl, a trademark for an inhibitor of cholinesterase (isoflurophate), used ophthalmically.

flossing, the mechanical cleansing of proximal tooth surfaces, subgingivally and supragingivally, by dental tape or waxed or unwaxed dental floss.

flotation device /flōtā′shən/ [Fr, *flotter,* to float], a foam mattress with a gellike pad located in its center, designed to protect bony prominences and distribute pressure evenly against the skin's surface.

flotation therapy, a state of semiweightlessness produced by various types of hospital equipment and used in the treatment and prevention of pressure ulcers.



Flossing *(Potter and Perry, 2005)*

flow, **1.** the movement of a liquid or gas. **2.** copious menstruation but less profuse than flooding.

flow chart [AS, *flowan* + L, *charta,* paper], a graphic representation of a computer program sequence. It is developed before the writing of a computer program.

flow cycling, the delivery of gas under positive pressure during inspiration until flow drops to a specified terminal level.

flow cytometry, a technique in which cells suspended in a fluid flow one at a time through a focus of exciting light, which is scattered in patterns characteristic to the cells and their components. They are often labeled with fluorescent markers so that light is first absorbed and then emitted at altered frequencies. A sensor detecting the scattered or emitted light measures the size and molecular characteristics of individual cells. Tens of thousands of cells can be examined per minute and the data gathered are processed by computer.

flower essences, aqueous extracts of the fresh flowers of various plants chosen for their effects on specific mental or emotional symptoms, combined with brandy as a preservative. They are used to address spiritual, mental, and emotional as well as physical problems.

flowmeter, a device that regulates and measures the flow of a fluid or gas. In an anesthetic gas machine it is the flowmeter that measures gases by speed of flow, according to their viscosity and density. Also called **rotameter** and Thorpe tube.

flow sheet, (in a patient record) a graphic summary of several changing factors, especially the patient's vital signs or weight and the treatments and medications given. In labor the flow sheet displays the progress of labor, including centimeters of cervical dilation, cervical effacement, position of the baby's head, baby's heart rate, frequency of contractions, mother's temperature and blood pressure, and medications given or procedures performed.

flow study. See **uroflowmetry.**

flow transducer, a measuring device that calculates volume by dividing flow by time.

flow trigger, a trigger for initiating assisted ventilation, consisting of a mechanism for measuring the patient's inspiratory effort and starting assisted ventilation when flow reaches a given level.

flow-volume curve, a graphic of the instantaneous rate of airflow during a forced expiration. It is plotted as a function of the volume. It may be a maximum expiratory flow-volume curve or a partial expiratory flow-volume curve.

flow-volume dysequilibrium, the lower than normal solute content of blood that has just gone through dialysis, which tends to draw solutes out of other fluid-containing body compartments, such as cells. Urea rebound is one result.

flow-volume loop, a graph of the rate of airflow as a function of lung volume during a complete respiratory cycle consisting of a forced inspiration followed by a forced expiration. The plotted curve appears as a loop and is used in assessing pulmonary function.

floxuridine /floksyo͝or′ədēn/, an antineoplastic agent.

■ INDICATIONS: It is prescribed in the treatment of metastases to the liver from colon, stomach, and other GI cancers.

■ CONTRAINDICATIONS: Bone marrow depression, infection, poor nutritional state, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects leading to drug discontinuation are severe depression of the bone marrow; acute GI disturbances, including nausea, vomiting, diarrhea, and stomatitis; and myocardial ischemia. Alopecia and dermatitis commonly occur.

fl. oz., abbreviation for **fluid ounce.**

flu /flo͞o/ *(informal)* **1.** influenza. **2.** any viral infection, especially of the respiratory or intestinal system.

fluctuant /fluk′cho͞o·ənt/, pertaining to a wavelike motion that is detected when a structure containing a liquid is palpated.

fluctuation /fluk·cho͞o·ā′shən/ [L, *fluctuare*, to wave], **1.** a wavelike motion of fluid in a body cavity that follows a shaking motion. **2.** a variation in a fixed value or mass.

flucytosine /flo͞osī′təsēn/, an antifungal.

■ INDICATIONS: It is prescribed as an adjunct in the treatment of certain serious fungal infections, usually ***Candida*** or ***Cryptococcus.***

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. Close monitoring is required when administering it to patients with renal disorders, bone marrow depression, or AIDS.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, including enterocolitis, abnormal liver function, hepatomegaly, and bone marrow depression. Also causes hallucinations, confusion and other CNS effects, respiratory depression, peripheral neuropathy, and hearing loss.

Fludara, a trademark for an antineoplastic **(fludarabine).**

fludarabine, an antimetabolite used to treat neoplasia.

■ INDICATIONS: It is prescribed in the treatment of patients with B cell chronic lymphocytic leukemia and as salvage therapy for non-Hodgkin's lymphoma and acute leukemias.

■ CONTRAINDICATIONS: It should not be given to patients who are pregnant or hypersensitive to this drug or its components. Patients should be closely observed for signs of hematologic and nonhematologic toxicity (e.g., edema, fatigue, myalgias).

■ ADVERSE EFFECTS: It is a potent antineoplastic agent with potentially significant side effects. The side effects most often reported include myelosuppression, fever and chills, nausea, and vomiting.

fludeoxyglucose F 18 /floo′de·ok′segloo′kōs/, radiolabeled 2-deoxy-D-glucose. It is used in positron emission tomography in the diagnosis of brain disorders, cardiac disease, and tumors of various organs.

fluency disorder. See **stuttering.**

fluent /flo͞o′ənt/ [L. *fluens* flowing], flowing effortlessly. It is said of speech.

-fluent, suffix meaning "flowing": *diffluent, ossifluent.*

fluent aphasia /flo͞o′ənt/ [L, *fluere,* to flow; Gk, *a,* not, *phasis,* speech], a form of aphasia in which the patient articulates words easily, although the message may be unintelligible or may not be related to a particular stimulus. Types include **Wernicke's aphasia** and **conduction aphasia.**

fluid /flo͞o′id/ [L, *fluere,* to flow], **1.** a substance, such as a liquid or gas, that is able to flow and to adjust its shape to that of a container because it is composed of molecules that are able to change positions with respect to each other without separating from the total mass. **2.** a body fluid, either intracellular or extracellular, involved in the transport of electrolytes and other vital chemicals to, through, and from tissue cells. See also **blood, cerebrospinal fluid, lymph.**

fluid balance^1, a state of equilibrium in which the amount of fluid consumed equals the amount lost in urine, feces, perspiration, and exhaled water vapor.

fluid balance^2, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as water balance in the intracellular and extracellular compartments of the body. See also **Nursing Outcomes Classification.**

fluid dram (fl. dr.), a unit of liquid measure equal to 3.696 mL, 60 minims, or ⅛ fluid ounce.

fluid/electrolyte management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as regulation and prevention of complications from altered fluid and/or electrolyte levels. See also **Nursing Interventions Classification.**

fluidic ventilator /flo͞o·id′ik/, a device used in respiratory therapy that applies the Coanda effect to the movement of the flow of air or gases. As the airstream passes a wall, a pocket of turbulence forms a low-pressure bubble next to the wall, causing the airstream to adhere to the wall. As a gas travels faster over the pocket of turbulence, the surrounding gas molecules not in the stream acquire a higher pressure, holding the stream against the wall. The gas flow tends to remain in that pattern until it is diverted by a different input pressure. See also **Coanda effect.**

fluidized air bed, a bed that minimizes pressure and distributes weight evenly over the support surface. A gentle flow of temperature-controlled air is projected upward through numerous tiny openings called ceramic microspheres. Also called **Clinitron bed.**

fluid management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of fluid balance and prevention of complications resulting from abnormal or undesired fluid levels. See also **Nursing Interventions Classification.**

fluid monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collection and analysis of patient data to regulate fluid balance. See also **Nursing Interventions Classification.**

fluidotherapy /flo͞o′idōther′əpē/, a modality of dry heat that uses a suspended airstream with the properties of a liquid. It simultaneously performs the functions of applied heat, massage, sensory stimulation, levitation, and pressure oscillations.

fluid ounce (fl. oz.), a measure of liquid volume in the apothecaries' system, which is equal to 8 fluid drams or 29 mL, 480 minims, $^{1}/_{20}$ imperial pint, or the volume occupied by 437.5 grains of distilled water at a temperature of 16.7° C. See also **apothecaries' measure, metric system.**

fluid overload, an excessive accumulation of fluid in the body caused by excessive parenteral infusion or deficiencies in cardiovascular or renal fluid volume regulation. Compare **circulatory overload, hypervolemia.**

fluid overload severity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of excess fluids in the intracellular and extracellular compartments of the body. See also **Nursing Outcomes Classification.**

fluid resuscitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administering prescribed intravenous fluids rapidly. See also **Nursing Interventions Classification.**

fluid retention, a failure to excrete excess fluid from the body. Causes may include renal, cardiovascular, or metabolic disorders. In uncomplicated cases the condition can sometimes be corrected with diuretics and a low-salt diet.

fluid therapy, the regulation of water balance in patients with impaired renal, cardiovascular, or metabolic function by careful measurement of fluid intake against daily losses.

fluid volume, the volume of the body fluids, including both intracellular fluid and extracellular fluid.

fluid volume imbalance, abnormally decreased or increased fluid volume or rapid shift from one compartment of body fluid to another.

fluke /flo͞ok/, a parasitic flatworm of the class Trematoda, including the genus ***Schistosoma.*** See also **schistosomiasis.**

flunisolide, an intranasal and oral inhalation adrenal corticosteroid.

■ INDICATIONS: It is prescribed in the treatment of seasonal or continuing allergic rhinitis that involves inflammation of the mucous membranes of the nasal passages and for the treatment of asthma.

■ CONTRAINDICATIONS: It should not be given to patients with allergy to this drug or any of its components or to patients with status asthmaticus or untreated bacterial, viral, or fungal infections of the respiratory tract or nasal mucosa.

■ ADVERSE EFFECTS: The side effects most often reported include nasal or throat irritation, stinging, burning, or dryness; nosebleed; sneezing; bloody mucus; congestion; asthma; increased coughing; sore throat; or lesions in the nose or throat.

fluocinolone acetonide /flo͞o′ōsin′əlōn/, a topical glucocorticoid.

■ INDICATION: It is prescribed for severe dermatoses.

■ CONTRAINDICATIONS: Impaired circulation, viral and fungal diseases of the skin, or known hypersensitivity to this drug or to other steroid medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are systemic side effects that result from prolonged use or excessive application. Various hypersensitivity reactions may occur.

fluocinonide /flo͞o′ōsin′ənīd/, a topical corticosteroid.

■ INDICATION: It is prescribed to reduce skin inflammation and the associated pruritus.

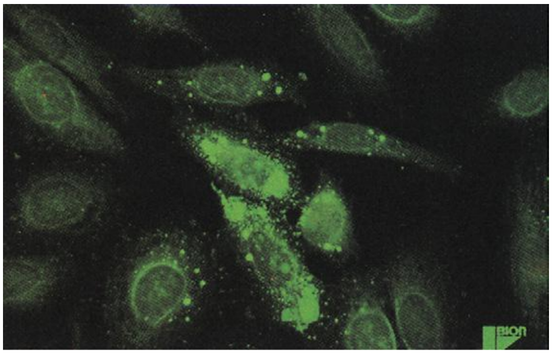
■ CONTRAINDICATIONS: Viral and fungal diseases of the skin, tuberculosis of the skin, or known hypersensitivity to this drug prohibits its use.

fluorescein dilaurate, an ester of fluorescein with two molecules of laurate, used in the pancreolauryl test of pancreatic function.

fluorescence /flo͝ores′əns/ [L, *flux*, a discharge], the emission of light of one wavelength by a substance when it is exposed to electromagnetic radiation of a shorter wavelength. Fluorescent substances that emit visible light appear luminous. **—fluoresce,** *v.*

fluorescent /flo͝ores′ent/, pertaining to or characterized by fluorescence.

fluorescent antibody test (FA test) /flo͝ores′ənt/, a test in which a fluorescent dye is used to stain an antibody for identification of clinical specimens. Fluorescent dyes conjugate with immunoglobulins without altering the antibody-antigen reaction, making the dyed organisms glow visibly when examined under a fluorescent microscope. The fluorescent antibody technique can be used in identification of *Mycobacterium tuberculosis* and in the most common serological screening test for syphilis. One kind of fluorescent antibody test is the **fluorescent treponemal antibody absorption test.** Also called **immunofluorescence test.**



Fluorescent antibody test showing mumps virus
(Courtesy Bion Enterprises, Ltd.)

fluorescent in situ hybridization (FISH), a genetic mapping technique using fluorescent tags for analysis of chromosomal aberrations and genetic abnormalities. Also called **chromosome painting.**

fluorescent microscopy, examination with a fluorescent microscope equipped with a source of ultraviolet light rays, used to study specimens, such as tissues or microorganisms, that have been stained with fluorescent dye. Also called **ultraviolet microscopy.** See also **fluorescent antibody test.**

fluorescent treponemal antibody absorption test (FTA-ABS test), the standard treponemal antigen test for syphilis. Nonspecific antibodies are removed from patient serum, which is then reacted with ***Treponema pallidum*** fixed to a glass slide. Specific antibodies adhering to the treponemes are demonstrated with fluorescein-labeled antihuman globulin. Positive tests are seen in about 85% of cases of primary syphilis, 100% in secondary syphilis, and 98% in late syphilis. The test remains positive for life even after syphilis has been successfully treated. See also **fluorescent antibody test.**

fluoridation /flo͝or′idā′shən/ [L, *fluere*, to flow], the process of adding **fluoride**, especially to a public water supply, to reduce tooth decay.

fluoride /flo͝or′īd/, an anion of fluorine. Fluoride compounds are introduced into drinking water or applied directly to the teeth to prevent tooth decay.

fluoride application, fluoride dental treatment [L, *fluere*, to flow, *dens*, tooth; Fr, *traitment*], the direct oral application of fluoride compounds to reduce the incidence of dental caries.

fluoride poisoning [L, *fluere*, to flow, *potio*, drink], **1.** See **fluorosis. 2.** the toxic effects of contact with compounds of fluorine, an intensely poisonous pale yellow gas. Sodium fluoroacetate is a powerful rodent poison; methyl fluoroacetate is regarded as too toxic to use as a pesticide. The fluoroacetate compounds inhibit enzymes of the citric acid cycle. Inhalation of hydrogen fluoride can lead to bronchospasm, laryngospasm, and pulmonary edema.

fluorination /flo͝or′inā′shən/, the addition of fluorine to a compound, such as those commonly found in topical corticosteroids.

fluorine (F) /flo͝or′ēn, flo͞o′ərēn/ [L, *fluere*, to flow], an element of the halogen family and the most reactive of the nonmetals. Its atomic number is 9, and its atomic mass is 19.00. It occurs in nature only as a component of substances such as fluorspar, cryolite, and phosphate rocks. It can be prepared by the electrolytic decomposition of hydrogen fluoride and in its pure form is a pale yellow toxic gas 1.6 times heavier than air. It is also a component of very stable fluorocarbons used in the manufacture of resins and plastics. As a component of fluorides, it is widely distributed throughout the soils of the earth, enters plants, is ingested by humans, and is absorbed from the GI tract. Fluorides in the atmosphere and industrial dust are absorbed by the lungs and the skin. Relatively soluble compounds, such as sodium fluoride, are almost completely absorbed by humans. The relatively insoluble compounds, such as cryolite, are poorly absorbed. Small amounts of sodium fluoride are added to the water supply of many communities to harden tooth enamel and decrease dental caries. Excessive amounts of fluoride can mottle tooth enamel and cause osteosclerosis. Acute fluoride poisoning and death can result from the accidental ingestion of insecticides and rodenticides containing fluoride salts.

fluoroacetic acid (FCH_2COOH) /flo͝or′ō·asē′tik, -aset′ik/, a colorless water-soluble, highly toxic compound that blocks the citric acid cycle, causing convulsions and ventricular fibrillation. It is derived from a South African tree and is used in some potent pesticides.

fluorocarbons /flo͝or′ōkär′bəns/ [L, *fluere,* to flow, *carbo,* coal], hydrocarbons where some or all of the hydrogens are replaced by fluorine. Fluorocarbons are generally colorless, nonflammable gases, but some are liquids at room temperature. The compounds can produce mild upper respiratory tract irritation, and excessive exposure has been cited as a cause of central nervous system depression.

fluorochrome stain, a fluorescent dye used to stain the cell walls of fungi and bacteria. The organisms then fluoresce when exposed to UV light rays. It is commonly used to visualize acid-fast bacilli (mycobacteria) in specimens. An example is acridine orange stain or **auramine O.**

fluorodopa F 18 /floor′odo′pə/, a radiolabeled compound of fluorine and levodopa, used for positron emission tomography of the cerebrum.

fluorometry /flo͝orom′ətrē/ [L, *fluere* + Gk, *metron,* measure], measurement of fluorescence emitted by compounds when exposed to ultraviolet or other intense radiant energy. The atoms of certain substances produce fluorescence of a characteristic color and wavelength, allowing identification and quantification of several clinically significant compounds in biological specimens. Although fluorometry is a highly sensitive method of analysis, test interference by other compounds, especially drugs, may limit its usefulness in some situations. **—fluorometric,** *adj.*

Fluoroplex, a trademark for a topical preparation of the antineoplastic drug **fluorouracil.**

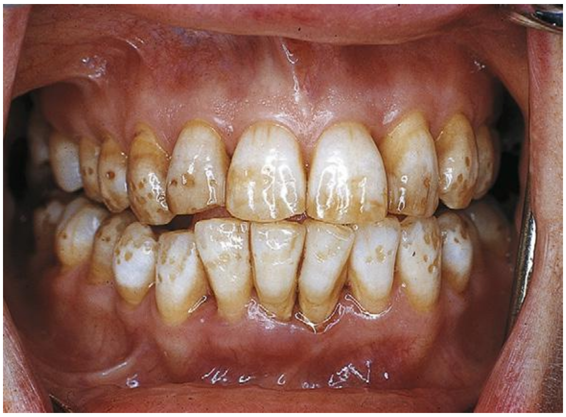
fluoroquinolone /flo͝o′okwin′olōn/, any of a subgroup of quinolones that contain one or more fluorine atoms attached to the central ring system that have a broader spectrum of antibiotic activity than quinolones. Examples include **nalidixic acid** and ciprofloxacin (Cipro).

fluoroscope /flo͝or′əskōp′/ [L, *fluere* + Gk, *skopein,* to look], a device used to project a radiographic image on a fluorescent screen for visual examination. **—fluoroscopic,** *adj.*

fluoroscopic compression device /flo͝or′əskop′ik/, any of several objects that can be placed on a specific area of a patient's abdomen to compress the abdomen and separate loops of bowel during fluoroscopy of the digestive tract.

fluoroscopy /flo͝oros′kəpē/, the visual examination of a part of the body or the function of an organ with a fluoroscope. The technique offers continuous imaging of the motion of internal structures and immediate serial images. It is invaluable in many clinical procedures, such as intrauterine fetal transfusion and cardiac catheterization.

fluorosis /flo͝orō′sis/ [L, *fluere* + Gk, *osis,* condition], the condition that results from excessive prolonged ingestion of fluorine. Unusually high concentration of fluorine in the drinking water typically causes mottled discoloration and pitting of the enamel of the secondary and primary dentition in children whose teeth developed while maternal intake of fluorinated water was high. Severe chronic fluorine poisoning leads to osteosclerosis and other pathological bone and joint changes in adults. See also **fluoridation, fluoride.**



Fluorosis *(Regezi, Sciubba, and Pogrel, 2000)*

fluorouracil /flo͝or′ōyo͝or′əsil/, an antimetabolite antineoplastic.

■ INDICATIONS: It is prescribed in the treatment of malignant neoplastic disease of the skin, breast, and internal organs.

■ CONTRAINDICATIONS: Bone marrow depression, infection, poor nutritional status, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are severe depression of the bone marrow and acute GI disturbances, including nausea, vomiting, diarrhea, and stomatitis. Alopecia and dermatitis commonly occur. Effects of topical application include photosensitivity, rash, and scarring.

Fluothane, a trademark for an inhalational general anesthetic **(halothane).**

fluoxetine hydrochloride /flo͞o·ok′sətēn/, an oral antidepressant that acts by selectively preventing serotonin re-uptake.

■ INDICATIONS: It is prescribed for major depressive disorder, obsessive-compulsive disorder, and bulemia nervosa.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Serious adverse effects include seizures, hemorrhage, tachycardia, bradycardia, myocardial infarction, and thrombophlebitis.

fluoxymesterone /flo͞o·ok′simes′tərōn/, an androgenic and anabolic steroid.

■ INDICATIONS: It is prescribed in the treatment of testosterone deficiency, breast cancer in females, and delayed puberty in males.

■ CONTRAINDICATIONS: Male breast or prostate cancer, liver disease, known or suspected pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: It commonly causes priapism in males, menstrual irregularities in females, edema, and acne. Among the more serious adverse effects are anaphylaxis, hypercalcemia, and jaundice.

flupenthixol decanoate, a long-acting ester of flupenthixol, administered intramuscularly as a depot injection.

flupenthixol hydrochloride, the hydrochloride salt of flupenthixol, administered orally.

fluphenazine hydrochloride /flo͝ofen′əzēn/, a phenothiazine antipsychotic drug.

■ INDICATIONS: It is prescribed in the treatment of schizophrenia and other psychotic disorders.

■ CONTRAINDICATIONS: Parkinson's disease, concurrent administration of central nervous system depressants, liver or renal dysfunction, severe hypotension, or known hypersensitivity to this drug or to other phenothiazine medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, liver toxicity, a variety of extrapyramidal reactions, blood dyscrasias, and hypersensitivity reactions. It also interacts with many other drugs.

flurandrenolide /flo͞o′rəndren′əlīd/, a topical glucocorticoid.

■ INDICATION: It is prescribed for the treatment of skin inflammation.

■ CONTRAINDICATIONS: Impaired circulation, viral and fungal diseases of the skin, or known hypersensitivity to this drug or to steroid medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are systemic side effects that result from prolonged use or excessive application and hypersensitivity.

flurazepam hydrochloride /flo͝oraz′əpam/, a benzodiazepine sedative-hypnotic agent.

■ INDICATION: It is prescribed in the short-term treatment of insomnia.

■ CONTRAINDICATIONS: Liver or kidney insufficiency, sleep apnea, and known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are possible physical and psychological dependence. Dizziness and drug hangover may also occur, and there have been instances of anterograde amnesia with aggressive behavior.

flurbiprofen /flo͝orbi′profen/, a nonsteroidal antiinflammatory drug, administered orally in the treatment of arthritis, ankylosing spondylitis, bursitis, tendinitis, soft tissue injuries, and dysmenorrhea. The sodium salt is applied topically to the conjunctiva to inhibit miosis during, and inflammation after, ophthalmic surgery.

flurbiprofen sodium, the sodium salt of flurbiprofen, applied topically to the conjunctiva to inhibit miosis during, and as an antiinflammatory after, ophthalmic surgery.

flush [ME, *fluschen*], **1.** a blush or sudden reddening of the face and neck. **2.** a sudden subjective feeling of heat. **3.** a prolonged reddening of the face such as may be seen with fever, use of certain drugs, or hyperthyroidism. **4.** a sudden rapid flow of water or other liquid.

flush device, an apparatus in a hemodynamic monitoring system used to infuse normal saline to remove air bubbles, clear blood, and assure line patency. This ensures transmission of a clear pressure wave from a catheter to a transducer to provide accurate arterial or venous pressure measures.

flutamide, a hormonal (antiandrogen) antineoplastic agent.

■ INDICATIONS: It is prescribed along with leuprolide in the treatment of metastatic prostate cancer and other cancers stimulated by male hormones and is sometimes used to treat female hirsutism.

■ CONTRAINDICATIONS: It should not be given to patients who are allergic to the product. Hormonal medications should be avoided or used with extreme caution by women who are breastfeeding or who may be pregnant. Anticoagulants may interact with flutamide.

■ ADVERSE EFFECTS: The side effects most often reported include hot flashes, loss of sex drive, impotence, nausea, vomiting, breast enlargement, and stomach upset.

fluticasone /flo͝otik′äsōn′/, a steroid antiinflammatory agent, used topically as the propionate salt in treatment of itching or inflammation, intranasally in the treatment of allergic rhinitis and other inflammatory nasal conditions and of nasal polyps, and by inhalation in treatment of asthma.

flutter, a rapid vibration or pulsation that may interfere with normal function.

flutter-fibrillation [AS, *fleotan,* to move quickly; L, *fibrilla,* small fiber], a type of atrial fibrillation (involuntary recurrent contraction) in which the irregular fibrillatory line resembles atrial flutter mixed with atrial fibrillatory waves.

fluvastatin, an antilipidemic.

■ INDICATIONS: It is used as an adjunct treatment in primary hypercholesterolemia (types Ia and Ib) and in coronary atherosclerosis associated with coronary artery disease.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to this drug, pregnancy, lactation, and active liver disease.

■ ADVERSE EFFECTS: Life-threatening effects are liver dysfunction, myositis, rhabdomyolysis, thrombocytopenia, hemolytic anemia, and leukopenia. Other adverse effects include rash, pruritus, nausea, constipation, diarrhea, dyspepsia, flatus, pancreatitis, lens opacities, myalgia, headache, dizziness, insomnia, fatigue, influenza, upper respiratory infection, rhinitis, cough, pharyngitis, and sinusitis.

fluvoxamine /flo͝ovok′sämēn/, a selective serotonin reuptake inhibitor used as the maleate salt to relieve the symptoms of obsessive-compulsive disorder, administered orally.

fluvoxamine maleate, an antidepressant drug with selective inhibitory action in neuronal serotonin reuptake.

■ INDICATIONS: It is prescribed in the treatment of obsessive-compulsive disorder in adult patients and has unlabeled uses for treating depression and panic attacks in adults, and anxiety in children.

■ CONTRAINDICATIONS: It should not be given to patients with allergy to fluvoxamine maleate, patients who use monoamine oxidase inhibitors, or patients with a history of seizures, suicide attempts, or mania.

■ ADVERSE EFFECTS: The side effects most often reported include headache, sleepiness or insomnia, nausea, vomiting, and sexual dysfunction.

flux /fluks/ [L, *fluere,* to flow], **1.** an excessive flow or discharge. **2.** a substance that maintains the cleanliness of metals to be united and facilitates the easy flow and attachment of solder.

flux gain /fluks/, the ratio of the number of light photons at the output phosphor of a radiographic image intensifier tube to the number at the input phosphor.

fly [AS, *flyge*], a two-winged insect of the order Diptera, some species of which transmit arboviruses to humans.

fly bites, bites that may be caused by species of deerflies, horseflies, blackflies, or sand flies. Such bites produce a small painful wound with swelling caused by substances in the insect's saliva that are injected beneath the surface of the skin. Emergency treatment for fly bites includes cleaning the site and placing ice on it. The bite should be monitored for possible infections, as biting flies often transmit diseases.

Fm, symbol for the element **fermium.**

FMD, abbreviation for **fibromuscular dysplasia.**

FMET, abbreviation for **formylmethionine.**

FMG, abbreviation for **foreign medical graduate.**

FMIA, abbreviation for **Frankfurt-mandibular incisor angle.**

FML, a trademark for an ophthalmic glucocorticoid agent (fluorometholone).

FMR-1, the symbol for a gene associated with a mental retardation disorder of the **fragile X syndrome.** The normal function of the gene has not been determined.

fMRI, abbreviation for **functional magnetic resonance imaging.**

FNP, abbreviation for **family nurse practitioner.**

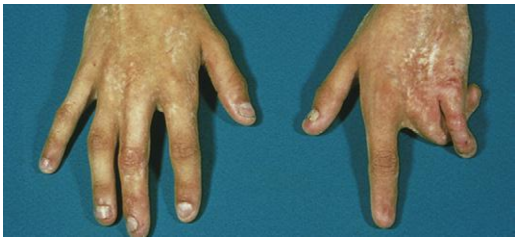
foam /fōm/ [A.S. *fām*], **1.** *n.* a dispersion of gas in a liquid or solid, such as pumice or whipped cream. **2.** *n.* frothy saliva, produced particularly on exertion or pathologically. **3.** *v.* to produce or cause production of such a substance.

foam bath [AS, *fam* + *baeth*], a bath taken in water containing a saponin substance that covers the surface of the liquid and through which air or oxygen is blown to form the foam.

foam test. See **shake test.**

focal /fō′kəl/ [L, *focus,* hearth], pertaining to a focus.

focal dermal hypoplasia, an autosomal-dominant X-linked disorder found exclusively in females, characterized by linear areas of dermal hypoplasia with herniation of underlying tissue through the defects. There are also telangiectasias, areas of discoloration, localized fatty deposits, papillomas of mucous membranes around orifices, and limb anomalies such as syndactyly, adactyly, and oligodactyly. Also called **Goltz's syndrome.**



Focal dermal hypoplasia *(Hordinsky, Sawaya, and Scher, 2000)*

focal emphysema, centriacinar emphysema associated with inhalation of environmental dusts, producing dilation of the terminal and respiratory bronchioles. Also called *focal dust emphysema*.

focal glomerular sclerosis, focal sclerosing lesions of renal glomeruli with proteinuria, hematuria, hypertension, and the nephrotic syndrome. It may be idiopathic or secondary to other conditions, including heroin-abuse nephropathy, chronic interstitial nephritis, and malignancies. Exacerbations and remissions may occur, most often in children; progression to renal failure occurs at a variable and unpredictable rate. Also called *focal glomerulosclerosis*.

focal illumination. See **illumination.**

focal lesion [L, *focus* hearth + *laesio,* hurting], an infection, tumor, or injury that develops at a restricted or circumscribed area of tissue.

focal plane, the plane of tissue that is in focus on a tomogram.

focal point [L, *focus, punctus,* pricked], a point at which rays of light meet when deflected, either by reflection or refraction.

focal seizure [L, *focus,* hearth; OFr, *seisir*], a transitory disturbance in motor, sensory, or autonomic function that results from abnormal neuronal discharges in a localized part of the brain, most frequently motor or sensory areas adjacent to the central sulcus. Focal motor seizures commonly begin as spasmodic movements in the hand, face, or foot. Abnormal neuronal discharges that arise in the motor area that controls mastication and salivation may be manifested by chewing, lip smacking, swallowing movements, and profuse salivation. Abnormal electrical activity in the sensory strip of the cortex may be evident initially as a numb, prickling, tingling, or crawling feeling, and the neuronal discharge may spread to motor areas. See also **epilepsy, motor seizure.**

focal spot, the area on the anode of an x-ray tube or the target of an accelerator that is struck by electrons and from which the resulting x-rays are emitted. The shape and size of a focal spot influence the resolution of a radiographic image. An increase in focal spot size, which may accompany deterioration of the x-ray tube, reduces the ability to define small structures. Also called **actual focal spot.**

focal symptom [L, *focus,* hearth; Gk, *symptoma,* that which happens], a body function disturbance centered on a specific body system or part.

focal zone, in ultrasonography, the distance along the beam axis of a focused transducer assembly, from the point where the beam area first becomes equal to four times the focal area to the point beyond the focal surface where the beam area again becomes equal to four times the focal area.

-focon, suffix for hydrophobic contact lens material.

focus /fō′kəs/ [L, hearth], **1.** a specific location, as the site of an infection or the point at which an electrochemical impulse originates. **2.** the point at which light rays converge after passing through a lens.

focused activity /fō′kəst/, a therapeutic technique of actively leading the patient to adaptive coping skills and away from maladaptive ones.

focused grid, an x-ray grid that has lead foils placed at an angle so that they all point to a focus at a specific distance.

foetal. See **fetus.**

foeti-, foeto-. See **feti-.**

foetus. See **fetus.**

Fogarty catheter, a type of balloon-tip catheter used to remove thrombi and emboli from blood vessels.

fogged film fault /fogd/ [Dan, *spray* + AS, *filmen,* membrane; L, *fallere,* to deceive], a defect in a photograph or radiograph that appears as a foggy area. It is usually caused by stray light or radiation, use of expired film, or an unsafe darkroom light. See also **artifact.**

fogging [ME, *fogge*], an optical method of determining refractive error by placing excessively convex lenses in front of the eyes. The patient is made artificially hyperopic by means of the spheres in order to relax all accommodation.

fog nebulizer /neb′yəlī′zer/, (in respiratory care) a device that humidifies by producing large volumes of particles.

foil pellet, a loosely rolled piece of gold foil, used for making various dental restorations, such as permanent tooth cavity fillings and tooth crowns. See also **gold foil.**

folacin. See **folic acid.**

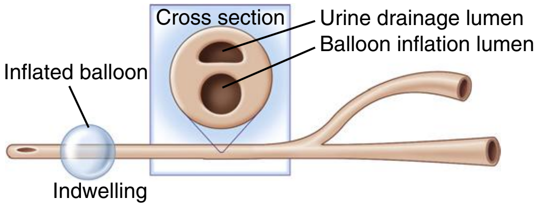
folate /fō′lāt/, **1.** a salt of folic acid. **2.** any of a group of substances found in some foods and in mammalian cells that act as coenzymes and promote the chemical transfer of single carbon units from one molecule to another. See also **folic acid.**

folate deficiency, a deficiency of folic acid. See also **folic acid.**

fold. See **plica.**

folded cravat sling, a bandage suspended from the neck, usually for supporting a forearm. It is prepared by placing a broad fold of cloth on the chest vertically with one end over the shoulder of the affected arm. The other end hangs in front of the chest, and the lower end is moved up and over the shoulder and tied.

Foley catheter /fō′lē/ [Frederick E.B. Foley, American physician, 1891–1966], a rubber catheter with a balloon tip that is filled with a sterile liquid after it has been placed in the bladder. This kind of catheter is used when continuous drainage of the bladder is desired, such as in surgery, or when repeated urinary catheterization would be necessary if an indwelling catheter were not used. Sterile technique is used in placing the catheter. See also **catheterization.**



Foley catheter *(Harkreader, Hogan, and Thobaben, 2007)*

Foley Y-V pyeloplasty, pyeloplasty for repair of an obstructed and high ureteropelvic junction. A V-shaped flap is made from part of the renal pelvis and inserted into a Y-shaped incision whose angle is at the junction.

foliate papillae /fō′lē·āt/, a series of nipplelike processes that occur in folds along the lateral margins and in the front of the palatoglossus muscle of the tongue.

folic acid (FA) /fō′lik, fol′ik/, a yellow crystalline water-soluble vitamin essential for cell growth and reproduction. It functions as a coenzyme with vitamins B_{12} and C in the metabolism and use of proteins and in the formation of nucleic acids and heme for hemoglobin. Deficiency results in poor growth, graying of hair, glossitis, stomatitis, GI lesions, and diarrhea, and it may lead to megaloblastic anemia. Deficiency is caused by inadequate dietary intake of the vitamin, malabsorption, metabolic abnormalities, or drug-nutrient interactions. Need for folic acid increases in pregnancy, infancy, and periods of stress. A daily intake of 400 mg before conception and during early pregnancy has been found to lower the risk of fetal neural tube defects. Rich dietary sources include spinach and other green leafy vegetables, liver, kidney, asparagus, lima beans, nuts, orange juice, and whole-grain cereals. It is both heat- and light-labile, and considerable loss of the vitamin occurs during cooking and when it has been stored for a long period. Also called **folacin, pteroylglutamic acid, vitamin B_9.**

folic acid deficiency anemia, a form of megaloblastic (macrocytic) anemia caused by a lack of folic acid in the diet.

folic acid test (folate), a blood test performed to evaluate hemolytic disorders and to detect anemia caused by folic acid deficiency.

folie /fōlē′/ [Fr, madness], a psychiatric condition in a person who has previously been in good mental health. Kinds of folie include **folie à deux, folie circulaire, folie du doute, folie du pourquoi, folie gemellaire, folie musculaire,** and **folie raisonnante.**

folie à deux. See **shared paranoid disorder.**

folie circulaire. See **bipolar disorder.**

folie du doute /dYdo͞ot′/ [Fr, madness of doubts], an extreme obsessive-compulsive reaction characterized by persistent doubting, vacillation, repetition of a particular act or behavior, and pathological indecisiveness to the point of being unable to make even the most trifling decision.

folie du pourquoi /dYpo͞orkwô·ä′/ [Fr, madness of why], a psychopathological condition characterized by the persistent tendency to ask questions, usually concerning unrelated topics.

folie gemellaire /zhemeler′/ [Fr, madness in twins], a psychotic condition that occurs simultaneously in twins, sometimes in those not living together or closely associated at the time.

folie musculaire /mYskYler′/, severe chorea.

folie raisonnante /rezônäNt′/ [Fr, deliberating reason], a delusional form of any psychosis marked by a thought process that seems logical but lacks common sense.

folinic acid /fōlin′ik/, an active form of folic acid. It is used to treat megaloblastic anemias that are not caused by vitamin B_{12} deficiency and to counteract the toxic effects of antineoplastic folic acid antagonists, such as methotrexate. Also called **citrovorum factor, leucovorin.**

folk illnesses /fōk/, health disorders that are attributed to nonscientific causes. The major categories are naturalistic illnesses, caused by impersonal factors such as yin-yang forces, and personalistic illnesses, caused by evil eye or other "magic."

follicle /fol′ikəl/ [L, *folliculus,* small bag], **1.** a small, secretory sac, such as the dental follicles that enclose the teeth before eruption or the hair follicles within the epidermis. **2.** a fluid- or colloid-filled ball of cells in some glands such as the thyroid and the ovaries.**—follicular,** *adj.*

follicle recruitment, the process by which certain primordial ovarian follicles begin growing in a given menstrual cycle.

follicles of Lieberkühn. See **Lieberkühn's glands.**

follicle-stimulating hormone (FSH), a gonadotropin that stimulates the growth and maturation of graafian follicles in the ovary and promotes spermatogenesis in the male. It is secreted by the anterior pituitary gland. FSH-releasing hormone produced in the median eminence of the hypothalamus controls the release of FSH by the pituitary. Increasing amounts of FSH are secreted in the postmenstrual or resting phase of the menstrual cycle, causing a primordial follicle to develop into a mature graafian follicle containing a mature ovum. The graafian follicle produces estrogen, which reaches a high level before ovulation and suppresses release of FSH. In males FSH maintains the integrity of the seminiferous tubules and influences all the stages of spermatogenesis. It may be used to treat some conditions. One form with luteinizing hormone **(menotropins)** is derived from the urine of postmenopausal women.

follicle-stimulating hormone–releasing factor (FSH-RF) [L, *folliculus,* small bag, *stimulare,* to incite; Gk, *horaein,* to set in motion], a hormone from the hypothalamus that stimulates the synthesis and release of FSH and luteinizing hormone from the anterior pituitary. See also **gonadorelin acetate.**

follicle-stimulating hormone surge, a sharp increase in serum levels of follicle-stimulating hormone seen around the middle of the menstrual cycle about 1 to 2 days before ovulation.

follicular /fōlik′yo͞olər/ [L, *folliculus,* small bag], of or pertaining to a follicle or follicles.

follicular adenocarcinoma /fōlik′yələr/, a neoplasm characterized by a follicular arrangement of cells often seen in the thyroid gland, occurring most often in older individuals. The follicular thyroid carcinoma has a tendency to metastasize distantly to the lungs and bones. Surgery is the preferred treatment. If complete excision of the primary tumor is not feasible, radioiodine therapy is indicated. See also **medullary carcinoma, papillary adenocarcinoma.**

follicular antrum, a cavity filled with follicular fluid on one side of a vesicular ovarian follicle in its later stages of growth just before ovulation.

follicular cyst, a tooth-forming sac that arises from the epithelium of a tooth bud and dental lamina. The kinds of follicular cysts are dentigerous, multilocular, and primordial.

follicular goiter, an enlargement of the thyroid gland characterized by proliferation of the follicles and epithelial tissue.

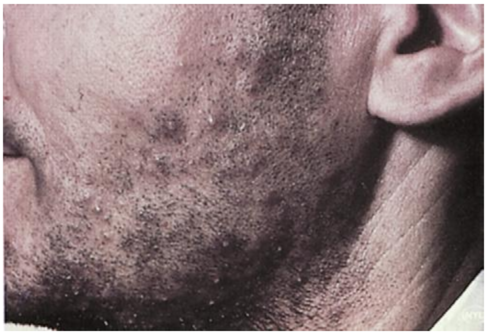
follicular phase, the long phase constituting the first half of the human menstrual cycle. As the menstrual flow ceases, the ovarian follicle continues its development started at the end of the previous cycle and increases its production of inhibin B and estradiol. The endometrium is stimulated by increasing levels of estrogen and increases in thickness to prepare for possible reproduction. At the end of this phase the luteinizing hormone surge and follicle-stimulating hormone surge begin, signaling the start of the ovulatory phase.

follicular stigma, a spot on the surface of an ovary where the vesicular ovarian follicle will rupture and permit passage of the ovum during ovulation. Also called **macula folliculi.**

follicular tonsillitis [L, *folliculus,* a small bag, *tonsilla* + Gk, *itis,* inflammation], inflammation of the tonsils accompanied by a purulent infection of the tonsillar crypts.

follicular vulvitis [L, *folliculus,* a small bag, *vulva,* a wrapper; Gk, *itis,* inflammation], an inflammation of the skin follicles of the vulva.

folliculitis /fōlik′yŏŏlī′tis/, inflammation of hair follicles, caused by an infection, such as in sycosis barbae.



Folliculitis *(Courtesy American Academy of Dermatology and Institute for Dermatologic Communication and Education)*

folliculitis keloidalis. See **keloid acne.**

folliculogenesis /fōlik′yəlōjen′əsis/, **1.** the stimulation of follicle development in the ovary by hormones or drugs. **2.** the development of follicles in the ovary, normally under the influence of the follicle-stimulating hormone secreted by the anterior pituitary gland.

folliculoma. See **granulosa cell tumor.**

folliculosis /fōlik′yŏŏlōsis/, a condition characterized by the development of a large number of lymph follicles, which may or may not be associated with an infection. In conjunctival folliculosis the large number of lymph follicles may give the conjunctival sac a granular appearance.

follitropin /folitro′pin/, a follicle-stimulating hormone. **Follitropin alfa** and **follitropin beta** are forms produced by genetically modified hamster cells and used in the treatment of infertility.

follitropin alfa/follitropin beta, an ovulation stimulant.

■ INDICATIONS: It is used to induce ovulation during assisted reproductive technologies such as in vitro fertilization.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity, pregnancy, undiagnosed vaginal bleeding, intracranial lesion, and ovarian cyst not caused by polycystic ovarian disease.

■ ADVERSE EFFECTS: Life-threatening effects are birth defects and spontaneous abortion. Other adverse effects include malaise, nausea, vomiting, constipation, increased appetite, abdominal pain, rash, dermatitis, urticaria, alopecia, polyuria, urinary frequency, multiple ovulation, and breast pain.

follow-up, **1.** an act of renewing contact with sources of information and reviewing data needed to reinforce or evaluate a previous action or report, such as reexamination of an earlier diagnosis or prognosis. **2.** some further action taken after a procedure is finished, such as contact by a health care agency days or weeks after a patient has undergone treatment.

fomentation /fō′mentā′shən/ [L, *fomentare,* to apply a poultice], **1.** a topical treatment for pain or inflammation that uses a warm, moist application. **2.** a substance or poultice that is used as a warm, moist application.

fomite /fō′mīt/ [L, *fomes,* tinder], nonliving material such as bed linen that may transmit microorganisms.

fomivirsen /fomiv′ersin/, an antiviral agent administered by intravitreal injection in the treatment of cytomegalovirus retinitis associated with acquired immunodeficiency syndrome (AIDS); used as the sodium salt.

fondaparinux, an anticoagulant, antithrombotic agent used for the prevention of deep-vein thrombosis and pulmonary emboli in hip and knee replacement and hip fracture surgery.

Fones' method /fōnz/ [Alfred C. Fones, American dentist, 1869–1938], a toothbrushing technique that uses large, sweeping, scrubbing circles over occluded teeth, with the toothbrush held at right angles to the tooth surfaces. With the jaws parted, the palatal and lingual surfaces of the teeth are scrubbed in smaller circles. Occlusal surfaces of the teeth are scrubbed in an anteroposterior direction.

Fonsecaea /fon′sese′ə/, a genus of imperfect fungi. *F. compactum* and *F. pedrosoi* are causal agents of chromoblastomycosis.

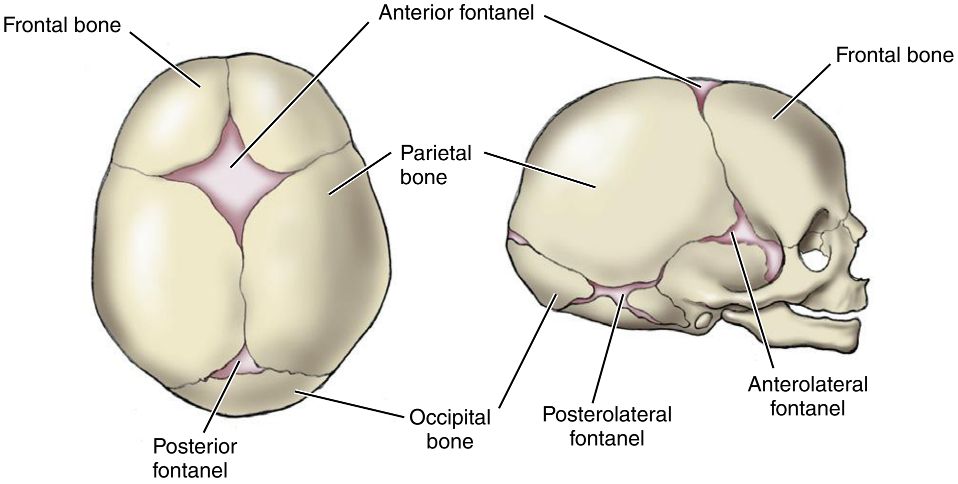
font, a set of type of one size and face.

fontanel /fon′tənel′/ [Fr, *fontaine,* fountain], a space covered by tough membranes between the bones of an infant's cranium. The anterior fontanel, roughly diamond-shaped, usually closes between the ages of 12 and 18 months. The posterior fontanel, triangular in shape, closes about 2 to 3 months after birth. Increase in intracranial pressure may cause a fontanel to become tense or bulge, as evidenced in infection such as meningitis. A fontanel may be soft and depressed as a result of dehydration. Also spelled *fontanelle, fonticulus.*

food [AS, *foda*], **1.** any substance, usually of plant or animal origin, consisting of carbohydrates, proteins, fats, and such supplementary elements as minerals and vitamins, that is ingested or otherwise taken into the body and assimilated to provide energy and to promote the growth, repair, and maintenance essential for sustaining life. **2.** nourishment in solid form, as contrasted with liquid form. **3.** a particular kind of solid nourishment, such as breakfast food or snack food.

food additive, any of a large variety of substances added to foods to prevent spoilage, improve appearance, enhance flavor or texture, or increase nutritional value. Most food additives must be approved by the U.S. Food and Drug Administration to determine whether they can cause cancer, birth defects, or other health problems. Examples include butylated hydroxyanisole and butylated hydroxytoluene in vitro, antioxidants that are added to fats to retard rancidity.

food allergy, a hypersensitive state that results from the ingestion, inhalation, or other contact with a specific food antigen. Symptoms of sensitivity to specific foods can include allergic rhinitis, bronchial asthma, urticaria, angioneurotic edema, dermatitis, pruritus, headache, labyrinthitis and conjunctivitis, nausea, vomiting, diarrhea, pylorospasm, colic, spastic constipation, mucous colitis, and perianal eczema. Food allergens are protein in nature and elicit an immunoglobulin response. The most common foods that cause allergic reactions are wheat, milk, eggs, fish and other seafoods, chocolate, corn, nuts (particularly peanuts), strawberries, chicken, pork, legumes, tomatoes, cucumbers, garlic, and citrus fruits. Foods that are rarely allergenic are rice, lamb, gelatin, peaches, pears, lettuce, artichokes, sesame oil,



Fontanels *(Herlihy, 2011)*

and apples. Diagnosis of a specific food allergy is obtained by a detailed food history, food diary, elimination diet, cutaneous tests, and blood examination for an immunoglobulin response. Compare **gastrointestinal allergy.**

Food and Drug Administration (FDA), a U.S. federal agency responsible for the enforcement of federal regulations on the manufacture and distribution of food, drugs, medical devices, and cosmetics. The regulations are intended to prevent the sale of impure or dangerous substances.

food and drug interactions, adverse health effects of certain combinations of foods and medications. Examples include reduced activity of drug-metabolizing enzymes (e.g., grapefruit juice is an inhibitor), and interference with the absorption of the drug (e.g., calcium inhibits tetracycline absorption from the GI tract).

food-borne botulism. See **botulism.**

food chain [AS, *foda* + *chaine*], an ecological sequence in which the various organisms within a community subsist on organisms lower in the sequence, as the human eats the fish that eats the worm, and so on. Each level within the chain has a fundamental role, and destruction of any one member affects the rest of the chain negatively.

food challenge, a challenge test for determining food allergens. A small amount of a lyophilized preparation of the suspected allergen is administered orally, and the patient is monitored for reactions such as rash, rhinorrhea, or diarrhea. Also called *food challenge test*.

food contaminants /kəntam′inənts/, substances that make food unfit for human consumption. Examples include bacteria, toxic chemicals, carcinogens, teratogens, and radioactive materials. Basically harmless substances, such as water, that may be added to food to increase its weight are also regarded as contaminants.

food exchange list. See **Exchange Lists for Meal Planning.**

food poisoning, any of a large group of toxic processes that result from the ingestion of a food contaminated by toxic substances or by bacteria that contain toxins. Kinds of food poisoning include **ciguatera poisoning, Minamata disease, mushroom poisoning, *Salmonella* gastroenteritis,** and **shellfish poisoning.** See also **botulism, ergot alkaloid, phalloidine, toadstool poisoning.**

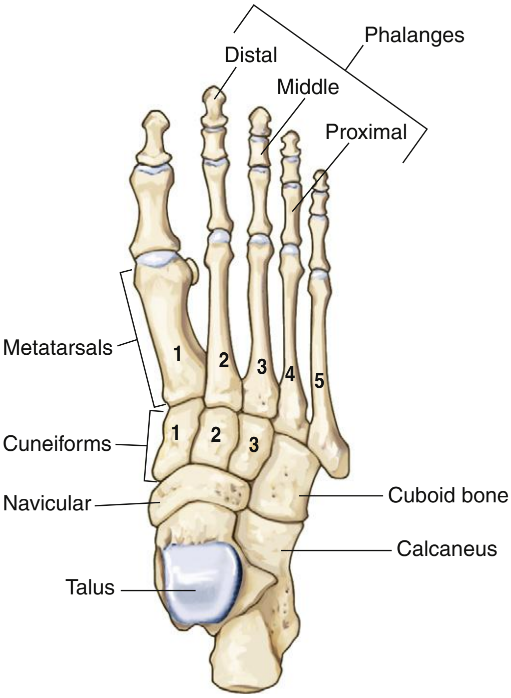
food pyramid, a diagrammatic proportional representation of human nutritional needs updated in 2005 by the U.S. Department of Agriculture to replace the previous food pyramid created in 1992. Replaced in 2011 with the "My Plate" icon.

food sensitivity/hypersensitivity reaction, sensitivity to food items that is not a food allergy and does not involve the immune system. See also **food allergy.**

food service administrator, a member of a hospital staff who is responsible for the planning and management of the food service system of the facility.

food service department, the section of a hospital or similar health facility that is responsible for food preparation and services to patients and personnel. It also provides nutritional care to patients.

foot [AS, *fot*], the distal extremity of the leg, consisting of the tarsus, the metatarsus, and the phalanges.



Bones of the foot *(Patton and Thibodeau, 2010)*

foot-and-mouth disease, an acute extremely contagious rhabdovirus, specifically vesicular stomatitis virus, infection, primarily of cloven-hooved animals. It is characterized by the development of ulcers on the skin around the mouth, on the mucous membrane in the mouth, and on the udders. Horses are immune. The virus is transmitted to humans by direct contact with infected animals or their secretions or with contaminated milk, although this is rare. It should not be confused with hand-foot-and-mouth disease, which is caused by a different virus (coxsackie A). Symptoms and signs in humans include headache, fever, malaise, and vesicles on the tongue, oral mucous membranes, hands, and feet. Generalized pruritus and painful ulcerations may occur; however, the temperature soon falls, the lesions subside in about a week, and total healing without scars is complete by 2 or 3 weeks. Treatment is symptomatic. Also called **aphthous fever.** See also **picornavirus.**

footboard, a board, device or open box placed at the end of a patient's bed and at a level above the top of the mattress to prevent the weight of the top sheet and blankets from resting on the feet. It is situated so that the soles of the feet are positioned firmly against the board with the legs at right angles to it. Its purposes are to help the bedridden patient retain normal posture and prevent footdrop.

Footboard *(Courtesy J. T. Posey, Co.)*

foot-candle /fo͝ot′kandəl/ [AS, *fot;* L, *candela,* light], a unit of illumination being 1 lumen per square foot or equivalent to 1.0764 milliphots. Compare **lux.** See also **phot.**

foot care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as cleansing and inspecting the feet for the purposes of relaxation, cleanliness, and healthy skin. See also **Nursing Interventions Classification.**

footdrop /fo͝ot′drop/ [AS, *fot* + *dropa*], an abnormal neuromuscular condition of the lower leg and foot characterized by an inability to dorsiflex, or evert, the foot, caused by damage to the common peroneal nerve.

-footed, suffix meaning "having feet" of a specified sort or number: *clubfooted, flatfooted, four-footed.*

footling breech [AS, *fot* + ME, *brech*], an intrauterine position of the fetus in which one or both feet are positioned below the buttocks at the inlet of the maternal pelvis. One foot presents in a **single footling breech**, both in a double footling breech. Compare **frank breech.** See also **breech birth.**

foot-pound, a unit for the measurement of work or energy. One foot-pound is the amount of work required to move 1 pound a distance of 1 foot in the same direction as that of the applied force.

footprinting, a method for determining the location of binding between a protein and a DNA molecule. The technique involves nuclease digestion of the unbound and therefore unprotected sequences of DNA. The protected DNA fragment that remains can be identified electrophoretically.

for-, prefix meaning "an opening": *foramen, foramina, foration.*

foramen /fôrā′mən/ *pl.* **foramina** [L, hole], an opening or aperture in a membranous structure or bone, such as the apical dental foramen and the carotid foramen.

foramen caecum, a foramen immediately posterior to the frontal crest that may transmit emissary veins connecting the nasal cavity with the superior sagittal sinus.

foramen diaphragmatis. See **pacchionian foramen.**

foramen lacerum, an irregular opening in the temporal bone that is filled in life with cartilage.

foramen of Monro /monrō′/, a passage between the lateral and third ventricles of the brain.

foramen of Vesalius. See **venous foramen.**

foramenotomy, surgical removal of small pieces of bone around an intervertebral foramen, allowing more room for the spinal nerve. The procedure usually accompanies a laminectomy.

foramen ovale. See **oval foramen.**

foramen spinosum, a small opening near the posterior angle of the greater wing of the sphenoid bone. It is the smallest of three pairs of sphenoidal foramina that transmit nerves and blood vessels.

foramina. See **foramen.**

foramina transversarium, openings in the transverse processes of the vertebrae that together form a longitudinal passage on each side of the cervical spine for the vertebral artery and veins.

Forbes-Albright syndrome /fôrbs-ôl′brīt/ [Anne P. Forbes, American physician, 1911–1992; Fuller Albright, American physician, 1900–1969], an endocrine disease characterized by amenorrhea, prolactinemia, and galactorrhea, caused by an adenoma of the anterior pituitary. Diagnosis is made by radiographic examination of the anterior pituitary and a blood test for prolactin. Surgical resection of the adenoma is usually indicated. See also **galactorrhea, pituitary gland.**

Forbes' disease. See **Cori's disease.**

forbidden clone hypothesis [AS, *forbeodan* + Gk, *klon,* a cutting, *theoria,* speculation], a proposed explanation for autoimmunity that postulates that clones of cells that can react against the body persist after birth and can be activated by a viral infection or by some metabolic change. It holds that most cells of the immune system attack only foreign antigens, but these clones of cells attack the tissues of the body. Compare **sequestered antigens hypothesis.**

force [L, *fortis,* strong], **1.** energy applied so that it initiates motion, changes the speed or direction of motion, or alters the size or shape of an object. **2.** a push or pull defined as mass times acceleration. If the force on an object produces movement, it is called dynamic. If the force does not produce movement, it is called static.

forced expiratory flow (FEF), the average volumetric flow rate during any stated volume interval while a forced expired vital capacity test is performed. It is usually expressed as a percentage of vital capacity.

forced expiratory time (FET), the time required to exhale a given volume of air.

forced expiratory vital capacity (FEVC), the maximum volume of gas that can be forcibly and rapidly exhaled after a full inspiration. Also called **forced vital capacity, timed vital capacity.**

forced expiratory volume (FEV), the volume of air that can be forcibly expelled in a fixed period after full inspiration. Compare **vital capacity.** See also **expiratory reserve volume.**

forced-inhalation abdominal breathing, a respiratory therapy technique in which the patient inhales through the nose with an effort forceful enough to lift small sandbag weights placed on the abdomen. The technique is said to resemble closely the abdominal effort involved in normal breathing.

forced vital capacity. See **forced expired vital capacity.**

forceps *pl.* **forceps** [L, pair of tongs], a pair of any of a large variety and number of surgical instruments, all of which have two handles or sides, each attached to a dull blade. The handles may be joined at one end, such as a pair of tweezers, or the two sides may be separate to be drawn together in use, such as obstetric forceps. Forceps are used to grasp, handle, compress, pull, or join tissue, equipment, or supplies. See also **thumb forceps,** specific forceps.

Magill forceps *(Sanders et al, 2007)*

forceps delivery, an obstetric operation in which instruments are used to deliver a baby. It is performed to overcome dystocia, to quickly deliver a baby experiencing fetal distress, or, most often, to shorten normal labor. Local or regional anesthesia is usual, as is episiotomy. Prerequisites to forceps delivery include full dilation of the cervix, engagement of the fetal head, certain knowledge of the position of the head, and ruptured membranes. The blades of the forceps are introduced into the vagina one at a time and applied symmetrically to opposite sides of the baby's head; the handles of the forceps are pulled together so that the head is held firmly between the blades; the head is rotated, if necessary, to the occiput anterior or occiput posterior position; and traction is applied so as to draw the head from the birth passage. When the head has been delivered, the forceps are removed and the delivery is completed manually. Because cesarean section is performed more often now than formerly, traumatic forceps deliveries are uncommon. Kinds of forceps delivery are **high forceps, low forceps,** and **mid forceps.** Compare **forceps rotation, trial forceps.** See also **obstetric forceps.**

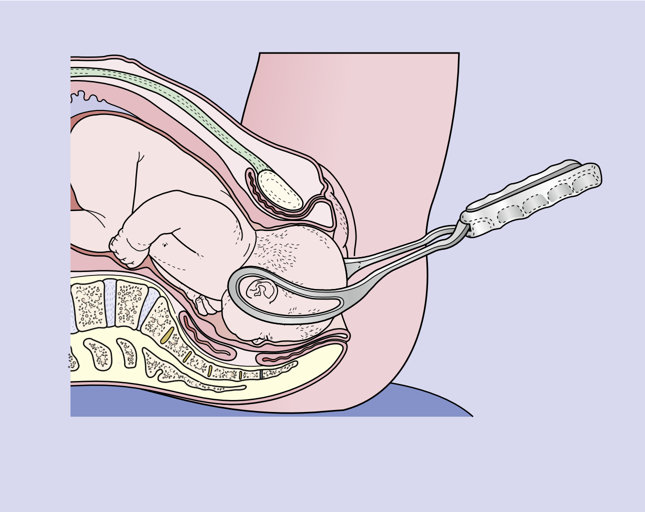
forceps rotation, an obstetric operation in which forceps are used to turn a baby's head that is arrested in transverse or posterior position in the birth canal. It may be performed to facilitate spontaneous birth or to initiate a forceps delivery. Kinds of forceps rotation are **Kielland's rotation** and *Scanzoni's rotation.* Compare **forceps delivery, manual rotation.** See also **obstetric forceps.**

forceps tenaculum. See **tenaculum.**

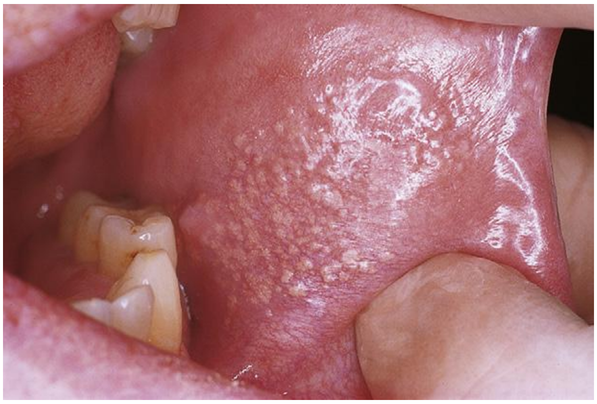
forcible inspiration [L, *fortis,* strong, *inspirare*], breathing that is assisted by a mechanical ventilator that forces air into the lungs during inhalation but allows the patient to exhale passively.

Fordyce-Fox disease /fôr′dis-foks′/ [G.H. Fox, American dermatologist, 1846–1937; John A. Fordyce, American dermatologist, 1858–1925], an apocrine gland disorder that produces symptoms similar to those of miliaria. It is characterized by intensely itchy follicular papules in the axillae, umbilicus, areolae of the breast, and pubic area.

Fordyce's disease [John A. Fordyce], the presence of enlarged oil glands in the mucosal membranes of the lips, cheeks, gums, and genitalia. It is a common condition and may be symptomless. The ectopic sebaceous glands of the buccal mucosa appear as tiny, whitish yellow raised lesions (Fordyce spots).



Forceps delivery *(Greer et al, 2001)*



Fordyce's disease *(Regezi, Sciubba, and Jordan, 2008)*

fore-, prefix meaning "front or before": *forearm, foregut, forewaters.*

forearm, the portion of the upper extremity between the elbow and the wrist. It contains two long bones, the radius and ulna. Also called **antebrachium.**

forebrain. See **prosencephalon.**

forefinger, the first, or index, finger.

forefoot, the portion of the foot that includes the metatarsus and toes.

foregut /fôr′gut/ [AS, *fore,* in front, *guttas*], the cephalic portion of the embryonic alimentary canal. It consists of endodermal tissue and gives rise to the pharynx, esophagus, stomach, liver, pancreas, most of the small intestine, and respiratory ducts. Compare **hindgut, midgut.**

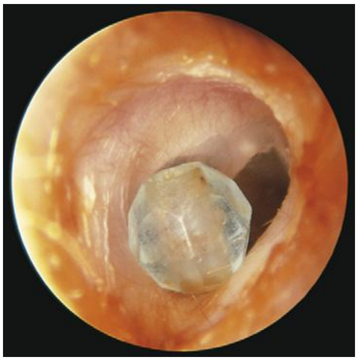
forehead /fôr′hed/ [AS, *fore,* in front + *heafod,* head], the region of the face superior to the eyes.

foreign body /fôr′in/ [Fr, *forain,* alien; AS, *bodig*], any object or substance found in an organ or tissue in which it does not belong under normal circumstances, such as a bolus of food in the trachea or a particle of dust in the eye.

foreign body granuloma [OFr, *forain* + AS, *bodig* + L, *granulum,* little grain; Gk, *oma,* tumor], a chronic inflammatory mass of tissue that accumulates around foreign bodies such as gravel, splinters, or bits of sutures.

foreign body in airway, anything found in the airway that is not normally present. Examples include food, coins, small pieces of toys, and bones. It is crucial to determine the extent of airway obstruction. The patient may be asymptomatic or may exhibit dyspnea or changes in breathing pattern or color (cyanosis). Removal of the foreign body is generally performed with a fiberoptic laryngoscope and forceps or by bronchoscopy.

foreign body in ear [OFr, *forain* + AS, *bodig* + *eare*], any object found in the ear canal that is not normally part of it, such as a bean, insect, or pebble.



Foreign body in the ear *(Swartz, 2009)*

foreign body in esophagus [OFr, *forain* + AS, *bodig* + Gk, *oisophagos,* gullet], anything found in the esophagus that is not normally a part of the tissue.

foreign body in eye [OFr, *forain* + AS, *bodig* + *eage*], anything found in the eye that is not a normal part of the tissue. Foreign bodies may be superficially embedded in the tissue surfaces or may penetrate the globe.

foreign body in throat [OFr, *forain* + AS, *bodig* + *throte*], anything found in the throat that is not normally present. A common foreign body in the throat is a posteriorly displaced tongue.

foreign body obstruction, a disturbance in normal function or a pathological condition caused by an object lodged in a body orifice, passage, or organ. Most cases occur in children who suddenly inhale or swallow a foreign object or insert it into a body opening. Large boluses of hastily eaten food frequently lodge in the esophagus, causing coughing, choking, and, if the airway is obstructed, asphyxia. Forceful blows to the victim's back between the shoulder blades or the Heimlich maneuver may dislodge the bolus. Esophageal foreign bodies usually produce an immediate reaction but occasionally result in a long asymptomatic period before signs of obstruction or infection are evident. Laryngeal foreign bodies usually cause hoarseness, wheezing, and dyspnea; a sharp object, such as a chicken bone, may perforate the larynx and cause swelling and infection. A foreign body in the trachea may cause wheezing, an audible slap, coughing, and dyspnea. A small object may become lodged in a bronchus, producing coughing, which is often followed by an asymptomatic period before signs of obstruction and inflammation appear.

foreign medical graduate (FMG), a physician trained in and graduated from a medical school outside the United States and Canada. U.S. citizens graduated from medical schools outside the United States and Canada are also classified as FMGs.

forensic /fôren′sik/ [L, *forum,* public place], **1.** pertaining to courts of law. **2.** relating to or dealing with the application of scientific knowledge to legal problems.

forensic data collection, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the collection and recording of pertinent patient data for a forensic report. See also **Nursing Interventions Classification.**

forensic dentistry, the branch of dentistry that deals with the legal aspects of professional dental practices and treatment, with particular emphasis on the use of dental records to identify victims of crimes or accidents.

forensic medicine [L, *forum,* public place, *medicinus,* physician], a branch of medicine that deals with the legal aspects of health care (e.g., autopsies, investigation and determination of time and cause of death).

forensic nursing, a nursing specialty involving provision of care to victims of crime, such as sexual and other types of assaults, as well as collecting evidence, performing certain types of death investigations, and working with prison inmates.

forensic psychiatry [L, *forum,* public place; Gk, *psyche,* mind, *iatreia,* treament], a branch of psychiatry concerned with the application of psychiatry to law, including criminal responsibility, guardianship, and competence to stand trial.

foreplay /fôr′plā/, sexual activities, such as kissing and fondling, that precede coitus.

foreshortened image. See **image foreshortening.**

foreskin /for′skin/ [AS, *fore* + *skinn*], a loose fold of skin that covers the end of the penis or clitoris. Its removal constitutes circumcision. Also called **prepuce.**

Forestier's disease /fō′restē·āz′/ [Jacques Forestier, French neurologist, 1890–1978], hyperostosis of the anterolateral part of the vertebral column, especially in the thoracic region.

forestomach, a constricted passage from the esophagus to the stomach, lying just inside the opening formed by the cardiac sphincter.

forest yaws /for′ist/ [L, *foris,* outside; Afr, *yaw,* strawberry], a cutaneous form of American leishmaniasis, common in South and Central America, caused by *Leishmania guyanensis*. The disease is chronic, with multiple deep skin ulcers that occasionally spread to the nasal mucosa. Also called **pian bois.**

forewaters /fôr′wôtərs/ [AS, *fore* + *waeter*], the part of the amniotic sac that pouches into the cervix in front of the presenting part of the fetus. Sometimes called the *forebag*.

forgiveness facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting an individual's willingness to replace feelings of anger and resentment toward another, self, or higher power, with beneficence, empathy, and humility. See also **Nursing Interventions Classification.**

fork /fôrk/ [L, *furca*], **1.** an instrument with prongs. **2.** something resembling such an instrument.

forked tongue /fôrkt/ [L, *furca* + AS, *tunge*], a tongue divided by a longitudinal fissure. Also called **bifid tongue, slit tongue.**

-form, -forme, suffix meaning "having a (specified) shape or form": *linguiform, toruliform*.

formaldehyde (HCHO) /fərmal′dəhīd/, a toxic, colorless foul-smelling gas that is soluble in water and used in that form as a disinfectant, fixative, or preservative. Also called **methanol.**

formalin /fôr′məlin/, a clear solution of formaldehyde in water. A 37% solution is used for fixing and preserving biological specimens for pathological and histological examination.

formal operations, a form of thinking following the stage of concrete operations and representing the final, most mature state of thinking. It usually occurs after age 11 and is characterized by true logical thought, capability for deductive reasoning, abstract thinking, formulation and testing of hypotheses, appreciation for multiple perspectives on an issue, and the manipulation of ideas and concepts.

format /fôr′mət/, a computerized arrangement of data for storage or display requiring the division of space on a disk into sectors for storage.

formation /fôrmā′shən/, **1.** a cluster of people who occupy and therefore define a quantum of space. **2.** a structure, shape, or figure.

formative evaluation /fôr′mətiv/, **1.** judgments made about effectiveness of nursing interventions as they are implemented. **2.** (in nursing education) periodic evaluation of a student during a course, usually a clinical practicum.

formboard, equipment used in tactile performance testing. It consists of a board with cutouts of various shapes and sizes and blocks of corresponding geometric characteristics. Subjects are tested on their ability to fit the blocks into the proper cutout spaces.

forme fruste /fôrm′ frYst′, fôrm′ fro͞ost′/ *pl.* **formes frustes** [Fr, rough form], **1.** an incomplete or atypical form of a disease or a disease that is spontaneously arrested before it has run its usual course. **2.** (in genetics) an inherited disorder in which there is minimal expression of an abnormal trait.

formic acid (HCOOH) /fôr′mik/, a colorless, pungent liquid found in nature in nettles, ants, and other insects. It is prepared commercially from oxalic acid and glycerin and from the oxidation of formaldehyde. Formerly used as a vesicant, it currently has no therapeutic applications. Also called *methanoic acid*.

formiminoglutamic acid (FIGLU) /fôrmim′inōglo͞otam′ik/, a compound formed in the metabolism of histidine, present in urine in elevated levels in folic acid deficiency. Increased excretion of FIGLU may indicate folic acid deficiency.

-formin, suffix for phenformin–type oral hypoglycemics.

formol. See **formaldehyde.**

formoterol fumarate, a beta-adrenergic agonist used to treat chronic obstructive pulmonary disorder, maintain and treat asthma, and prevent exercise-induced bronchospasm.

formula /fôr′m(y)ələ/ [L, *forma,* pattern], a simplified statement, generally using numerals and other symbols, expressing the constituents of a chemical compound, a method for preparing a substance, or a procedure for achieving a desired value or result. **—formulaic,** *adj*.

formulary /fôr′myəle′rē/ [L, *forma,* pattern], a listing of drugs intended to include a large enough range of medications and sufficient information about them to enable health practitioners to prescribe treatment that is medically appropriate. Hospitals maintain formularies that list all drugs commonly stocked in their pharmacies. Third-party organizations such as insurance companies usually maintain formularies that list drugs that the company will cover under plan benefits. See also **compendium, *United States Pharmacopeia.***

formulation /fôr′myəlā′shən/ [L, *forma,* pattern], **1.** a pharmacological substance prepared according to a formula. **2.** a systematic and precise statement of a problem, a theory, or a method of analysis in research.

formylmethionine (FMET) /fôr′milməthī′ənēn/, (in molecular genetics) the first amino acid in a protein sequence.

fornication /fôr′nikā′shən/ [L, *fornix,* arch], (in law) sexual intercourse between two people who are not married to each other. The specific legal definition varies from jurisdiction to jurisdiction. In some, both persons are unmarried; in some, one is unmarried; in some, the charge is adultery rather than fornication if the woman is married, regardless of the man's marital status.

fornix /fôr′niks/ *pl.* **fornices** [L, arch], an archlike structure or space, such as the fornix cerebri, the superior or inferior conjunctival fornices, or the vaginal fornices.

fornix cerebri /ser′əbrī/, an archlike body of nerve fibers that lies beneath the corpus callosum of the cranium and serves as the efferent pathway from the hippocampus.

fornix vaginae. See **vaginal fornix.**

forskolin (FSK), an activator of adenylate cyclase. FSK interacts directly with ion channels, increasing glutamate responses and amplitude and decay time of spontaneous excitatory postsynaptic currents.

Fortaz, a trademark for a cephalosporin antibiotic **(ceftazidime).**

Fort Bragg fever. See **pretibial fever.**

fortified milk [L, *fortis,* strong; AS, *milc*], pasteurized milk enriched with one or more nutrients, usually vitamins A and D, that has been standardized at 400 International Units per quart (fortified vitamin D milk).

fortify, addition of a substance to a food product to increase its nutritional benefit.

forward chaining^1, a method of measuring rehabilitation performance. The patient performs the first step independently, and the therapist helps the patient perform the rest of the steps. The routine is then repeated with the patient performing the first two steps independently, then the first three steps, and so on.

forward chaining^2, a method to grade an activity in which an individual learns each step from the beginning; begins with the individual starting the sequence and ends with the occupational therapy practitioner finishing what the individual has not yet learned.

forward-leaning posture, a respiratory therapy technique intended to reduce or eliminate the involvement of the accessory muscles of respiration in ambulatory patients with breathing difficulty. It involves walking while bent forward in a slightly stooped posture. For patients unable to tolerate functional walking, a special high walker with wheels may be used.

fosamprenavir, an antiretroviral.

■ INDICATIONS: This drug is used in combination with other antiretrovirals to treat HIV-1 infection.

■ CONTRAINDICATIONS: Known hypersensitivity to protease inhibitors prohibits the use of this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include rash, pruritus, headache, fatigue, depression, oral paresthesia, and redistribution or accumulation of body fat. Common side effects include nausea, diarrhea, vomiting, and abdominal pain.

Foscavir, a trademark for an antiviral drug (foscarnet) used in the treatment of cytomegalovirus retinitis in conjunction with ganciclovir and for the treatment of herpes simplex infections when acyclovir fails.

fosfomycin, a urinary antiinfective.

■ INDICATIONS: It is used to treat infections of the urinary tract caused by *Enterococcus faecalis* and ***Escherichia coli.***

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects include vaginitis, dysuria, hematuria, menstrual disorder, fever, insomnia, somnolence, migraine, asthenia, nervousness, constipation, dry mouth, flatulence, increased SGPT, dyspepsia, and pruritus. Common side effects are headache, dizziness, nausea, vomiting, anorexia, diarrhea, and rash.

fosinopril, an angiotensin-converting enzyme inhibitor. It inhibits the formation of the hormone angiotensin II, which is a powerful vasoconstrictor that also stimulates the release of the sodium-retaining hormone aldosterone.

■ INDICATIONS: It is prescribed alone or in combination for the treatment of high blood pressure, congestive heart failure, and left ventricular dysfunction following myocardial infarction.

■ CONTRAINDICATIONS: It should not be given to patients with allergy to angiotensin-converting enzyme inhibitors. It should be used with caution in patients with kidney diseases or diabetes or with potassium-containing products.

■ ADVERSE EFFECTS: The side effects most often reported include "first-dose effect," including dizziness and fainting caused by lowered blood pressure, persistent dry nonproductive cough, depression, headache, palpitations, breathing difficulty, and fluid retention.

fosphenytoin, an anticonvulsant.

■ INDICATIONS: It is used to treat generalized tonic-clonic seizures and status epilepticus.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to this drug, psychiatric conditions, pregnancy, bradycardia, sinoatrial and atrioventricular block, and Stokes-Adams syndrome.

■ ADVERSE EFFECTS: Life-threatening effects are ventricular fibrillation, nephritis, agranulocytosis, leukopenia, aplastic anemia, thrombocytopenia, megaloblastic anemia, and Stevens-Johnson syndrome. Other adverse effects include drowsiness, dizziness, insomnia, paresthesias, depression, suicidal tendencies, aggression, headache, confusion, hypotension, nystagmus, diplopia, blurred vision, nausea, vomiting, constipation, anorexia, weight loss, hepatitis, jaundice, gingival hyperplasia, urine discoloration, rash, lupus erythematosus, hirsutism, and hypocalcemia.

Fosrenol, a trademark for **lanthanum.**

fossa /fos′ə/ *pl.* **fossae** [L, ditch], a hollow or depression, especially on the surface of the end of a bone, such as the olecranon fossa or the coronoid fossa.

fossa of vestibule of vagina. See **vestibular fossa.**

Foster bed, a trademark for a special bed used in the care and treatment of severely injured patients, especially those with spinal injuries. It consists of two Bradford frames mounted on a castered base. The assembly is attached to a rotary bearing mechanism, permitting horizontal turning of the patient without moving the spine. The patient can be rotated to supine and prone positions while maintaining proper immobilization and alignment of injured body structures. A horizontal turning frame permits hyperextension and traction at each end of the frame, and either end of the bed can be elevated to provide countertraction. It can be used in posttraumatic management of patients with spinal instability, with or without cord damage, and in the management of the postoperative patient with multilevel spinal fusion when weight-bearing or ambulation is contraindicated. The Foster bed is also used for halo-femoral traction and maintenance of continuous cervical traction in flexion for patients with unstable cervical neck problems. Compare **CircOlectric bed, hyperextension bed, Stryker wedge frame.** See also **Bradford frame.**

Foster Kennedy's syndrome /fos′tər ken′ə·dē/ [Robert Foster Kennedy, American neurologist, 1884–1952], a syndrome characterized by retrobulbar neuritis, central scotoma, optic disc atrophy on the side of the lesion, and papilledema on the opposite side, occurring in tumors of the frontal lobe of the brain that press downward.

fo-ti, a climbing perennial herb found in China.

■ USES: It is used for tiredness, constipation, cancer, and elevated cholesterol. It appears to be safe and effective as a laxative, but proof of efficacy for other indications is lacking.

■ CONTRAINDICATIONS: It is contraindicated during pregnancy and lactation, in children, and in those with known hypersensitivity to this product or with diarrhea.

foulage. See **pétrissage.**

foundation [L, *fundamentum*], (in dentistry) any device or material added to a remaining tooth structure to enhance the stability and retention of an overlying cast restoration, such as a pin retainer, amalgam, or casting.

foundation model, a health maintenance organization or other health system that is legally established as a tax-exempt, not-for-profit corporation organized to operate as a charitable institution.

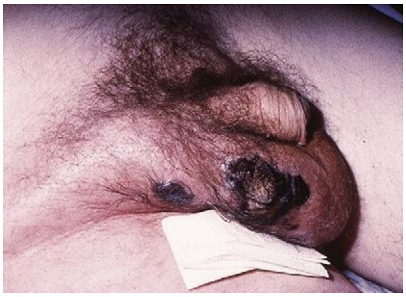
fourchette /fo͞orshet′/ [Fr, fork], a tense band of mucous membranes at the posterior angle of the vagina that connects the posterior ends of the labia minora.

four-handed dentistry, a technique in which a dental assistant or dental hygienist works directly with the dentist on the procedures being done in the mouth of a patient. The technique reduces fatigue and improves the effectiveness of dental procedures.

Fourier transform (FT) /fo͞oryā′/ [Jean B.J. Fourier, French mathematician, 1768–1830; L, *transformare,* to change form], a mathematical procedure that separates out the frequency components of a signal from its amplitudes as a function of time, or vice versa.

Fourier transform imaging [Jean B.J. Fourier], (in medical physics) nuclear magnetic resonance (NMR) imaging techniques in which at least one dimension is phase encoded by applying variable gradient pulses along that dimension before "reading out" the NMR signal with a gradient magnetic field perpendicular to the variable gradient. The Fourier transform is then used to reconstruct an image from the set of encoded NMR signals.

Fournier's gangrene /fo͝ornyāz′/ [Jean A. Fournier, French syphilographer, 1832–1914], an infective gangrene of the scrotum or vulva caused by an anaerobic hemolytic strain of streptococcus. This form of gangrene is associated with diabetes. It occurs after local trauma, operative procedures, underlying urinary tract disease, or a distant acute inflammatory process. It is relatively rare in the United States. Infective agents are *Bacteroides fragilis* and aerobic ***Escherichia coli.*** Also called **polymicrobial necrotizing fasciitis.**



Fournier's gangrene *(Stone and Gorbach, 2000/Courtesy Dr. Mark Dropkin, Newton Wellesley Hospital)*

four-poster orthosis, an orthosis to immobilize the cervical vertebrae. It contains four vertical posts or poles on the anterior and posterior lateral sides of the head and is placed over the shoulders. The head is supported under the chin and occiput, and the posts prevent movement.

four-tailed bandage, a narrow piece of cloth with two ties on each end for wrapping a joint, such as an elbow or knee, or a prominence, such as the nose or chin.

fourth cranial nerve. See **trochlear nerve.**

fourth-degree burn, a burn that extends deeply into the subcutaneous tissue, completely destroying the skin, subcutaneous fat, and underlying tendons, and sometimes involving muscle, fascia, or bone.

fourth-generation cephalosporin, a broad-spectrum cephalosporin having the greatest activity against gram-negative organisms of any of the cephalosporins. Cefepime is often so classified, although it is sometimes included with the third-generation cephalosporins.

fourth-generation scanner, a computed tomography machine in which the x-ray source rotates but the detector assembly does not. Radiation detection is accomplished through a fixed, circular array of up to 1000 detectors. Fourth-generation scanners may have scanning times as short as 1 second.

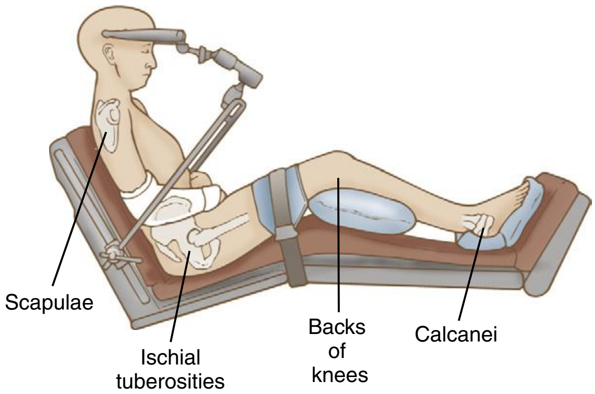
fourth stage of labor [ME, *feower,* four; OFr, *estage* + L, *labor,* work], a postpartum period of about 4 hours after the third stage, or delivery of the placenta. Some complications, especially hemorrhage, occur at this time, necessitating careful observation of the mother.

fourth ventricle [ME, *feower,* four; L, *ventriculus,* little belly], a cavity with a diamond-shaped floor in the hindbrain, communicating below with the central canal of the spinal cord and above with the cerebral aqueduct of the midbrain. At the bottom of the ventricle are surfaces of the pons and medulla.

fovea capitis /fō′vē·ə/ [L, *fovea,* pit], **1.** a depression on the proximal surface of the head of the radius where it meets the capitulum of the humerus. **2.** a fovea on the head of the femur, where the round ligament is attached.

fovea centralis, an area at the center of the retina where cone cells are concentrated and there are no rod cells. See also **macula lutea.**

Fowler's position /fou′lərz/ [George R. Fowler, American surgeon, 1848–1906], the posture assumed by the patient when the head of the bed is raised 90 degrees and his or her knees are elevated slightly. See also **high-Fowler's position.**



Potential pressure areas in the Fowler's position *(Rothrock, 2011)*

Fox-Fordyce disease /foksfôr′dīs/ [G.H. Fox, American dermatologist, 1846–1937; John Addison Fordyce, American dermatologist, 1858–1925], a chronic skin disease, usually seen in women, characterized by small papular eruptions and other skin changes of apocrine gland-bearing areas, especially the axillae and pubes, caused by obstruction and rupture of the intraepidermal part of the ducts of the glands. Also called **apocrine miliaria.**

foxglove /foks′glov/, the common name for *Digitalis purpura,* the plant that is a source of digitalis, a powerful cardiac stimulant.

Fox's knife, a flat metallic device used to visualize the relationships of denture baseplate/wax rims to facial landmarks, aiding in the placement of artificial teeth in wax during denture construction. See **Goldman-Fox knife.**

FPG, abbreviation for **fasting plasma glucose.**

Fr, **1.** symbol for the element **francium.** **2.** abbreviation for **French scale.**

FR, abbreviation for *fixed ratio.*

fract-, prefix meaning "a breaking": *fractional, fractography, fracture.*

fractional dilation and curettage /frak′shənəl/, a diagnostic technique in which each section of the uterus is examined and curetted to obtain specimens of the endometrium from all parts of the organ. It is often performed in the diagnosis of endometrial cancer.

fractional excretion of sodium (FE_{Na}), an assessment of acute renal failure comparing the sodium clearance with the creatinine clearance.

fractionation /frak′shənā′shən/ [L, *frangere,* to break], **1.** (in neurology) a mechanism within the neural arch of the vertebrae whereby only a portion of the efferent nerves innervating a muscle reacts to a stimulus, even when the reflex requirement is maximal, so that a reserve of neurons remains to respond to additional stimuli. Through this phenomenon muscle tension is maintained. **2.** (in chemistry) the separation of a substance into its basic constituents by using such procedures as fractional distillation or crystallization. **3.** (in bacteriology) the process of isolating a pure culture by successive culturing of a small portion of a colony of bacteria. **4.** (in histology) the process of isolating the different components of living cells by centrifugation. **5.** (in radiology) the process of administering a dose of radiation in smaller units over time to minimize tissue damage rather than in a single large dose. Also called **dose fractionation.**

fraction of inspired oxygen (FiO_2) [L, *frangere,* to break, *inspirare,* to breathe in; Gk, *oxys,* sharp, *genein,* to produce], the proportion of oxygen in the air that is inspired.

fracture /frak′chər/ [L, *frangere,* to break], **1.** the breaking of a part, especially of a bone or tooth. **2.** a traumatic injury to a bone in which the continuity of the bone tissue is broken. A fracture is classified by the bone involved, the part of that bone, and the nature of the break, such as a comminuted fracture of the head of the tibia. See also specific types of fractures.

fracture-dislocation, a break in the bony structures of any joint, with associated dislocation of the same joint.

fracture of clavicle [L, *frangere* + *clavicula,* little key], a break in the long bone of the shoulder girdle. It is typically accompanied by pain, swelling, and a protuberance and depression over the site of the injury. The patient usually supports the arm on the injured side at the elbow. Treatment generally involves application of a clavicle strap or a figure-eight bandage.

fracture of olecranon [L, *frangere* + Gk, *olekranon,* point of the elbow], a break in the bony prominence of the ulna at the elbow joint. Different types of olecranon fractures may occur, depending on the articular surfaces involved. The triceps, which normally extends the elbow, may become spastic as a result of the injury.

fracture of patella [L, *frangere* + *patella,* small pan], a break in the sesamoid knee cap. The fracture often occurs in automobile accidents in which the knee strikes the dashboard. The damage is complicated by reflex bracing of the quadriceps femoris muscle, which pulls the fragments apart. Treatment includes suturing the bone fragments and confining the patient in a long-leg cast.

fracture of radius [L, *frangere* + *ray*], a break in the radius, usually with backward and radial displacement of the wrist and hand. The fracture commonly occurs when a falling person extends the arm and hand in an effort to cushion the impact. See also **Colles' fracture.**

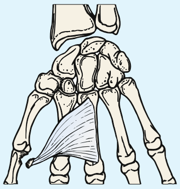
fracture of skull [L, *frangere* + AS, *skulle,* bowl], a break in one or more of the cranial bones. A fracture in the vault of the skull is usually a compound fracture and is complicated by possible damage to brain tissue, particularly if shards of bone are driven into the brain by the force of the trauma.

fracture threshold, a measure of bone density used in predicting osteoporosis risk factors. Various investigators have established different methods of interpreting bone density data. One method predicts that 95% of women will have vertebral fractures if their trabecular bone volume is less than 14% of the mean.

fragile X syndrome /fraj′əl/, a reproductive disorder characterized by a nearly broken X chromosome, which has a tip hanging by a flimsy thread. It is the most common inherited cause of mental retardation. Only about 75% of the results of tests for the broken chromosome are accurate. Some healthy individuals may possess fragile X chromosomes without exhibiting symptoms and may transmit the condition to children or grandchildren.

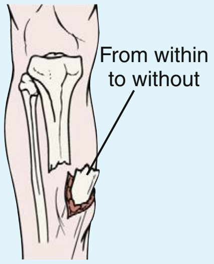
Types and causes of fractures

Type	*Description*	*Cause*
Avulsion	Fracture that pulls bone and other tissues from usual attachments	Direct energy or force, with resisted extension of bone and joint
Bucket-handle	Double vertical fractures of pelvis on same side, resulting in pelvic dislocation	Direct blow or anterior compression force, with or without sacral torsion
Butterfly	Butterfly-shaped piece of fractured bone, usually accompanying comminuted fracture	Direct, indirect, or rotational force to bone
Comminuted	Fracture with more than two pieces; may have significant associated soft tissue trauma	Direct crushing injury or force to tissues and bone
Compound (open)	Skin broken over fracture; possible soft tissue trauma	Moderate to severe energy that is continuous and exceeds tissue tolerances
Compression	Fraction is squeezed or wedged together at one side	Compressive, axial energy or force applied directly from above fracture site
Displaced	Fracture with one, both, or all fragments out of normal alignment	Direct energy or force to site
Greenstick	Break in only one cortex of bone	Minor direct or indirect energy
Impacted	Fracture with one end wedged into opposite end or inside fractured fragment	Compressive axial energy or force directly to distal fragment

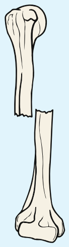


Avulsion

Comminuted

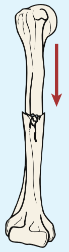


Compound (open)



Displaced

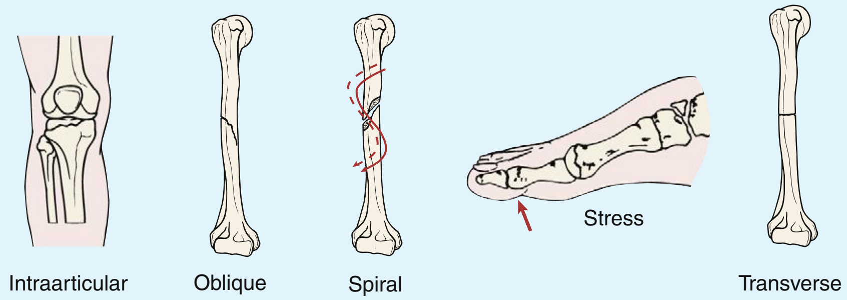
Greenstick



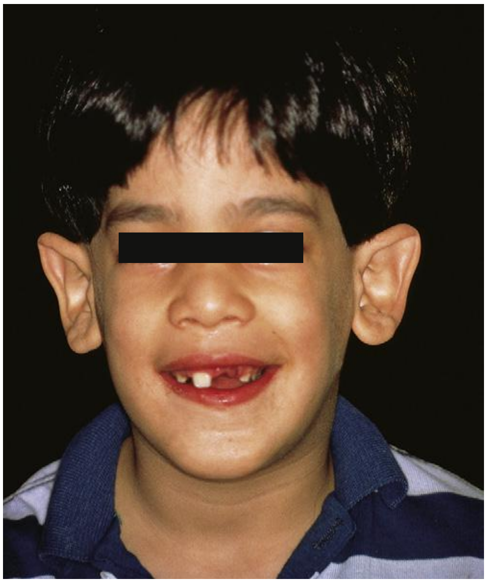
Impacted

Types and causes of fractures—cont'd

Type	*Description*	*Cause*
Intraarticular	Fracture involving bones inside a joint	Direct or indirect energy or force to joint
Lead pipe (torus)	Fracture of one cortex of shafts of radius and ulna (one cortex of each bone), shown as wrinkle or buckle	Direct blow to forearm or indirect compressive force, as from a fall
Linear	As a line, so can be transverse or oblique	Minor or moderate energy of force directly to bone
Neoplastic (pathological)	Transverse, oblique, or spiral fracture of bone weakened by tumor pressure or presence	Minor energy or force, which may be direct or indirect
Oblique	Fracture at oblique angle across both cortices	Direct or indirect energy, with angulation and some compression
Occult	Fracture that is hidden or not readily discernible	Minor force or energy
Segmental	Fracture with two or more pieces or segments	Direct or indirect moderate to severe force
Spiral	Fracture that curves around cortices and may become displaced by twist	Direct or indirect twisting energy or force with distal part held or unable to move
Stellate	Central fracture point from which fissures radiate	Direct blow or force of moderate energy
Stress	Crack in one cortex of bone	Repetitive direct energy or force, as from jogging, running, or striking a lever, or from osteoporosis
Transverse	Horizontal break through bone	Direct or indirect energy toward bone



Illustrations from Lewis SL et al: *Medical surgical nursing: assessment and management of clinical problems*, ed 8, St Louis, 2011, Mosby; and Lewis SL et al: *Medical surgical nursing: assessment and management of clinical problems*, ed 7, St Louis, 2007, Mosby.



[redacted]

Fragile X syndrome *(Regezi, Sciubba, and Jordan, 2008)*

fragilitas ossium. See **osteogenesis imperfecta.**

fragment /frag′mənt/ [L, *frangere,* to break], one of the small pieces into which a larger entity has been broken.

fragmented fracture. See **comminuted fracture.**

Fragmin, a trademark for a low-molecular-weight heparin **(dalteparin sodium).**

frail elder, an older person (usually above 85 years of age) who has multiple physical or mental disabilities that may interfere with the ability to perform activities of daily living independently.

fraise /frāz/ [Fr, strawberry], a smooth hemispheric or conic burr with cutting edges. It is used for enlarging trephine openings or cutting osteopathic flaps.

Fraley's syndrome, nephralgia with dilation of the upper pole renal calices around the kidney caused by compression of the adjacent infundibulum, usually caused by pressure from vessels serving that part of the kidney.

frambesia, framboesia. See **yaws.**

frame /frām/, a structure, usually rigid, designed for giving support to or for immobilizing a part.

frame of reference [AS, *framian,* to help; L, *referre,* to carry back], the personal guidelines of an individual, taken as a whole. An individual frame of reference reflects the person's social status, cultural norms, and concepts.

frame of reference, in occupational therapy, the framework assisting the occupational therapy practitioner identify problems, evaluate, develop intervention, and measure outcomes.

Franceschetti's syndrome /fran′chesket′ēz/ [Adolphe Franceschetti, Swiss ophthalmologist, 1896–1968], a complete form of mandibulofacial dysostosis. See also **Treacher Collins' syndrome.**

franchise dentistry /fran′chīz/ [Fr, exemption; L, *dens,* tooth], the practice of dentistry under a trade name purchased from another dentist or dental practice. Under a franchise license agreement, the franchiser may use the trade name, associated marketing products, and treatment techniques for a sum of money, in accordance with the franchise rules and regulations.

Francisella, a genus of nonmotile nonspore-forming gram-negative aerobic bacteria that is a facultative intracellular pathogen of macrophages. Frequently found in natural waters, it can be parasitic in humans, other mammals, birds, and arthropods. The organism causes tularemia in humans.

francium (Fr) /fran′sē·əm/ [France], a metallic element of the alkali metal group. Its atomic number is 87, and the mass of its longest-lived isotope is 223. Formed from the decay of actinium, all of its 20 isotopes are radioactive and short-lived.

frank [L, *francus,* forthright], obvious or clinically evident, such as the unequivocal presence of a condition or a disease. An example is frank bleeding.

Frank biopsy guide, a trademark for a device consisting of a long needle containing a hooked wire used to obtain biopsy samples of breast tissue. The needle is inserted into the breast until its tip nearly touches the lesion observed by mammography. The needle is withdrawn, but the hooked wire remains to locate the tissue site. The surgeon cuts along the wire or otherwise approaches the hooked end of the wire and removes the tissue. See also **Kopan's needle.**

frank breech [L, *francus* + ME, *brec*], an intrauterine position of the fetus in which the buttocks present at the maternal pelvic inlet, the legs are straight up in front of the body, and the feet are at the shoulders. Babies born in this position tend to hold their feet near the head for some days after birth. Compare **complete breech, footling breech.** See also **breech birth.**

Frankfurt horizontal plane [Frankfurt-am-Main (anthropological) Agreement, 1882], (in dentistry) a craniometric surface determined by the inferior borders of the bony orbits and the upper margin of the auditory meatus. It passes through the two orbitales and the two tragions and is commonly used as a reference surface in orthodontic diagnosis and treatment planning.

Frankfurt line. See **Reid's base line.**

Frankfurt-mandibular incisor angle (FMIA), (in dentistry) the precumbency of the mandibular incisor to the Frankfurt horizontal plane. The angle is formed by the intersection of the long axis of the lower central incisor with the Frankfurt-mandibular plane.

Frank-Starling relationship [Otto Frank, German physiologist, 1865–1944; Ernest H. Starling, English physiologist, 1866–1927], a mathematical expression stating that stroke volume increases with diastolic volume. The relationship is based on the principle that the force exerted by the myocardial fibers during contraction is directly proportional to their length or degree of stretch at the start of contraction. Because there are no adequate in vivo methods of measuring fiber length or diastolic volume, pulmonary artery obstructive pressure or pulmonary artery end-diastolic pressure is used as an index of diastolic volume. The relationship holds over a range of diastolic volumes. Beyond that range, the myocardial fibers are stretched past the point of maximal overlap between thick and thin filaments, and contractile force and stroke volume decrease. Also called *Frank-Starling mechanism,* **Starling's law of the heart.**

Fraser's syndrome /frā′zer/ [George Robert Fraser, Czechoslovakian-born American geneticist, b. 1932], an autosomal-recessive abnormality characterized by absence of an opening in the eyelids, disorganization of one or both ocular globes, malformed ears, cleft palate, laryngeal stenosis, syndactyly, meningoencephalocele, imperforate anus, cardiac defects, and maldeveloped kidneys. Also called **cryptophthalmos syndrome.**

fraternal twins. See **dizygotic twins.**

***F*-ratio** [Sir Ronald Aylmer *Fisher,* British statistician, 1890–1962], **1.** the variance between the means of several groups relative to the variance within the groups, used in the ***F*-test** in the analysis of variance. **2.** the variance between or within treatments.

fraud /frôd/ [L, *fraudare,* to cheat], (in law) the act of intentionally misleading or deceiving another person by any means so as to cause him or her legal injury, usually the loss of something valuable or the surrender of a legal right resulting from the action of that person on the misrepresentation.

Fraunhofer's lines, absorption bands or lines seen in a spectrum, caused by the absorption of groups of light rays in their passage through solids, liquids, or gases.

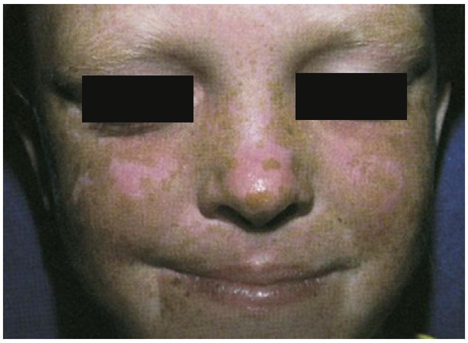
Fraunhofer zone /froun′hōfər/ [Joseph von Fraunhofer, German optician, 1787–1826], the zone farthest from the face of an ultrasound transducer. It is characterized by a divergence of the ultrasound beam and a more uniform ultrasound intensity. Also called **far field.** See also **Fresnel zone.**

FRC, abbreviation for **functional residual capacity.**

F.R.C.P., abbreviation for *Fellow of the Royal College of Physicians.*

F.R.C.S., abbreviation for *Fellow of the Royal College of Surgeons.*

freckle [ME, *freken*], a brown or tan macule on the skin that results from exposure to sunlight. There is an inherited tendency to freckling, and it is most frequently seen in persons with red hair. Freckles are harmless, but people who freckle easily should avoid excessive sun exposure or use protective sunscreens because they have a tendency toward development of more serious actinic skin changes. Compare **lentigo.**



Freckles *(Weston, Lane, and Morrelli, 2007)*

Fredet-Ramstedt operation. See **pyloromyotomy.**

free-air chamber [AS, *freo,* free; Gk, *aer,* air; L, *camera,* vault], a device used throughout the world as a primary standard for calibrating x-ray exposure.

free association, **1.** spontaneous, consciously unrestricted association of ideas, feelings, or mental images. **2.** spontaneous verbalization of thoughts and emotions that enter the consciousness during psychoanalysis. It is the basis of classical freudian analysis and also of jungian type analysis.

freebase. See **crack.**

freebasing, a chemical process (e.g., ether extraction, addition of ammonia) used to increase the stimulating effect of illicit drugs, such as cocaine, by converting the salt of the drug into its noncharged base form that can more readily enter the brain. The resulting product is smoked.

free circulating phagocyte. See **phagocyte.**

free clinic, a clinic or health program, usually located in a neighborhood setting, that provides health care for ambulatory patients at nominal or no cost.

Freedom of Information Act, a law requiring federal agencies to provide access to information, with some exceptions, upon request. Amendments to the original law have made it easier for individuals to review agency records. The Department of Health and Human Services provides indices to assist the public and makes many records available on the WEB sites of its offices.

free fatty acid (FFA) [AS, *freo* + *faett* + L, *acidus,* sour], a nonesterified fatty acid, released by the hydrolysis of triglycerides within adipose tissue. Free fatty acids can be used as an immediate source of energy by many organs and can be converted by the liver into ketone bodies.

free-floating anxiety, a generalized, persistent, pervasive fear that is not attributable to any specific object, event, or source. See also **anxiety.**

free-form foot orthosis, an orthosis that is molded directly to a patient's foot. It requires less material and time to produce than other orthoses but does not provide a positive model for a more exact fabrication of a balanced orthosis.

free gingiva, the unattached portion of the gum coronal to the junctional epithelium. It encircles each tooth and forms a gingival sulcus or crevice.

free gingival groove, a shallow line or depression on the gingival surface at the junction of the free and attached gingivae. Also called **mucogingival line.**

free graft [AS, *freo* + Gk, *graphein,* stylus], a graft completely removed from its original site and replaced at a new site in a single one-stage operation.

free-induction decay (FID), a signal emitted by the atomic nuclei in a tissue after a radiofrequency pulse has excited the nuclear spins at resonance. The decaying oscillation of the nuclei back to their normal state causes them to emit photons, which provide the signal from which a magnetic resonance image is made.

free macrophage [AS, *freo* + Gk, *makros,* large, *phagein,* to eat], a motile macrophage derived from a monocyte. It responds to chemotactic stimuli and migrates from blood vessels to tissue spaces.

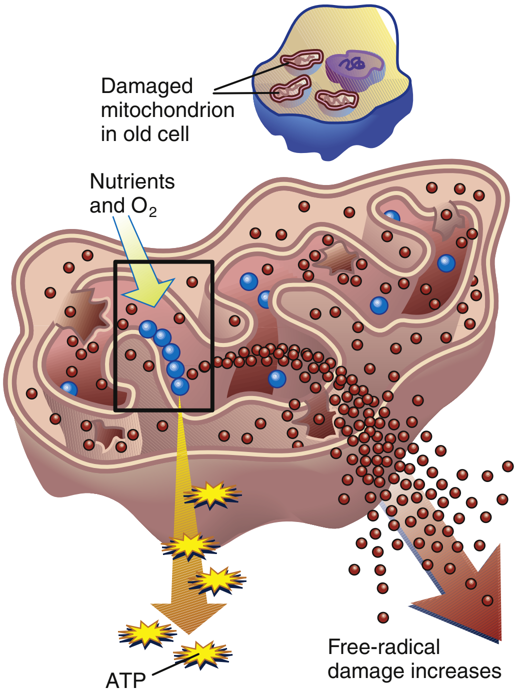
Freeman-Sheldon syndrome /frē′mən shel′dən/ [Ernest Arthur Freeman, British orthopedic surgeon, 1900–1975; Joseph Harold Sheldon, British physician, 1920–1964], a congenital anomaly, transmitted as an autosomal-dominant trait, consisting of characteristic flattened, masklike facies; small mouth, the lips protruding as in whistling; deep-set eyes with hypertelorism; camptodactyly with ulnar drift of the fingers; and clubfoot. Also called **craniocarpotarsal dystrophy, whistling face syndrome, whistling face-windmill vane hand syndrome.**

free nerve ending, a receptor nerve ending that is not enclosed in a capsule. A typical free nerve ending consists of a bare axon that may be myelinated or unmyelinated. It is often found in fibrous capsules, ligaments, or synovial spaces and may be sensitive to mechanical or biochemical stimuli.

free phagocyte. See **phagocyte.**

free radical, a species with at least one unpaired electron. Oxygen is a stable diradical, but most other free radicals are unstable and react readily with other molecules.

free-radical theory of aging, a concept of aging based on the premise that the main causative factor is an imbalance between the production and elimination in the body tissues of free chemical radicals from oxygen metabolism.



Damaged mitochondrion in old cell
Nutrients and O_2
ATP
Free-radical damage increases

Free-radical theory of aging *(McCance and Huether, 2010)*

free-standing tax-exempt clinic, (in U.S. managed care) an organization that may employ physicians or make arrangements with physicians as independent contractors. It is usually organized as a not-for-profit, tax-exempt corporation. It is the direct provider of health care and holds preferred provider organization and health maintenance organization contracts, bills and collects in its own name, and owns the accounts receivable department.

free thyroxine, the amount of the unbound, active thyroid hormone thyroxine circulating in the blood, measured by specific laboratory procedures. See also **free thyroxine index.**

free thyroxine index, the amount of unbound, physiologically active thyroxine (T_4) in serum. This amount is determined by direct assay or, more frequently, calculated on the basis of an in vitro uptake test. In this test the uptake (by resin or charcoal) of labeled triiodothyronine (T_3) is measured; because T_3 is less strongly bound by serum, it is used instead of T_4. The free T_4 index is then obtained by multiplying the T_3 uptake by the total concentration of T_4 in serum.

free thyroxine (FT_4) test, a blood test used to determine thyroid function, especially when the patient has concurrent clinical situations that may alter protein blood levels. Abnormal levels indicate either hyper- or hypothyroid states.

free water, that portion of the water in body tissue that is not bound by macromolecules or organelles.

free-water clearance, the calculated volume of water that must be added to a given volume of urine to make it isotonic to the plasma.

freeway space [AS, *freo* + *wegan* + L, *spatiaum*], the separation between the occlusal surfaces of the maxillary and mandibular teeth when the mandible is in its rest position. Also called **interocclusal distance, interocclusal gap.**

freezing, a sudden inability to initiate or continue repetitive motor activity of patients with Parkinson's disease. The patient may be unable to take the first step in walking or, if walking, may find a real or imagined obstacle that causes the feet to remain in one spot.

freezing point [ME, *fresen,* to be cold; L, *punctus,* pricked], the temperature at which a substance changes from a liquid to a solid state. The freezing point for water is 32° on the **Fahrenheit** scale and 0° on the **Celsius** scale.

Freiberg's infraction [Albert H. Freiberg, American surgeon, 1868–1940; L, *infarcire,* to stuff], an abnormal orthopedic condition characterized by osteochondritis or aseptic necrosis of bone tissue, most commonly affecting the head of the second metatarsal.

Frei's test /frī/ [William S. Frei, German dermatologist, 1885–1943], a test performed to confirm a diagnosis of lymphogranuloma venereum. Killed antigen, originally derived from infected patients, is injected intradermally in one forearm, and a control material is injected into the other arm. If a red, thickened papule develops at the site of injection of antigen, the test result is positive. See also ***Chlamydia.***

Frejka splint /frā′kə/, a corrective device used to maintain abduction and articulation of the head of the femur with the acetabulum in a baby born with dislocated hips. It consists of a pillow that is belted between the legs. See also **congenital dislocation of the hip.**

fremitus /frem′itəs/ [L, a growling], a tremulous vibration of the chest wall caused by vocalization that is primarily palpated during physical examination. Kinds of fremitus include **tactile fremitus** and **vocal fremitus.**

frena. See **frenum.**

French scale (Fr), a method of sizing catheters, tubules, and sounds in which each Fr unit is equivalent to 1.3 mm.

frenectomy /frənek′təmē/ [L, *frenum,* bridle; Gk, *ektomē,* excision], a surgical procedure for excising a frenum or frenulum, such as the excision of the lingual frenum from its attachment into the mucoperiosteal covering of the alveolar process to correct ankyloglossia. Compare **frenotomy.**

frenga. See **bejel.**

Frenkel's exercises [Heinrich S. Frenkel, Swiss neurologist, 1860–1931], a system of slow repetitious exercises of increasing difficulty developed to treat ataxia in multiple sclerosis and similar disorders.

frenotomy /frənot′əmē/ [L, *frenum* + Gk, *temnein,* to cut], a surgical procedure for repairing a defective frenum, such as the cutting or lengthening of the lingual frenum to correct ankyloglossia. Compare **frenectomy.**

frenulum. See **frenum.**

frenulum linguae. See **frenulum of the tongue.**

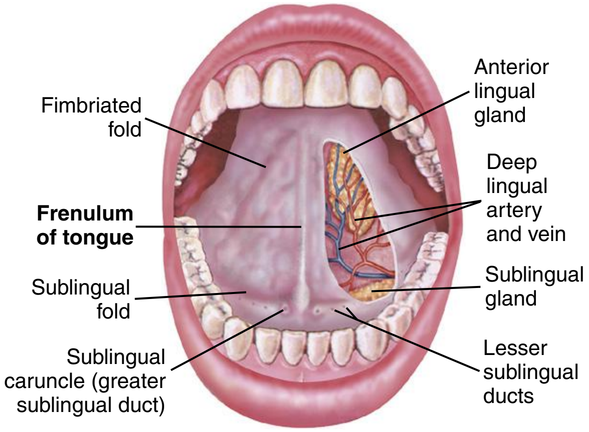
frenulum of labia minora, the small transverse fold formed by the union of the labia minora posterior to the vestibule.

frenulum of the clitoris. See **labia minora.**

frenulum of the ileal orifice, a fold formed by the joined extremities of the ileal orifice, extending partly around the lumen of the colon. It was called *frenulum of ileocecal valve* before it was discovered that the valve was found only in cadavers.

frenulum of the lips /fren′yələm/, a fold of movement-limiting mucous membrane running from the gums to the lips or tongue. The frenulum of the lower lip is called the frenulum labii inferioris. That of the upper lip is the frenulum labii superioris.

frenulum of the tongue [L, *frenum,* bridle; AS, *tunge*], a longitudinal fold of mucous membrane connecting the floor of the mouth to the underside of the tongue in midline. A congenital defect causes an abnormal shortness of the frenulum, causing tongue-tie, which can be surgically corrected. Also called **frenulum linguae, lingual frenum.**



Frenulum of tongue *(Seidel et al, 2011)*

frenum /frē′nəm/ *pl.* **frenums, frena** [L, *frenum,* bridle], a restraining portion or structure, a fold of mucous membrane that connects two parts, one more or less movable. Also called **frenulum.**

frequency (F) /frē′kwənsē/ [L, *frequens,* frequent], **1.** the number of repetitions of any phenomenon within a fixed period, such as the number of heartbeats per minute. **2.** (in biometry) the proportion of the number of persons having a discrete characteristic to the total number of persons being studied. **3.** (in electronics) the number of cycles of a periodic quantity, such as alternating current, that occur in a period of 1 second. Electromagnetic frequencies, formerly expressed in cycles per second (cps), are now expressed in hertz (Hz).

freshening, a step in the process of wound repair in which fibrin, granulation, and early scar tissue are removed in preparation for secondary closure.

fresh frozen plasma [ME, *fresen,* to be cold; Gk, *plassein,* to mold], plasma separated from whole blood and frozen within 8 hours of collection. FFP has a shelf life of 12 months when stored at 18C or below. Contains normal levels of all the coagulation proteins, including the labile factors V and VIII. See also **plasma.**

Fresnel zone /freznel′/ [Augustine J. Fresnel, French physicist, 1788–1827], the region nearest the face of an ultrasound transducer. It is characterized by a highly collimated beam with great variation in ultrasound intensity and is generally the area of best image resolution. Also called **near field.**

freudian /froi′dē·ən/ [Sigmund Freud], **1.** *adj,* pertaining to Sigmund Freud; his theories and doctrines, which stress the formative years of childhood as the basis for later psychoneurotic disorders, primarily through the unconscious repression of instinctual drives and sexual desires; and his system of psychoanalysis, based on free association and dream analysis, for treating such disturbances. **2.** *adj,* pertaining to anything that is easily interpreted according to the theories of Freud or in psychoanalytic terms. **3.** *adj,* pertaining to the school of psychiatry based on Freud's teachings. **4.** *n*, one who adheres to Freud's school of psychiatry. See also **psychoanalysis.**

freudian fixation [Sigmund Freud], an arrest in psychosexual development characterized by a firm emotional attachment to another person or object. Some kinds of freudian fixation are **father fixation** and **mother fixation.**

freudianism /froi′dē·əniz′əm/, the school of psychiatry based on the psychoanalytic theories and psychotherapeutic methods of treating disorders developed by Sigmund Freud and his followers. Also called **freudism.** See also **psychoanalysis.**

freudian slip, (in freudian psychology) a behavioral error in speech or action that is believed to reveal a hidden motive in the unconscious thoughts or feelings of the perpetrator. Also called *parapraxis*.

freudism. See **freudianism.**

Freud, Sigmund /froid/ [Austrian neurologist, 1856–1939], founder of a complex integrated theory of psychological causes of mental disorders, some, such as hysteria, with physical symptoms. Among tenets of freudian theory are that human beings are motivated by a pleasure principle; receive internal stimulation from a sex instinct and a death instinct; have personality structures that can be divided into ego, superego, and id; and have unconscious, preconscious, and conscious levels of mental activity. See also **freudian, freudian fixation, freudianism.**

friable /frī′əbəl/ [L, *friare,* to crumble], easily shattered, crumbled, or pulverized, such as tissues of the liver.

fricative /frik′ətiv/, a consonant speech sound such as an /f/ or /s/, made by forcing an airstream through a constricted opening.

Fricke dosimeter, a meter that quantifies radiation dose by measuring the change in the concentration of ferric ions in a solution subject to irradiation.

friction /frik′shən/ [L, *fricare,* to rub], **1.** the act of rubbing one object against another. See also **attrition. 2.** a type of massage in which deeper tissues are stroked or rubbed, usually through strong circular movements of the hand. See also **massage.**

Friction massage *(Harkreader, Hogan, and Thobaben, 2007)*

frictional force /frik′shənəl/, the force component parallel to the surfaces at the point of contact between two objects. The frictional component, in contact between curved objects, may be tangential to the surfaces. Frictional force may be increased or decreased by such factors as moisture on a surface.

friction burn, tissue injury caused by abrasion of the skin. See also **abrasion.**

friction rub, a dry, grating sound heard with a stethoscope during auscultation. It is a normal finding when heard over the liver and splenic areas. A friction rub auscultated over the pericardial area is suggestive of pericarditis; a rub over the pleural area may be a sign of lung disease.

Friedländer's bacillus /frēd′lendərz/ [Carl Friedländer, German pathologist, 1847–1887]. See ***Klebsiella pneumoniae.***

Friedländer's pneumonia [Carl Friedländer; Gk, *pneumon,* lung], a form of bronchopneumonia with a high mortality rate, particularly among older patients, caused by the bacterium ***Klebsiella pneumoniae.*** The pneumonic patches tend to become confluent, and those who survive may experience pulmonary abscesses and necrosis.

Friedman curve /frēd′mən/ [Emanuel A. Friedman, American obstetrician, b. 1926], a graph depicting the progress of labor, prepared by labor attendants to facilitate detection of dysfunctional labor. Observations of cervical dilation and fetal descent are plotted on the vertical axis against time on the horizontal axis. The labor curve is divided into latent and active phases, with the latter subdivided into latent, acceleration, maximum slope, and deceleration.

Friedman's test [Maurice H. Friedman, American physiologist, 1903–1991], a modification of the Aschheim-Zondek test. A sample of urine from a woman is injected into a mature unmated female rabbit. If, days later, the rabbit ovaries contain fresh corpora lutea or hemorrhaging corpora, the result is positive, indicating that the woman is pregnant.

Friedreich's ataxia /frēd′rīshs/ [Nikolaus Friedreich, German physician, 1825–1882], a condition characterized by muscular weakness, loss of muscular control, weakness of the lower extremities, and an abnormal gait. It may be hereditary and exhibits both dominant and recessive inheritance patterns. The primary pathological feature is pronounced sclerosis of the posterior columns of the spinal cord with possible involvement of the spinocerebellar tracts and the corticospinal tracts. Friedreich's ataxia usually affects individuals between 5 and 20 years of age. The highest incidence of onset is at puberty. The characteristically ataxic gait may progress to severe disability. Over a period of years a child who is affected may also have ataxia of the upper extremities and difficulty in performing simple maneuvers such as writing or handling eating utensils. The characteristic gait of this disease is caused by a cavus deformity, or clawfoot. The gait and the stance of the affected individual are unsteady. A positive Romberg's sign may be evident, and Babinski's sign is present with absent or decreased deep reflexes. The condition may also cause slurred speech, head tremors, tachycardia, and cardiac failure. Thoracic scoliosis is present in approximately 80% to 90% of the patients afflicted. All the signs and symptoms are progressive. There is no cure. Treatment is supportive. Orthoses may be useful to varying degrees in prevention of associated deformities and maintenance of an ambulatory status. Correction of the foot deformity allows the patient to remain ambulatory as long as possible and is performed when the disease process does not appear to be progressing, thereby reducing the potential for recurrence. Spinal fusion may correct the associated scoliosis. In progression of this disease, death usually results from myocardial failure.

Friedreich's sign [Nikolaus Friedreich; L, *signum,* sign], the diastolic collapse of the jugular veins in adherent pericardium.

Fried's rule, a method of estimating the dose of medicine for a child by multiplying the adult dose by the child's age in months and dividing the product by 150. See also **Clark's rule.**

frigid /frij′id/ [L, *frigidus*, cold], **1.** lacking warmth of feeling; unemotional; unimaginative; without passion or ardor and stiff or formal in manner. **2.** (of a woman) unresponsive to sexual advances or stimuli, abnormally indifferent or averse to sexual intercourse, or unable to have an orgasm during sexual intercourse. Compare **impotence.** See also **orgasm. —frigidity,** *n*.

fringe field /frinj/, in magnetic resonance imaging, the part of the magnetic field that extends away from the confines of the magnet and cannot be used for imaging. It may affect nearby equipment and personnel.

frit /frit, frē/ [Fr, fried], a partially or wholly fused porcelain that is cracked by plunging into water while hot. It is used to make dental porcelain powders.

frog leg position. See **Lauenstein method.**

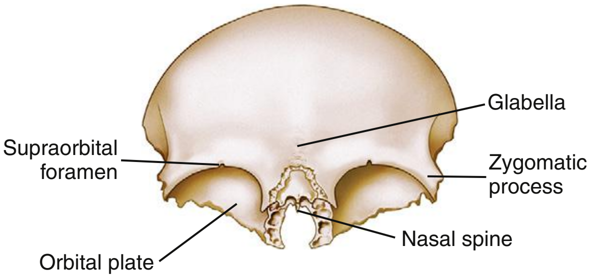
Fröhlich's syndrome. See **adiposogenital dystrophy.**

frôlement /frôlmäN′/ [Fr, brushing], **1.** the rustling type of sound often heard on auscultating the chest in diseases of the pericardium. **2.** a kind of massage that uses a light brushing stroke with the hand. See also **massage.**

Froment's sign, the flexing of the terminal phalanx of the thumb against the flexed index finger. See **thumb sign.**

front-, prefix combining form meaning "forehead or front": *frontad, frontalis, frontonasal*.

frontal bone /fron′təl/ [L, *frons*, forehead], a single cranial bone that forms the front of the skull, from above the orbits, posteriorly to a junction with the parietal bones at the coronal suture and sagittal suture (bregma).



Frontal bone

frontal crest, a midline ridge of bone extending from the surface of the frontal bone. It is a point of attachment for the falx cerebri.

frontal lobe, the largest of five lobes constituting each of the two cerebral hemispheres. It lies beneath the frontal bone; occupies part of the lateral, medial, and inferior surfaces of each hemisphere; and extends posteriorly to the central sulcus and inferiorly to the lateral fissure. It is responsible for voluntary control over most skeletal muscles. The frontal lobe significantly influences personality and is associated with the higher mental activities, such as planning, judgment, emotion, and conceptualization. Compare **central lobe, occipital lobe, parietal lobe, temporal lobe.**

frontal lobe dementia, any of various dementias caused by frontal lobe lesions, such as that seen in Pick's disease.

frontal lobe syndrome, behavioral and personality changes usually observed after a neoplastic or traumatic frontal lobe lesion. The patient may become sociopathic, boastful, hypomanic, uninhibited, exhibitionistic, and subject to outbursts of irritability or violence. In other cases the person may become depressed, apathetic, lacking in initiative, negligent about personal appearance, and inclined to perseverate. Partial frontal lobectomy was formerly performed by some psychosurgeons to reduce drive in extremely disturbed psychotic patients, but the results were highly questionable.

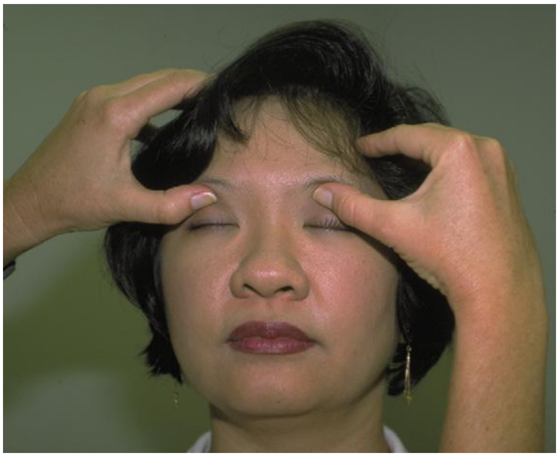
frontal nerve, the largest branch of the ophthalmic nerve. Its two terminal branches are the supratrochlear nerve and the supraorbital nerve.

frontal plane, any of the vertical planes passing through the body from the head to the feet, perpendicular to the sagittal planes; the plane parallel to the long axis of the body and at right angles to the median sagittal plane, dividing the body into front and back portions. Also called **coronal plane.** Compare **median plane, sagittal plane, transverse plane.** See also **frontal section.**

frontal pole [L, *frons*, forehead, *polus*], the anterior extremity of the frontal lobe of the cerebrum.

frontal section [L, *frons*, forehead, *sectio*, a cutting], a section of the head or other body part cut into anterior and posterior portions. Also called **coronal section.** See also **frontal plane.**

frontal sinus, one of a pair of small cavities in the frontal bone of the skull that communicate with the nasal cavity and lie above the orbits. The frontal sinuses are situated behind the superciliary arches and are lined with a mucous membrane that is continuous with that of the nasal cavity. Each sinus opens into the anterior part of the middle meatus through the frontonasal duct. The frontal sinuses are absent at birth, become well developed between the seventh and eighth years, and reach their full size after puberty. Compare **ethmoidal air cell, maxillary sinus, sphenoidal sinus.**



Assessment of the frontal sinuses *(Lemmi and Lemmi, 2000)*

frontal-temporal dementia, any of several degenerative conditions of the frontal and anterior temporal lobes that cause personality and behavioral changes sometimes mistaken for those of Alzheimer's disease and may eventually progress to immobility and loss of speech. There is not the memory loss seen in Alzheimer's disease, but there is often hyperorality.

frontal vein, one of a pair of superficial veins of the face, arising in the plexus of the forehead. Each frontal vein communicates with the frontal tributaries of the superficial temporal vein and lies near the vein of the opposite side as it courses toward the root of the nose. Compare **angular vein, facial vein.**

frontocortical aphasia. See **motor aphasia.**

frontoethmoidal suture. See **ethmoidofrontal suture.**

frontonasal dysplasia, a hereditary form of defective midline development of the head and face, including ocular hypertelorism, occult cleft nose and maxilla, and sometimes mental retardation or other defects. Also called **median cleft facial syndrome.**

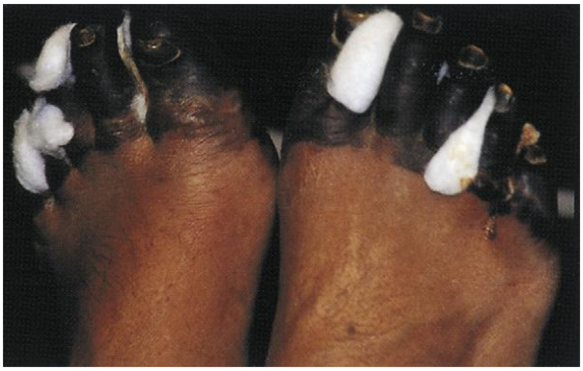
front-tap reflex, in spinal irritability, contraction of the gastrocnemius muscle caused by a tap on the skin muscles of the extended leg.

frostbite [AS, *frost* + *bitan*], a traumatic effect of extreme cold on skin and subcutaneous tissues that is first recognized by distinct pallor of exposed skin surfaces, particularly the nose, ears, fingers, and toes. Vasoconstriction and damage to blood vessels impair local circulation and cause anoxia, edema, vesiculation, and necrosis. Gentle warming is appropriate first-aid treatment; rubbing of the affected part is avoided. Later therapy is similar to treatment of thermal burns. Iatrogenic frostbite is the result of excessive use of ethyl chloride sprays for local anesthesia for the relief of muscle and tendon strains. Compare **chilblain, immersion foot.**

■ OBSERVATIONS: Manifestations for superficial frostbite present as a white, waxy, soft, and numb appearance of the injured area while it is still cold. As thawing occurs, the area becomes flushed, edematous, and painful, and may become mottled and purple. Within 24 hours, large blisters form and remain for about 2 weeks before turning into a hardened eschar, which separates in about a month. As the eschar separates, it leaves painful, sensitive new skin that often sweats excessively. In deep frostbite, the injured part remains hard, cold, mottled, and blue-gray after thawing; edema forms in entire limb and may remain for months. Blisters may or may not form weeks after the injury. After several weeks, dead tissue blackens and sloughs off and a line demarcates dead from live tissue. Diagnosis is made by clinical evaluation plus a history of exposure to cold. Loss of digits, ears, nose, and extremities is possible, as is secondary infection and long-term residual symptoms, such as neuropathic pain, sensory deficits, hyperhidrosis, hair and nail deformities, and arthritis.

■ INTERVENTIONS: Acute treatment centers around rapid rewarming by immersion in water (40° C to 42° C) for 15 to 30 minutes. Intravenous analgesics are used for pain. Immunological agents (tetanus) and antiinfective drugs are given for prophylaxis. Fluid and electrolytes are replaced. After the affected area has thawed, plasma expanders are used to reduce sludge and thrombus formation. Whirlpool hydrotherapy is used 20 to 30 minutes three to four times a day. Physical therapy is used to increase function after edema resolves. In deep and severe cases, escharotomy may be performed with debridement after retraction of viable tissue. Amputation is done for nonviable extremities. Sympathectomy may be performed for severe vasospasm.

■ NURSING CONSIDERATIONS: Immediately after injury, constrictive and wet clothing should be removed and the affected area should be insulated and immobilized. The area should never be massaged or rubbed or subjected to dry heat. Associated hypothermia must be stabilized with heated saline; warming blankets; and warmed, humidified oxygen. Long-term precautions should be taken with injured area to prevent dislodgement of eschar and further damage. An exercise program may be needed to prevent joint restriction. Counseling may be needed for altered body image from loss of digits or limbs. Education is needed about adequate protection when exposed to cold temperatures and use of preventive measures, such as carrying extra clothing, coats, blankets, fluids, high carbohydrate foods, cell phone, and hazard markers in the car when traveling in cold weather.



Frostbite *(Auerbach, 2007)*

frottage /frôtäzh′/ [Fr, rubbing], **1.** sexual gratification obtained by rubbing (especially the genital area) against the clothing of another person, as can occur in a crowd. **2.** a massage technique using rubbing. Compare **masturbation**.

frotteur /frôtœr′/ [Fr], a person who obtains sexual gratification by the practice of frottage.

frovatriptan, an antimigraine agent used for the acute treatment of migraine with or without aura.

frozen red blood cells, red cells cryopreserved with glycerol and stored frozen at -65C for up to 10 years. Also called glycerolized red cells.

frozen section [ME, *fresen* + L, *sectio*], a histological section of tissue that has been frozen by exposure to dry ice.

frozen section method [AS, *freosan,* to freeze; L, *sectio,* a cutting; Gk *meta* order, *hodos* path], (in surgical pathology) a method used in preparing a selected portion of tissue for pathological examination. The tissue is moistened and, fixed or unfixed, is rapidly frozen and cut by a microtome in a cryostat. This method is very rapid, allowing the pathologist to examine the specimen during a surgical procedure.

F.R.S.C., abbreviation for *Fellow of the Royal Society of Canada*.

fructokinase /fruk′tōkī′nās/, an enzyme that catalyzes the transfer of a high-energy phosphate group from adenosine triphosphate to D-fructose.

fructosamine test /fro͝oktōs′əmēn/, determination of the glycated albumin level by measuring the reduction of nitroblue tetrazolium to purple under alkaline conditions, used as an index of the average glycemic state over the preceding 2 to 3 weeks. It is not widely used; however, it is useful when glycosylated hemoglobin (hemoglobin A1C) cannot be reliably measured.

fructose /fruk′tōs, fro͝ok′-/, a yellowish-to-white, crystalline, water-soluble levorotatory ketose monosaccharide that is sweeter than sucrose. It is found in honey and several fruits and combines with glucose to form the disaccharide sucrose. Also called **fruit sugar, levulose.** See also **high-fructose corn syrup.**

fructose intolerance [L, *fructus,* fruit, *in* + *tolerare,* to bear], an inherited disorder marked by an absence of enzymes needed to metabolize fructose. Symptoms include sweating, tremors, confusion, digestive distress with vomiting, and failure of infants to grow. The condition is transmitted as an autosomal-recessive trait. Also called **hereditary fructose intolerance.**

fructosemia /fro͝ok′tōsē′mē·ə/ [L, *fructus*, fruit; Gk, *haima*, blood], the presence of fructose in the blood.

fructose test, a laboratory fertility examination of the semen of azoospermic men. Fructose comes primarily from the seminal vesicles. The purpose of the test is to rule out possible ejaculatory duct obstruction or agenesis of seminal vesicles.

fructosuria /fro͝ok′tōso͝or′ē·ə/, presence of the sugar fructose in the urine. This usually harmless and asymptomatic condition is caused by the hereditary absence of the enzyme fructokinase, which normally assists fructose metabolism. Essential fructosuria is associated with symptoms of diabetes mellitus. Also called **levulosuria.**

fruit sugar. See **fructose.**

frustration /frustrā′shən/, a feeling that results from interference with one's ability to attain a desired goal or satisfaction.

FSE, abbreviation for **fast spin-echo.**

FSF, abbreviation for **fibrin-stabilizing factor**. See **factor XIII**.

FSH, abbreviation for **follicle-stimulating hormone.**

FSH-RF, abbreviation for **follicle-stimulating hormone–releasing factor.**

FSK, abbreviation for **forskolin.**

FT, abbreviation for *fast-twitch*. See **fast-twitch (FT) fiber.**

FT_4, abbreviation for *free thyroxine*.

FTA-ABS test, abbreviation for **fluorescent treponemal antibody absorption test.**

FTC, abbreviation for **Federal Trade Commission.**

***F*-test** [Sir Ronald Aylmer *Fisher,* British statistician, 1890–1962], a statistical test comparing the means of more than two groups simultaneously by comparing two different measures of variance of the observations. One statistic measures the variations between the means of the groups (the between-groups variation), the other the variations within the groups (the within-group variation). If the two measures of variance yield similar results and their ratio, the *F*-ratio, approximates 1.0, the null hypothesis that all observations came from the same population cannot be rejected, whereas under the alternative hypothesis, the *F*-ratio is expected to be larger than 1.0. The test is the first step in the analysis of variance.

FTT, abbreviation for **failure to thrive.**

fuchsin bodies. See **Russell's bodies.**

Fuchs method, a technique for a radiographic examination of the odontoid process projected through the foramen magnum. It is used when it is difficult to visualize the tip of the process on an image obtained by using the conventional open mouth method. See also **Judd method.**

fucosidosis /fyo͞o′kōsidō′sis/, a hereditary lysosomal storage disorder that results from the absence of the enzyme required to metabolize fucoside moieties. It causes mental retardation, neurological deterioration, coarse facial features, thickened skin, and hepatosplenomegaly.

FUDR, a trademark for an antiviral and antineoplastic **(floxuridine).**

fugue /fyo͞og/ [L, *fuga,* running away], a state of dissociative reaction characterized by amnesia and physical flight from an intolerable situation. During the episode the person appears normal and seems consciously aware of what may be very complex activities and behavior, but afterward he or she has no recollection of the actions or behavior. The condition may last for only a few days or weeks, or it may continue for several years, during which the person wanders away from the customary environment, enters a new occupation, and undertakes an entirely different way of life. The syndrome appears to be caused by an inability to cope with a severe conflict or with a chronically stressful life situation. A form of fugue also occurs briefly after an epileptic seizure. See also **ambulatory automatism, automatism, dissociative disorder.**

Fukuhara's syndrome. See **MERRF syndrome.**

Fukuyama type congenital muscular dystrophy /fo͞o′ko͞oya′ma/ [Yukio Fukuyama, Japanese physician, 20th century], an autosomal-recessive type of muscular dystrophy evident in infancy. Muscle abnormalities resemble those of Duchenne's muscular dystrophy, and patients are mentally retarded with microgyria and other cerebral abnormalities. Also called *Fukuyama's syndrome*. See also **Duchenne's muscular dystrophy.**

fulcrum /fo͝ol′krəm, ful′-/ [L, *fulcire,* to support], **1.** the stable point or the position on which a lever, such as the ulna or the femur, turns. Numerous common body movements, such as raising the arm and walking, are combinations of lever actions involving fulcrums. The muscles provide the forces that move the numerous bones acting as levers. **2.** (in radiology) an imaginary pivot point about which the x-ray tube and film move. During computed tomography the fulcrum lies in the focal, or object, plane, and only anatomical areas lying in this plane are focused and imaged.

fulfillment [AS, *fullfyllan,* to make full], a perception of harmony in life that results when an individual has found meaning and acts purposefully.

fulgurate /ful′gyərāt/ [L, *fulgur,* lightning], **1.** *adj*, pertaining to sudden, intense, sharp pain. **2.** *v*, to use a movable electrode to destroy superficial tissue.

fulguration. See **electrodesiccation.**

full-arch wire, a wire that is attached to the teeth and extends from the molar region of one side, across the front of the mouth, to the molar region on the other side. It is used to cause or guide orthodontic tooth movement. A sectional arch wire or shorter version of the full-arch wire may also be used. A section arch usually spans three to four posterior teeth in the same dental arch.

full bath [AS, *fol* + *baeth*], a bath in which the patient's body is immersed in water up to the neck.

full denture [AS, *fol* + L, *dens,* tooth], a removable dental prosthesis that replaces all of the natural teeth in the maxillary or mandibular dental arch. The denture is usually made of methyl methacrylate along with synthetic artificial teeth, and is completely supported by the mouth tissues. Also called **complete denture.**

full-liquid diet, a diet consisting of only liquids and foods that liquefy at body temperature. It includes milk, milk drinks, carbonated beverages, coffee, tea, strained fruit juices, broth, strained cream soup, eggs cooked to liquid consistency or pasteurized, egg substitutes, cream, melted butter or margarine, strained precooked infant cereals in milk, thin custards, gelatin desserts, ice cream, sherbet, strained vegetables in soup, honey, syrups, sugar, and dry skim milk dissolved in liquids. The diet is prescribed after surgery, in some acute infections of short duration, in the treatment of acute GI disorders, and for patients too ill to chew. See also **liquid diet.**

full-lung tomography, a technique for producing general tomographic surveys of both lungs for the purpose of detecting possible occult nodules of metastases. Such lesions usually cannot be visualized with conventional radiological methods.

full pulse [AS, *fol* +, *pulsare,* to beat], a large-volume pulse with a low pulse pressure. Also called **pulsus magnus.**

full-risk HMO, (in U.S. managed care) a health maintenance organization in which the hospital receives capitation (money paid) for all facility and hospital-based physician services. The physician group receives capitation and shares the deficit or surplus of the hospital risk pool. The HMO retains premium dollars and assumes risk for out-of-area emergencies, pharmacy benefits, and vision benefits.

full term [AS, *fol* + Gk, *terma,* limit], pertaining to the normal period of human gestation, between 38 and 41 weeks.

When pregnancy is calculated from the date of the last menstrual cycle, full term is considered 37 to 40 weeks.

full-thickness graft, a tissue transplant that includes the full thickness of the skin and subcutaneous layers.

full weight-bearing (FWB) [AS, *fol* + *gewiht* + ME, *beren*], relating to a view in radiology that shows the response to stresses of a natural posture. Full weight-bearing views of the foot are useful in studying flatfoot and clawfoot.

full-width half maximum (FWHM), a measure of resolution equal to the width of an image line source at points where the intensity is reduced to half the maximum.

fulminant hepatitis, a rare and frequently fatal form of acute hepatitis B in which the patient's condition rapidly deteriorates, with hepatic encephalopathy, necrosis of the hepatic parenchyma, coagulopathy, renal failure, and coma.

fulminating /ful′minā′ting/ [L, *fulminare,* lightening flash], (of a disease or condition) rapid, sudden, and severe, such as an infection, fever, or hemorrhage. Also called *fulminant*. **—fulminate,** *v.*

fulvestrant, an antineoplastic agent used to treat advanced breast carcinoma in estrogen-receptor-positive patients.

Fulvicin, a trademark for an antifungal **(griseofulvin).**

fumigate /fyo͞o′migāt/, to disinfect by exposing an area or object to pesticidal smoke or fumes.

fuming, producing a visible vapor.

function /fungk′shən/ [L, *functio,* performance], **1.** *n,* an act, process, or series of processes that serve a purpose. **2.** *v,* to perform an activity or to work properly and normally.

functional /fungk′shənəl/ [L, *functio,* performance], **1.** pertaining to a function. **2.** affecting the functions but not the structure of an organism or organ system.

functional age, a combination of the chronological, physiological, mental, and emotional ages.

functional analysis, (in psychiatry) a type of therapy that traces the sequence of events involved in producing and maintaining undesirable behavior.

functional antagonism, (in pharmacology) a situation in which two agonists interact with different receptors and produce opposing effects.

functional assessment. See **health history.**

functional bowel syndrome. See **irritable bowel syndrome.**

functional contracture. See **hypertonic contracture.**

functional differentiation, (in embryology) the specialization or diversification that results from the particular function of a cell or tissue.

functional disease, **1.** a disease that affects function or performance. **2.** a condition marked by signs or symptoms of an organic disease or disorder although careful examination fails to reveal any evidence of structural or physiological abnormalities. The symptoms of a functional disorder are as real as those of an organic disease. Headache, impotence, certain heart murmurs, and constipation may be symptoms either of organic disease or of functional disease.

functional dyspepsia, a condition characterized by impaired digestion caused by an atonic or a neurological problem. See also **dyspepsia.**

functional foods, foods and food supplements marketed for presumed health benefits, such as vitamin supplements and certain herbs.

functional health history. See **complete health history.**

functional hearing loss, hearing loss that lacks any organic lesion. Also called **nonorganic hearing loss.**

functional illness, a physical disorder with no known structural explanation for the symptoms. See also **disorder, functional disease, illness.**

functional imaging, a diagnostic procedure in which a sequence of radiographic or scintillation camera images of the distribution of an administered radioactive tracer delineates one or more physiological processes in the body.

functional impotence. See **impotence.**

functional magnetic resonance imaging (fMRI), a radiographic technique for imaging brain activity. In fMRI the examiner takes a rapid succession of scans designed to detect increases in oxygen consumption in various regions of the brain, which reflects small changes in blood flow and increased activity in certain cells.

functional method, a type of nursing care delivery system.

functional murmur [L, *functio,* performance], a heart murmur caused by an alteration of function without structural heart disease or damage, as in a murmur related to anemia. Also called **physiological murmur.**

functional nursing, an organizational mode for assigning nursing personnel that is task- and activity-oriented, using auxiliary health workers trained in a variety of skills. Each person is assigned specific functions performed for all patients in a given unit, and all report to the head nurse.

functional overlay, an emotional aspect of an organic disease. It may occur as an overreaction to an illness and is characterized by symptoms that continue long after clinical signs of the disease have ended.

functional pathology [L, *functio,* performance; Gk, *pathos,* disease, *logos,* science], a study of the functional changes that result from structural alterations in tissues.

functional position of the hand, a position for splinting the hand, including the wrist and fingers. It consists of dorsiflexing both the wrist between 20 and 35 degrees and the proximal interphalangeal joints between 45 and 60 degrees. The thumb is abducted and in opposition and alignment with the pads of the fingers.

functional progression, a rehabilitative sequence for a musculoskeletal or similar injury. With variations for individual cases, the program usually progresses from immobilization for primary healing through protection of range of motion to endurance and strengthening activities related to the patient's work and play requirements.

functional psychosis, a severe emotional disorder characterized by personality derangement and loss of ability to function in reality, but without evidence that the disorder is related to the physical processes of the brain.

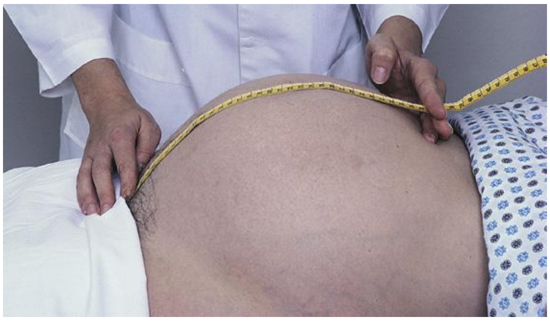
functional residual capacity (FRC), the volume of gas in the lungs at the end of a normal tidal volume exhalation. The functional residual capacity is equal to the residual volume plus the expiratory reserve volume. In anesthesia FRC serves as an oxygen reservoir in an apneic patient. FRC is reduced in obesity due to the cephalad position of the diaphragm.

functional splint [L, *functio,* performance; ME, *splent*], an orthopedic device that allows or assists a patient's movements. Also called **ambulatory splint, dynamic splint.** See also **splint.**

functional visual skills, various normal eye activities, such as depth perception, eye aiming and alignment, oculomotility, convergence and divergence, and accommodative ability.

functional vomiting, vomiting whose physiological cause is unknown.

fundal height /fun′dəl/ [L, *fundus,* bottom; AS, *heightho*], the height of the fundus of the uterus, measured in centimeters from the top of the symphysis pubis to the highest point in the midline at the top of the uterus. Fundal height is measured at each prenatal visit with large blunt calipers or with a tape measure. From the twentieth to the thirty-second week of pregnancy the height in centimeters is equal to the gestation in weeks. Two measurements 2 weeks apart showing a deviation of more than 2 cm may indicate that the fetus is large or small for dates, that the estimated gestation is in error, or that the woman is carrying a multiple pregnancy.



Measurement of fundal height *(Seidel et al, 2011)*

fundal placenta [L, *fundus,* bottom, *placenta,* flat cake], a placenta that is attached to the fundus of the uterus.

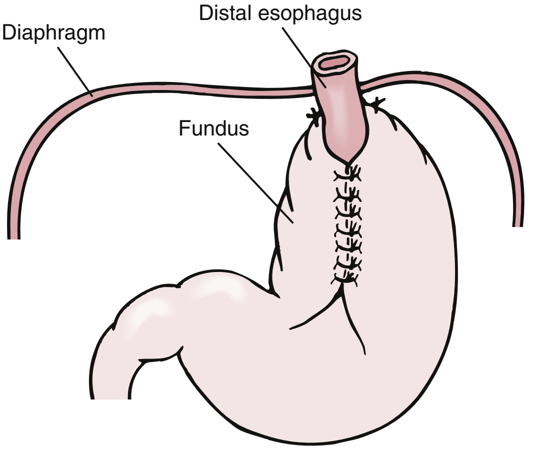
fundamentals of nursing /fun′dəmen′təls/, the basic principles and practices of nursing as taught in educational programs for nurses. In a course on the fundamentals of nursing, traditionally required in the first semester of the program, the student attends classes and gives care to selected patients. A fundamentals of nursing course emphasizes the importance of the fundamental needs of humans as well as competence in basic skills as prerequisites to providing comprehensive nursing care.

fundi. See **fundus.**

fundic gastritis, gastritis whose focus is in the gastric fundus.

fundiform ligament of the penis /fun′difôrm/, a band of fibrous and elastic fibers blending with the fascia surrounding the penis. It extends from the linea alba above the pubic symphysis and attaches to the penile fascia.

fundoplication /fun′dəplikā′shən/ [L, *fundus,* bottom, *plicare,* to fold], a surgical procedure involving making tucks (plication) in the fundus of the stomach around the lower end of the esophagus. The operation is used in the treatment of gastroesophageal and paraesophageal hernias. See also **plication.**



Nissen fundoplication for hiatal hernia *(Lewis et al, 2007)*

fundoscopy. See **ophthalmoscopy.**

fundus /fun′dəs/ *pl.* **fundi** [L, bottom], the base or the deepest part of an organ. The portion farthest from the mouth of an organ, such as the fundus of the uterus or the fundus of an eye.

funduscope. See **ophthalmoscope.**

funduscopy. See **ophthalmoscopy.**

fundus microscopy, examination of the interior of the eye using an instrument that combines an ophthalmoscope and a lens with high magnifying power for observing minute structures on the retina.

fundus of the gallbladder, the closed end of the gallbladder, adjacent to the inferior border of the liver.

fundus of the stomach, a cul-de-sac of the stomach that lies above the level of the cardiac orifice, where the esophagus joins the stomach. It contains a gas bubble, the magenblassen.

fundus of the urinary bladder, the bottom of the bladder, formed by the convex posterior wall.

fungal /fung′gəl/ [L, *fungus,* mushroom], pertaining to or resembling a fungus or fungi.

fungal abscess, a collection of pus produced by a fungal infection.

fungal antibody tests, a relatively unreliable blood test to detect fungal infections.

fungal infection [L, *fungus,* mushroom, *inficere,* to stain], any inflammatory condition caused by a fungus. Most fungal infections are superficial and mild, though persistent and difficult to eradicate. Some, particularly in older, debilitated, or immunosuppressed or immunodeficient people, may become systemic and life threatening. Some kinds of fungal infections are **aspergillosis, blastomycosis, candidiasis, coccidioidomycosis,** and **histoplasmosis.**

fungal infection of nail, an infection of the horny cutaneous plates on the dorsal tips of the fingers and toes. The infection is commonly caused by *Tricophyton* organisms and treated with terbinafine or itraconazole. The infection is defined by the part of the nail that is infected.

fungal pneumonia, pneumonia caused by inhaled fungi, usually *Blastomyces dermatitidis, Coccidioides immitis,* or ***Histoplasma capsulatum.*** Numerous other fungi, such as ***Aspergillus*** and ***Candida,*** infect immunocompromised patients. See also **blastomycosis, histoplasmosis.**

fungal septicemia [L, *fungus* + Gk, *septikos,* putrid, *haima,* blood], a form of systemic infection in which the causative agent is a fungus in the circulatory bloodstream.

fungemia /funjē′mē·ə/ [L, *fungus* + Gk, *haima,* blood], the presence of fungi in the blood, mostly seen in immunocompromised patients. Diagnosis is difficult because routine blood cultures have poor sensitivity. Compare **bacteremia, parasitemia, viremia.**

Fungi /fun′ji/, in the classification of living organisms, one of the kingdoms of eukaryotic organisms. See also **fungus**.

fungicide /fun′jisīd/, a drug that kills fungi. See also **antifungal,** def. 2. **—fungicidal,** *adj.*

fungiform /fun′jifôrm/ [L, *funis* + *forma*], shaped like a mushroom.

fungiform papilla. See **papilla.**

-fungin, suffix for antifungal antibiotics.

fungistatic /fun′jēstat′ik/, having an inhibiting effect on the growth of fungi.

Fungizone, a trademark for an antifungal **(amphotericin B).**

fungus /fun′gəs/ *pl.* **fungi,** [L, *fungus,* mushroom], a eukaryotic, thallus-forming organism that feeds by absorbing organic molecules from its surroundings. Fungi lack chlorophyll and therefore are not capable of photosynthesis. They may be saprophytes or parasites. Unicellular fungi (yeasts) reproduce by budding; multicellular fungi, such as molds, reproduce by spore formation. Fungi may invade living organisms, including humans, as well as nonliving organic substances. Of the 100,000 identified species of fungi, 100 are common in humans and 10 are pathogenic. See also **fungal infection. —fungal, fungous,** *adj.*

funic presentation /fyo͞o′nik/ [L, *funis* + *praesentare,* to show], (in obstetrics) the appearance of the umbilical cord before the main presenting part of the fetus. Also called **cord presentation, funis presentation, presentation.**

funic souffle /fyo͞o′nik so͞o′fəl/ [L, *funis,* cord; Fr, *souffle,* breath], a soft, muffled blowing sound produced by blood rushing through the umbilical vessels and synchronous with the fetal heart sound.

funicular hernia, an indirect inguinal hernia that includes part of the umbilical cord or spermatic cord.

funicular part of ductus deferens, a middle part of the ductus deferens, where it is within the spermatic cord.

funiculitis /fənik′yəlī′tis/, any abnormal inflammatory condition of a cordlike structure of the body, such as the spinal cord or spermatic cord. Inflammation of the umbilical cord is usually associated with chorioamnionitis.

funiculopexy /fənik′yəlōpek′sē/, a surgical procedure for correcting an undescended testicle, in which the spermatic cord is sutured to surrounding tissue.

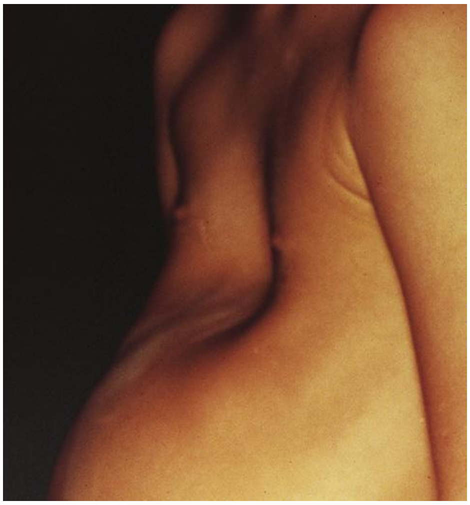
funiculus /fənik′yələs/ [L, little cord], a division of the white matter of the spinal cord, consisting of fasciculi or fiber tracts.

funiculus umbilicalis. See **umbilical cord.**

funis /fyo͞o′nis, fo͞o′nis/, a cordlike structure, such as the umbilical cord.

funis presentation. See **funic presentation.**

funnel chest [L, *fundere,* to pour], a skeletal abnormality of the chest characterized by a depressed sternum. The deformity may not interfere with breathing, but surgical correction is often recommended for cosmetic reasons. Also called **pectus excavatum.**



Funnel chest *(Zitelli and Davis, 2007)*

funnel feeding, a technique in which liquids may be given orally to a patient who cannot move the lips or masticate, such as after surgery on the mouth or lips. A rubber tube attached to a funnel is placed in the mouth, usually at one corner, and a liquid is poured slowly through the funnel and tube into the mouth near the back of the tongue. The patient quickly learns to control the flow with sucking action and tongue position. If the method is used for a weak or young infant, a rubber bulb or a large syringe may be used instead of a funnel. The bulb or syringe is compressed gently, slowly, and continuously to control the rate of flow and prevent choking.

funny bone, a popular name for a point at the lower end of the humerus where the ulnar nerve crosses the elbow joint near the surface and, if subjected to external pressure, produces a tingling sensation.

FUO, abbreviation for **fever of unknown origin.**

Furadantin, a trademark for an antibacterial **(nitrofurantoin).**

furazolidone /fo͝o′rəzol′idōn/, an antibiotic with antibacterial and antiprotozoal activity.

■ INDICATIONS: It is prescribed for the treatment of diarrhea caused by susceptible bacterial or protozoal infections (e.g., *Giardiasis, Vibrio*) of the GI tract.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not given to children less than 1 month of age, and it is not used with drugs that are contraindicated with monoamine oxidase inhibitors. Foods high in tyramine and concurrent use of alcohol should be avoided.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hemolytic anemia and fever, skin rash, and abdominal pain.

furcation /fərkā′shən/ [L, *furca,* fork], the region of division of tooth root. It is a bifurcation if there are two roots or a trifurcation if there are three roots.

furcation probe. See **periodontal probe.**

furfuraceous desquamation /fur′fərā′sē·əs/ [L, *furfur,* bran, *desquamare,* to scale off], the shedding of epidermis in large scales.

furosemide /fo͞orō′səmīd/, a loop diuretic.

■ INDICATIONS: It is prescribed in the treatment of edema caused by congestive heart failure, renal failure, or liver failure and alone or in combination for the treatment of hypertension.

■ CONTRAINDICATIONS: Anuria, pregnancy, lactation, electrolyte depletion, or known hypersensitivity to this drug or other sulfonylureas prohibits its use.

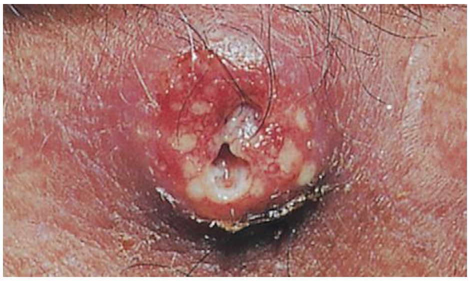
■ ADVERSE EFFECTS: Among the more serious adverse effects are fluid and electrolyte imbalances.

Furoxone, a trademark for an antibacterial antiprotozoal drug **(furazolidone).**

furred tongue. See **coated tongue.**

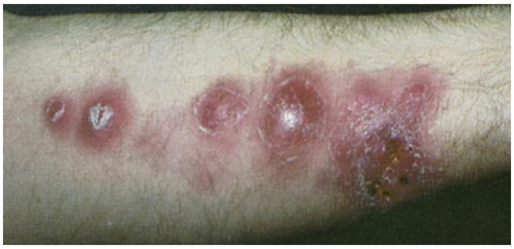
furrow /fur′ō/ [AS, *furh*], a groove, such as the atrioventricular furrow that separates the atria from the ventricles of the heart.

furuncle /fyo͝or′ungkəl/ [L, *furunculus,* petty thief], a localized suppurative staphylococcal skin infection originating in a gland or hair follicle and characterized by pain, redness, and swelling. Necrosis deep in the center of the inflamed area forms a core of dead tissue that is spontaneously extruded, eventually resorbed, or surgically removed. It is important to avoid irritating or squeezing the lesion to prevent spread of the infection. Treatment may include antibiotics, local moist heat, and, when there is definite fluctuation and the hard white core is evident, incision and drainage. Also called **boil.** Compare **carbuncle. —furunculous,** *adj.*



Furuncle *(Seidel et al, 2006/Courtesy Dr. Jaime A. Tschen, Baylor College of Medicine, Department of Dermatology)*

furunculosis /fyo͝orung′kyo͝olō′sis/, an acute skin disease characterized by boils or successive crops of boils that are caused by staphylococci or streptococci.



Furunculosis *(Weston, Lane, and Morrelli, 2007)*

furunculous. See **furuncle.**

-fuse, suffix meaning "to pour or flow": *diffuse, effuse, perfuse.*

fused teeth /fyo͞ozd/ [L, *fundere,* to melt], partial or complete fusion of two or more individual teeth caused by union of two adjacent tooth buds by either enamel or cementum. Not to be confused with germination or "twinning" of a single tooth bud. Also called **fusion.**

fusiform /fyo͞o′sifôrm/ [L, *fusus,* spindle, *forma,* form], a structure that is tapered at both ends.

fusiform aneurysm, a localized dilation of an artery in which the entire circumference of the vessel is distended. The result is an elongated, tubular, or spindlelike swelling. Also called **Richet's aneurysm.** Compare **saccular aneurysm.**

fusiform gyrus [L, *fusus,* spindle, *forma,* form; Gk, *gyros,* turn], a convolution of the cerebral hemispheres that lies below the collateral fissures and joins the occipital and temporal lobes.

fusiform megalourethra, a huge diverticulum of the anterior urethra, resulting from absence of an entire section of the corpus spongiosum.

fusimotor /fyo͞o′zimō′tər/ [L, *fusus* + *motare,* to move about], pertaining to the motor nerve fibers, or gamma efferent fibers, that innervate the intrafusal fibers of the muscle spindle.

fusion /fyo͞o′zhən/ [L, *fusio,* outpouring], **1.** the joining into a single entity, as in optic fusion. **2.** See also **ankylosis. 3.** the surgical joining of two or more vertebrae, performed to stabilize a segment of the spinal column after severe trauma, herniation of a disk, or degenerative disease. Under general anesthesia the cartilage pads are removed from between the posterior parts of the involved vertebrae. Bone chips are cut from one of the patient's iliac crests and inserted in place of the cartilage, fusing the articulating surfaces into one segment of bone. **4.** (in psychiatry) the tendency of two people who are experiencing an intense emotion to unite.

fusional amplitude. See **amplitude of convergence.**

fusional movement /fyo͞o′zhənəl/, a reflex that moves the visual axes to the point of fixation, producing stereoscopic vision.

fusion beat, in an electrocardiogram, a P wave or QRS complex resulting from the concurrent activation of the atria or the ventricles by two stimuli in the same chamber. An atrial fusion beat results when the sinus beat coincides with an atrial ectopic beat, when two atrial ectopic beats coincide, or when an atrial or sinus beat coincides with retrograde conduction from a junctional focus. A ventricular fusion beat results when a ventricular beat coincides with a sinus beat, a ventricular ectopic beat, or a junctional beat.

fusion imaging, a combination of two images from different modalities, such as computed tomography and positron emission tomography.

Fusobacterium, a large cigar-shaped anaerobic bacillus genus, only some of which are pathogenic to humans. *F. fusiforme* is found in cavities of humans and other animals. It is sometimes associated with Vincent's angina. *F. nucleatum* is associated with pleuropulmonary infection and disease and also is one of the causes of gingivitis.

fusospirochetal disease /fyo͞o′zōspī′rōkē′təl/ [L, *fusus,* spindle; Gk, *speira,* coil, *chaite,* hair], any infection characterized by ulcerative lesions in which both a fusiform bacillus and a spirochete are found, such as trench mouth or Vincent's angina.

Fuzeon, a trademark for **enfuvirtide.**

FVIII, a large glycoprotein containing more than 2300 amino acids, 24 cysteine residues, and 25 potential glycosylation sites. The factor is used to treat blood-clotting disorders, such as **hemophilia A,** in which the factor is deficient or missing. Also called **recombinant factor VIII concentrate.**

FVL, abbreviation for *factor V–Leiden.* See **factor V–Leiden test.**

F wave, a waveform recorded in electroneuromyographic and nerve conduction tests. It appears on supramaximal stimulation of a motor nerve and is caused by antidromic transmission of a stimulus. The F wave is used in studies of motor nerve function in the arms and legs.

f waves, in an electrocardiogram, wavy deflections at a rate of 400 or more per minute that represent atrial fibrillation.

FWB, abbreviation for **full weight-bearing.**

FWHM, abbreviation for **full-width half maximum.**

-fy, suffix meaning "to make into" something specified: *acidify, decalcify, salify.*

-fying. See **-factive.**

-fylline, suffix for theophylline derivatives.

G

g, **1.** abbreviation for **gram.** **2.** abbreviation for **standard gravity.**

G1, a phase in the cell cycle during which the cell's future can be influenced by various positive and negative signals, such as growth factors. The signals determine whether the cell will advance beyond a certain checkpoint. Once beyond the checkpoint, the cell is committed to entering a phase during which it replicates its DNA in preparation for mitosis.

G2, a phase in the cell cycle that follows DNA replication. During G2, the cell checks the accuracy of DNA replication and prepares for mitosis.

G6PD deficiency, abbreviation for **glucose-6-phosphate dehydrogenase deficiency.** G6PD is an enzyme in the pentose-phosphate shunt of the **Embden-Meyerhof pathway.**

Ga, symbol for the element **gallium.**

GA, abbreviation for **general anesthesia.**

GABA, abbreviation for **gamma-aminobutyric acid.**

gabapentin /gab′äpen′tin/, an anticonvulsant chemically related to alpha-aminobutyric acid, used in treatment of partial seizures, administered orally.

GABHS, abbreviation for *group A beta-hemolytic streptococcal skin disease*.

GAD, abbreviation for **generalized anxiety disorder.**

gadolinium (Gd) /gad′əlin′ē·əm/ [Johan Gadolin, Finnish chemist, 1760–1852], **1.** a rare earth metallic element. Its atomic number is 64, and its atomic mass is 157.25. It is now widely used as an MRI contrast agent. **2.** (in radiology) a phosphor used to intensify screens.

GAF, abbreviation for **Global Assessment of Functioning.**

gag [ME, *gaggen,* to strangle], **1.** *n,* a dental device for holding the jaws open during oral surgery or dental restoration. Also called **mouth prop** or **bite block.** **2.** *v,* to retch or attempt to vomit.

gag reflex [ME, *gaggen,* to strangle; L, *reflectere,* to bend back], a normal neural reflex elicited by touching the soft palate or posterior pharynx, in which the responses are symmetric elevation of the palate, retraction of the tongue, and contraction of the pharyngeal muscles. The reflex is used as a test of the integrity of the vagus and glossopharyngeal nerves. Also called **pharyngeal reflex.**

Gail model, a collection of epidemiological and risk factor data used to calculate the risk of breast cancer.

gait [ONorse, *geta,* a way], the manner or style of walking, including rhythm, cadence, and speed.

Gait Assessment Rating Scale (GARS), a standardized test or inventory of 16 abnormal aspects of gait that may be observed by an examiner as a patient walks at a self-selected pace. The abnormalities are commonly seen in elderly people who fall. Each aspect is graded on a scale of 0-1-2-3, with lower numbers indicating less abnormality.

gait determinant, one of a number of the kinetic anatomical factors that govern an individual's locomotion in the process of walking. Some authorities have defined pelvic rotation, pelvic tilt, knee and hip flexion, knee and ankle interaction, and lateral pelvic displacement as the main determinants of gait. Such descriptions are often important in analyzing and correcting pathological gaits of patients afflicted by orthopedic diseases, deformities, or abnormal bone conditions.

gait disorder, an abnormality in the manner or style of walking, which usually results from neuromuscular, arthritic, or other body changes. The body's center of gravity may change over the years, causing a change in the degree of knee flexion needed to maintain one's balance when walking. Some individuals with neuromuscular disorders walk with a shuffling gait or move with lurching actions. At times a gait disorder may be the result of a medication that causes confusion or loss of coordination or an eye or ear disturbance that affects the sense of balance.

galact-, galacta-. See **galacto-.**

-galactia, suffix meaning a "condition involving secretion of milk": *cacogalactia, dysgalactia, oligogalactia*.

galacto-, galact-, galacta-, prefix meaning "milk": *galactochloral, galactogen, galactorrhea*.

galactocele /gəlak′təsēl′/, a cyst or hydrocele caused by blockage of a mammary gland milk duct.

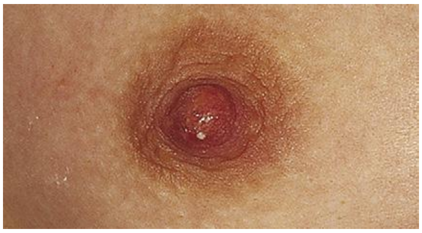
galactokinase /gəlak′tōkī′nās/ [Gk, *gala,* milk, *kinesis,* movement; Fr, *diastase,* enzyme], an enzyme that functions in the metabolism of glycogen. Galactokinase catalyzes a metabolic step involving the transfer of a high-energy phosphate group from a donor molecule to a molecule of galactose, producing a molecule of D-galactose 1-phosphate.

galactokinase deficiency, an autosomal-recessive inherited disorder of carbohydrate metabolism in which the enzyme galactokinase is deficient or absent. As a result, dietary galactose is not metabolized, galactose accumulates in the blood, and cataracts may develop rapidly. Food containing galactose, such as milk and certain milk products, must be eliminated from the diet. Compare **lactase deficiency.**

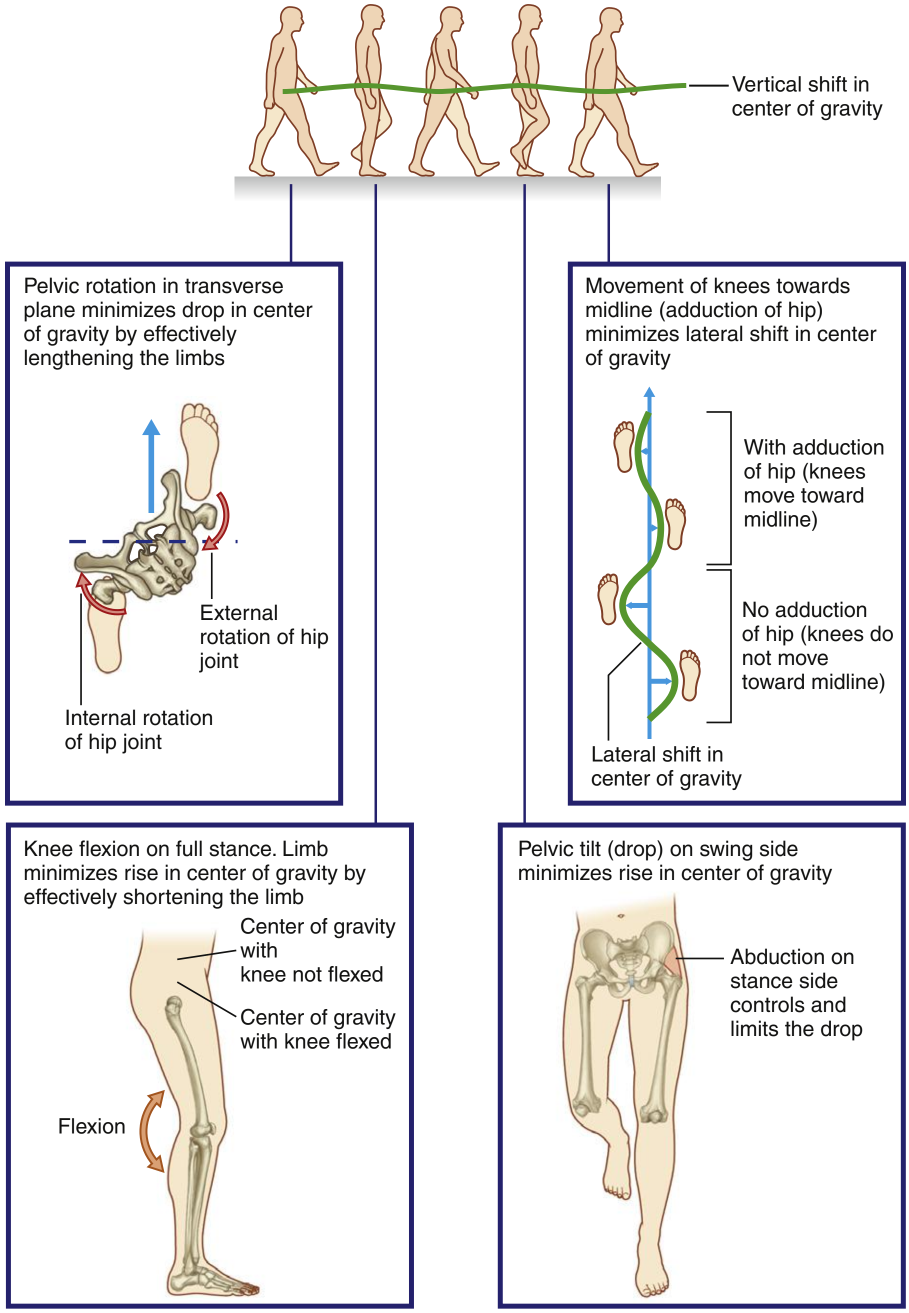
galactophorous duct /-fôr′əs/ [Gk, *gala* + *pherein,* to bear; L, *ducere,* to lead], a passage for milk in the lobes of the breast.

galactopoiesis, the maintenance of milk production. Also called **lactogenesis.**

galactorrhea /gəlak′tərē′ə/ [Gk, *gala* + *rhoia,* flowing], **1.** a spontaneous flow of milk from the nipple. **2.** lactation not associated with childbirth or nursing. The condition is sometimes a symptom of a pituitary gland tumor. See also **Forbes-Albright syndrome.**



Galactorrhea *(Belchetz and Hammond, 2003)*



Vertical shift in center of gravity
Pelvic rotation in transverse plane minimizes drop in center of gravity by effectively lengthening the limbs
External rotation of hip joint
Internal rotation of hip joint
Movement of knees towards midline (adduction of hip) minimizes lateral shift in center of gravity
With adduction of hip (knees move toward midline)
No adduction of hip (knees do not move toward midline)
Lateral shift in center of gravity
Knee flexion on full stance. Limb minimizes rise in center of gravity by effectively shortening the limb
Center of gravity with knee not flexed
Center of gravity with knee flexed
Flexion
Pelvic tilt (drop) on swing side minimizes rise in center of gravity
Abduction on stance side controls and limits the drop

Gait determinants *(Drake, Vogl, and Mitchell, 2010)*

galactosamine, galactose that contains an amine group on the second group.

galactose /gəlak′tōs/ [Gk, *gala* + *glykys,* sweet], a simple sugar found in the dextrorotatory form in lactose (milk sugar), nerve cell membranes, sugar beets, gums, and seaweed and in the levorotatory form in flaxseed mucilage. Prepared galactose, a white crystalline substance, is less sweet and less soluble in water than glucose but is similar in other properties.

galactose breath test, a breath test of liver function, in which the fasting subject is administered a dose of galactose labeled with carbon 13 and levels of labeled carbon dioxide in the breath are measured at specific time intervals. Low levels of carbon dioxide indicate that the galactose is not being metabolized properly, indicating either an enzyme deficiency or liver dysfunction, such as the fibrosis accompanying hepatitis.

galactosemia /gəlak′tōsē′mē·ə/ [Gk, *gala* + *glykys,* sweet, *haima,* blood], a group of inherited autosomal-recessive disorders of galactose metabolism. It is characterized by a deficiency of an enzyme involved in galactose metabolism, galactose-1-phosphate uridyl transferase. Shortly after birth an intolerance to milk occurs; it is evidenced by anorexia, nausea, vomiting, and diarrhea and causes failure to thrive. Hepatosplenomegaly, cataracts, and mental retardation develop. Greater than normal amounts of galactose are present in the blood, the galactose tolerance test result indicates an abnormality, and the red cells show deficient galactose enzyme activity. Because the elimination of galactose from the diet results in the rapid decrease of all symptoms except mental retardation, early diagnosis and prompt therapy are essential. Pregnant women known to be carriers should exclude lactose and galactose from their diet. Compare **glycogen storage disease.** See also **galactose, inborn error of metabolism.**

galactose tolerance test, a test of the ability of the liver to remove galactose from the blood and convert it to glycogen. The test, which is used to estimate impaired liver function, measures the rate of galactose excretion after ingestion or injection of a measured amount of galactose.

galactosidase, an enzyme that catalyzes the metabolism of galactosides.

galactoside /gəlak′tō′sīd′/, a glycoside containing galactose.

galactoside permease, an enzyme that catalyses the transport of lactose into the cell.

galactosis /gal′əktōsis/, lactation; the formation of milk by the lacteal glands.

galactosuria /-so͞or′ē·ə/, the presence of galactose, a simple sugar, in the urine.

galactosyl ceramide lipidosis /gəlak′təsil/ [Gk, *gala* + *glykys,* sweet; L, *cera,* wax, *lipos,* fat, *osis,* condition], a rare, fatal inherited disorder of lipid metabolism, present at birth. Infants become paralyzed, blind, deaf, and increasingly retarded; eventually they die of bulbar paralysis. There is no known treatment for the disorder, but it can be detected in pregnancy by amniocentesis. Also called **globoid leukodystrophy, Krabbe's disease.** Compare **Tay-Sachs disease.**

galactosyl transferase, an enzyme in the head of sperm that is required for sperm to bind to eggs.

galactozymase /-zī′māz/, an enzyme in milk that is able to hydrolyze starch.

galacturia /gal′əkto͞or′ē·ə/ [Gk, *gala,* milk, *ouron,* urine], a condition in which the urine has a milky color caused by the abnormal presence of galactose, a monosaccharide, in the urine.

galanin /galan′in, gal′ənin/, a neuropeptide in the small intestine and central and peripheral nervous systems that has a role in bowel motility, pancreas activity, and prolactin and growth hormone release.

galantamine /gälan′tämēn/, a reversible competitive inhibitor of acetylcholinesterase used as the hydrobromide salt in the treatment of mild to moderate Alzheimer's disease, administered orally.

Galant reflex /gəlant′/, a normal response in the neonate when held in ventral suspension (face down) to move the hips toward the stimulated side when the back is stroked along the spinal cord. The reflex disappears by about 4 weeks of age. Absence of the reflex may indicate spinal cord lesion. Also called **trunk incurvation reflex.**

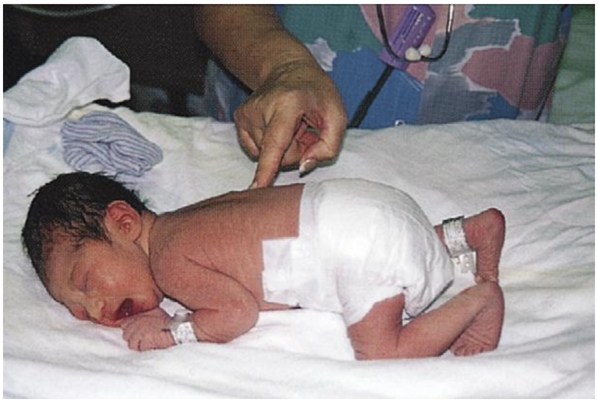
galea aponeurotica. See **epicranial aponeurosis.**

Galeazzi's fracture /gal′ē·at′sēz/ [Riccardo Galeazzi, Italian surgeon, 1866–1952], a break in the distal radius accompanied by dislocation of the radioulnar joint. Also called **Dupuytren's fracture.**

Galen's vein /gā′lənz/ [Claudius Galen, Greek physician, circa AD 130–200], the large vein formed by the union of the two terminal cerebral veins. It curves around the splenium of the corpus callosum and continues as the straight sinus of the brain. Also called **great cerebral vein of Galen.**

gall. **1.** See **bile. 2.** a lump or ball that forms most often on the stems, leaves, or roots of plants at the site of injuries caused by insects, fungi, bacteria, or other organisms. An example is the oak gall, which contains tannin.

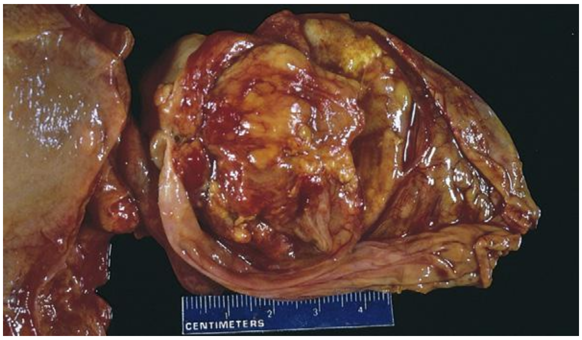
gallamine triethiodide /gal′ämēn trī′ĕthi′odīd/, a quaternary ammonium compound, the triethiodide salt used as a skeletal muscle relaxant during surgery and other procedures, such as endoscopy or intubation, administered intravenously.



Elicitation of the Galant reflex *(Lowdermilk et al, 2012/ Courtesy Marjorie Pyle, RNC, Lifecircle Coster Mesa, California)*

gallbladder (GB) /gôl′blad′ər/ [ME, *gal* + AS, *blaedre*], a pear-shaped excretory sac lodged in a fossa on the visceral surface of the right lobe of the liver. It stores and concentrates bile, which it receives from the liver via the hepatic duct. In an adult it holds about 32 mL of bile. During digestion of fats the gallbladder contracts, ejecting bile through the common bile duct into the duodenum. The gallbladder is divided into a fundus, body, and neck and is covered by the peritoneum. Obstruction of the biliary system by gallstones may lead to jaundice and pain and may require surgical or other intervention. See also **lithotripsy.**

gallbladder carcinoma, a malignant neoplasm of the bile reservoir, characterized by anorexia, nausea, vomiting, weight loss, progressively worsening right upper quadrant pain, and eventually jaundice. Tumors of the gallbladder are predominantly adenocarcinomas. Often associated with biliary calculi and chronic cholecystitis, they are three to four times more common in women than in men and rarely occur before 40 years of age. Physical examination reveals an enlarged gallbladder in about half of the cases. Ultrasound or radiographic tests may aid in making a diagnosis. Complete removal of the gallbladder may sometimes be curative, but partial hepatectomy may be required because the tumor typically infiltrates the liver and ducts. Palliative surgery is often needed. Radiotherapy may be palliative. Chemotherapy is usually ineffective.



Gallbladder carcinoma *(Kumar et al, 2007)*

gallbladder lithiasis. See **cholecystolithiasis.**

gallbladder nuclear scanning, a nuclear scan used to evaluate the biliary tract. This test may also be used to evaluate the gallbladder for obstruction of the cystic duct, cholecystitis, and common bile duct obstruction.

gallium (Ga) /gal′ē·əm/ [L, *Gallia,* Gaul], a metallic element. Its atomic number is 31, and its atomic mass is 69.72.

The melting point of gallium is 29.8° C (88.6° F); it will melt if held in the hand. Because of its high boiling point (1983° C; 3602° F), it is used in high-temperature thermometers. Radioisotopes of gallium are used in total body scanning procedures. Many of its compounds are poisonous.

gallium scan, a nuclear scan of the total body performed after an IV injection of radioactive gallium, a radionuclide that concentrates in areas of inflammation and infection, abscess, and benign and malignant tumor. It is useful in detecting metastatic tumor, especially lymphoma.

gallop /gal′əp/ [Fr, *galop*], a third or fourth heart sound, which at certain heart rates sometimes sounds like the gait of a horse. Also called **gallop rhythm.** See also **S_3, S_4, summation gallop.**

gallstone. See **biliary calculus, cholelithiasis.**

gallstone pancreatitis, acute pancreatitis accompanied by presence of gallstones, one of the most common types.

galoche chin /gəlosh/ [Fr, *galosh* + AS, *cin*], a narrow protruding or thrusting chin. It is a congenital condition.

galsulfase, a rarely used miscellaneous drug.

■ INDICATIONS: This drug is used to treat mucopolysaccharidosis VI and Maroteaux-Lamy syndrome.

galvanic /galvan′ik/ [Luigi Galvani, Italian physician, 1737–1798], pertaining to or involving electricity.

galvanic cautery. See **electrocautery.**

galvanic electric stimulation [Luigi Galvani], the use of a high-voltage electric stimulator to treat muscle spasms, edema of acute injury, myofascial pain, and certain other disorders. See also **transcutaneous electric nerve stimulation.**

galvanic skin response (GSR) [Luigi Galvani; AS, *scinn* + L, *respondere,* to reply], a reaction to certain stimuli as indicated by a change in the electrical resistance of the skin. The effect is related to subconscious activity of the sweat glands and may result from pleasant as well as unpleasant stimuli. The GSR is used in some polygraph examinations.

galvanocautery. See **electrocautery.**

galvanoionization. See **iontophoresis.**

galvanometer /gal′vənom′ətər/ [Luigi Galvani], an instrument used to measure the strength and direction of flow of an electric current. Its action depends on the deflection of a magnetic needle in the field produced by current passing through a coil. A simple galvanometer is used mainly to detect the presence of an electric current. Galvanometers are used in certain diagnostic instruments, such as electrocardiographs.

Galveston Orientation and Amnesia Test (GOAT), a series of 10 questions asked of a patient to help evaluate posttraumatic amnesia. The test is repeated on a weekly basis and is scored on a scale of 0 to 100. A patient is determined to be out of the amnesic state when the score exceeds 75.

gam-. See **gamo-.**

Gambian trypanosomiasis /gam′bē·ən/, a usually chronic form of African trypanosomiasis, caused by the parasite *Trypanosoma brucei gambiense*. An infected individual may have relatively mild symptoms for months or years before developing the neurological symptoms of the terminal stage. Also called ***Trypanosoma brucei gambiense,* West African sleeping sickness.** Compare **Rhodesian trypanosomiasis.** See also **African trypanosomiasis.**

game knee [ME, *gamen* + AS, *cneow*], an informal term for any injury or condition that interferes with normal function of the knee joint.

gamet-. See **gameto-.**

gamete /gam′ēt/ [Gk, marriage partner], **1.** a mature male or female germ cell that is capable of functioning in fertilization or conjugation and contains the haploid number of chromosomes of the organism. **2.** an ovum or a spermatozoon. See also **meiosis. —gametic,** *adj*.

gamete intrafallopian transfer (GIFT), a human fertilization technique in which male and female gametes are injected through a laparoscope into the fimbriated ends of the fallopian tubes.

gametic /gəmat′ik/, pertaining to a reproductive cell such as a spermatozoon or ovum forming the gamete.

gametic chromosome, any of the chromosomes contained in a haploid cell, specifically a spermatozoon or an ovum, as contrasted with those in a diploid, or somatic, cell.

gameto-, gamet-, prefix meaning "reproductive cell": *gametocyte, gametogenesis, gametophore*.

gametocide /gəmē′tōsīd/ [Gk, *gamete* + L, *caedere,* to kill], any agent that is destructive to gametes or gametocytes. The term is most often used to refer to agents specific for gametocytes of the protozoon ***Plasmodium,*** which causes malaria. *—gametocidal, adj*.

gametocyte /gəmē′tōsīt/ [Gk, *gamete* + *kytos,* cell], any cell capable of dividing into or in the process of developing into a gamete.

gametogenesis /gam′itōjen′əsis/ [Gk, *gamete* + *genein,* to produce], the origin and maturation of gametes, which occurs through meiosis. See also **oogenesis, spermatogenesis.** *—gametogenic, gametogenous, adj*.

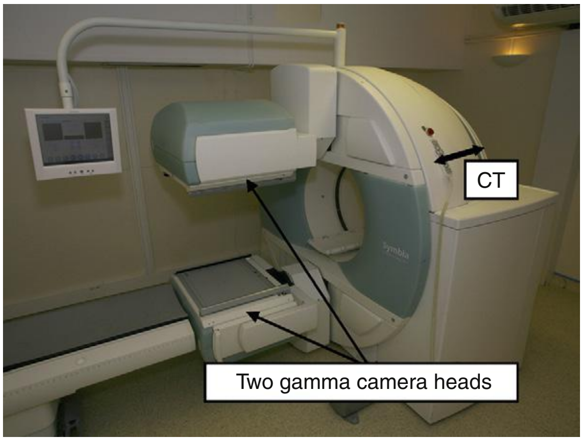
gametophyte /gəmē′tōfīt/ [Gk, *gamete* + *phyton,* plant], a cell in the reproductive stage when the nuclei are in a haploid condition.

gamma /gam′ə/, Γ, γ, the third letter of the Greek alphabet. It is a symbol for photon, heavy-chain immunoglobulins, or the third component in a series of certain chemical groups, such as the gamma-chain of hemoglobin.

gamma-aminobutyric acid (GABA), an amino acid that functions as an inhibitory neurotransmitter in the brain and spinal cord. It is also found in the heart, lungs, and kidneys and in certain plants.

gamma-benzene hexachloride. See **lindane.**

gamma camera [Gk, *gamma,* third letter of Greek alphabet; L, *camera,* vault], a device that uses the emission of light from a crystal struck by gamma rays to produce an image of the distribution of radioactive material in a body organ. The light is detected by an array of light-sensitive electronic components and is converted into electric signals, which are processed to produce the image. The gamma camera is a workhorse of nuclear medicine departments, where it is used to produce scans of patients who have been injected with small amounts of radioactive materials.



Gamma camera *(Papathanassiou and Liehn, 2008)*

gamma efferent fiber [Gk, *gamma* + L, *efferre,* to carry out, *fibra,* fiber], any of the motor nerve fibers that transmit impulses from the central nervous system to the intrafusal fibers of the muscle spindle. The gamma efferent fibers are responsible for deep tendon reflexes, spasticity, and rigidity, but not for the degree of contractile response. They function in regulating the sensitivity of the spindle and the total tension of the muscle.

gamma globulin. See **immune gamma globulin.**

gamma-glutamyltransferase (GGT), an enzyme that appears in the serum of patients with several types of liver or gallbladder disorders, including drug hepatotoxicity, biliary tract obstruction, alcohol-induced liver disease, and liver carcinoma. Normal adult (after 45 years of age) GGT blood levels are 8 to 38 U/L.

gamma-glutamyltransferase (GGT) test, a blood test that measures GGT and is used to detect liver cell dysfunction. It accurately indicates cholestasis, biliary obstruction, cholangitis, or cholecystitis. It can also detect chronic alcohol ingestion and therefore is useful in the screening or evaluation of patients with alcoholism. Levels of GGT are also elevated after acute myocardial infarction.

gamma interferon. See **interferon gamma.**

gamma knife, an apparatus for precisely aimed intersecting beams of gamma rays that delivers radiation therapies as treatment for intracranial lesions, either tumors or vascular anomalies. It is used in stereotactic radiosurgery.

gamma knife stereotaxic radiosurgery, a method for destroying deep-seated brain tumors with a focused beam of gamma radiation. By using three-dimensional stereoscopic techniques to aim the radiation from several angles, it is possible to concentrate the energy on the tumor while minimizing damage to surrounding tissues.

gamma radiation [Gk, *gamma* + L, *radiare,* to emit rays], a very-high-frequency form of electromagnetic radiation consisting of photons emitted by radioactive elements in the course of nuclear transition. The wavelength of gamma radiation is characteristic of the radioactive elements involved and ranges from about 4×10^{-10} to 5×10^{-13} m. Gamma radiation can penetrate thousands of meters of air and several centimeters of soft tissue and bone. It is more penetrating than alpha radiation and beta radiation but has less ionizing power and is not deflected in electric or magnetic fields. Like x radiation, gamma radiation can injure and destroy body cells and tissue, especially cell nuclei. However, controlled application of gamma radiation is important in the diagnosis and treatment of various conditions, including skin cancer and malignancies deep within the body. Also called *gamma rays*. See also **x-ray.**

gammopathy /gamop′əthē/, an abnormal condition characterized by the presence of markedly increased levels of gamma globulin in the blood. Two different types of hypergammaglobulinemia can be distinguished. **Monoclonal gammopathy** is commonly associated with an electrophoretic pattern showing one sharp, homogenous electrophoretic band in the gamma globulin region. This reflects the presence of excessive amounts of one type of immunoglobulin secreted by a single clone of B lymphocytes. **Polyclonal gammopathy** reflects the presence of a diffuse hypergammaglobulinemia in which all immunoglobulin classes are proportionally increased. See also **Bence Jones protein, multiple myeloma.**

gamo-, gam-, prefix meaning “marriage or sexual union”: *gamobium, gamont, gamophagia*.

gamogenesis /gam′ōjen′əsis/ [Gk, *gamos,* marriage, *genein,* to produce], sexual reproduction through the fusion of gametes. **—***gamogenetic, adj.*

gamone /gam′ōn/ [Gk, *gamos,* marriage], a chemical substance secreted by ova and spermatozoa that is believed to attract the gametes of the opposite sex and facilitate union. Kinds of gamones are **androgamone** and **gynogamone.**

gampsodactyly. See **clawfoot.**

-gamy, **1.** suffix meaning a “(specified) type of marriage”: *endogamy, monogamy, pedogamy*. **2.** suffix meaning “possession of organs for reproduction”: *cleistogamy, dichogamy, homogamy*. **3.** suffix meaning a “union for propagation”: *hologamy, macrogamy, syngamy*.

ganciclovir /gansik′lōvir/, an antiviral drug structurally related to acyclovir, used to prevent cytomegalovirus disease after transplantation and to treat or prevent cytomegalovirus retinitis in persons with acquired immunodeficiency syndrome.

gangli-. See **ganglio-.**

ganglia. See **ganglion.**

gangliated. See **ganglionated.**

ganglio-, gangli-, prefix meaning “ganglion”: *gangliocytoma, ganglioneuroma, ganglioplexus*.

gangliocytoma /gang′glē·ō′sītō′mə/, a benign tumor involving ganglion cells. These tumors are frequently found in the pituitary gland, where they are associated with hypersecretion of growth hormone–releasing hormone (ganglioneuroma).

ganglion /gang′glē·on/ *pl.* **ganglia** [Gk, knot], **1.** a knot or knotlike mass of nervous tissue. **2.** one of the nerve cell bodies, chiefly collected in groups outside the central nervous system. Very small groups abound in association with alimentary organs. The two types of ganglia in the body are the sensory ganglia on the dorsal roots of spinal nerves and on the sensory roots of the trigeminal, facial, glossopharyngeal, and vagus nerves and the autonomic ganglia of the sympathetic and parasympathetic systems.

ganglionar neuroma /gang·glē′ənər/ [Gk, *ganglion* + *neuron,* nerve, *oma,* tumor], a tumor composed of a solid mass of ganglia and nerve fibers, usually found in abdominal tissues and occurring most commonly in children. Chemotherapy or surgery is often recommended. Also called **ganglionated neuroma, ganglionic neuroma.**

ganglionated, having ganglia. Also called **gangliated.**

ganglionated nerve, a nerve of the sympathetic nervous system.

ganglionated neuroma. See **ganglionar neuroma.**

ganglionic blockade /gang′glē·on′ik/, the blocking of nerve impulses at synapses of autonomic ganglia, usually by the administration of ganglionic blocking agents.

ganglionic blocking agent, any one of a group of drugs prescribed to produce controlled hypotension, as required in certain surgical procedures or in emergency management of hypertensive crisis. The drugs act by occupying receptor sites (nicotinic neuronal receptors) on sympathetic and parasympathetic autonomic ganglia, preventing a response of these nerves to the action of acetylcholine liberated by the presynaptic nerve endings. Mecamylamine is the most commonly prescribed ganglionic blocking agent. These drugs are used with great caution in treating patients who are affected with coronary, cerebrovascular, or renal insufficiency or who have a history of severe allergy. Adverse reactions to the drugs include sudden marked hypotension, paralytic ileus, urinary retention, constipation, visual disturbances, heartburn, and nausea.

ganglionic crest. See **neural crest.**

ganglionic cyst, a swollen area of the synovial sheath of a tendon that is common at the back of the wrist.

ganglionic glioma [Gk, *ganglion* + *glia,* glue, *oma,* tumor], a tumor composed of glial cells and ganglion cells that are nearly mature. See also **neuroblastoma.**

ganglionic neuroma. See **ganglionar neuroma.**

ganglionic ridge. See **neural crest.**

ganglion impar, the union of the two sympathetic trunks anterior to the coccyx.

ganglionitis /gang′glē·ənī′tis/, an inflammation of a nerve or lymph ganglion.

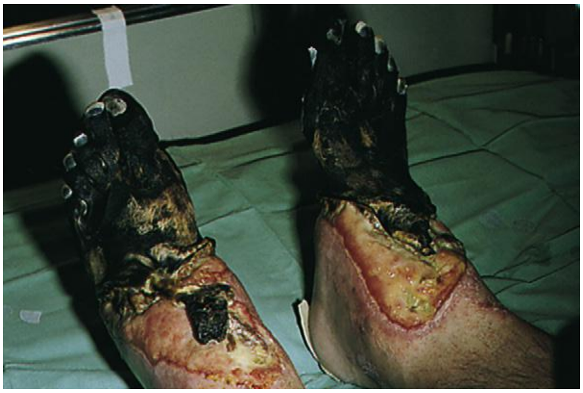
ganglioside /gang′glē·əsīd′/, a glycosphingolipid found in the brain and other nervous system tissues. Gangliosides are members of a group of galactose-containing cerebrosides with a basic composition of ceramide-glucose-galactose-*N*-acetyl neuraminic acid. Accumulation of gangliosides caused by an inborn error of metabolism results in gangliosidosis or Tay-Sachs disease.

gangliosidosis type I. See **Tay-Sachs disease.**

gangliosidosis type II. See **Sandhoff's disease.**

gang rape, sexual intercourse against the will of the victim by a group of assailants. Gang sex attacks usually, but not always, are committed by several males who take turns assaulting a female, but the victim may be another male, as in a prison. See also **rape, statutory rape.**

gangrene /gang′grēn/ [Gk, *gangraina,* a gnawing sore], necrosis or death of tissue, usually the result of ischemia (loss of blood supply), bacterial invasion, and subsequent putrefaction. The extremities are most often affected, but it can occur in the intestines and gallbladder. Internally gangrene may be a complication of strangulated hernia, appendicitis, cholecystitis, or thrombosis of the mesenteric arteries to the gut. **Dry gangrene** is a late complication of diabetes mellitus that is already complicated by arteriosclerosis, in which the affected extremity becomes cold, dry, and shriveled and eventually turns black. **Moist gangrene** may follow a crushing injury or an obstruction of blood flow by an embolism, tight bandages, or a tourniquet. This form of gangrene has an offensive odor, spreads rapidly, and may result in death within days. In all types of gangrene, surgical debridement is necessary to remove the necrotic tissue before healing can progress. Cleanliness and maintenance of good circulation are considerations essential in preventing this condition. See also **gas gangrene, open amputation.** —*gangrenous, adj.*



Gangrene *(Auerbach, 2007/Courtesy Dr. Cameron Bangs)*

gangrenous appendicitis /gang′grənəs/ [Gk, *gangraina,* a gnawing sore; L, *appendere,* to hang upon, Gk, *itis,* inflammation], a condition in which the appendix becomes gangrenous because obstruction of its lumen blocks the flow of blood to that body part.

gangrenous necrosis. See **necrosis.**

gangrenous stomatitis. See **noma.**

gangrenous vulvitis [Gk, *gaggraina* + L, *vulva,* wrapper; Gk, *itis,* inflammation], the death of tissues in the area of the vulva that results when an inadequate blood supply causes sloughing of cells.

ganirelix, a gonadotropin-releasing hormone antagonist.

■ INDICATIONS: It is used to inhibit premature luteinizing hormone surges in women undergoing controlled ovarian hyperstimulation.

■ CONTRAINDICATIONS: Pregnancy, lactation, latex allergy, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Fetal death is a life-threatening consequence of this drug's use. Other adverse effects include headache, ovarian hyperstimulation syndrome, gynecological abdominal pain, nausea, and pain on injection. Common side effects include spotting and breakthrough bleeding.

ganja. See **cannabis.**

Gantanol, a trademark for a sulfa antibiotic **(sulfamethoxazole).**

Gantrisin, a trademark for a sulfa antibiotic **(sulfiSOXAZOLE).**

gantry assembly /gan′trē/, a subsystem of the computed tomography apparatus consisting of the x-ray tube, the detector array, the high-voltage generator, the patient support and positioning couch, and the mechanical support for each.

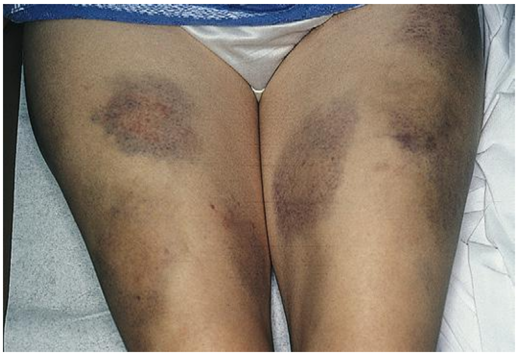
gap [OE, *gapa,* a hole], a short, missing segment in one strand of a DNA molecule.

gap junction, a type of junction between cells, consisting of a narrowed portion of the intercellular space that contains channels or pores composed of hexagonal arrays of membrane-spanning proteins around a central lumen (connexon), through which pass ions and small molecules. In electrically excitable tissues such as myocardial tissue and the central nervous system, gap junctions serve to transmit electrical impulses by movement of ions and are known as **electrotonic synapses.** Also called **nexus.** See also **connexon.**

gap phenomenon, a situation in which a premature cardiac stimulus encounters a block where an earlier or later stimulus could be conducted.

Garamycin, a trademark for an aminoglycoside antibacterial **(gentamicin sulfate).**

Gardner-Diamond syndrome [Frank H. Gardner, American physician, b. 1919; Louis K. Diamond, American physician, b. 1902], a condition resulting from autoerythrocyte sensitization, marked by large, painful transient skin discolorations that appear without apparent cause but often accompany emotional upsets, various collagen disorders, and abnormalities of protein metabolism. Treatment includes topical and systemic corticosteroids. Also called **autoerythrocyte sensitization syndrome.**



Gardner-Diamond syndrome *(Callen et al, 2000)*

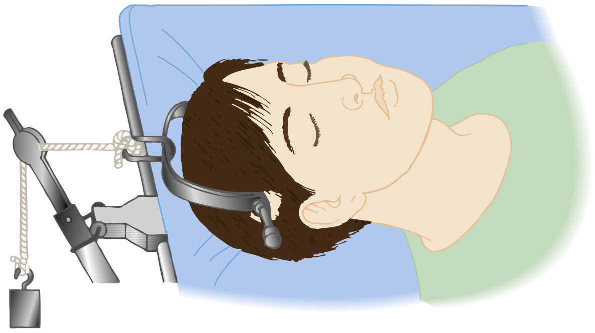
Gardnerella vaginalis /gärd′nərel′ə/ [Herman L. Gardner, twentieth-century American bacteriologist; L, *vagina,* sheath], a genus of rod-shaped gram-negative bacteria normally found in the female genital tract. The bacteria, formerly identified as *Haemophilus vaginalis,* may also be a marker for bacterial vaginosis.

***Gardnerella vaginalis* vaginitis** [Herman L. Gardner, L, *vagina,* sheath; Gk, *itis,* inflammation], a chronic inflammation of the vagina caused by the bacterium *Gardnerella vaginalis*. Also called **vulvovaginitis.**

Gardner, Mary Sewell, (1871–1961), an American public health nurse who wrote the classic *Public Health Nurse*. She directed the Providence, Rhode Island, District Nursing Association and was instrumental in the development of the National Organization for Public Health Nursing and of public health nursing in the American Red Cross.

Gardner's syndrome [Eldon J. Gardner, American geneticist, b. 1909], familial polyposis of the large bowel, with fibrous dysplasia of the skull, extra teeth, osteomas, fibromas, and epidermal cysts. The condition is inherited as an autosomal-dominant trait, and malignancies occur more often than usual in families having this syndrome.

Gardner-Wells tongs, pins that are attached to the skull of patients immobilized with cervical injuries. The pins are used to apply traction to reduce a fracture or dislocation while the patient is in a bed with a traction setup.



Gardner-Wells tongs *(Black and Hawks, 2009)*

gargle /gär′gəl/ [Fr, *gargouille,* drainpipe], **1.** *v,* to hold and agitate a liquid at the back of the throat by tilting the head backward and forcing air through the solution. The procedure is used for cleansing or medicating the mouth and oropharynx. **2.** *n,* a solution used to rinse the mouth and oropharynx.

gargoylism. See **Hurler's syndrome.**

garlic, an herbal product taken from a perennial bulb grown throughout the world.

■ USES: It is used for vascular disease, elevated LDL, elevated triglycerides, low HDL, high blood pressure, poor circulation, risk of cancer, inflammatory disorders, childhood ear infection, and yeast infection. The allicin of fresh garlic may cause a small decrease in LDL cholesterol and slight decrease in blood pressure and may have some antibacterial properties, but garlic is not nearly as effective as prescribed drugs for these purposes. Its influence on cancer risk and efficacy for other uses has not been adequately documented. Allicin is very labile, and there is concern that many commercial products contain less than the advertised amount of allicin.

■ CONTRAINDICATIONS: In normal amounts, garlic is likely safe during pregnancy and for children. Garlic should not be used in large amounts during pregnancy, because it may be fatal to the fetus or stimulate labor. Large amounts also should not be given to children directly or via breast milk because it may cause colic in infants or be fatal to children through uncharacterized mechanisms. It is contraindicated in those with known hypersensitivity, stomach inflammation, or gastritis. People who have had or are about to have surgery should also avoid it, since clotting time may be increased.

GARS, abbreviation for **Gait Assessment Rating Scale.**

Garth method, a positioning method for producing x-ray images of the scapulohumeral joint and identifying shoulder dislocations, scapular fractures, and bony defects involving the humeral head. The patient faces the x-ray tube with the affected shoulder joint centered to the midline of the image receptor (IR). The affected elbow is flexed and the forearm is placed across the patient's chest. The opposite shoulder is angled 45 degrees away from the IR. The central ray is directed at a 45-degree angle toward the patient's feet and passes through the affected shoulder joint.

Gartner's cyst [Hermann T. Gartner, Danish anatomist, 1785–1827], a remnant of the mesonephric (Wolffian) ducts that develop, form predetermined structures, and later regress. The remnant may develop a secretory mechanism, causing dilation of surrounding cells, and transform into a duct cyst, usually during late adolescence.

Gartner's duct, one of two vestigial closed ducts, each parallel to a uterine tube.

gas [Gk, *chaos*], an aeriform fluid that possesses complete molecular mobility and the property of indefinite expansion. A gas has no definite shape, and its volume is determined by its container and by temperature and pressure. Compare **liquid, solid. —gaseous,** *adj*.

GAS, abbreviation for **general adaptation syndrome.**

gas bacillus [Gk, *chaos* + L, *bacillum,* small rod], any of several species of bacillus that produce a gas as a by-product of their metabolism. Examples include ***Escherichia coli,*** which ferments lactose and glucose, and the clostridial species that produces gas gangrene.

gas chromatography, the separation and analysis of different substances according to their different affinities for a standard absorbent. In the process a gaseous mixture of the substances is passed through a glass cylinder containing the absorbent, which may be dampened with a nonvolatile liquid solvent for one or more of the gaseous components. As the mixture passes through the absorbent, each substance is absorbed to a different extent and leaves a characteristic pigment. The bands of different colors left when all the gaseous mixture has moved through the absorbent constitute a chromatograph for analysis. Compare **column chromatography, ion exchange chromatography.**

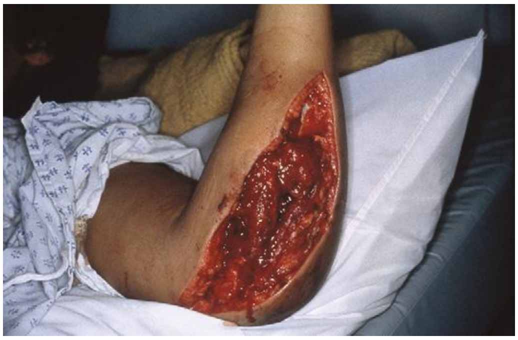
gas distension. See **flatulence.**

gas embolism, an occlusion of one or more small blood vessels, especially in the muscles, tendons, and joints, caused by expanding gas bubbles. Gas emboli can rupture tissue and blood vessels, causing decompression sickness and death. This phenomenon commonly affects deep-sea divers who rise too quickly to the surface without adequate decompression. Gas emboli are most dangerous in the central nervous system because of associated neurological changes, such as syncope, paralysis, and aphasia. Such emboli are extremely painful. The prevention and treatment of gas emboli involve gradual decompression of atmospheric gases, especially nitrogen, that are dissolved in the blood. Compare **air embolism, fat embolism.** See also **decompression sickness.**

gas endarterectomy. See **endarterectomy.**

gaseous. See **gas.**

gas gangrene, necrosis accompanied by gas bubbles in soft tissue after surgery or trauma. It is caused by anaerobic organisms, such as various species of ***Clostridium,*** particularly ***C. perfringens.*** Symptoms include pain, swelling, and tenderness of the wound area; moderate fever; tachycardia; and hypotension. The skin around the wound becomes necrotic and ruptures, revealing necrotic muscle. A characteristic finding is toxic delirium. Spontaneous gas gangrene is most often caused by the spread of *C. septicum* from the GI tract of colon cancer patients. Because of its aerotolerant nature, *C. septicum* can infect normal tissues. If untreated, gas gangrene is rapidly fatal. Prompt treatment, including excision of gangrenous tissue and IV administration of penicillin G, saves 80% of patients. The disease is prevented by proper wound care. Also called **anaerobic myositis.**



Gas gangrene due to *Clostridium perfringens*
(Auerbach, 2012)

gasoline poisoning. See **petroleum distillate poisoning.**

gas pains. See **flatulence.**

gas permeable contact lens. See **rigid gas permeable (RGP) contact lens.**

gas-scavenging system, the equipment used to prevent waste anesthetic gases from escaping into the atmosphere of the operating room. Also called **scavenging system.** See also **trace gas.**

Gasser's syndrome. See **hemolytic uremic syndrome.**

gas sterilization [Gk, *chaos,* gas; L, *sterilis,* barren], the use of a gas such as ethylene oxide, C_2H_4O, to sterilize medical equipment.

Gastaut's disease. See **Lennox-Gastaut syndrome.**

gaster-. See **gastro-.**

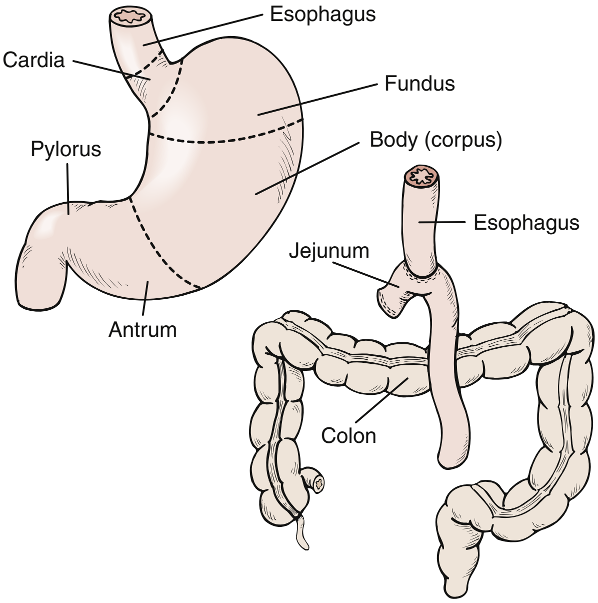
gas therapy, the use of medical gases in respiratory therapy. Kinds of gas therapy include **carbon dioxide therapy, controlled oxygen therapy, helium therapy,** and **hyperbaric oxygenation.**

gastr-. See **gastro-.**

gastralgia. See **stomachache.**

gastrectasia /gas′trektā′zhə/ [Gk, *gaster,* stomach, *ektasis,* stretching], an abnormal dilation of the stomach that may be accompanied by pain, vomiting, rapid pulse, and falling body temperature. Causes include overeating, obstruction of the pyloric valve, or a hernia.

gastrectomy /gastrek′təmē/, surgical excision of all or, more commonly, part of the stomach, performed to remove a chronic peptic ulcer, to stop hemorrhage in a perforating ulcer, or to remove a malignancy. Before surgery a GI series is done and a nasogastric tube is inserted. With the patient under general anesthesia, one half to two thirds of the stomach is removed, including the ulcer and a large area of acid-secreting mucosa. A gastroenterostomy is then done, joining the remainder of the stomach to the jejunum or duodenum. After surgery the nurse observes the drainage from the nasogastric suction tube for bright red blood, indicative of hemorrhage. Blockage of the tube is reported at once, because gastric distension strains the suture lines. Irrigation is done only according to surgeon's orders, gently and with small amounts of fluid, if at all. Adequate medication for pain allows deeper breathing and coughing because the incision is close to the diaphragm. The nurse encourages the patient to breathe deeply and, if necessary, to cough. With the return of peristalsis, water is given orally, and, if tolerated without pain or nausea, the nasogastric tube is removed. The diet gradually progresses to six small bland meals a day with 120 ml of fluid hourly between meals. A temperature elevation or dyspnea may indicate leakage of oral fluids or gastric leaks from the incision around the anastomosis. The most common complication of gastrectomy is dumping syndrome, with fullness and discomfort after meals. Other possible complications include marginal peptic ulcer, in which gastric acids come into contact with a suture line; afferent loop syndrome, in which the duodenal loop is blocked and pancreatic juices and bile flow back into the stomach; vitamin B_{12} and folic acid deficiency; reduced absorption of calcium and vitamin D; and functional hyperinsulinism, in which carbohydrates now passing directly into the small bowel cause an outpouring of insulin into the bloodstream and a resultant hypoglycemia within 2 hours. See also **dumping syndrome, gastric resection, gastroenterostomy, nasogastric tube, peptic ulcer.**



Total gastrectomy *(Lewis et al, 2011)*

-gastria, suffix meaning "(condition of) possessing a stomach or stomachs": *atretogastria, macrogastria, megalogastria.*

gastric /gas′trik/ [Gk, *gaster,* stomach], pertaining to the stomach.

-gastric, suffix meaning a "type of stomach or number of stomachs": *endogastric, paragastric, trigastric.*

gastric acid pump inhibitor. See **proton pump inhibitor.**

gastric analysis, examination of the contents of the stomach, primarily to determine the quantity of acid present and incidentally to ascertain the presence of blood, bile, bacteria, and abnormal cells. It may also be done to detect acid-fast bacillus in a client with undiagnosed tuberculosis. A sample of gastric secretion is obtained via a nasogastric tube. The technique used varies according to the information desired. The total absence of hydrochloric acid is diagnostic of pernicious anemia. Patients with gastric ulcer and gastric cancer may secrete less acid than normal whereas patients with duodenal ulcers secrete more. The composition and volume of the secretions may also provide diagnostic information. This procedure is rarely performed.

gastric antacid. See **antacid.**

gastric antral vascular ectasia, a rare vascular anomaly of the gastric antrum consisting of dilated and thrombosed capillaries and veins that form lines in the antrum that radiate toward the pylorus, resembling the stripes on a watermelon, seen most often in elderly women or patients with chronic liver disease. It may result in chronic blood loss and anemia. Also called *watermelon stomach*.

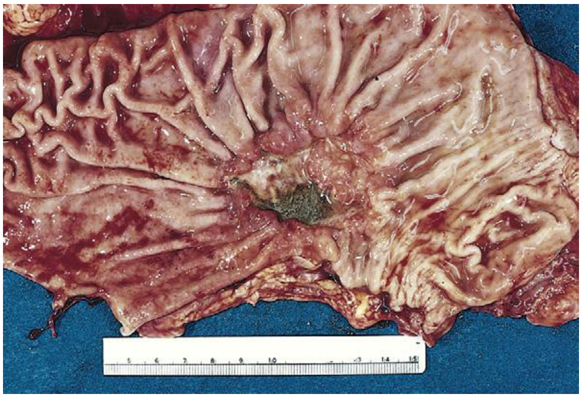
gastric areas, small patches of gastric mucosa, 1 to 5 mm in diameter, separated by the plicae villosae and containing the gastric pits.

gastric atrophy. See **atrophic gastritis.**

gastric banding, a surgical treatment for morbid obesity consisting of creation of a gastric pouch by application to the proximal stomach of a silicone band, sometimes with an accompanying reservoir that can be filled with saline to adjust the size of the pouch's stoma.

gastric bypass, bariatric surgery performed to reduce stomach capacity and allow food to bypass part of the small intestine.

gastric cancer, a malignancy of the stomach. Approximately 97% of stomach tumors are adenocarcinomas, which may be ulcerating, polypoid, diffuse, and fibrous, or superficial spreading lesions. Lymphomas and leiomyosarcomas account for less than 3%. Symptoms of gastric cancer are vague epigastric discomfort, dysphagia, anorexia, weight loss, back pain, and unexplained iron deficiency anemia. However, many cases are asymptomatic in the early stages, and metastases may cause the first symptoms. Diagnostic measures include a test for occult blood in the stool, an upper GI series, a computed tomographic examination of the gastric mucosa with a flexible endoscope, and biopsy and cytological studies of exfoliated tumor cells. Surgery is usually recommended for suitable lesions. Radiotherapy and chemotherapy are usually not effective in adenocarcinoma but are often used in gastric lymphoma. Chemotherapy is used in treating advanced metastatic gastric adenocarcinoma. Gastric cancer is declining in incidence in North America and Western Europe but is common in Japan. Dietary factors, such as nitrates, smoked and salted fish and meats, and moldy foods containing aflatoxin, and infection with ***Helicobacter pylori*** are thought to cause gastric cancer, but the cause remains unknown. Genetic factors also play a role. The incidence is higher in men than in women and peaks in individuals 50 to 59 years of age. The risk increases in workers exposed to asbestos and in patients with pernicious anemia.



Gastric cancer *(Kumar et al, 2007)*

gastric digestion [Gk, *gaster,* stomach; L, *digere,* to separate], digestion by gastric juice in the stomach.

gastric dumping, excessively rapid movement of partially digested food from the stomach into the jejunum, occurring most often in patients who have had partial gastrectomy with gastrojejunostomy.

gastric dyspepsia, pain or discomfort localized in the stomach. See also **dyspepsia.**

gastric emesis [Gk, *gaster,* stomach, *emesis,* vomiting], vomiting associated with a stomach disorder, such as stomach cancer, stomach ulcer, or severe gastritis.

gastric fistula, an abnormal passage into the stomach, communicating most frequently with an opening on the external surface of the abdomen. A gastric fistula may be created surgically to provide tube feeding for patients with severe esophageal disorders. See also **gastrostomy, gastrostomy feeding.**

gastric fundus, that part of the stomach to the left and above the level of the entrance of the esophagus.

gastric glands, the secreting glands of the stomach, including the fundic, cardiac, and pyloric glands; sometimes used specifically to denote the fundic glands.

gastric inhibitory polypeptide (GIP), a GI hormone found in the mucosa of the small intestine. Release of the hormone, mediated by the presence of glucose or fatty acids in the duodenum, results in the release of insulin by the pancreas and inhibition of gastric mobility acid secretion.

gastric intubation, a procedure in which a Levin tube or other small-caliber catheter is passed through the nose into the esophagus and stomach. It may be used for the introduction into the stomach of liquid formulas to provide nutrition for unconscious patients or for premature or sick newborns. Medication or a contrast medium may be instilled for treatment or for radiological examination. See also **gastric lavage, Levin tube.**

gastric juice, digestive secretions of the gastric glands in the stomach, consisting chiefly of pepsin, hydrochloric acid, rennin, and mucin. The pH is strongly acid (0.9 to 1.5). Achlorhydria (a deficiency of hydrochloric acid in gastric juice) is present in pernicious anemia and stomach cancer. Excessive secretion of gastric juice may lead to mucosal irritation and **peptic ulcer.** See also **achlorhydria, gastric analysis.**

gastric lavage, the washing out of the stomach with sterile water or a saline solution. The procedure is performed before and after surgery to remove irritants or toxic substances and possibly before such examinations as endoscopy or gastroscopy. See also **irrigation.**

gastric motility, the spontaneous peristaltic movements of the stomach that aid in digestion, moving food through the stomach and out through the pyloric sphincter into the duodenum. Excess gastric motility causes pain that is usually treated with antispasmodic medication. Below normal motility is common in labor, after general anesthesia, and as a side effect of some sedative hypnotics.

gastric mucin [Gk, *gaster,* stomach; L, *mucus*], a viscous secretion of glycoproteins produced from the mucous membrane lining of swine stomachs and formerly used in the treatment of peptic ulcers.

gastric node, a node in one of three groups of lymph glands associated with the abdominal and pelvic viscera supplied by branches of the celiac artery. The gastric nodes accompany the left gastric artery and are divided into the superior and inferior gastric nodes. Compare **hepatic node, pancreaticolienal node.**

gastric pacing, surgical implantation of pacing wires attached to stomach, an emerging therapy for gastroparesis.

gastric resection [Gk, *gaster,* stomach; L, *re* + *secare,* to cut], the surgical removal of part or all of the stomach, usually performed in the treatment of stomach cancer or intractable peptic ulcer. See also **gastrectomy, gastroenterostomy.**

gastric restriction, any of various surgical treatments for morbid obesity in which part of the stomach is closed off from the flow of nutrients through the alimentary canal, such as gastric banding, gastric bypass, and gastric partitioning.

gastric tetany. See **tetany.**

gastric ulcer. See **peptic ulcer.**

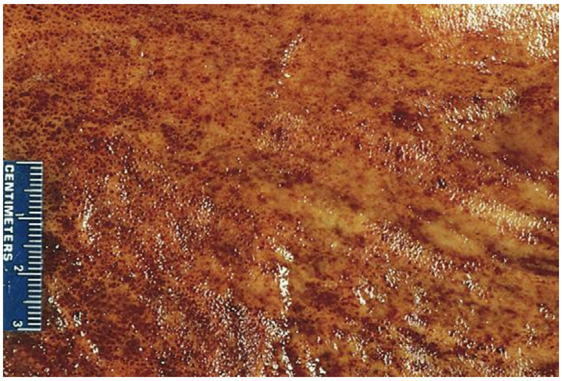
gastrin /gas′trin/ [Gk, *gaster,* stomach], a polypeptide hormone, secreted by the pylorus, that stimulates the flow of gastric juice and contributes to the stimulus for bile and pancreatic enzyme secretion. Normal findings of blood levels of gastrin are less than 200 pg/mL.

gastrinoma /gas′trinō′mə/, a tumor found in the pancreas and in the duodenum associated with the presence of peptic ulcers.

gastrin-releasing peptide, a 27-amino acid linear neuropeptide, structurally and functionally related to bombesin, that mediates neural release of antral gastrin, causes bronchoconstriction and respiratory tract vasodilation, stimulates growth and mitogenesis of cells in culture, and may act as an excitatory neurotransmitter of enteric interneurons.

gastrin test, a blood test used to help identify patients with Zollinger-Ellison syndrome and G-cell hyperplasia who typically have high serum gastrin levels. Gastrin is a hormone that is secreted by cells of the stomach and causes secretion of hydrochloric acid. Test results can help the clinician institute appropriate, aggressive medical and surgical therapy for these patients.

gastritis /gastrī′tis/, an inflammation of the lining of the stomach that occurs in two forms. **Acute gastritis** may be caused by severe burns; major surgery; aspirin or other antiinflammatory agents (nonsteroidal antiinflammatory drugs); corticosteroids; drugs; food allergens; or viral, bacterial, or chemical toxins. Symptoms include anorexia, nausea, vomiting, and discomfort after eating. They usually abate after the causative agent has been removed. **Chronic gastritis** is usually a sign of underlying disease, such as peptic ulcer, stomach cancer, Zollinger-Ellison syndrome, or pernicious anemia. Differential diagnosis is by endoscopy with biopsy. Kinds of gastritis include **atrophic gastritis, hemorrhagic gastritis,** and **hypertrophic gastritis.** Compare **peptic ulcer.** See also **acute erosive gastritis, alkaline reflux gastritis.**

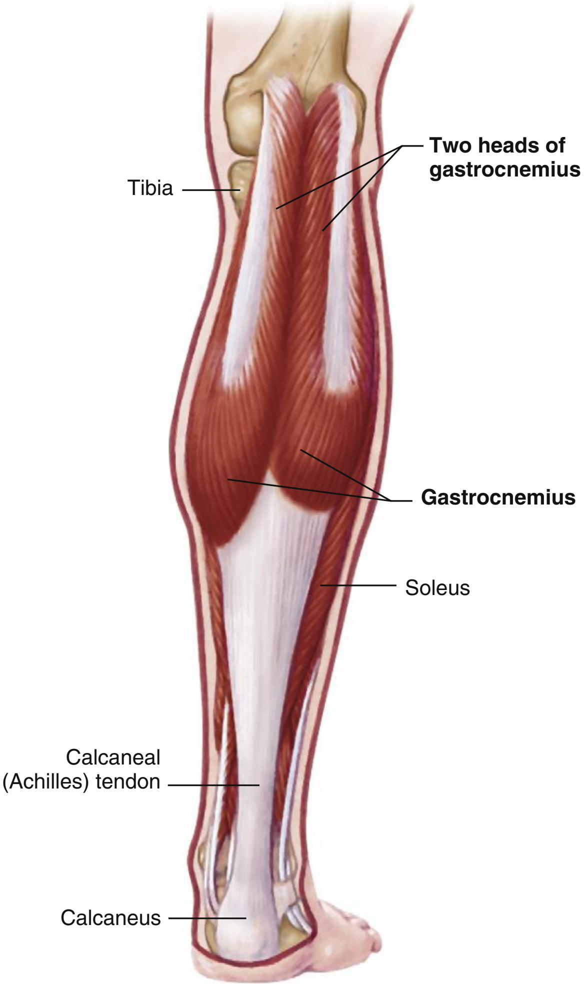


Acute gastritis *(Kumar, Abbas, and Fausto, 2005)*

gastro-, gaster-, gastr-, prefix meaning “stomach or abdomen”: *gastroadynamia, gastrocolitis, gastrophrenic.*

gastrocamera /gas′trōkam′ərə/, a small camera that can be lowered into the stomach through the esophagus and retrieved after recording images of the stomach lining.

gastrocnemius /gas′trōnē′me·us/ [Gk, *gastroknemia,* calf of the leg], the most superficial calf muscle in the posterior part of the leg. It joins the tendon of the soleus as part of the tendo calcaneus. It flexes the leg and plantarflexes the foot. Compare **plantaris, soleus.**



Gastrocnemius *(Patton and Thibodeau, 2010)*

gastrocnemius gait, an abnormal gait associated with a weakness of the gastrocnemius, characterized by the dropping of the pelvis on the affected side at the last moment of the stance phase in the walking cycle, accompanied by lagging or slowness in forward pelvic movement.

gastrocnemius test, a test of the function of the gastrocnemius muscle by ankle plantar flexion while the patient is in a prone position. The examiner places fingers for palpation on the posterior of the calf while the patient pulls the heel upward, thus plantar flexing the ankle. Flexion of the toes and forefoot before movement of the heel is evidence of muscle substitution.

gastrocoele. See **archenteron.**

gastrocolic omentum. See **greater omentum.**

gastrocolic reflex /-kol′ik/ [Gk, *gaster* + *kolon,* colon; L, *reflectere,* to bend backward], a mass peristaltic movement of the colon that often occurs 15 to 20 minutes after food enters the stomach. When an infant is fed, this reflex may cause bowel movement.

gastrocystoplasty /gas′trosis′toplas′te/, augmentation cystoplasty using a portion of the stomach for the graft.

gastrodidymus /-did′iməs/ [Gk, *gaster* + *didymos,* twin], conjoined, equally developed twins united at the abdominal region. Also called **omphalodidymus.**

gastrodisciasis /gas′trōdiskī′əsis/ [Gk, *gaster* + *diskos,* disk, *eidos,* form, *osis,* condition], an infection of trematodes of the genus *Gastrodiscoides,* which are digestive tract parasites. The species *G. hominis,* a reddish-orange fluke averaging 1 cm in length, is endemic in the hog populations of Southeast Asia and is transmitted to humans.

gastrodisk. See **embryonic disk.**

gastroduodenal /-do͞o′ədē′nəl/ [Gk, *gaster* + L, *duodeni,* 12 fingers], pertaining to the stomach and duodenum.

gastroduodenitis /-do͞o′ədenī′tis/ [Gk, *gaster,* stomach; L, *duodeni,* 12 fingers; Gk, *itis,* inflammation], inflammation of the stomach and duodenum.

gastroduodenoscopy /-do͞o′ədenos′kəpē/, inspection of the stomach and duodenum by means of a gastroscope passed through the oral cavity and esophagus.

gastroduodenostomy /-do͞o′ədenos′təmē/, surgical establishment of a passageway between the stomach and the duodenum. It may be done, for example, to bypass a pyloric obstruction.

gastrodynia. See **stomachache.**

gastroenteritis /gas′trō·en′tərī′tis/ [Gk, *gaster* + *enteron,* intestine, *itis,* inflammation], an inflammation of the stomach and intestines accompanying numerous GI disorders. Symptoms are anorexia, nausea, vomiting, fever (depending on causative factor), abdominal discomfort, and diarrhea. The condition may be caused by bacterial enterotoxins, bacterial or viral invasion, chemical toxins, or miscellaneous conditions, such as lactose intolerance. The onset may be slow, but more often it is abrupt and violent, with rapid loss of fluids and electrolytes caused by persistent vomiting and diarrhea. Hypokalemia and hyponatremia, acidosis, or alkalosis may develop. Treatment is supportive and includes bed rest, sedation, IV replacement of electrolytes, and antispasmodic medication to control vomiting and diarrhea. With a precise diagnosis, medication and treatment can be specific and curative, such as an antitoxin prescribed for gastroenteritis resulting from a bacterial endotoxin. After the acute phase, water may be given by mouth. If it produces no vomiting or diarrhea, clear fluids may be added, followed, if tolerated, by a diet of foods that appeal to the patient and do not cause symptoms. Also called **enterogastritis.**

■ OBSERVATIONS: Onset is often sudden, with abdominal pain and cramping, nausea and vomiting, diarrhea with or without blood and mucus, anorexia, general malaise, and muscle aches. Dehydration, hypokalemia, and hyponatremia occur with persistent vomiting and diarrhea. Diagnosis relies on identification of the causative agent through stool and blood cultures, Gram's stain, and direct swab rectal cultures. Complications of gastroenteritis include dehydration, shock, vascular collapse, and renal failure. In rare instances, complications may lead to death. Infants, small children, the elderly, and debilitated individuals are at greatest risk.

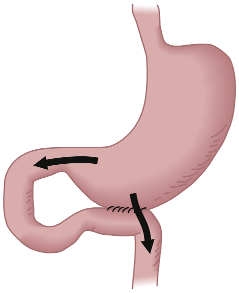
■ INTERVENTIONS: Most gastroenteritis is self-limiting and does not require therapy. Adequate rehydration is the primary treatment. Fluids are limited until vomiting ceases, then oral rehydration is instituted. IV fluid and electrolyte replacement may be necessary if dehydration is severe. Antidiarrheal agents may be used to slow diarrhea. Antibiotic agents may be used for gastroenteritis with systemic involvement. Antimicrobials are not generally recommended for simple gastroenteritis because these drugs may prolong the carrier state and contribute to the emergence of drug-resistant organisms. Antiemetics may be used for moderate to severe vomiting unless the causative agent is viral or bacterial, in which case antiemetics are not given to avoid impairment of GI motility.

■ NURSING CONSIDERATIONS: Nursing focus is on the replacement and monitoring of fluid and electrolytes. Accurate monitoring of intake and output is essential. Strict medical asepsis should be instituted when indicated by the causative agent. The importance of rest and increased fluid intake should be stressed along with the self-limiting nature of the disease. Education about proper food handling and storage is necessary after acute symptoms have ceased.

gastroenterologist /gas′trō·en′tərol′əjist/, a physician who specializes in diseases affecting the GI tract.

gastroenterology /gas′trō·en′tərol′əjē/ [Gk, *gaster* + *enteron,* intestine, *logos,* science], the study of diseases affecting the GI tract, including the stomach, intestines, gallbladder, and bile duct.

gastroenterostomy /gas′trō·en′təros′təmē/ [Gk, *gaster* + *enteron,* intestine, *stoma,* mouth], surgical formation of an artificial opening between the stomach and the small intestine, usually at the jejunum. The operation is performed with a gastrectomy to route food from the remainder of the stomach into the small intestine or alone to treat a perforating ulcer of the duodenum. A GI series is done before surgery, and a nasogastric tube is inserted. The jejunum is pulled up and anastomosed with the stomach. A new opening is then made for food to pass from the stomach directly into the jejunum. Pancreatic juices and bile are still secreted into the duodenum and pass through its distal end to the jejunum. After surgery complications and care are the same as for gastrectomy. Compare **gastrectomy.**



Gastroenterostomy *(Black and Hawks, 2009)*

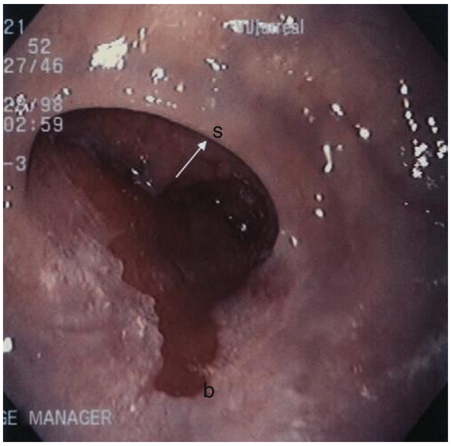
gastroesophageal /gas′trō·isof′əjē′əl/ [Gk, *gaster* + *oisophagos,* gullet], pertaining to the stomach and esophagus.

gastroesophageal hemorrhage. See **Mallory-Weiss syndrome.**

gastroesophageal reflux, a backflow of contents of the stomach into the esophagus that is often the result of incompetence of the lower esophageal sphincter. Gastric juices are acidic and therefore produce burning pain in the esophagus. Repeated episodes of reflux may cause esophagitis, peptic esophageal stricture, or esophageal ulcer. In uncomplicated cases treatment consists of elevation of the head of the bed, avoidance of acid-stimulating foods, and regular administration of antacids. In complicated cases surgical repair may provide relief. Also called **GERD.** See also **chalasia, esophagitis, heartburn, hiatal hernia, reflux esophagitis.**

gastroesophageal reflux scan, a nuclear scan that is used to evaluate patients with symptoms of heartburn, regurgitation, vomiting, and dysphagia and to evaluate the medical or surgical treatment of patients with gastroesophageal reflux.

gastroesophagitis /gas′trō′isof′əjī′tis/, inflammation of the stomach and esophagus.



Gastroesophageal reflux: endoscopic view
(Goldman et al, 2008)

gastrofiberscope /-fī′bərskōp′/, a flexible fiber endoscope for examination of the stomach.

gastrohepatic omentum. See **lesser omentum.**

gastrointestinal (GI) /gas′trō·intes′tinəl/ [Gk, *gaster* + L, *intestinum,* intestine], pertaining to the organs of the GI tract, from mouth to anus.

gastrointestinal allergy, an immediate hypersensitivity reaction of the digestive system after the ingestion of certain foods or drugs. GI allergy differs from food allergy, which can affect other organ systems. Characteristic symptoms include itching and swelling of the mouth and oral passages, nausea, vomiting, diarrhea (sometimes containing blood), severe abdominal pain, and, in severe cases, anaphylactic shock. Treatment includes identification and removal of the allergen. In an acute attack epinephrine may be administered as a stimulant, and muscle relaxants may be given to reduce intestinal spasms that cause abdominal pain. In childhood, GI allergy is most often caused by hypersensitivity to cow's milk and is characterized by diarrhea and colicky pain, sometimes with vomiting, eczema, respiratory distress, and thrombocytopenia. Compare **food allergy.** See also **lactose intolerance.**

gastrointestinal anthrax. See **anthrax.**

gastrointestinal bleeding, any bleeding from the GI tract. The most common underlying conditions are peptic ulcer, Mallory-Weiss syndrome, esophageal varices, diverticulosis, ulcerative colitis, and carcinoma of the stomach and colon. Vomiting of bright red blood or passage of coffee ground vomitus indicates upper GI bleeding, usually from the esophagus, stomach, or upper duodenum. Aspiration of the gastric contents, lavage, and endoscopy are performed to determine the site and rate of bleeding. Tarry black stools indicate a bleeding source in the upper GI tract; bright red blood from the rectum usually indicates bleeding in the distal colon. GI bleeding is treated as a potential emergency. Patients may require transfusions, fluid replacement, endoscopic treatment, or gastric lavage and are watched carefully so as to prevent shock and hypovolemia. In all patients blood loss is evaluated and ability to coagulate is tested. See also **coffee-ground vomitus, hematochezia, melena.**

gastrointestinal bleeding scan, a nuclear scan that is used to localize the site of bleeding in patients who are having active gastrointestinal hemorrhage. It may also be used in patients with suspected intraabdominal (nongastrointestinal) hemorrhage of unknown origin.

gastrointestinal function, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which foods (ingested or tube-fed) are moved from ingestion to excretion. See also **Nursing Outcomes Classification.**

gastrointestinal gas. See **flatulence.**

gastrointestinal infection, any infection of the digestive tract caused by bacteria, viruses, or parasites. All may have common clinical features of nausea, vomiting, diarrhea, and anorexia. Treatment in most cases includes bed rest, ready access to a bathroom, and food and beverages to replenish loss of fluid and electrolytes.

gastrointestinal intubation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as insertion of a tube into the gastrointestinal tract. See also **Nursing Interventions Classification.**

gastrointestinal obstruction, any obstruction of the passage of intestinal contents, caused by mechanical blockage or failure of motility. Mechanical blockage may be caused by adhesions resulting from surgery or inflammatory bowel disease, an incarcerated hernia, fecal impaction, tumor, intussusception, volvulus, or foreign body ingestion. Failure of motility may follow anesthesia, abdominal surgery, or occlusion of any of the mesenteric arteries to the gut. Symptoms vary with the cause of obstruction but generally include vomiting, abdominal pain, and increasing abdominal distension. Dehydration and prostration may follow. Characteristically bowel sounds are diminished or absent, especially distal to the obstruction, and abdominal guarding is prominent. A barium enema may be performed, but barium is never given by mouth because it increases the volume of the obstruction. The objective of therapy is to remove the obstruction as quickly and safely as possible. A tube is inserted into the stomach or small intestine to aspirate contents and relieve distension. During these procedures the patient is monitored for proper fluid and electrolyte balance. Surgical intervention may be necessary. Medication for pain can aggravate the condition by further decreasing motility of the GI tract, and it may not be prescribed in the acute period, before the location and extent of the obstruction are discovered.

gastrointestinal series, an examination of the upper GI tract using barium as the contrast medium for a series of x-ray films. Also called **barium meal.**

gastrointestinal system assessment, an evaluation of the patient's digestive system and symptoms.

■ METHOD: Discussion of symptoms is encouraged. The patient is asked whether there is or has been pain or tenderness in the oral cavity, gums, tongue, lips, abdomen, or rectum, and whether there have been instances of dysphagia, belching, heartburn, anorexia, nausea, vomiting, constipation, diarrhea, or painful defecation. Information is elicited about changes in eating; bowel habits; the color, character, and frequency of stools and urine; the use of laxatives or enemas; and the occurrence of fatigue, hemorrhoids, and edema of the extremities. The patient's general appearance, weight, and temperature are noted; the blood pressure, pulse, and respirations are checked in the supine, sitting, and standing positions; and the urinary output and color are determined. The presence of allergies, stomatitis, and halitosis and the condition of the tongue, gums, oral mucosa, and teeth are recorded. The abdomen is examined for distension, rigidity, ascites, symmetry, organomegaly, keloid tissue, visible peristalsis, bowel sounds, masses, and the presence of an ostomy. The perianal area is inspected for its general condition, color, odor, and hemorrhoids; the sclera for signs of jaundice; and the skin for pruritus, spider angioma, purpura, palmar erythema, peripheral edema, jaundice, and distended, tortuous blood vessels. Relevant to the assessment are concurrent endocrine, cardiovascular, and neurological disorders; severe burns; psychological problems; carcinoma; alcohol or drug abuse; and previous GI surgery and illnesses such as hepatitis, liver cirrhosis, or pancreatitis. The patient's personality type, attitude toward work, and use of tobacco, antacids, laxatives, anticholinergics, steroids, antidiarrheals, antiemetics, sedatives, tranquilizers, barbiturates, antihypertensives, antibiotics, and aspirin are investigated. The family history, especially of GI disease, carcinoma, and diabetes mellitus, is an important aspect of the evaluation. Diagnostic aids include a complete blood count, stool examination, prothrombin time, and determinations of levels of alkaline phosphatase, serum and urine bilirubin, aspartate aminotransferase, alanine aminotransferase, lactic acid dehydrogenase, blood urea nitrogen, serum lipase, cholinesterase, calcium, albumin, and glucose. Additional laboratory studies for evaluation are total protein level; serum electrolyte profile; serum carotene, delta-xylose tolerance, galactose tolerance, hippuric acid, and bromsulphalein tests; the albumin-globulin ratio, serum flocculation, and thymol turbidity tests; urobilinogen level; the polyvinylpyrrolidone test for protein loss; Sulkowitch's test for calcium in urine; and Schilling's test for GI absorption of vitamin B_{12}. Procedures that may be required for the diagnosis include upper GI, small bowel, and gallbladder series; esophageal and gastric endoscopy and biopsy; scans of the liver and pancreas; biopsy of the liver, colon, or rectum; gastric analysis, sigmoidoscopy, abdominal x-ray films, ultrasound, fluoroscopy, percutaneous transhepatic cholangiography, endoscopic retrograde cholangiopancreatography, magnetic resonance cholangiopancreatography, hepatobiliary iminodiacetic acid scan, splenoportography, and digital rectal examinations.

■ INTERVENTIONS: The physician or other health care provider conducts the interview, records observations of the patient, and assembles the results of the diagnostic laboratory studies and procedures.

gastrointestinal tract. See **digestive tract.**

gastrojejunostomy. See **Billroth's operation II.**

gastrokinetic drugs /-kinet′ik/, chemicals that stimulate salivation, increase lower esophageal sphincter pressure, and improve esophageal clearance in the supine, but not in the upright, position. Cisapride, once the widely used drug in this category, has been taken off the market because of fatal arrhythmias. Metoclopramide, another agent in this category, has side effects that make it undesirable, and its efficacy is questionable in comparison to the now widely-used proton pump inhibitors.

gastromalacia /-məlā′shə/ [Gk, *gaster,* stomach, *malakia,* softness], an abnormal softening of the walls of the stomach.

gastromegaly /-meg′əlē/ [Gk, *gaster* + *megas,* large], an abnormal enlargement of the stomach or abdomen.

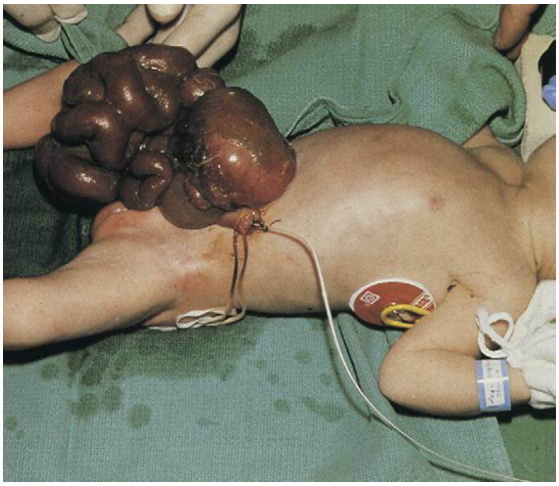
gastroparesis /-pərē′sis/, **1.** paralysis of the stomach. **2.** failure of the stomach to empty caused by decreased gastric motility. The major causes are various kinds of abdominal inflammation, scleroderma, diabetic autonomic neuropathy, vagotomy, and use of anticholinergic medications.

gastropericardial fistula, a fistula connecting the stomach with the pericardium, usually a complication after gastroesophageal surgery.

gastroplasty /gas′troplas′tē/ [Gk, *gaster* + *plassein,* to mold], any surgery performed to reshape or repair any stomach defect or deformity.

gastropore. See **blastopore.**

gastroschisis /gastros′kəsis/ [Gk, *gaster* + *schisis,* division], a congenital defect characterized by incomplete closure of the abdominal wall with protrusion of the viscera. Compare **omphalocele.**



Neonate with gastroschisis *(Moore, Persaud, and Shiota, 2000/Courtesy Dr. A.E. Chudley, Department of Pediatrics and Child Health, University of Manitoba, Children's Hospital)*

gastroscope /gas′trōskōp′/ [Gk, *gaster* + *skopein,* to look], a fiberoptic instrument for examining the interior of the stomach. See also **fiberoptics.** —*gastroscopic, adj.*

gastroscopy /gastros′kəpē/, the visual inspection of the interior of the stomach by means of a gastroscope inserted through the esophagus. The flexible fiberoptic gastroscope increases the visualization of the prepyloric antrum, but the fundus is still not visible. See also **endoscopy, fiberoptics.** —*gastroscopic, adj.*

gastrostomy /gastros′təmē/ [Gk, *gaster* + *stoma,* mouth], surgical creation of an artificial opening into the stomach through the abdominal wall. It is performed to prevent malnutrition and starvation in patients who have esophageal cancer or tracheoesophageal fistula, who may be unconscious for a prolonged period, or who are unable to swallow as a result of a cerebrovascular accident, Alzheimer's disease, or another disorder. It also permits retrograde dilation of an esophageal stricture. The anterior wall of the stomach is drawn forward and sutured to the abdominal wall. A Foley catheter or other tube or a special prosthesis is then inserted into an incision in the stomach, and the opening is tightly sutured to prevent leakage of the stomach contents. The device is clamped and is opened when liquid food supplement is instilled. After surgery glucose water may be given, followed by a slow continuous feeding of a warm blended formula to increase absorption. The skin is kept clean and dry around the site. Skin irritation indicates leakage of gastric secretions and digestive enzymes.

gastrostomy feeding, the introduction of a nutrient solution through a tube that has been surgically inserted into the stomach through the abdominal wall. See also **enteral tube feeding.**

gastrostomy tube. See **stomach tube.**

gastrothoracopagus /gas′trōthôr′əkop′əgəs/ [Gk, *gaster* + *thorax,* chest, *pagos,* fixture], conjoined twins who are united at the thorax and abdomen.

gastrula /gas′tro͞olə/ [Gk, *gaster,* stomach], the early embryonic stage formed by the invagination of the blastula. The cup-shaped gastrula consists of an outer layer of ectoderm and an inner layer of mesentoderm that subsequently differentiate into the mesoderm and endoderm. See also **blastula, embryonic layer.**

-gastrula, suffix meaning an “embryonic stage after the blastula”: *amphigastrula, discogastrula, paragastrula.*

gastrulation /gas′trəlā′shən/ [Gk, *gaster,* stomach], the development of the gastrula in lower animals and the formation of the three germ layers in the embryo of humans and higher animals. It is characterized by an extensive series of coordinated morphogenetic movements within the blastula or blastocyst by which the primitive body plan of the organism is established and by which the areas that later differentiate into various structures and organs are in their proper position for development.

Gatch bed /gach/ [William D. Gatch, American surgeon, 1878–1961; AS, *bedd*], a bed that has an adjustable joint, allowing the knees to be flexed and the legs supported.

gate /gāt/, **1.** *n,* an electronic circuit that passes a pulse only when a signal (the gate pulse) is present at a second input. **2.** *n,* a mechanism for opening or closing a protein channel in a cell membrane, regulated by a signal such as increased concentration of a neurotransmitter, change in electrical potential, or physical binding of a ligand molecule to the protein to cause a conformational change in the protein molecule. **3.** *v,* to open and close selectively and function as a gate.

gatekeeper, a health care professional, usually a primary care physician or a physician extender, who is the patient’s first contact with the health care system and triages the patient’s further access to the system.

gatekeeper effect, a contraction of the endothelium mediated by immunoglobulin G. It permits components of the blood to gain access to the extravascular space as a result of the increased vascular permeability.

gate theory of pain. See **pain mechanism.**

gateway drugs, minor substances of abuse, such as inhalants, used in general by children or young people before they experiment with marijuana or hard drugs; entry drugs.

gatifloxacin, a broad-spectrum antiinfective.

■ INDICATIONS: It is used to treat acute bacterial exacerbation of chronic bronchitis, acute sinusitis, community-acquired pneumonia, gonorrhea, and infections caused by susceptible *Escherichia coli, Staphylococcus aureus, Haemophilus influenzae, H. parainfluenzae, Klebsiella pneumoniae, Moraxella catarrhalis, Neisseria gonorrhoeae, Proteus mirabilis, Chlamydia pneumoniae, Legionella pneumophila,* and *Mycoplasma pneumoniae.*

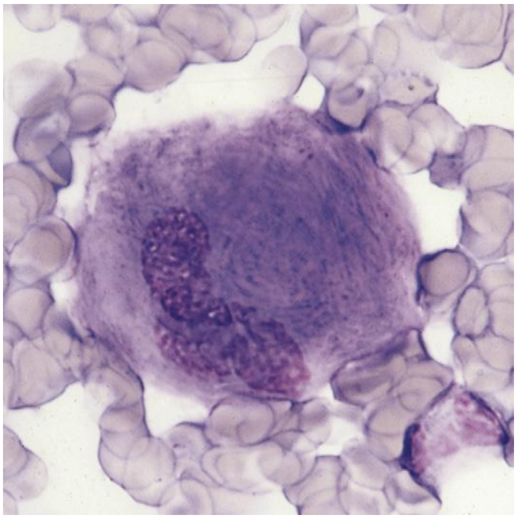
■ CONTRAINDICATIONS: Known hypersensitivity to quinolones prohibits its use.

■ ADVERSE EFFECTS: Pseudomembranous colitis is a life-threatening effect. Other adverse effects include dizziness, insomnia, paresthesia, tremor, vasodilation, increased aspartate aminotransferase and alanine aminotransferase, pruritus, urticaria, photosensitivity, flushing, fever, and chills. Common side effects include headache, nausea, diarrhea, rash, dyspnea, and pharyngitis.

gating, the organizing of image data so that information used to construct an image originates in the same point in the cycle of a repeating movement, such as a heartbeat. The moving object is thus frozen at that phase of its movement, and image blurring is minimized.

gating mechanism, **1.** the increasing duration of an action potential from the atrioventricular node to a point in the distal Purkinje system, beyond which it decreases. **2.** a process that controls the opening and closing of cell-membrane ion channels.

Gaucher's disease /gôshāz′/ [Phillipe C.E. Gaucher, French physician, 1854–1918], a rare autosomal-recessive familial disorder of lipid metabolism caused by an enzyme deficiency, characterized by widespread reticulum cell hyperplasia in the liver, spleen, lymph nodes, and bone marrow. Beginning in infancy or early childhood, splenomegaly, hepatomegaly, and abnormal bone growth develop. Diagnosis is made through biopsy of the liver, spleen, or bone marrow. Mortality rate is high, but children who survive adolescence may live for many years. Also called **glucosyl cerebroside lipidosis.**



Bone marrow smear in Gaucher's disease

(Carr and Rodak, 2008)

gauge /gāj/ [ME], an instrument for determining physical properties of anything, including caliber, dimensions, or pressure.

gauntlet bandage /gônt′lit/ [Fr, *gantlet,* small glove, *bande,* strip], a glovelike bandage covering the hand and the fingers. See also **demigauntlet bandage.**

gauss /gôs, gous/ [J.K.F. Gauss, German physicist, 1777–1855], a unit of magnetic field strength. It is equal to 10^{-5} tesla.

gauze /gôz/ [Fr, *gaze*], a transparent fabric of open weave and differing degrees of fineness, most often cotton muslin, used in surgical procedures and for bandages and dressings. It may be sterilized and permeated by an antiseptic or lotion. Kinds of gauze include **absorbable gauze, absorbent gauze,** and **petrolatum gauze.** See also **bandage.**

gauze sponge [Fr, *gaze* + Gk, *spoggia*], a piece of folded gauze used during surgery to wipe up bleeding surfaces and thereby help locate any sources of blood loss.

gavage /gävāzh′/ [Fr, *gaver,* to gorge], the process of feeding a patient through a nasogastric tube. Also called **gavage feeding, nasogastric feeding.** See also **drip gavage, enteral tube feeding.**

gavage feeding of the newborn, a procedure in which a tube passed through the nose or mouth into the stomach is used to feed a newborn with weak sucking, uncoordinated sucking and swallowing, respiratory distress, tachypnea, or repeated apneic spells.

■ METHOD: After the gastric tube is inserted, its placement is checked by radiography or by instillation of air and auscultation of the stomach for air sounds or by immersion of the proximal end of the tube in water. If the amount of residual formula left in the infant's stomach at the time of the next feeding exceeds the quantity specified, the next feeding may be delayed or omitted. Blue food coloring is often added to the gavage to distinguish gastric contents from respiratory secretions to help detect aspiration of gastric contents into the lungs. During feeding the infant is held in a low Fowler's position, preferably by the mother, and is restrained only if necessary. The feeding syringe is held 18 centimeters above the infant's head, and the flow is initiated by pressure on the plunger. As the formula is slowly instilled, the baby is stroked and is offered a pacifier to promote gravity flow, exert a calming effect, and reinforce the relationship between sucking and feeding. If the infant gags, spits, chokes, regurgitates, vomits, or becomes cyanotic, the rate of flow of formula is reduced, and the feeding may be stopped. To prevent air from entering the stomach when the feeding is completed, the tube is pinched closed as it is withdrawn. The infant is burped gently by patting or rubbing the back and then positioned on the right side in the crib. Postural drainage and percussion are avoided for at least 1 hour after feeding. The time, amount, and kind of feeding and the size of tube used are entered in the nursing care plan.

■ INTERVENTIONS: The nurse administers intermittent gavage feeding to the infant, explains the need for the procedure to the parents, and explains that nipple feedings may be instituted when the infant sucks on the gavage tube or pacifier, actively seeks nourishment, shows good suck and swallow coordination, gains weight, and has a respiratory rate of less than 60 breaths per minute.

■ OUTCOME CRITERIA: Intermittent gavage feedings can enable the high-risk infant to survive.

gay [Fr, *gai,* merry], **1.** *n,* any person who is homosexual. **2.** *adj,* pertaining to homosexuality.

Gay-Lussac's law /gā′ ləsaks′/ [Joseph L. Gay-Lussac, French scientist, 1778–1850; L, *legu,* a rule], (in physics) a law stating that the volume of a specific mass of a gas increases as the temperature increases if the pressure remains constant. Also called **Charles' law.**

Gay Nurses' Alliance (GNA), a national organization of gay and lesbian nurses.

gaze /gāz/ [ME, *gazen,* to stare], a state of looking in one direction. A person with normal vision has six basic positions of gaze, each determined by control of different combinations of contractions of extraocular muscles. See also **cardinal position of gaze.**

gaze palsy. See **supranuclear gaze disturbance.**

gaze paresis, a disturbance of eye conjugate movement in which gaze tends to be tonically deviated in the direction of normal gaze. For example, in left frontal lobe damage the patient cannot voluntarily look to the right and the eyes spontaneously deviate to the left. The patient may be able to return the gaze voluntarily to the midline but cannot move the eyes past the midline into the paretic field of gaze.

gaze test, a test of ocular and vestibular functioning. Movements of the eye are recorded with the patient gazing straight at an object and at positions off to different sides of it; then with eyes closed for 20 seconds, the patient must perform a small mental exercise. The eyes normally should assume a center gaze while they are closed.

GB, abbreviation for **gallbladder.**

GBIA, abbreviation for **Guthrie's bacterial inhibition assay.**

g.c., *(informal)* abbreviation for **gonococcus.**

G cell hyperplasia, increased numbers of G cells in the gastric mucosa, causing marked hypergastrinemia resembling that seen in Zollinger-Ellison syndrome.

G-CSF, abbreviation for **granulocyte colony-stimulating factor.**

Gd, symbol for the element **gadolinium.**

GDM, abbreviation for **gestational diabetes mellitus.**

GDNF, abbreviation for **glial cell line–derived neurotrophic factor.**

GDS, abbreviation for **Geriatric Depression Scale.**

Ge, symbol for the element **germanium.**

gefitinib, an antineoplastic.

■ INDICATION: This drug is used to treat non–small cell lung cancer.

■ CONTRAINDICATIONS: Pregnancy and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include nausea, diarrhea, vomiting, anorexia, mouth ulceration, rash, pruritus, acne, dry skin, cough, dyspnea, peripheral edema, amblyopia, conjunctivitis, eye pain, corneal erosion, and ulcer. Life-threatening side effects include pancreatitis, toxic epidermal neurolysis, angioedema, and interstitial lung disease.

gegenhalten /gā′gənhäl′tən/ [Ger, counterpressure], the involuntary resistance to passive movement of the extremities. It may occur as a symptom of catatonia, in which there is passive resistance to stretching movements, even when the patient attempts to cooperate. The effect may be psychogenic in origin or may be a sign of dementia or cerebral deterioration. Also called **paratonia.**

Geiger-Müller (GM) counter /gī′gər mil′ər/ [Hans Geiger, German physicist, 1882–1945; Walther Müller, twentieth century German physicist; Fr, *conter,* to tell], an electronic device that indicates the level of radioactivity of a substance by counting the number of ionizing subatomic particles emitted by the substance. As the particles pass through a gas-filled tube inside the counter, they ionize the gas and cause an electric discharge. The tube cannot identify the type or energy of a particle. Also called **Geiger counter.**

gel /jel/ [L, *gelare,* to congeal], a colloid that is firm although it contains a large amount of liquid, used in many medicines as a demulcent, a vehicle for other drugs, an antacid, or an astringent, depending on the drug from which it is derived. Also called **jelly.**

-gel, suffix meaning “jellylike substances” formed by cooling a colloid into a semisolid state.

gelat-, prefix meaning “to freeze, congeal”: *gelatigenous, gelatinoid, gelatum.*

gelatin buildup /jel′ətən/, an x-ray film artifact that may appear as a sharp area of either increased or reduced density.

gelatin film, absorbable, a hemostatic.

■ INDICATIONS: It is used to attain hemostasis during surgery, particularly neurological, thoracic, and ophthalmic procedures.

■ CONTRAINDICATIONS: Infection or gross contamination of the surgical wound prohibits its use.

■ ADVERSE EFFECTS: There are no known adverse effects.

gelatiniform carcinoma. See **mucinous carcinoma.**

gelatinous /jəlat′ənəs/ [L, *gelare,* to congeal], pertaining to or resembling a viscous, jellylike substance.

gelatinous carcinoma. See **mucinous carcinoma.**

gelatin sponge, an absorbable local hemostatic.

■ INDICATIONS: It is prescribed to control surgical bleeding and treat pressure ulcers.

■ CONTRAINDICATIONS: Frank infection, extensive and abnormal bleeding, postpartum bleeding, or menorrhagia prohibits its use.

■ ADVERSE EFFECTS: There are no known adverse effects.

gel diffusion. See **immunodiffusion.**

gel filtration, a method of separating molecules by size. A solution containing molecules of various sizes is passed through a filter consisting of a porous material, generally a polyacrylamide or polysaccharide. The larger molecules are excluded from the interior of the filter and thus emerge from it earlier than the smaller molecules.

Gelfoam, a trademark for an absorbable hemostatic gelatin sponge.

Gell and Coombs classification /jel; ko͞omz/, a classification of immune mechanisms of tissue injury, comprising four types of hypersensitivity reactions: *type I* (anaphylactic reactions), immediate hypersensitivity reactions mediated by interaction of immunoglobulin E antibody and antigen and release of histamine and other mediators; *type II* (cytotoxic reactions), antibody-mediated hypersensitivity reactions caused by antibody-antigen interactions on cell surfaces; *type III* (immune complex reactions), mediated hypersensitivity reactions, local or general inflammatory responses caused by formation of circulating immune complexes and their deposition in tissues; and *type IV* (cell-mediated hypersensitivity reactions), delayed hypersensitivity reactions initiated by sensitized T lymphocytes either by release of lymphokines or by T-cell–mediated cytotoxicity.

Gellhorn pessary. See **pessary.**

gemcitabine, a miscellaneous antineoplastic.

■ INDICATIONS: It is used to treat adenocarcinoma of the pancreas (nonresectable Stages II and III or metastatic Stage IV) and non–small-cell lung cancer (Stages IIIA or B and IV). It is also used in combination with cisplatin to treat inoperable, advanced, or metastatic non–small-cell lung cancer.

■ CONTRAINDICATIONS: Known hypersensitivity and pregnancy prohibit its use.

■ ADVERSE EFFECTS: Life-threatening effects are leukopenia, anemia, neutropenia, thrombocytopenia, and hemorrhage. Other adverse effects include diarrhea, nausea, vomiting, anorexia, constipation, stomatitis, irritation at the site of administration, rash, alopecia, dyspnea, fever, and infection.

gemellary /jem′əler′ē/ [L, *gemellus,* twin], pertaining to twins.

gemellipara /jem′əlip′ərə/ [L, *gemellus* + *parare,* to give birth], a woman who has given birth to twins.

gemellology /jem′əlol′əjē/ [L, *gemellus* + Gk, *logos,* science], the study of twins and the phenomenon of twinning.

gemellus /jəmel′əs/, either of a pair of small muscles arising from the ischium. They rotate the thigh laterally and blend with the obturator internus tendon.

gemellus test, a test of the function of the gemellus superior and gemellus inferior in hip external rotation while the patient is seated with the knees flexed. The examiner places one hand on the lateral aspect of the knee to prevent flexion or abduction of the hip while the patient rotates the thigh outward by moving the foot medially.

gemfibrozil /jemfī′brəzil/, an antihyperlipidemic agent.

■ INDICATION: It is prescribed for the treatment of hyperlipidemia, specifically high levels of plasma triglycerides.

■ CONTRAINDICATIONS: Renal or hepatic dysfunction, gallbladder disease, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the adverse effects are abdominal or epigastric pain, urticaria, dizziness, and anemia.

gemifloxacin, an antiinfective that inhibits DNA gyrase.

■ INDICATIONS: This drug is used to treat acute bacterial exacerbation of chronic bronchitis caused by *Streptococcus pneumoniae, Haemophilus influenzae, H. parainfluenzae,* and *Moraxella catarrhalis* and community-acquired pneumonia caused by *S. pneumoniae* (including multidrug-resistant strains), *H. influenzae, M. catarrhalis, Mycoplasma pneumoniae, Chlamydia pneumoniae,* and *Klebsiella pneumoniae*.

■ CONTRAINDICATIONS: Known hypersensitivity to quinolones prohibits the use of this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include somnolence, depression, insomnia, nervousness, confusion, agitation, diarrhea, vomiting, anorexia, flatulence, heartburn, dry mouth, increased aspartate aminotransferase and alanine aminotransferase, constipation, abdominal pain, oral thrush, glossitis, stomatitis, rash, pruritus, urticaria, and visual disturbances. Life-threatening side effects include pseudomembranous colitis, anaphylaxis, and Stevens-Johnson syndrome. Common side effects include dizziness, headache, nausea, and photosensitivity.

gemin-, prefix meaning "a twin or double": *geminate, gemini, geminous*.

gemination, in dentistry, the "twinning" of a single tooth bud. Geminated teeth usually have a single common root, a common pulp canal, and visible partial cleavage of the enamel crown. The normal quantity of teeth are present in the dental arch. Not to be confused with **fusion.**

gemistocyte /gemis′təsīt/, an astrocyte with an eccentric nucleus and swollen cytoplasm, as seen in areas of nervous tissue affected by edema, demyelination, or infarction.

gemma /jem′ə/ *pl. gemmae* [L, bud], **1.** also called **gemmule.** a budlike projection produced by some organisms during budding, a type of asexual reproduction. **2.** any budlike or bulblike structure, such as a taste bud or end bulb. —*gemmaceous, adj*.

gemmate /jem′āt/ [L, *gemma* + *atus,* function], **1.** *adj,* having buds or gemmae. **2.** *v*, to reproduce by budding.

gemmation /jemā′shən/ [L, *gemmare,* to produce buds], the process of reproduction by budding. Also called **gemmulation.**

gemmiferous /jemif′ərəs/ [L, *gemma* + *fer,* bearing], having buds or gemmae; gemmiparous.

gemmiform /jem′ifôrm′/, resembling a bud or gemma.

gemmipara /jemip′ərə/ [L, *gemma* + *parare,* to give birth], an animal that produces gemmae or reproduces by budding, such as a hydra. —*gemmiparous, adj*.

gemmulation. See **gemmation.**

gemmule. See **gemma.**

gemtuzumab ozogamicin /gemto͞o′zo͞omab′ o′zo-gahmi′sin/, a recombinant DNA-derived monoclonal antibody conjugated with a cytotoxic antitumor antibiotic used as an antineoplastic in the treatment of relapsed acute myelogenous leukemia, administered intravenously.

gen-, geno-, prefix meaning "to become or produce": *generic, genesiology, genophobia, genus*.

-gen, -gene, **1.** suffix meaning "that which generates": *aerogen, proteinogen, venogen*. **2.** suffix meaning "that which is generated": *immunogen, ionogen, nitrogen*.

gender /jen′dər/ [L, *genus,* kind], **1.** the classification of the sex of a person into male, female, or ambivalent. **2.** the specific sex of a person. See also **sex.**

gender identity, the inner sense of maleness or femaleness. Differentiation of gender identity begins in infancy, continues throughout childhood, and is reinforced during adolescence. Also called **core gender identity.**

gender identity disorder, a condition characterized by a persistent feeling of discomfort or inappropriateness concerning one's anatomical sex. The disorder typically begins in childhood with gender identity problems and is manifested in adolescence or adulthood as cross-dressing.

Age of onset of selected genetic disorders

Age of onset	*Disorder*
Lethal during prenatal life	Some chromosome abnormalities Some extensive malformations Osteogenesis imperfecta
At birth (congenital)	Congenital malformations Chromosome abnormalities (e.g., Down syndrome) Some forms of hereditary deafness Osteogenesis imperfecta
Soon after birth or after feeding is initiated	Phenylketonuria Galactosemia Maple syrup urine disease Lactase insufficiency
Infancy	Sickle cell disease Tay-Sachs disease Werdnig-Hoffmann disease Hereditary clotting disorders Osteogenesis imperfecta Mucopolysaccharidoses
Early childhood	Cystic fibrosis Various muscular dystrophies Fragile X syndrome
Near puberty	Limb-girdle muscular dystrophy Adrenogenital syndrome Turner syndrome Klinefelter syndrome
Young adulthood	Acute intermittent porphyria Hereditary juvenile glaucoma
Variable age of onset	Diabetes mellitus Huntington disease Myotonic dystrophy Macular degeneration Hereditary amyotrophic lateral sclerosis

From Hockenberry MJ, Wilson D: *Wong's nursing care of infants and children,* ed 8, St Louis, 2007, Mosby.

gender role, the expression of a person's gender identity; the image that a person presents to both himself or herself and others, demonstrating maleness or femaleness.

gender testing [L, *genus,* kind, *testum,* crucible], a procedure for validating the sex of an individual by examining a tissue sample, usually obtained from oral mucous membrane cells, for the presence of a Y chromosome.

gene /jēn/ [Gk, *genein,* to produce], the biological unit of inheritance, consisting of a particular nucleotide sequence within a DNA sequence that occupies a precise locus on a chromosome and codes for a specific polypeptide chain. In diploid organisms, which include humans and other mammals, genes occur as paired alleles. Kinds of genes include **complementary gene, mutant gene, operator gene, pleiotropic gene, regulator gene, structural gene,** and **supplementary gene.** See also **chromosome, cistron, deoxyribonucleic acid, operon.**

-gene. See **-gen.**

gene amplification [Gk, *genein,* to produce; L, *amplus,* large], a process in which a specific gene or set of genes is duplicated many times in certain cells in response to defined signals or environmental stresses.

gene amplification technique, a term sometimes used to denote a nucleic acid amplification technique, although the segment of DNA or RNA undergoing amplification does not necessarily correspond to a single entire gene. See also **polymerase chain reaction (PCR).**

gene expression, the flow of genetic information from gene to protein; the process, or the regulation of the process, by which the effects of a gene are manifested; the manifestation of a heritable trait in an individual carrying the gene or genes that determine it.

gene library. See **DNA library.**

gene marker. See **genetic marker.**

gene pool [Gk, *genein,* to produce; AS, *pol*], the total number of genes in a population. If the population reproduces by random sexual selection, there will be a normal (bell-shaped) distribution of genes in the gene pool.

gene probe, a device used in molecular biology for locating a particular gene on a chromosome. It involves pairing a short known segment of deoxyribonucleic acid or ribonucleic acid with a matching sequence of bases on a chromosome.

genera. See **genus.**

general adaptation syndrome (GAS) [L, *genus,* kind; L, *adaptare,* to fit; Gk, *syn,* together, *dromos,* course], the defense response of the body or the psyche to injury or prolonged stress, as described by Hans Selye (1907–1982). It consists of an initial stage of shock or alarm reaction, followed by a phase of increasing resistance or adaptation in which the various defense mechanisms of the body or mind are used, and culminates in a state of adjustment and healing or of exhaustion and disintegration. Also called **adaptation syndrome.** See also **alarm reaction, crisis, posttraumatic stress disorder, stress.**

general anesthesia (GA), the absence of sensation and consciousness as induced by various anesthetic medications, given by inhalation or IV injection. The components of general anesthesia are analgesia, amnesia, muscle relaxation, control of vital signs, and unconsciousness. The depth of anesthesia is planned to allow the surgical procedure to be performed without the patient experiencing pain, moving, or having any recall of the procedure. Endotracheal intubation or insertion of another artificial airway device and respiratory support are often necessary. General anesthesia may be administered only by an anesthesiologist with or without an assistant or a certified registered nurse anesthetist and by a dentist with post-graduate training and licensing. See also **anesthesia.** Compare **local anesthesia, regional anesthesia, topical anesthesia.**

generalization /jen′(ə)rəlīzā′shən/ [L, *genus,* kind; Gk, *izein,* to cause], **1.** the reasoning by which a basic conclusion is reached, with application to different items that have a common factor. **2.** the process of reducing or subsuming under a general rule or statement, such as classifying items in general categories. **3.** a principle with general application. **4.** (in occupational therapy) the ability of a patient to apply knowledge and skills learned in therapy to a variety of similar but new situations.

generalized anaphylaxis /jen′(ə)rəlīzd′/, a severe reaction to an allergen characterized by itching, edema, wheezing respirations, apprehension, cyanosis, dyspnea, pupillary dilation, falling blood pressure, and rapid, weak pulse that may quickly produce shock and death. The reaction is mediated by immunoglobulin E antibodies that form in response to an initial sensitizing dose of an allergen and render the individual hypersensitive to the allergen by binding it to mast cells and basophils. A subsequent challenging dose of the allergen causes the cells to release histamine, bradykinin, and other vasoactive amines, producing anaphylaxis. See also **anaphylactic shock, anaphylaxis, reagin-mediated disorder.**

generalized anxiety disorder (GAD), an anxiety reaction characterized by persistent apprehension. The symptoms range from mild, chronic tenseness, with feelings of timidity, fatigue, apprehension, and indecisiveness, to more intense states of restlessness and irritability that may lead to aggressive acts. In extreme cases the overwhelming emotional discomfort is accompanied by physical reactions, including tremor, sustained muscle tension, tachycardia, dyspnea, hypertension, increased respiration, and profuse perspiration. Other physical signs include changes in skin color, nausea, vomiting, diarrhea, restlessness, immobilization, insomnia, and changes in appetite, all occurring without underlying organic cause. The symptoms of anxiety may be controlled with medication, such as tranquilizers, but psychotherapy is the preferred treatment. Also called **anxiety reaction, anxiety state.** See also **anxiety, anxiety attack.**

generalized emphysema. See **panacinar emphysema.**

generalized peritonitis [L, *genus,* kind; Gk, *peri,* near, *teinein,* to stretch, *itis,* inflammation], a bacterial infection of the peritoneum secondary to an infection in another organ, as when an appendix ruptures or an ulcer perforates the gastric wall. The symptoms are usually acute and severe. See also **peritonitis.**

generalized scleroderma. See also **scleroderma.**

generally recognized as effective (GRAE), one of the statutory criteria that must be met by a drug before it can be approved as a new drug. Meeting these criteria relieves the manufacturer of the necessity of obtaining premarket approval as required by the Federal Food, Drug, and Cosmetic Act. To be recognized as effective, the drug must be, according to the act, considered safe and effective by "experts qualified by scientific training and experience."

generally recognized as safe (GRAS), a 1958 rule established by the U.S. Food and Drug Administration (FDA) to identify foods regarded as safe to use because of lack of evidence that they may be harmful. Originally the rule was applied to all foods that were in use in 1958 and were not then known to be hazardous. Later, because of improved scientific techniques for detecting mutagens and carcinogens, items that had been classified as safe, such as caffeine, were further tested by the FDA to determine whether they should remain on the GRAS list.

general paresis [L, *genus,* kind; Gk, paralysis], a neurological disorder that results from chronic syphilitic infection. It is characterized by degeneration of the cortical neurons; progressive dementia, tremor, and speech disturbances; muscular weakness; and ultimately generalized paralysis. It is often accompanied by periods of exultation and delusions of grandeur. Treatment usually consists of large doses of penicillin, without which the outcomes are almost invariably progressive deterioration and death. Also called **paretic dementia, syphilitic meningoencephalitis.**

general practice, old term for comprehensive medical care regardless of age of the patient or presence of a condition that may require the services of a specialist. This term has now largely been replaced by the term **family practice.**

general practitioner (GP) [L, *genus,* kind; Gk, *praktikos,* practical], a family practice physician. See also **family medicine, family practice, family practice physician.**

general relaxation [L, *genus,* kind, *relaxare,* to ease], a slackening of strain or tension of the entire body, particularly of the muscles.

general sensory disorganization, disorders in which sensory systems are providing inaccurate information; may be associated with impairments in the tactile, vestibular, and/or auditory systems, also associated with infants who are characterized as "fussy babies".

general symptom [L, *genus* + Gk, *symptoma,* that which happens], a symptom that affects the entire body rather than a specific organ or location. Also called **constitutional symptom.**

generation /jen′ərā′shən/ [L, *generare,* to beget], **1.** the act or process of reproduction; procreation. **2.** a group of contemporary individuals that have descended through the same number of life cycles from a common ancestor. **3.** the period between the birth of one individual and the birth of its offspring. Kinds of generation include **alternate generation, filial generation,** and **parental generation.**

generative /jen′ərā′tiv/ [L, *generare,* to beget], pertaining to activity that generates new physical or mental growth, such as creative problem solving.

generic /jəner′ik/ [L, *genus,* kind], **1.** pertaining to a genus. **2.** pertaining to a substance, product, or drug that is not protected by trademark. **3.** pertaining to the nontrademarked name assigned to a drug by the U.S. Adopted Names (USAN) Council.

generic equivalent, a drug product sold under its generic name whose active ingredients are identical in chemical composition to one or more others sold under trademark. Inactive ingredients may not be the same.

generic name, the official established nonproprietary name assigned to a drug. A drug is licensed under its generic name, and all manufacturers of the drug list it by its generic name. However, a drug is usually marketed under trademark chosen by the manufacturer. See also **chemical name, established name, trademark.**

generic nursing program, a program that prepares people with no professional nursing experience for entry into the field of nursing. It can lead to a licensed practical nurse degree, an associate degree of nursing, or a bachelor of science in nursing degree.

-genesia, **1.** suffix meaning a "(specified) condition concerning information": *agenesia, morphogenesia, paragenesia.* **2.** also called **-genesis.** suffix meaning "the production or procreation of something (specified)": *algogenesia, palingenesis, syngenesia.*

genesis /jen′əsis/ [Gk, origin], **1.** the origin, generation, or developmental evolution of anything. **2.** the act of producing or procreating.

-genesis. See **-genesia.**

gene splicing /jēn/, a process by which a segment of DNA is attached to or inserted into a strand of DNA from another source. In recombinant DNA technology, DNA from humans or other organisms is spliced into bacterial plasmids.

gene therapy, a procedure that involves injection of "healthy genes" into the bloodstream of a patient to cure or treat a hereditary disease or similar illness. Blood is withdrawn from the patient; the white cells are separated and cultured in a laboratory. Normal genes from a volunteer are inserted into modified viruses, which, in turn, transfer the normal gene into the chromosomes of the patient's white cells. The white cells containing the normal genes are finally injected into the patient's bloodstream. A clinical application of gene therapy may be found in the treatment of thalassemia, a genetically determined disease, in which efforts have been made to increase hemoglobin F production and improve the level of anemia. Research goals include changing the actual hemoglobin genes in red blood cell precursors or transplantation of normal hemoglobin genes into the bone marrow of thalassemia patients. Also called **somatic-cell gene therapy.**

genetic /jənet′ik/ [Gk, *genesis,* origin], **1.** pertaining to reproduction, birth, or origin. **2.** pertaining to genetics or heredity. **3.** pertaining to or produced by a gene; inherited.

-genetic, **1.** suffix meaning "generation by (specified) agents": *gamogenetic, mitogenetic, spermatogenetic.* **2.** suffix meaning "generating": *glycogenetic, ovigenetic, ureagenetic.* **3.** suffix meaning "something generated by a (specified) agent": *biogenetic, ideogenetic, phylogenetic.*

genetic affinity, relationship by direct descent.

genetically significant dose (GSD) /jənet′iklē/, **1.** an arbitrary measure of the estimated annual gonadal radiation received by the population gene pool. In the United States the estimated GSD is 20 mrad. The figure is not intended to suggest possible genetic effects of exposure to that level of radiation. **2.** an estimate of the genetic significance of gonad radiation doses, which takes into account the number of offspring expected for each individual on the basis of age and sex.

genetic association, a condition in which specific genotypes are associated with other factors, such as specific diseases.

genetic carrier, a person who carries an allele without exhibiting its effects. Such an allele is usually recessive, but it may also be dominant and latent, with symptoms that do not appear until adulthood.

genetic code, the information carried by DNA that determines the specific amino acids and their sequence in each protein synthesized by an organism. The code consists of the sequence of nucleotides in the DNA molecule of each chromosome in the nucleus of every cell. During transcription, a specific part of the code is transcribed into a sequence of nucleotides in the messenger RNA (mRNA). The mRNA travels from the nucleus to the cytoplasm, where it is translated into protein by the ribosomes. A codon consisting of three consecutive nucleotides in the mRNA codes for each amino acid in the protein. A change in the code may result in an incorrect sequence of the amino acids in the protein, causing a mutation. See also **anticodon, transcription, translation.**

genetic colonization, the process by which a parasite introduces into its host genetic information that induces the host to synthesize products solely for the use of the parasite.

genetic counseling^1, the process of determining the occurrence or risk of occurrence of a genetic disorder in a family and of providing information and advice about topics such as care of an affected child, prenatal diagnosis, termination of a pregnancy, sterilization, and artificial insemination. Effective genetic counseling begins with an accurate diagnosis of the condition because many of the more than 3000 known inherited disorders have similar clinical manifestations. Special biochemical cytogenetic or molecular genetic tests may be required. A genetic counselor also must prepare a careful, detailed family history, recorded in the form of a pedigree chart, and must have an understanding of genetic principles, especially a knowledge of the risks related to multifactorial inheritance. The most efficient counseling services consist of a group of specialists, including physicians, geneticists, psychologists, biochemists, cytologists, nurses, and social workers. Nurses must be especially alert to situations in which persons may need genetic counseling, must become familiar with facilities in the area that provide genetic counseling, and must help couples arrive at tentative decisions regarding family planning or the care of a child with a genetic disorder. See also **genetic screening, prenatal diagnosis.**

genetic counseling^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of an interactive helping process focusing on assisting an individual, family, or group, manifesting or at risk for developing or transmitting a birth defect or genetic condition to cope. See also **Nursing Interventions Classification.**

genetic counselor, a health professional academically and clinically prepared to communicate genetic, medical, and technical information about the occurrence, or risk of occurrence, of a genetic condition or birth defect. As part of a genetic delivery services team, the genetic counselor consults with individuals, and/or their families, about their birth defects or genetic disorders, their risk for inherited conditions, and their options. A masters' degree in genetic counseling is usually required; the American Board of Genetic Counseling provides certification.

genetic death, **1.** the failure of an organism to survive as a result of its genetic makeup. **2.** the removal of an allele or genotype from the gene pool of a population or from a given familial descent because of the sterility, failure to reproduce, or death before sexual maturity of all individuals bearing that allele or genotype.

genetic disorder. See **inherited disorder.**

genetic drift, a gradual change in the allelic frequencies within a population as a result of chance. The smaller a population is, the greater is the tendency for variation within each generation so that eventually small, isolated, inbreeding groups become genetically quite different from their ancestors. Also called **random genetic drift.**

genetic engineering, the process of producing recombinant DNA for the purposes of altering and controlling the genotype and phenotype of organisms. Restriction enzymes are used to break a DNA molecule into fragments so that genes from another organism can be inserted into the DNA. Genetic engineering has been used to produce a variety of human proteins, including growth hormone, insulin, and interferon, in bacteria. At present, it represents a powerful tool for medical research but is possible only in microorganisms. In the future, genetic engineering may be applicable to more complex organisms, offering the possibility of controlling and eliminating genetic disorders and malformations in humans.

genetic equilibrium, the state within a population at which the frequency of alleles and genotypes does not change from generation to generation. It routinely occurs in large, interbreeding populations in which mating is random and there are no or relatively few mutations. See also **Hardy-Weinberg equilibrium principle.**

genetic homeostasis, the maintenance of genetic variability within a population through adaptation to varied or changing environments and conditions of life as a result of shifts or resistance to shifts in allelic frequencies.

genetic immunity. See **natural immunity.**

genetic isolate, a group of individuals that are genetically separated by geographic, racial, social, cultural, or other barriers that prevent them from interbreeding with those outside the group. Depending on the size of the group and the amount of inbreeding that occurs, genetic isolates may show an increased incidence of otherwise rare inherited defects. See also **deme.**

geneticist /jənet′isist/, a scientist who specializes in the study or application of genetics.

genetic load, the average number of accumulated detrimental genes per individual within a population, including those caused by mutation and selection within a recent generation and those inherited from ancestors. Genetic load is expressed in lethal equivalents.

genetic map, the graphic representation of the linear arrangement of genes on a chromosome and the relative distances between them, in map units or morgans. Also called **linkage map.**

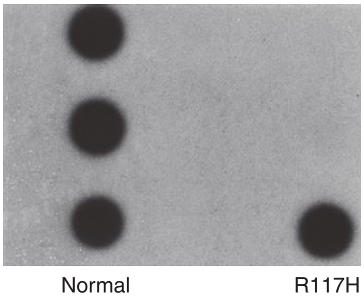
genetic marker, any specific gene that produces a readily recognizable genetic trait that can be used in family and population studies or in linkage analysis. Also called **gene marker, marker gene.**

genetic polymorphism, the recurrence within a population of two or more discontinuous genetic variants of a specific trait in such proportions that they cannot be maintained simply by mutation. Examples include the sickle cell trait, the Rh factor, and the blood groups. Compare **balanced polymorphism.**

genetic population. See **deme.**

genetics /jənet′iks/, **1.** the science that studies the principles and mechanics of heredity, specifically the means by which traits are passed from parents to offspring and the causes of the similarities and differences between related organisms. **2.** the total genetic makeup of a particular individual, family, group, or condition. Kinds of genetics are **clinical genetics, molecular genetics,** and **population genetics.** See also **cytogenetics, Mendel's laws.**

genetic screening, the process of investigating a specific population of persons for the purpose of detecting the presence of disease, either incipient or overt, such as the generalized screening of all newborns for phenylketonuria. Genetic screening may be used to identify those who possess defective genes, gain information concerning the incidence of a disorder in the population, and provide reproductive information, specifically to those at risk, such as the close relatives of persons affected with inborn errors of metabolism or those in certain ethnic groups who have a high incidence of a particular disease, specifically sickle cell anemia in African-Americans and Tay-Sachs disease in Ashkenazic Jews. When accompanied by education and counseling, mass screening programs can be effective in the management of genetic disorders. See also **genetic counseling.**



Genetic screening *(Jorde et al, 2006/Courtesy Lesa Nelson and Dr. Kenneth Ward, University of Utah Health Sciences Center)*

gene transfer [Gk, *genein,* to produce; L, *transferre,* to bring across], a type of gene therapy in which a gene is transplanted from a donor organism into a recipient organism.

Genga's bandage. See **Theden's bandage.**

-genia, suffix meaning "(condition or development of the) jaw": *microgenia, opisthogenia, progenia.*

-genic, **1.** suffix meaning "causing, forming, producing": *collagenic, hemorrhagenic, phosphagenic.* **2.** suffix meaning "produced by or formed from": *bacillogenic, coccigenic, pituitarigenic.* **3.** suffix meaning "related to a gene": *intragenic, polygenic, trigenic.*

geniculate neuralgia /jənik′yəlāt/ [L, *geniculum,* little knee; Gk, *neuron,* nerve, *algos,* pain], a severe debilitating inflammatory condition of the geniculate ganglion of the facial nerve. It is characterized by pain in the ear, loss of the sense of taste, facial paralysis, and a decrease in salivation and lacrimation. It sometimes follows herpes zoster infection. It may be treated with Tegretol or Sansert. Also called **Hunt's neuralgia.** See also **Ramsay Hunt syndrome.**

geniculate zoster. See **herpes zoster.**

genio-, prefix meaning "chin": *genion, genioplasty.*

genioglossus, one of the thick, fan-shaped extrinsic muscles that depress the central part of the tongue and protrude the anterior part of the tongue out of the oral fissure. The genioglossus muscles are innervated by the hypoglossal nerves.

geniohyoideus /jē′nē·ōhī·oi′dē·əs/ [Gk, *genion,* chin, *hyoides,* Y-shaped], one of the four suprahyoid muscles that draw the hyoid bone and the tongue forward. Also called *geniohyoid muscle*. Compare **digastricus, mylohyoideus, stylohyoideus.** See also **suprahyoid muscles.**

genit-, **1.** prefix meaning "birth or reproduction": *genitalia.* **2.** prefix meaning "generative organs or sexual reproduction": *genitalia, genitourinary.*

genital. See **genitals.**

genital herpes. See **herpes genitalis, herpes simplex.**

genitalia. See **genitals.**

genital reflex. See **sexual reflex.**

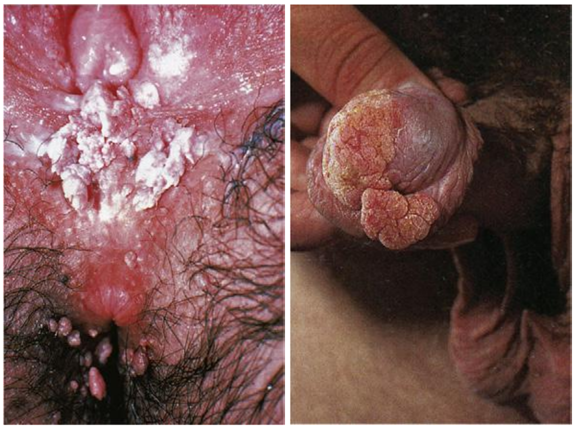
genitals /jen′itəlz/ [L, *genitalis*], the sex, or reproductive, organs visible on the outside of the body. In the female they include the vulva, mons pubis, labia majora, labia minora, clitoris, and vaginal vestibule. The male genitals include the penis, scrotum, and testicles. Also called **genitalia. —genital,** *adj.*

genital self-examination. See **self-breast examination, testicular self-examination.**

genital stage /jen′itəl/ [L, *genitalis* + Fr, *stage,* trial period], (in psychoanalysis) the final period in freudian psychosexual development, beginning with adolescence and continuing through the adult years, when the genitals are the predominant source of pleasurable stimulation. The most significant feature of this stage is direction of sexual interest not just toward self-satisfaction but toward establishment of a stable and meaningful relationship. See also **psychosexual development.**

genital tract. See **reproductive system.**

genital wart [L, *genitalis* + AS, *wearte*], a small, soft, moist pink or red swelling of the genitals that becomes pedunculated and may be painless, caused by a sexually transmitted disease, human papillomavirus (HPV), which accounts for over 50% of all cases of sexually transmitted disease. The growth may be solitary, or a cauliflower-like group may be present in the same area of the genitalia. Atypical genital warts should be biopsied and examined as possible carcinomas because they are associated with cervical cancer. No therapy has been shown to eradicate HPV. One third of lesions disappear without treatment. Treatment may include podofilox, resin, or trichloracetic acid or cryotherapy with liquid nitrogen, laser, or surgical removal. A vaccine (Gardasil) for young females to help prevent HPV infections that may lead to cervical cancer protects against four types of HPV. Also called **condyloma, condyloma acuminatum, venereal wart, verruca acuminata.**



Genital warts *(Graham-Brown and Bourke, 2007)*

genitourinary (GU) /jen′itō·yo͝or′iner′ē/ [L, *genitalis* + Gk, *ouron,* urine], referring to the genital and urinary systems of the body: the organ structures, functions, or both. Also called **urogenital.**

genitourinary fistula, an abnormal communication between organs of the urogenital system or between organs of the urogenital system and some other system.

genitourinary system. See **urogenital system.**

genocide /jen′əsīd/, the systematic extermination of a national, ethnic, political, religious, or other population.

genogram /jē′nōgram/, a diagram that depicts family relationships over at least three generations. It is useful as a tool for studying the process of a family system or hereditary disease over time.

genome /jē′nōm/ [Gk, *genein,* to produce], the complete set of genes in the chromosomes of each cell of a specific organism. **—genomic,** *adj.*

genome map, a graphic representation of the locations of genes in a genome. The human genome map, completed in 1996, locates 5264 markers for genes and has led to the discovery of 223 genes linked to more than 200 diseases. The mouse genome map locates 7377 markers on 20 chromosomes.

genomic /jēnō′mik/, pertaining to the genome.

genomic imprinting, differential expression of a gene or genes as a function of whether they were inherited from the male or the female parent (e.g., a deletion on chromosome 15 that causes Prader-Willi syndrome if inherited from the father causes instead Angelman's syndrome if inherited from the mother).

genontopia. See **senopia.**

genotoxic /jē′nōtok′sik/, capable of altering DNA, thereby causing cancer or mutation.

genotoxic carcinogens, cancer-causing agents that can alter deoxyribonucleic acid (DNA) molecules. Genotoxic carcinogens include organic compounds that induce mutations directly, organic compounds that alter DNA after activating metabolism, and metals or metal salts that can alter DNA.

genotype /jē′nōtīp′/ [Gk, *genos,* birth, *typos,* mark], **1.** the complete genetic constitution of an organism or group, as determined by the specific combination and location of the genes on the chromosomes. **2.** the alleles situated at one or more sites on homologous chromosomes. A pair of alleles is usually designated by letters or symbols, such as *AA* when the alleles are identical and *Aa* when they are different. **3.** a group or class of organisms having the same genetic makeup; the type species of a genus. Compare **phenotype.** **—***genotypic, adj.*

-genous, suffix meaning "to originate from or to contain": *homogenous, hydrogenous.*

gentamicin sulfate /jen′təmī′sin/, an aminoglycoside antibiotic.

■ INDICATION: It is prescribed for the treatment of severe infections caused by organisms sensitive to gentamicin, especially gram-negative organisms.

■ CONTRAINDICATIONS: Concomitant administration of other potentially ototoxic or nephrotoxic drugs or known hypersensitivity to this drug or to other aminoglycoside medications prohibits its use. It is used with caution in patients with impaired renal function. It cannot be coadministered with a variety of other drugs, including penicillins.

■ ADVERSE EFFECTS: Among the more serious adverse effects are nephrotoxicity, auditory or vestibular ototoxicity, impairment of neuromuscular transmission, and hypersensitivity reactions.

gentian violet /jen′shən/, a topical antibacterial and antifungal agent.

■ INDICATIONS: It is used to treat superficial ***Candida*** infections of the skin and vagina. It is also effective against some superficial bacterial infections such as those caused by ***Staphylococcus.***

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not applied to ulcerative lesions of the face.

■ ADVERSE EFFECT: Permanent discoloration of the skin may occur after topical exposure.

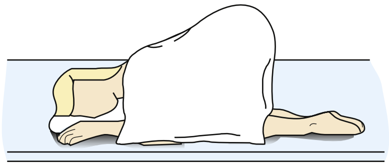
gentiotannic acid /jen′shē·ətan′ik/, a form of tannic acid once used as an astringent and in the treatment of burns but no longer recommended because of its hepatotoxicity.

Gentran 40, a trademark for a plasma volume extender (dextran 40).

Gentran 70, a trademark for a plasma volume extender (dextran 70).

genu /jē′no͞o/ [L, knee], the knee or any angular structure resembling the flexed knee.

genupectoral position /je′no͞opek′tərəl/ [L, *genu,* knee, *pectus,* breast, *positio*], knee-chest position. To assume the genupectoral position the person kneels so that the weight of the body is supported by the knees and chest, with the buttocks raised. The head is turned to one side and the arms are flexed so that the upper part of the body can be supported in part by the elbows.



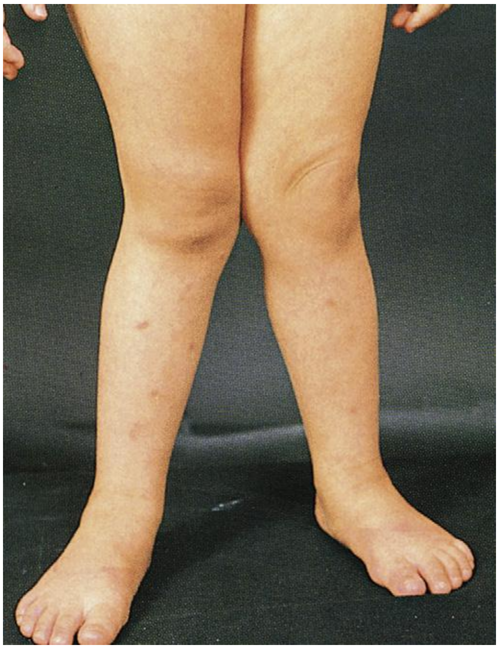
Genupectoral position *(Potter et al, 2011)*

genu recurvatum [L, *genu,* knee, *recurvare,* to bend back], a deformity in which the lower leg is hyperextended at the knee joint. Also called **back knee.**

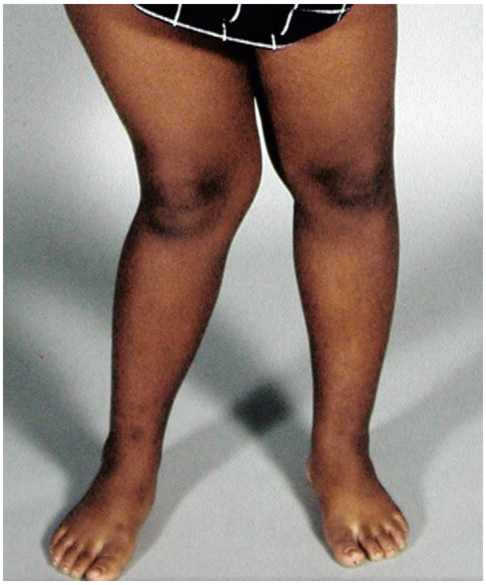
genus /jē′nəs/ *pl*. **genera** [L, kind], a subdivision of a family of organisms. A genus usually is composed of several closely related species. The genus *Homo* has only one species, ***Homo sapiens*** (humans). See also **family.**

genu valgum [L, *genu,* knee, *valgus,* bent inward], a deformity in which the legs are curved inward at the knee so that the knees are close together and strike each other as the person walks, and the ankles are widely separated. Also called **knock-knee,** *valgus deformity.*

genu varum [L, knee, *varus,* bent outward], a deformity in which one or both legs are bent outward at the knee. Also called **bowleg.** Compare **genu valgum.**



Genu valgum *(Zitelli and Davis, 2007)*



Genu varum *(Herring et al, 2008)*

-geny, suffix meaning "production, generation, origin": *homogeny, hylogeny, morphogeny.*

geo-, prefix meaning "earth or soil": *geobiology, geophagia, geotropism.*

Geocillin, a trademark for an antibacterial (carbenicillin indanyl sodium).

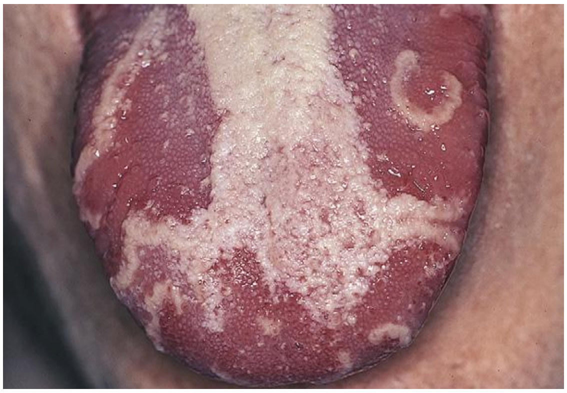
geographic retinal atrophy, a pattern of well-demarcated epithelial atrophy of retinal pigment leading to vision loss, most often associated with age-related macular degeneration.

geographic tongue /jē′əgraf′ik/ [Gk, *ge,* earth, *graphein,* to record; AS, *tunge*], a common benign condition of the tongue seen in 1%-3% of the population, more frequently seen in females, in which the dorsum of the tongue possesses multiple zones of erythema surrounded by slightly elevated yellow-white borders. The pattern of lesions can change in appearance every few days or weeks. Patients may experience no sensation, or tenderness with a burning sensation. Also called **benign migratory glossitis, erythema migrans, benign migratory glossitis,** *wandering rash of the tongue, erythema areata migrans, stomatitis areata migrans.*

geometric mean. See **mean.**

geometric unsharpness, image blur resulting from the finite size of the x-ray tube focal spot (as opposed to a point source).

geophagia, the practice of eating clay or dirt. A form of pica, the compulsion is thought by some to be associated with disorders of mineral balance. Some patients with pica have been found to suffer from an iron deficiency and respond to iron therapy. Red clay may be so rich in potassium that its ingestion can lead to hyperkalemia in individuals with renal failure.



Geographic tongue *(Regezi, Sciubba, and Pogrel, 2000)*

geotrichosis /jē′ōtrikō′sis/ [Gk, *ge,* earth, *thrix,* hair, *osis,* condition], a condition associated with a rare fungus *Geotrichum candidum*, which can cause oral, bronchial, pharyngeal, and intestinal disorders. *G. candidum* is normally found in healthy individuals, soil, and dairy products and is not necessarily pathogenic. Geotrichosis most commonly occurs in immunosuppressed individuals with diabetes. Bronchopulmonary complications associated with this disorder may produce a cough with thick, bloody sputum. Geotrichosis has been associated with allergic asthmatic reactions similar to allergic aspergillosis and a type of intestinal disorder characterized by abdominal pain, diarrhea, and rectal bleeding. Oral lesions that may occur with this disorder are commonly treated with a solution of gentian violet; associated abdominal lesions are treated with the oral administration of gentian violet capsules. Associated pulmonary lesions are treated with the oral administration of potassium iodide.

gEq, abbreviation for **gram-equivalent weight.**

Gerbich blood group /gər′bich/, a blood group consisting of three high-prevalence erythrocytic antigens, Ge 2, Ge 3 and Ge 4, and five antigens of very low prevalence.

GERD, abbreviation for *gastroesophageal reflux disease.* See **gastroesophageal reflux.**

geriatric day care /jer′ē·at′rik/ [Gk, *geras,* old age; AS, *daeg* + L, *garrire,* chatter], an ambulatory health care facility for elderly people who require continual supervision or assistance. It usually offers a broad range of professional and community services to maximize functional independence of the patients and may provide respite from care for family members during the day.

geriatric dentistry. See **gerodontics.**

Geriatric Depression Scale (GDS), a brief depression screening inventory composed of 30 items that require yes or no answers. A score of 11 or above indicates depressed individuals. There is a 15-item short version. Scores of 5 or more may indicate depression.

geriatric education for emergency medical services (GEMS), a continuing education program, developed by the American Geriatrics Society and the National Council of State Emergency Medical Services Training Coordinators, to train first responders, EMTs, paramedics, and other emergency care providers to deliver state-of-the-art prehospital care to older adults.

geriatrician /jer′ē·ətrish′ən/, a physician who has specialized postgraduate education and experience in the medical care of older persons.

geriatric nurse practitioner (GNP), a registered nurse with additional education obtained through a master's degree program in nursing that prepares the nurse to deliver primary health care to elderly adults.

geriatrics /jer′ē·at′riks/, the branch of medicine dealing with the physiological characteristics of aging and the diagnosis and treatment of diseases affecting the aged.

germ /jurm/ [L, *germen,* sprout], **1.** (nontechnical) any microorganism, especially one that is pathogenic. **2.** a unit of living matter able to develop into a self-sufficient organism, such as a seed, spore, or egg. **3.** (in embryology) the first stage in development, such as a spermatozoon or other germ cell.

German cockroach, *Blattella germanica,* a small light brown species found as a household pest in North America and Europe.

germanium (Ge) /jərmā′nē·əm/ [Germany], a metallic element with some nonmetallic semiconductor properties. Its atomic number is 32; its atomic mass is 72.61.

German measles. See **rubella.**

germ cell, **1.** a sexual reproductive cell in any stage of development, from the primordial embryonic form to the mature gamete. **2.** an ovum or spermatozoon or any of their preceding forms. **3.** any cell undergoing gametogenesis. Also called **gonoblast, gonocyte.** Compare **somatic cell.**

germ disk. See **embryonic disk.**

germ-free animal, a laboratory animal raised under sterile conditions, free of exposure to microorganisms. The diet is controlled, preventing exposure to microorganisms that may be in food. The germ-free animals have lymphoid tissue that is not fully developed and may have a deficiency of serum immunoglobulin.

germicide /jur′misīd/ [L, *germen,* sprout, *caedere,* to kill], a drug that kills pathogenic microorganisms. See also **antibacterial, antifungal, antiviral.** —*germicidal, adj.*

germinal /jur′minəl/ [L, *germen,* sprout], pertaining to or characteristic of a germ cell or to the early stages of development.

germinal area. See **embryonic disk.**

germinal center [L, *germen,* sprout; Gk, *kentron,* center], an antigen-localizing follicle of lymphoid tissue, occupying the center of the lymphatic nodules of the spleen, tonsils, and lymph nodes. It reacts to antigens, enlarging and becoming filled with lymphoblasts and macrophages at the center of a ring of small lymphocytes.

germinal cords, the precursors to the embryonic ovary or testis, derived from the gonadal cords.

germinal disk. See **embryonic disk.**

germinal epithelium, **1.** the epithelial layer covering the genital ridge from which the gonads are derived in early embryonic development. **2.** the epithelial covering of the ovary, formerly thought to be the site of the formation of the oogonia. See also **oogenesis.**

germinal infection, an infection transmitted to a child by the ovum or sperm of a parent. Compare **endogenous infection, mixed infection, retrograde infection, secondary infection.**

germinal membrane. See **blastoderm.**

germinal nucleus. See **pronucleus.**

germinal pole. See **animal pole.**

germinal stage, (in embryology) the interval of time from fertilization to implantation during which the ovum undergoes cell division several times, travels to the uterus, and, in the form of a blastocyst, begins to implant itself in the endometrium. The germinal stage is over at about 10 days of gestation.

germination /jur′minā′shən/ [L, *germen,* sprout], **1.** the initial growth and development of an organism from the time of fertilization to the formation of the embryo. **2.** the sprouting of a spore or the seed of a plant. —*germinate, v.*

germinoma /jur′minō′mə/, a neoplasm of the germinal tissue of the gonads, the mediastinum, or the pineal region. It is commonly associated with pituitary disorders.

germ layer, one of the three primordial cell layers formed during gastrulation in the early stages of embryonic development from which the entire range of body tissue is derived. Each germ layer has the potential for forming different cell types that differentiate into the various structures of the body. See also **ectoderm, endoderm, mesoderm.**

germ line, genetic material in a cell lineage that is passed down through the gametes before it is modified by somatic recombination or maturation.

germ nucleus. See **pronucleus.**

germ plasm, **1.** the part of a germ cell that contains the reproductive and hereditary material; the total of the DNA in a specific cell or organism. **2.** nontechnical. germ cells in any stage of development together with the tissues from which they originated.

germ theory [L, *germen,* sprout; Gk, *theoria,* speculation], the concept that all infectious and contagious diseases are caused by living microorganisms. The science of bacteriology developed after establishment of this theory. Also called **pathogenic theory of medicine.**

gero-, geronto-, prefix meaning "old age or the aged": *gerocomia, gerodontology, geromarasmus.*

geroderma /jer′ədur′mə/ [Gk, *geron,* old man, *derma,* skin], **1.** the atrophic skin of aging. **2.** skin that is thin and wrinkled as a result of a defective state of nutrition. **3.** any condition characterized by skin that is thin and wrinkled, resembling the skin of old age.

gerodontics /jer′ōdon′tiks/ [Gk, *geron,* old man + *odous,* tooth], the delivery of dental care to aging persons; the diagnosis, prevention, and treatment of dental problems peculiar to advanced age. Also called **geriatric dentistry,** *gerodontia, gerodontology.*

-gerontic, -gerontal, suffix meaning "old age": *parageront ic, phylogerontic, ungerontic.*

gerontic nursing, nursing care pertaining to an older person, a compromise between geriatric nursing (nursing care primarily for older persons who are ill) and gerontological nursing (a more holistic view of the nursing care of older persons).

geront(o) [word element, [Gr.]], *old age; the aged.*

geronto-. See **gero-.**

gerontogen /jeron′təjən/, an environmental agent that contributes to the aging process by accelerating the onset and/or rate of progression of aging. Examples include age-dependent cellular and biochemical responses to oxidant damage to aging of cells that have an intrinsic sensitivity to certain toxins and to toxic doses that are more likely to cause adverse effects on aging organisms.

Gerontological Society of America (GSA), an organization of scientific and academic professionals interested in studies of the nature of the aging process and the clinical manifestations of disease in the aging organism. GSA members participate with the International Association of Gerontology in periodic seminars at which worldwide research on longevity is presented.

gerontological rehabilitation nursing, a nursing specialty whose focus is helping elderly individuals affected by chronic illness or physical disability to adapt to their disabilities and to achieve their optimal level of physical, mental, and psychosocial well-being. It takes into consideration both normal age-related changes and functional limitations brought about by illness or injury.

gerontology /jer′əntol′əjē/ [Gk, *geras,* old age, *logos,* science], the study of all aspects of the aging process, including the clinical, psychological, economic, and sociological issues encountered by older persons and their consequences for both the individual and society.

gerontotoxon, an abnormal white or gray opaque ring at the outer edge of the cornea. Sometimes it is present at birth or appears in childhood and is called arcus juvenilis. It is particularly common in people over 50 years old and is then given the name arcus senilis. It results from deposits of cholesterol in the cornea or from degeneration of the cornea's supporting framework. See also **arcus senilis.**

geropsychiatry /jer′ōsīkī′ətrē/ [Gk, *geras,* old age, *psyche,* mind], the study and treatment of psychiatric aspects of aging and mental disorders of elderly people or the functional/mental disorders of people in their 50s and 60s if they qualify.

-gerous, suffix meaning "bearing, producing, or containing" something specified: *calcigerous, ovigerous, setigerous.*

Gerson diet, a detoxification diet, claimed to be useful in the treatment of cancer, allergies, and a wide variety of degenerative diseases, consisting of large quantities of organically grown fruits and vegetables, consumed mainly in the form of juice. It is often combined with other complementary therapies. The Gerson therapy has not been approved by the FDA for use as a treatment for cancer or any other disease.

Gerstmann's syndrome /gerst′mänz/ [Josef Gerstmann, Austrian neurologist, 1887–1969], a combination of finger agnosia, right-left disorientation, agraphia, acalculia, and often constructional apraxia. It is often associated with dominant parietal lobe lesions. See also **acalculia, agraphia, constructional apraxia, finger agnosia.**

Gerstmann-Sträussler-Scheinker syndrome /gerst′män shtrois′lershīn′ker/, a group of rare prion diseases, inherited as an autosomal-dominant trait but linked to different mutations of the prion protein gene. All forms of the syndrome have the common characteristics of cognitive and motor disturbances and the presence of numerous amyloid plaques in the brain. Three forms have been recognized: the ataxic form, which is accompanied by progressive cerebellar ataxia and dementia; the telencephalic form, which is accompanied by dysarthria, dementia, rigidity, tremor, and hyperreflexia; and Gerstmann-Sträussler-Scheinker syndrome with neurofibrillary tangles, in which there is progressive short-term memory loss and clumsiness. Death occurs in 1 to 5 years.

Gerstmann-Sträussler syndrome. See **transmissible spongiform encephalopathy.**

Gesell Developmental Assessment [Arnold L. Gesell, American pediatrician and psychologist, 1880–1961], an evaluation program that provides information by direct observation on gross motor, fine motor, language, personal-social, and cognitive development. There are no right or wrong answers.

Gestalt /gəshtält′/ *pl. Gestalts, Gestalten* [Ger, form], a single physical, psychological, or symbolic configuration, pattern, or experience that consists of a number of elements and that has an effect as a whole different from that of the sum of its parts.

Gestalt psychology, a school of psychology, originating in Germany, that maintains that a psychological phenomenon is perceived as a total configuration or pattern, rising from the relationships among its constituent elements, rather than as discrete elements possessing attributes of their own, and that the pattern, or Gestalt, cannot be derived from the summation of its constituents. Thus learning is regarded as resulting from insight, defined as a process or reorganization, rather than from association or trial and error, and behavior is seen as an integrated response to a unitary situation rather than as a series of reflexes and sensations. Also called **configurationism,** *Gestaltism.* See also **Gestalt.**

Gestalt therapy, a form of psychotherapy that stresses the unity of self-awareness, behavior, and experience. It incorporates elements of psychoanalytic, behavioristic, and humanistic existential therapy. See also **Gestalt psychology.**

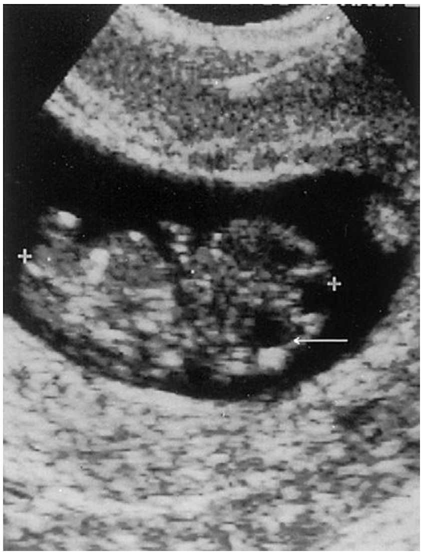
gestant anomaly. See **odontoma.**

gestant odontoma. See **dens in dente.**

gestate /jes′tāt/ [L, *gestare,* to bear], **1.** to carry a developing fetus in the womb. **2.** to grow and develop slowly toward maturity, such as a fetus in the womb.

gestation /jestā′shən/ [L, *gestare,* to bear], in a viviparous animal, the period from the fertilization of the ovum until birth. Gestation varies with the species. In humans the average duration is 266 days, or approximately 280 days from the onset of the last menstrual period. A gestation time of less than 37 weeks is regarded as premature; one that continues beyond 42 weeks is considered postmature, regardless of the size of the fetus or other factors. See also **pregnancy.**

gestational age /jestā′shənəl/ [L, *gestare* + *aetas,* time of life], the age of a fetus or a newborn, usually expressed in weeks dating from the first day of the mother's last menstrual period.



Ultrasound assessment of gestational age *(Moore and Persaud, 2008/Courtesy Dr. E.A. Lyons, Professor of Radiology and Obstetrics and Gynecology, Health Sciences Center, University of Manitoba)*

gestational assessment [L, *gestare,* to bear, *assidere,* to sit beside], calculation of the fetal age of the offspring on the basis of such factors as the menstrual history of the mother, the date when fetal heart sounds are first detected, and the evaluation of ultrasound data. The information is important in planning emergency care in the event of premature birth signs.

gestational diabetes mellitus (GDM), a disorder characterized by an impaired ability to metabolize carbohydrates, usually caused by a deficiency of insulin or insulin resistance, occurring in pregnancy. It disappears after delivery of the infant but, in a significant number of cases, returns years later as type 2 diabetes mellitus. Evidence suggests that placental lactogen and considerable destruction of insulin by the placenta play a role in precipitating GDM. Treatment consists of self-monitoring of blood glucose, insulin administration, increased activity, a meal plan that controls the amount of carbohydrates eaten, and an adequate intake of calcium and iron. See also **diabetes mellitus.**

gestational hypertension, abnormally increased blood pressure occurring in pregnancy, comprising the conditions preeclampsia and eclampsia. Also called **pregnancy-induced hypertension.**

gestational psychosis [L, *gestare,* to bear; Gk, *psyche,* mind, *osis,* condition], a psychotic episode that can be attributed to a pregnancy and resolves when pregnancy ends.

gestational sac, a pouch containing the fetus in extrauterine gestation.

gestation period [L, *gestare,* to bear; Gk, *peri,* near, *hodos,* way], the time span between conception and labor. In humans the period is approximately 38 weeks.

gestures in physical examination /jes′chərs/, physical appearance clues in diagnosis, such as a patient's pressing a clenched fist against the sternum as a "body language" message of the pain experienced during a myocardial infarction.

Getman visuomotor theory [Gerald Getman], a concept that visual perception is based on developmental sequences of physiological actions in children. The sequence of eight stages begins with innate response systems and advances to cognitive integration of perceptions, abstractions, and higher symbolic activity.

-geusia, -geustia, suffix meaning "(condition of the) sense of taste": *glycogeusia, hemiageusia, parageusia.*

gFOBT, abbreviation for guaiac fecal occult blood test.

GFP, abbreviation for **green fluorescent protein.**

GFR, abbreviation for **glomerular filtration rate.**

GGT, abbreviation for **gamma-glutamyltransferase.**

GH, abbreviation for **growth hormone.**

Ghon focus, the primary parenchymal lesion of primary pulmonary tuberculosis in children. When it is associated with a corresponding lymph node focus, it is known as **Ghon's complex.**

Ghon's complex [Anton Ghon, Czechoslovakian pathologist, 1866–1936], a combination of pleural surface-healed granulomas, calcifications, or scars on the middle lobe of the lung together with hilar lymph node granulomas. The complex is evidence that a primary tuberculosis case, usually from a childhood infection, has healed.

ghost cells [AS, *gast* + L, *cella,* storeroom], red blood cells that have lost their hemoglobin so that only the plasma membranes are observed in microscopic examinations of urine samples. Also called **shadow cells.**

ghost teeth. See **odontodysplasia.**

GHRF, abbreviation for *growth hormone–releasing factor.*

GH-RH, abbreviation for **growth hormone–releasing hormone.**

GHRIH, abbreviation for **growth hormone release inhibiting hormone.** See **somatostatin.**

GI, abbreviation for **gastrointestinal.**

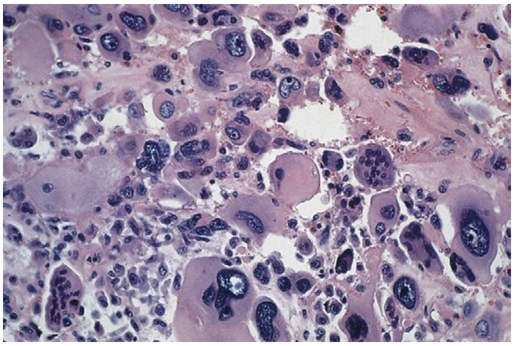
Gianotti-Crosti syndrome /jänot′ē kros′tē/ [Fernando Gianotti, Italian dermatologist, 1920–1984; Agostino Crosti, Italian dermatologist, 20th century], a generally benign and self-limited disease of young children that had previously been associated with hepatitis B virus now known to occur in other viral illnesses. It is characterized by the appearance of crops of usually nonpruritic, dusky or coppery red, flat-topped, firm papules forming a symmetric eruption on the face, buttocks, and limbs, including the palms and soles, and associated with malaise, low-grade fever, and a few other symptoms. Also called **acrodermatitis papulosa infantum, infantile acrodermatitis, papular acrodermatitis of childhood.**

giant axonal neuropathy, an autosomal-recessive neuropathy of childhood characterized by enlarged axons made up of masses of tightly woven neurofilaments.

giant cell /jī′ənt/ [L, *gigas,* huge, *cella,* storeroom], an abnormally large tissue cell that often contains more than one nucleus and may appear as a merger of several normal cells.

giant cell arteritis. See **temporal arteritis.**

giant cell carcinoma, a malignant epithelial neoplasm characteristically containing many large anaplastic cells. A small percentage of adenocarcinomas of the lung and liver also contain such cells. Also called **carcinoma gigantocellulare.**



Giant cell carcinoma of the bladder *(Fletcher, 2007)*

giant cell hepatitis. See **neonatal hepatitis.**

giant cell interstitial pneumonia. See **interstitial pneumonia.**

giant cell myeloma, a bone tumor of multinucleated giant cells that resembles osteoclasts scattered in a matrix of spindle cells. Myelomas of this kind may be benign or malignant and may cause pain, functional disability, and pathological fractures. Also called **giant cell tumor of bone.**

giant cell sarcoma. See **giant cell myeloma, osteoblastic sarcoma.**

giant cell thyroiditis. See **de Quervain's thyroiditis.**

giant cell tumor of bone. See **giant cell myeloma.**

giant chromosome, any of the excessively large chromosomes found in insects and certain other animals, including the lampbrush and polytene chromosomes.

giant condyloma, a destructive tumor resembling squamous cell carcinoma but actually a form of condyloma acuminatum, usually on the penis, but sometimes present elsewhere in the anogenital area in either men or women. It presents as a large verrucous to fungating, cauliflower-like mass that erodes the involved skin and progresses to penetrate and destroy deeper tissues. Also called **Buschke-Löwenstein tumor.**

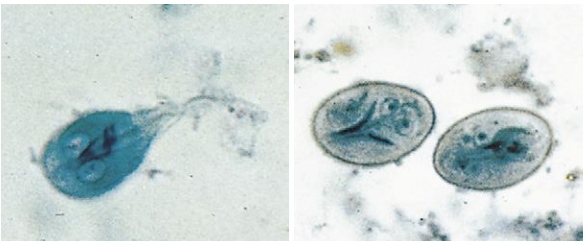
giant follicular lymphoma, a nodular, well-differentiated lymphocytic malignant lymphoma in which nodules distort the normal structure of a lymph node. Also called **Brill-Symmers disease, giant follicular lymphadenopathy, Symmers' disease.**

giant hypertrophic gastritis, a rare disease characterized by large folds of nodular gastric rugae that may cover the wall of the stomach, causing anorexia, nausea, vomiting, and abdominal distress. Radiographic or endoscopic examination or surgery may be necessary for diagnosis. The disease is associated with an increased incidence of stomach cancer. Also called **Ménétrier disease.**

giant peristaltic contraction, a propulsive contraction of the bowel that normally occurs periodically in the distal small intestine and colon. The contractions are 1.5 to 2 times larger than normal in amplitude and 4 to 6 times longer in duration than usual. In certain disease states, giant peristaltic contractions may start in the proximal small intestine and proceed uninterrupted. They may also be induced by a variety of stimuli including certain antibiotics, radiation therapy, and parasitic infections.

Gianturco coil, a mechanism for occluding a patent ductus arteriosus and for permanent vascular occlusion of other major arteries.

Giardia /jē·är′dē·ə/ [Alfred Giard, French biologist, 1846–1908], a common genus of flagellate protozoans and a major cause of nonbacterial diarrhea in North America and of intestinal disease globally. Many species of *Giardia* normally inhabit the digestive tract and cause inflammation in association with other factors that produce rapid proliferation of the organism. See also **giardiasis.**



***Giardia lamblia* trophozoite and cyst** *(Murray et al, 2002)*

giardiasis /jē·ärdī′əsis/ [Alfred Giard; Gk, *osis,* condition], a diarrheal illness caused by infection with the protozoan *Giardia lamblia*. The source of infection is usually fecally contaminated water. Cases have occurred in day-care facilities with poor hygienic practices. Infection may be asymptomatic or may cause nausea; abdominal cramps; foul-smelling, greasy diarrhea; fatigue; and weight loss. Treatment is metronidazole or tinidazole, furazolidone, or paromomycin. It is treated with flagyl. Also called **traveler's diarrhea.**

gibbus /gib′əs, jib′əs/ [L, hump], a hump, swelling, or enlargement on a body surface, usually confined to one side.

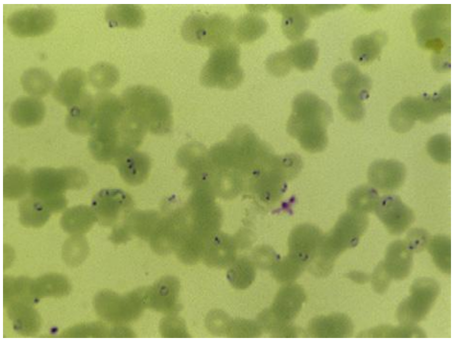
gibbus deformity, a form of structural kyphosis, usually secondary to tuberculosis infection of the thoracic vertebral body, in which the vertebral column becomes sharply angulated at the site of the lesion.

Gibraltar fever. See **brucellosis.**

Gibson's murmur [George A. Gibson, Scottish physician, 1854–1913], a heart murmur that is heard continuously throughout the cardiac cycle in patients with patent ductus arteriosus. It waxes at the end of systole and wanes near the end of diastole and is often described as a "machinery-like" murmur. It is often accompanied by a thrill. It is usually localized in the second left interspace near the sternum and usually is indicative of patent ductus arteriosus. Also called **machinery murmur.**

Gibson walking splint, a kind of Thomas splint that enables a patient to be ambulatory.

Giemsa's stain /gē·em′səz/ [Gustav Giemsa, German chemist, 1867–1948; Fr, *teindre,* to dye], an azure dye used as a stain in the microscopic examination of the blood for certain protozoan parasites, viral inclusion bodies, and rickettsia and, more routinely, in the preparation of a smear for a differential white cell count. It is modified and combined with Wright's stain to better detect organisms.



Giemsa's stain showing *Plasmodium falciparum* trophozoites *(Conlon and Snydman, 2000)*

GIFT, abbreviation for **gamete intrafallopian transfer.**

giga-, prefix meaning "one billion (10^9)": *gigabit, gigabyte, gigahertz.*

gigantism /jigan′tizəm/ [L, *gigas,* giant], an abnormal condition characterized by excessive size and stature. It is caused most frequently by hypersecretion of growth hormone (GH) that occurs before the closure of the bone epiphyses; it occurs to a lesser degree in hypogonadism and in certain genetic disorders. Gigantism with normal body proportions and normal sexual development usually results from hypersecretion of GH in early childhood. Hypogonadism, by delaying puberty and closure of the epiphyses, may lead to gigantism. Excessive linear growth often occurs in males with more than one Y chromosome, and it may accompany Klinefelter's syndrome, Marfan's syndrome, and some cases of generalized lipodystrophy. Children with cerebral gigantism are mentally retarded and have a large head and extremities and a clumsy gait. Growth is rapid during their first few years and then reverts to a normal rate. Appropriate gonadal hormones may be administered to control abnormal growth of children with hypogonadism. The treatment of acromegalic gigantism is usually irradiation or surgical removal of the GH secreting adenoma. Compare **acromegaly.** See also **eunuchoidism.**

giganto-, prefix meaning "huge": *gigantoblast, gigantochromoblast, gigantocyte.*

Gilbert's syndrome [Nicolas A. Gilbert, French physician, 1858–1927], a benign hereditary condition characterized by hyperbilirubinemia and jaundice. See also **hyperbilirubinemia of the newborn.**

Gilchrist's disease. See **blastomycosis.**

Gilles de la Tourette's syndrome /zhēl′də lä to͝orets′/ [George Gilles de la Tourette, French neurologist, 1857–1927], an abnormal condition characterized by facial grimaces, vocalizations, tics, and involuntary arm and shoulder movements. In adolescence the condition worsens. The patient may grunt, snort, and shout involuntarily. Coprolalia can develop. In adulthood the condition usually lessens and tends to wax and wane. Treatment with dopamine antagonists has been found to be very effective. Also called **Tourette's syndrome.** See also **aboiement.**

Gillies' operation /gil′ēz/ [Harold D. Gillies, English surgeon, 1882–1960], a surgical procedure for reducing fractures of the zygoma and zygomatic arch by making an incision in the temporal hairline.

Gil-Vernet technique, a surgical procedure in which both ureters are excised from their normal attachments to the bladder and reattached medially near each other within the trigone.

ginger, an herb native to the tropics of Asia and now cultivated in the tropics of South America, China, India, Africa, the Caribbean, and parts of the United States.

■ USES: It is considered safe when consumed in food. Medicinal amounts of the herb are used for nausea, motion sickness, indigestion, and inflammation. It does appear to be effective against motion sickness but does not help treat nausea from other causes (e.g., opioid analgesia, chemotherapy). Its efficacy as an antiinflammatory drug has not been established.

■ CONTRAINDICATIONS: It is not recommended during pregnancy (it may be an abortifacient when taken in large amounts) or lactation, in children, or in those with known hypersensitivity to this product. It should not be used in cholelithiasis unless directed by a physician. Safety when large amounts of ginger are ingested for medicinal purposes has not been established.

ginger paralysis /jin′jər/, a polyneuropathy that primarily affects motor nerves to the distal parts of the extremities. First observed in the 1930s during prohibition in the United States, it was caused by drinking an alcoholic extract of Jamaican ginger adulterated by a pesticide, tri-ortho-cresyl phosphate (JAKE). Also called **Jake paralysis.**

gingiva /jinjī′və/ *pl. gingivae* [L, gum], the gum tissues of the mouth, consisting of a mucous membrane with supporting fibrous tissue that overlies the crowns of unerupted teeth and encircles the necks of teeth that have erupted. **—gingival,** *adj.*

Healthy gingiva *(Christensen, 2002)*

gingival /jin′jival/, pertaining to the gingivae.

gingival blanching [L, *gingiva* + Fr, *blanchir,* to whiten], the lightening of gum color, usually temporary, caused by stretching or pressure upon gum tissue and decreased blood supply.

gingival blood supply, the vascular supply to the gums. It rises from blood vessels that pass along the outer periosteum of bone and anastomose with vessels of the periodontal membrane as well as intraalveolar blood vessels.

gingival cavity, a tooth cavity that occurs in the third of the clinical crown nearest the gum. A gingival cavity is in Class V of **Black's Classification of Caries.**

gingival color, the color of gum tissue. It is affected by the thickness and degree of keratinization of the epithelium, blood supply, pigmentation, medications, and periodontal, gingival and systemic diseases.

gingival consistency, the combination of tactile and visual characteristics of healthy gum tissue. The tissue should be firm and resilient and should resemble smooth velvet or a finely or coarsely grained orange peel. Compare **gingival color.**

gingival corium, the most stable connective tissue of the gingiva which lies between the periosteum and the lamina propria mucosae.

gingival crater, a depression in the gum tissue, especially in the area of the former apex of interdental papilla. It is commonly caused by necrotizing ulcerative gingivitis, human immunodeficiency virus (HIV), and food impaction against the tissue subjacent to the contact areas of adjacent teeth.

gingival crevice, a normal space located around a tooth between the wall of the unattached gum tissue and the enamel and/or cementum of the tooth. Also called **gingival sulcus.**

gingival cuff, the protective mucosa around enamel at the neck of a tooth. See **junctional epithelium.**

gingival cyst, a developmental nonkeratinizing odontogenic cyst found in the oral soft tissue of adults. Variation of the **lateral periodontal cyst.**

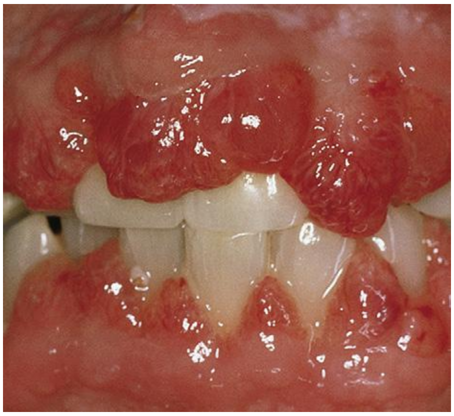
gingival discoloration, a change in the normal color of the gum tissue, associated with inflammation, reduced blood supply, abnormal pigmentation, and other problems.

gingival disease, any disease of the gingivae, such as gingivitis. The American Academy of Periodontology classifies gingival disease as a major group of periodontal diseases and distinguishes two main subgroups, those gingival diseases induced by dental plaque and those attributed to other causes. The plaque-induced diseases may be associated with endocrine changes, medications, systemic disease, or malnutrition. Other causes of gingival lesions include viral infections, fungal infections, genetic predispositions, systemic conditions, allergic reactions, and traumatic lesions, among others.

gingival festoon, the distinct rounding and enlargement of the margins of the gum tissue found in early gingival involvement. Compare **festoon, McCall's festoon.**

gingival hormonal enlargement, swelling of the gums associated with poor oral hygiene and hormonal imbalance during pregnancy, puberty, or postmenopausal therapy. Also called **pregnancy epulis.**

gingival hyperplasia, an increase in the number of cells of the gum tissues, resulting in an overgrowth that may partially or totally cover the teeth; may be generalized or localized. Causes include hereditary and metabolic disorders, or drugs such as: the anticonvulsants phenytoin and carbamazepine; cyclosporine, a potent immunosuppressant used for organ transplant recipients; calcium channel blockers, such as nifedipine and amlodipine, used for the treatment of hypertension; the antibiotic erythromycin; and oral contraceptives. While the cause is considered to be multifactorial, the presence of gingival inflammation due to poor oral hygiene can contribute to the development. The presence of malpositioned teeth or orthodontic bands can exaggerate the condition. Treatment includes surgical excision of the enlarged tissue, followed by meticulous oral hygiene. Compare **fibromatosis.**



Gingival hyperplasia *(Regezi, Sciubba, and Jordan, 2008)*

gingival hypertrophy, an increase in the size of gum tissue encircling the teeth. It may be caused by gum inflammation and periodontal disease.

gingival line [L, *gingiva,* gum, *linea*], the scalloped line formed by the edge of the unattached gum tissue at the margin of the soft tissues beside the teeth. The line is called marginal gingiva when viewed labially, buccally or lingually. Between the teeth in the interproximal area, the line is called interdental gingiva or interdental papilla. Also called **gum line.**

gingival massage, the mechanical rubbing of the gum tissues for cleansing purposes, for improvement of tissue tone and blood circulation, and for keratinization of the surface epithelium.

gingival mat, the connective tissue of the gum, composed of coarse, broad collagen fibers that attach the gingivae to the teeth and hold the unattached gum close to the teeth.

gingival papilla. See **interdental gingiva.**

gingival physiology, the function of the gum tissue as supportive and protective investments of the teeth and subjacent tissues. The gingival fiber apparatus serves as a barrier to apical migration of the junctional epithelium and binds the gingival tissues to the teeth. Normal gingival topography permits the free flow of food away from the occlusal surfaces and from the cervical and interproximal areas of the teeth.

gingival pocket. See **periodontal pocket.**

gingival position, the level of the gum margin in relation to the teeth.

gingival shrinkage, the reduction in the mass and height of the gum tissue, especially as a result of the therapeutic elimination of subgingival deposits and curettage of the soft tissue wall of the gingival pocket.

gingival stippling, numerous small dimples or depressions in the surface of healthy gum tissue, producing an appearance that varies from that of smooth velvet to that of an orange peel. See also **epithelial peg, gingival consistency.**

gingival sulcus. See **gingival crevice.**

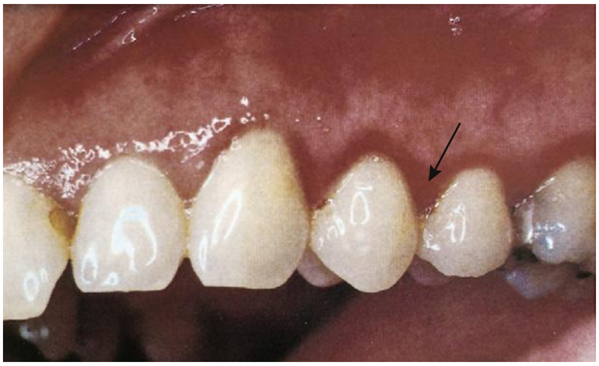
gingivectomy /jin′jīvek′təmē/ [L, *gingiva* + Gk, *ektomē,* excision], surgical removal of infected and diseased gum tissue, performed to arrest the progress of periodontal disease. With the patient under local anesthesia along with sedation, the affected tissue is removed, and the accessible root surfaces are debrided of calculus and necrotic cementum. This procedure eliminates periodontal pockets. The healthy gingival tissues are sutured into place, and a periodontal pack may be placed on the surgical site to prevent trauma during eating and to allow new tissue growth to fill in the area. Bleeding, discomfort, and pain are generally associated with the procedure. After surgery the patient is closely monitored for signs of hemorrhage, frequency in swallowing, or a rise in pulse rate. The periodontal pack is removed after 1 week. Compare **gingivoplasty.**

gingivitis /jin′jivī′tis/ [L, *gingiva* + Gk, *itis,* inflammation], inflammation of the gingiva, with symptoms that may include redness, swelling, and bleeding. Gingivitis is generally the result of poor oral hygiene and of the accumulation of bacterial plaque on the teeth, but it may be a sign of other conditions, such as diabetes mellitus, leukemia, hormonal changes, or vitamin deficiency. It is common in pregnancy, is usually painless, and may be acute or chronic. Research is finding associations between the occurrence of periodontal disease and heart disease, stroke, asthma, and low birth weight neonates. Frequent removal of plaque and regular visits to the dentist or dental hygienist along with proper oral hygiene may help in prevention. Compare **necrotizing ulcerative gingivitis.**

■ OBSERVATIONS: This gum inflammation is usually painless in its early stages and manifests as redness, swelling, and bleeding of the gums. Halitosis and bluish gum discoloration may also be present. Complications include development of pus pockets and abscess formation and pain. Diagnosis is made on oral examination.

■ INTERVENTIONS: Treatment is targeted at plaque removal and antibiotics for signs of infection. Soft tissue debridement may be indicated for chronic or severe cases.

■ NURSING CONSIDERATIONS: Interventions should focus on education about appropriate oral hygiene (brushing, flossing, and gum massage) and regular dental care with professional teeth cleaning.



Gingivitis *(Bird and Robinson, 2012)*

gingivo-, prefix meaning "gingiva": *gingivoglossitis, gingivolabial, gingivosis.*

gingivoplasty /jin′jivōplas′tē/ [L, *gingiva* + Gk, *plassein,* to shape], the surgical contouring of the gum tissues and interdental papillae to restore gingival tissue to more normal form and function. Compare **gingivectomy.**

gingivostomatitis /jin′jivōstō′mətī′tis/ [L, *gingiva* + Gk, *stoma,* mouth, *itis,* inflammation], multiple painful ulcers on the gums and mucous membranes of the mouth, the result of a herpesvirus infection. The condition most frequently affects infants and young children. It usually subsides after 1 week to 10 days, but in rare cases it may progress to a systemic viral infection. It may disguise other more serious mouth ulcers. See also **herpes simplex.**

ginglymus joint. See **hinge joint.**

ginkgo, an herbal product harvested from a tree that is native to China and Japan.

■ USES: It is used for poor circulation, diabetes, vascular disease, cancer, inflammatory disorders, impotence, and degenerative nerve conditions. It is also used for age-related declines in cognition and memory. Ginkgo is generally considered to have some efficacy against dementia, sometimes estimated as being equivalent to a 6-month delay in disease progression.

■ CONTRAINDICATIONS: It is contraindicated in people with coagulation or platelet disorders or hemophilia, in children, and in those with known hypersensitivity to this product.

ginseng, an herb with red or yellow fruits that is native to the Far East and is now found throughout the world. One species is native to North America.

■ USES: It is used for physical and mental exhaustion, stress, viral infections, diabetes, sluggishness, fatigue, weak immunity, and convalescence and may have some efficacy (e.g., better stress tolerance, reaction times, abstract thinking).

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation or in children. It is also contraindicated in those with known hypersensitivity, hypertension, and cardiac disorders.

Giordano-Giovannetti diet /jôrdä′nō jō′vənet′ē/, a low-protein, low-fat, high-carbohydrate diet with controlled potassium and sodium intake, used in chronic renal insufficiency and liver failure. Protein is given only in the form of essential amino acids so that the body will use excess blood urea nitrogen to synthesize the nonessential amino acids for the production of tissue protein. The foods included are eggs, small amounts of milk, low-protein bread, and some fruits and vegetables low in potassium, such as green beans, summer squash, cabbage, pears, grapefruit, and fresh or frozen blackberries, blueberries, and boysenberries. There are many modified forms of this diet, depending on patient requirements and tolerance and usually varying in the amount and origin of the protein. Also called **Giovannetti diet.** See also **renal diet.**

GIP, abbreviation for **gastric inhibitory polypeptide.**

gipoma /gipō′mə/, a pancreatic tumor that causes changes in secretion of gastric inhibitory polypeptide (GIP).

girdle /gur′dəl/, any curved or circular structure, such as the hipline formed by the bones and related tissues of the pelvis.

girdle pad, a covering that fits over the iliac crests and sacrum to protect the hip area in contact sports.

girdle sensation. See **zonesthesia.**

GI tract, abbreviation for **gastrointestinal tract.** See **digestive tract.**

Giuliani's sign [Emilio R. Giuliani, twentieth century American cardiologist], a posterior chest thrill felt between the left scapula and spinal column in mitral insufficiency caused by anterior mitral leaf prolapse.

glabella /gləbəl′ə/ [L, *glabrum,* bald], a flat triangular area of bone between the two superciliary ridges of the forehead. It is sometimes used as a baseline for cephalometric measurements.

glabella tap, a tap on the glabella to test the glabella tap reflex. Normally the patient stops blinking after the second or third tap, but in Parkinson's disease and certain kinds of cerebral degeneration the blinking continues even after many taps.

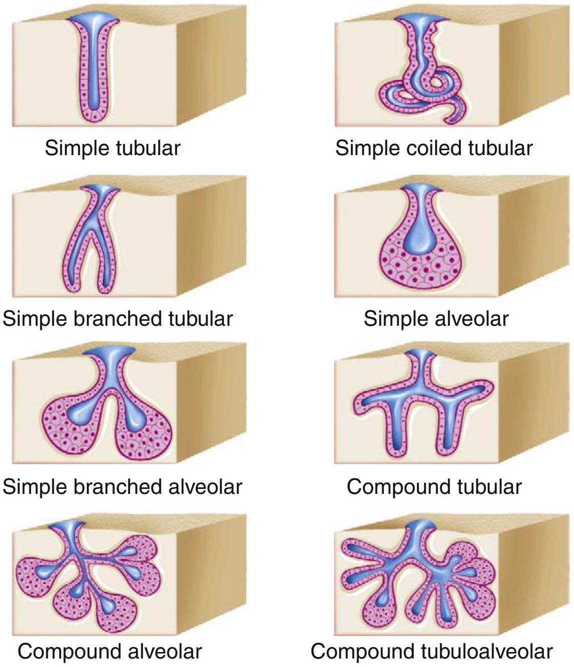
glabrous skin /glā′brəs/ [L, *glaber,* smooth; AS, *scinn*], smooth, hairless skin.

glacial acetic acid /glā′shəl/, a clear, colorless liquid or crystalline substance (CH_3COOH) with a pungent odor. It is obtained by the destructive distillation of wood, by oxidation of acetylene and water by air, or by the oxidation of ethyl alcohol by aerobic bacteria, as in the production of vinegar. Glacial acetic acid is strongly corrosive and potentially flammable, having a low flash point. It is miscible in alcohol, ether, glycerol, and water and is used as a solvent for organic compounds. Also called **vinegar acid.**

gladiate. See **xiphoid.**

gland [L, *glans,* acorn], any one of many organs in the body comprising specialized cells that secrete or excrete materials not related to their ordinary metabolism. Some glands lubricate; others, such as the pituitary gland, produce hormones; hematopoietic glands, such as the spleen and certain lymph nodes, take part in the production of blood components. **Exocrine glands** discharge their secretions into ducts. They may be classified by the shape and complexity of their duct systems. **Endocrine glands** are ductless and discharge their secretions directly into the blood or interstitial fluid.—**glandular,** *adj.*

glanders [OFr, *glandres,* neck gland swelling], an infection caused by the bacillus ***Burkholderia mallei*** (formerly called *Pseudomonas mallei*), transmitted to humans from horses and other domestic animals. It is characterized by purulent inflammation of the mucous membranes and development of skin nodules that ulcerate. If untreated with antibiotics, the infection may spread to the bones, liver, central nervous system, and other tissues and cause death. It is endemic in Africa, Asia, and South America but has been eradicated in Europe and North America. Infection has been seen in laboratory workers because of the low infectious dose. It is considered a potential agent for bioterrorism.



Simple tubular
Simple coiled tubular
Simple branched tubular
Simple alveolar
Simple branched alveolar
Compound tubular
Compound alveolar
Compound tubuloalveolar

Exocrine glands: structural classification

glandes. See **glans.**

gland of Montgomery. See **areolar gland.**

glands of bile duct, tubuloacinar glands in the mucosa of the bile ducts and the neck of the gallbladder. Also called **biliary glands.**

glands of Moll Zeis. See **ciliary gland.**

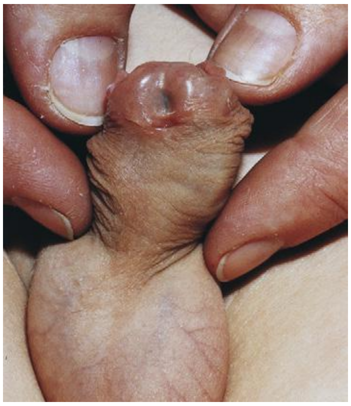
glandular. See **gland.**

glandular carcinoma. See **adenocarcinoma.**

glandular epithelium [L, *glandula,* small gland; Gk, *epi,* above, *thele,* nipple], epithelium that contains glandular cells.

glandular fever. See **infectious mononucleosis.**

glandular hypospadias [L, *glandula,* small gland + *hypo,* under + *spadōn,* a rent], the most common type of hypospadias, in which the urethral orifice opens at the site of the frenum, which may be rudimentary or absent. The normal site of the urinary meatus is represented on the glans penis as a blind pit. Also called **balanic hypospadias.**



Glandular hypospadias *(Moore, Persaud, and Shiota, 2000/ Courtesy Dr. A.E. Chudley, Department of Pediatrics and Child Health, University of Manitoba, Children's Hospital)*

glandular tissue [L, *glandula,* small gland; OFr, *tissu*], a group of epithelial secreting cells composing a definitive glandular organ, such as the thyroid.

glandula vestibularis major. See **Bartholin's gland.**

glans /glanz/ *pl.* **glandes** [L, acorn], **1.** a general term for a small rounded mass or a glandlike body. **2.** erectile tissue, as on the ends of the clitoris and the penis.

glans of clitoris [L, *glans* + Gk, *kleitoris*], the erectile tissue at the end of the clitoris. It comprises two corpora cavernosa enclosed in a dense, fibrous membrane and connected to the pubis and ischium. Also called **glans clitoridis.**

glans penis, the conical tip of the penis that covers the end of the corpora cavernosa penis and the corpus spongiosum like a cap. The urethral orifice is normally located at the distal tip of the glans penis. The corona glandis, the widest part of the glans penis, is around the base of the proximal portion. A fold of dark, thin, hairless skin forms the foreskin covering the glans penis.

Glanzmann thrombasthenia, severe mucocutaneous bleeding disorder caused by one of a series of mutations in platelet glycoprotein IIb or IIIa with a defect of fibrinogen-dependent platelet aggregation. See **thrombasthenia.**

glare, a strong, dazzling light that may cause discomfort to the eye. Visual problems that result from glare often involve inadequate lighting conditions; they particularly affect individuals with cataracts or other disease conditions. The condition is relieved somewhat by using incandescent rather than fluorescent lighting, wearing a visor, wearing special antiglare lenses, and using a matte-black cardboard typoscope for reading words on a glaring white paper.

Glasgow Coma Scale, a quick, practical standardized system for assessing the degree of consciousness in the critically ill and for predicting the duration and ultimate outcome of coma, primarily in patients with head injuries. The system involves eye opening, verbal response, and motor response, all of which are evaluated independently according to a rank order that indicates the level of consciousness and degree of dysfunction. The degree of consciousness is assessed numerically by the best response. The results may be plotted on a graph to provide a visual representation of the improvement, stability, or deterioration of a patient's level of consciousness, which is crucial to predicting the eventual outcome of coma. The sum of the numeric values for each parameter can also be used as an overall objective measurement, with 15 indicative of no impairment, 3 compatible with brain death, and 7 usually accepted as a state of coma. The test score can also function as an indicator for certain diagnostic tests or treatments, such as the need for a computed tomography scan, intracranial pressure monitoring, and intubation. The scale has a high degree of consistency even when used by staff with varied experience.

Glasgow Outcome Scale, a functional assessment inventory based on five global categories: death, persistent vegetative state, severe disability, moderate disability, and good recovery. It measures outcome. It has been criticized as lacking sensitivity to functionally significant changes.

glass factor. See **factor XII.**

glass ionomer cement, a dental cement used for small restorations on the proximal surfaces of anterior teeth, for restoration of eroded areas at the gingival margin, as base material under dental restorations, and as a luting agent for restorations and orthodontic bands. It releases fluoride ions, which can provide some anticaries activity.

glatiramer, a multiple sclerosis drug.

■ INDICATION: It is used to reduce the frequency of relapses in patients with relapsing-remitting multiple sclerosis.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to mannitol prohibits its use.

Glasgow Coma Scale scoring

Eyes open	
4	Spontaneously
3	On request
2	To pain stimuli (supraorbital or digital)
1	No opening
Best verbal response	
5	Oriented to time, place, person
4	Engages in conversation, confused in content
3	Words spoken but conversation not sustained
2	Groans evoked by pain
1	No response
Best motor response	
6	Obeys a command (“Hold out three fingers.”)
5	Localizes a painful stimulus
4	Withdraws in response to pain
3	Flexes either arm
2	Extends arm to painful stimulus
1	No response

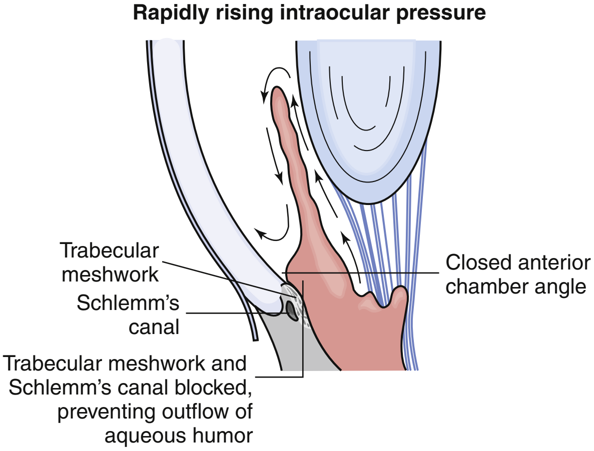
■ ADVERSE EFFECTS: Adverse effects include migraine, palpitations, syncope, tachycardia, vasodilation, nausea, vomiting, diarrhea, anorexia, gastroenteritis, ecchymosis, lymphadenopathy, edema, weight gain, arthralgia, anxiety, hypertonia, tremor, vertigo, speech disorder, agitation, confusion, bronchitis, dyspnea, pruritus, rash, sweating, urticaria, erythema, ear pain, urinary urgency, dysmenorrhea, and vaginal moniliasis.

glauco-, prefix meaning “gray or silver”: *glaucoma, glaucomatous.*

glaucoma /glôkō′mə, glou-/ [Gk, cataract], an abnormal condition of elevated pressure within an eye that occurs when aqueous production exceeds aqueous outflow, resulting in damage to the optic nerve. Acute (angle-closure, closed-angle, or narrow-angle) glaucoma occurs if the pupil in an eye with a narrow angle between the iris and cornea dilates markedly, causing obstruction of aqueous humor drainage from the anterior chamber. Primary open-angle glaucoma (POAG) is much more common in the United States and develops slowly and insidiously without a narrow angle. Peripheral visual field losses are most common, developing often without the patient’s awareness until there is very serious disease. The obstruction is believed to occur within the trabecular meshworks. **—glaucomatous,** *adj.*

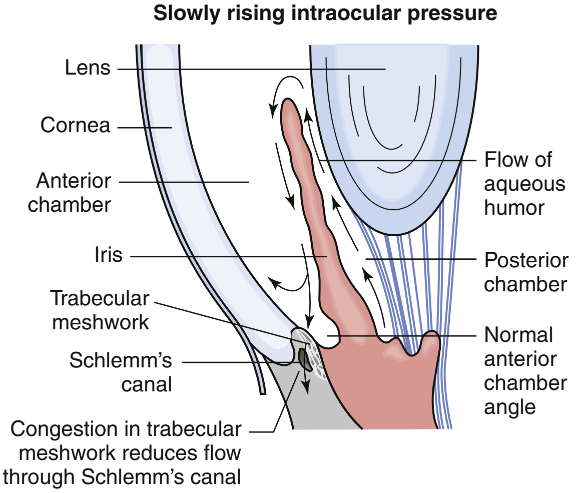
■ OBSERVATIONS: Acute angle-closure glaucoma is accompanied by extreme ocular pain, blurred vision, redness of the eye, and dilation of the pupil. Nausea and vomiting may occur. If untreated, acute glaucoma causes complete and permanent blindness within 2 to 5 days. Chronic open-angle glaucoma may produce no symptoms except gradual loss of peripheral vision over a period of years. Sometimes present are headaches, blurred vision, and dull pain in the eye. Cupping of the optic discs may be noted on ophthalmoscopic examination. Halos around lights and central blindness are late manifestations. Both types are characterized by elevated intraocular pressure indicated by tonometry.

■ INTERVENTIONS: Acute glaucoma is treated with eyedrops to constrict the pupil and draw the iris away from the cornea; osmotic agents such as mannitol or glycerol given systemically to lower intraocular pressure; acetazolamide to reduce fluid formation; and surgical iridectomy to produce a filtration pathway for aqueous humor. Chronic glaucoma can usually be controlled with eyedrops such as beta-blockers, alpha-agonists, topical carbonic anhydrase inhibitors, and prostaglandin analogs.



Rapidly rising intraocular pressure
Trabecular meshwork
Schlemm’s canal
Closed anterior chamber angle
Trabecular meshwork and Schlemm’s canal blocked, preventing outflow of aqueous humor

Acute angle-closure glaucoma *(Monahan et al, 2007)*



Slowly rising intraocular pressure
Lens
Cornea
Anterior chamber
Iris
Trabecular meshwork
Schlemm’s canal
Flow of aqueous humor
Posterior chamber
Normal anterior chamber angle
Congestion in trabecular meshwork reduces flow through Schlemm’s canal

Chronic open-angle glaucoma *(Monahan et al, 2007)*

glaucoma consummatum. See **absolute glaucoma.**

glaucomatocyclitic crisis /glôkom′ətōsiklit′ik/, an episodic rise in intraocular pressure in one eye, resembling acute angle-closure glaucoma, associated with minimal signs of uveitis. Also called **Posner-Schlossman syndrome.**

glaucomatous. See **glaucoma.**

glaucomatous halo /glôkom′ətəs/, **1.** an illusion of a circle of brightness surrounding a light, observed by patients with acute glaucoma, which is caused by edema of the corneal epithelium. **2.** a yellowish white ring surrounding the optic disc, a sign of atrophy of the choroid in glaucoma.

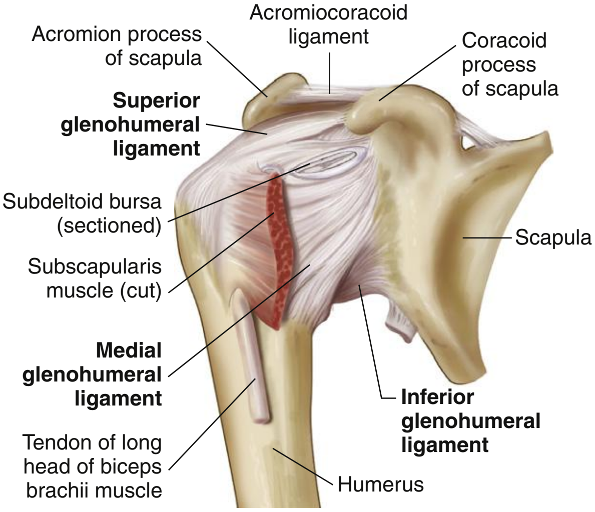
glaze /glāz/ [ME, *glasen*], **1.** *v,* to cover with a glossy, smooth surface or coating. **2.** *n,* a ceramic veneer added to a dental porcelain restoration after it has been fired, to give a completely nonporous, glossy, or semiglossy surface. **3.** *n,* the final firing (in air) of dental porcelain, when formation of a thin, vitreous, glossy surface takes place.

-glea, -glia, suffix meaning a “binding gelatinous medium”: *ooglea, zooglea.*

glenohumeral /glē′nōhyo͞o′mərəl/ [Gk, *glene,* joint socket; L, *humerus,* shoulder], pertaining to the glenoid cavity and the humerus at the shoulder joint.

glenohumeral joint, the shoulder joint, formed by the glenoid cavity of the scapula and the head of the humerus.

glenohumeral ligaments [Gk, *glene,* joint socket, *humerus,* shoulder], three thickened bands of connective tissue attached proximally to the anterior margin of the glenoid cavity and distally to the neck of the humerus.



Acromion process of scapula
Acromiocoracoid ligament
Coracoid process of scapula
Superior glenohumeral ligament
Subdeltoid bursa (sectioned)
Scapula
Subscapularis muscle (cut)
Medial glenohumeral ligament
Inferior glenohumeral ligament
Tendon of long head of biceps brachii muscle
Humerus

Glenohumeral ligaments *(Patton and Thibodeau, 2010)*

glenoid cavity /glē′noid/ [Gk, *glene,* joint socket, *eidos,* form; L, *cavum*], a shallow socket with which the head of the humerus articulates below the acromion at the junction of the superior and axillary borders. Also called **glenoid fossa.**

glenoid fossa. See **glenoid cavity, mandibular fossa.**

glenoid labrum, a fibrocartilaginous collar that deepens and expands the glenoid cavity.

glia. See **neuroglia.**

glia cells /glī′ə, glē′ə/ [Gk, *glia,* glue; L, *cella,* storeroom], neural cells that have a connective-tissue-supporting function in the central nervous system. Examples include astrocytes and oligodendroglial cells of ectodermal origin and microglial cells of mesodermal origin.

gliadin /glī′ədin/ [Gk, *glia,* glue], a fraction of the gluten protein that is found in wheat and rye and to a lesser extent in barley and oats. Its solubility in diluted alcohol distinguishes it from another grain protein, glutenin. Those with celiac disease are sensitive to this substance, and it is excluded from their diet. See also **celiac disease.**

gliadin and endomysial antibodies testing, a blood test to assist in the identification of celiac disease and to monitor disease status and dietary compliance.

glial cell line–derived neurotrophic factor (GDNF) /glī′əl/, a nerve growth drug that has been used in laboratory animals to reverse the progression of symptoms of Parkinson's disease and other brain diseases. GDNF is believed to act as a biological shield, protecting nerve cells from damage that normally would destroy them.

gliding [AS, *glidan,* to glide], **1.** one of the four basic movements allowed by the various joints of the skeleton. It is common to all movable joints and permits one surface to move smoothly over an adjacent surface, regardless of shape. Gliding is the only motion allowed by most of the wrist and the ankle joints. **2.** a smooth, continuous movement. Compare **angular movement, circumduction, rotation.**

gliding contusion, a brain injury caused by displacement of the gray matter of the cerebral cortex during angular acceleration of the head. Most of the damage occurs at the junction between the gray matter and the white matter. Such contusions are associated with diffuse axonal injuries and acute subdural hematomas.

gliding joint, a synovial joint in which articulation of contiguous bones allows only gliding movements, as in the wrist and the ankle. The ligaments or the osseous processes around each gliding joint limit movements of apposed plane surfaces or concavoconvex articulations. Also called **arthrodia, articulatio plana.** Compare **hinge joint, pivot joint.**

gliding testis, an undescended testis that can reach the top of the scrotum but then glides back up.

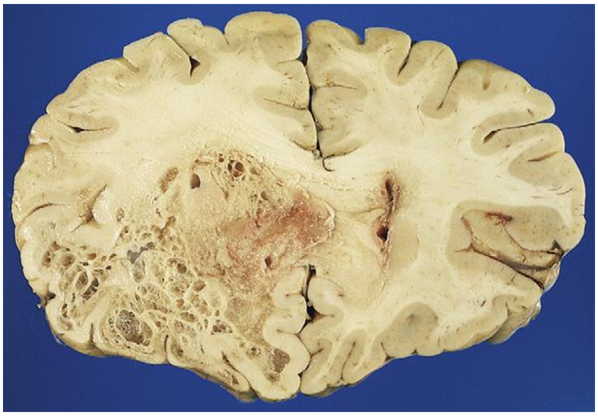
gliding zone, an articular cartilage surface area immediately adjacent to a joint space. It consists of a thin layer of densely packed collagen fibers lying parallel to the surface and covered by a fine acellular, afibrillar membrane. At the periphery the fibrous components merge with the fibrous periosteum of the adjacent bone.

glimepiride /glimep′irīd/, a sulfonylurea compound used as a hypoglycemic in treatment of type 2 diabetes mellitus, administered orally.

glio-, prefix meaning "neuroglia or a gluey substance": *gliococcus, gliosarcoma, gliosome.*

glioblastoma. See **spongioblastoma.**

glioblastoma multiforme /glī′ōblastō′mə mul′tifôr′mē/ [Gk, *glia,* glue, *blastos,* germ, *oma,* tumor; L, *multus,* many, *forma,* form], a malignant, invasive, rapidly growing pulpy or cystic tumor of the cerebrum or the spinal cord. The lesion spreads with pseudopod-like projections. It is composed of a mixture of monocytes, pyriform cells, immature and mature astrocytes, and neural ectodermal cells with fibrous or protoplasmic processes. Also called **anaplastic astrocytoma, glioma multiforme.**



Glioblastoma multiforme
(Finkbeiner, Ursell, and Davis, 2009)

glioma /glī·ō′mə/ *pl.* *gliomas,* **gliomata** [Gk, *glia* + *oma,* tumor], any of the largest group of primary tumors of the brain, composed of malignant glial cells. Kinds of gliomas are **astrocytoma, ependymoma, glioblastoma multiforme, medulloblastoma,** and **oligodendroglioma.**

-glioma, suffix meaning a "tumor arising from the neuroglia": *angioglioma, fibroglioma, ganglioma.*

glioma multiforme. See **glioblastoma multiforme.**

glioma retinae. See **retinoblastoma.**

glioma sarcomatosum. See **gliosarcoma.**

gliomata. See **glioma.**

glioneuroma /glī′ōnŏŏrō′mə/ *pl.* *glioneuromas, glioneuromata* [Gk, *glia* + *neuron,* nerve, *oma,* tumor], a neoplasm composed of nerve cells and elements of their supporting connective tissue.

gliosarcoma /glī′ōsärkō′mə/ *pl. gliosarcomas, gliosarcomata* [Gk, *glia* + *sarx,* flesh, *oma,* tumor], a tumor composed of spindle-shaped cells in the delicate supporting connective tissue of nerve cells. Also called **glioblastoma, glioma, spongioblastoma, spongiocytoma.**

gliosarcoma retinae. See **retinoblastoma.**

gliosis /glī·ō′sis/, a proliferation of astrocytes that may appear as a sign of healing after a central nervous system injury. See also **fibrogliosis.**

glipiZIDE /glip′izīd/, an oral antidiabetic drug.

■ INDICATIONS: It is prescribed as an adjunct to diet and exercise to lower blood glucose levels of patients with type 2 (non-insulin-dependent) diabetes mellitus.

■ CONTRAINDICATIONS: The dosage may have to be adjusted for patients who are taking drugs such as diuretics that increase blood glucose levels; elderly, debilitated, or malnourished patients are at risk of development of hypoglycemia.

■ ADVERSE EFFECTS: Among the most serious adverse effects are nausea, heartburn, and skin allergies.

Glisson's capsule /glis′ənz/ [Francis Glisson, English physician, 1597–1677; L, *capsula,* little box], the fibrous outer tissue sheath around lobules of the liver that carry branches of the hepatic artery, portal vein, and bile duct. Also called **hepatobiliary capsule.**

glitter cells [ME, *gliteren,* to shine], white blood cells in which movement of granules is observed in their cytoplasm. They are seen in microscopic examination of urine samples in cases of pyelonephritis or disorders marked by low osmolality.

Gln, abbreviation for **glutamine.**

global aphasia /glō′bəl/ [L, *globus,* ball; Gk, *a* + *phasis,* without speech], a loss of ability to use or comprehend any form of written or spoken language. The condition involves both sensory and motor nerve tracts and is a relatively more severe form of aphasia. Communication is attempted through gestures or the use of automatic words and phrases. Also called **mixed aphasia.**

Global Assessment of Functioning (GAF) scale, a scale used to assess psychiatric status, ranging from 1 (lowest level of functioning) to 100 (highest level), measuring psychological, social, and occupational functioning. It is widely used in studies of treatment effectiveness.

global price, (in U.S. managed care) an all-inclusive price for services rendered. It may refer to comprehensive physician services alone or include both hospital and physician services, depending on the contractual agreement.

global warming, an ecological model of world climate changes based on the **greenhouse effect,** exacerbated by burning of fossil fuels, massive deforestation, and conversion of cropland to industrial and other urban uses, all contributing to an increase in the earth's temperature. Major shifts in climate are not unusual in the history of the earth, which has undergone global warming in previous periods of geological history.

globin /glō′bin/ [L, *globus,* ball], a group of four protein molecules that become bound by the iron in heme molecules to form hemoglobin or myoglobin.

-globin, suffix meaning "containing protein": *hemoglobin, myoglobin.*

-globinuria, suffix meaning "(condition involving) the presence of complex proteins in the urine": *hemoglobinuria, methemoglobinuria, myoglobinuria.*

globoid leukodystrophy. See **galactosyl ceramide lipidosis.**

globose nucleus, one of four deeply placed cerebellar nuclei, located medially to the emboliform nucleus. It receives input from the intermediate zone of the cerebellar cortex, and its axons exit through the superior cerebellar peduncle. The globose nucleus is involved in posture control and voluntary movement.

globule /glob′yo͞ol/ [L, *globulus,* small ball], a small spheric mass. Kinds of globules are **dentin globule, Dobie's globule, Marchi's globule, milk globule, Morgagni's globule,** and **myelin globule.**

globulin /glob′yo͝olin/, one of a broad category of simple proteins classified by solubility, electrophoretic mobility, and molecular weights. Compare **albumin.** See also **euglobulin, plasma protein.**

globulinuria /-o͝or′ē·ə/ [L, *globulus,* small ball; Gk, *ouron,* urine], the presence of globulin-class proteins in the urine.

globus hystericus /glō′bus/ [L, small ball; Gk, *hystera,* womb], a transitory sensation of a lump in the throat that cannot be swallowed or coughed up, often accompanying emotional conflict or acute anxiety. The condition is thought to be caused by a functional disturbance of the ninth cranial nerve and spasm of the inferior constrictor muscle that encircles the lower part of the throat. The physical examination result tends to be normal, as does the result of barium esophagography.

globus pallidus /pal′idəs/ [L, small ball, pale], the smaller and more medial part of the lentiform nucleus of the brain, separated from the putamen by the lateral medullary lamina and divided into external and internal portions closely connected to the striatum, thalamus, and mesencephalon.

-gloea. See **-glea.**

glomangioma /glōman′jē·ō′mə/ *pl., glomangiomas, glomangiomata* [L, *glomus,* ball of thread; Gk, *angeion,* vessel, *oma*], a benign tumor that develops from a cluster of blood cells in the skin. Also called **angiomyoneuroma, angioneuroma.**

glomera. See **glomus.**

glomerular. See **glomerulus.**

glomerular capsule. See **Bowman's capsule.**

glomerular disease, any of a group of diseases in which the glomerulus of the kidney is affected. Depending on the particular disease, there may be hyperplasia, atrophy, necrosis, scarring, or deposits in the glomeruli. The symptoms may be abrupt in onset or slowly progressive. Compare **acute tubular necrosis.** See also **glomerulonephritis.**

glomerular endothelium, another name for the entire visceral layer of the kidney.

glomerular filtration, the renal process whereby fluid in the blood is filtered across the capillaries of the glomerulus and into the urinary space of Bowman's capsule.

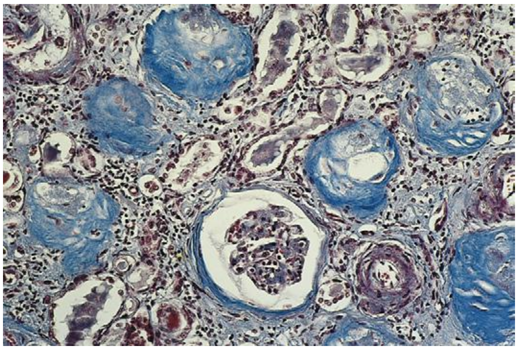
glomerular filtration rate (GFR) [L, *glomerulus,* small ball; Fr, *filtre* + L, *ratus*], a kidney function test in which results are determined from the amount of ultrafiltrate formed by plasma flowing through the glomeruli of the kidney. The amount is calculated from inulin and creatinine clearance, serum creatinine, and blood urea nitrogen. The GFR can also be estimated from equations that include creatinine, age, gender, and ethnicity.

glomerular proteinuria, the most common kind of proteinuria, caused by glomerular disease and abnormal permeability of the glomerular capillaries to protein.

glomeruli. See **glomerulus.**

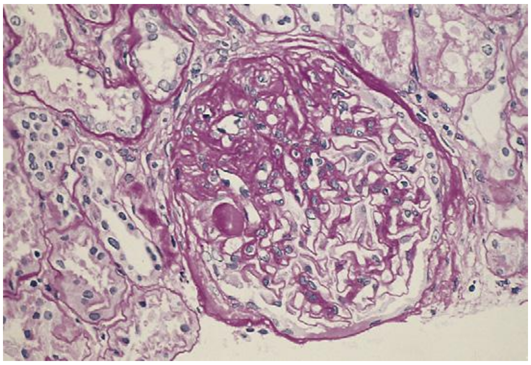
glomerulo-, prefix meaning "glomerulus," the functional unit of the kidney: *glomerulopathy.*

glomerulonephritis /glōmer′yo͝olōnəfrī′tis/ [L, *glomerulus*, small ball; Gk, *nephros*, kidney, *itis*], an inflammation of the glomerulus of the kidney, characterized by proteinuria, hematuria, decreased urine production, and edema. Kinds of glomerulonephritis are **acute glomerulonephritis, chronic glomerulonephritis,** and **subacute glomerulonephritis.** Also called **membranous nephropathy.**



Chronic glomerulonephritis *(Kumar et al, 2007/Courtesy Dr. M.A. Venkatachalam, Department of Pathology, University of Texas Health Sciences Center)*

glomerulosclerosis /-sklərō′sis/ [L, *glomerulus*, small ball; Gk, *sklerosis*, a hardening, *osis*, condition], a severe kidney disease in which glomerular function of blood filtration is lost as fibrous scar tissue replaces the glomeruli. The disease commonly follows an infection or arteriosclerosis.



Glomerulosclerosis *(Kumar et al, 2007/Courtesy Dr. H. Rennke, Department of Pathology, Brigham and Women's Hospital)*

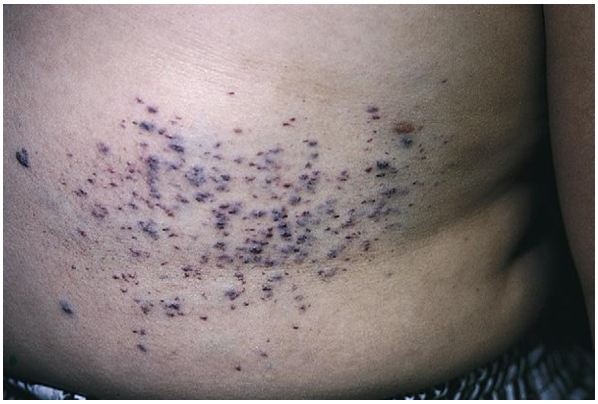
glomerulotubular balance, the balance between reabsorption of solutes in the proximal renal tubules and glomerular filtration, which must be as constant as possible. If the glomerular filtration rate rises or falls, the rate of tubular reabsorption must rise or fall proportionally. Balance is maintained by neural, hormonal, and other mechanisms.

glomerulus /glōmer′yo͝oləs/ *pl.* **glomeruli** [L, small ball], **1.** a tuft or cluster. **2.** a structure composed of blood vessels or nerve fibers, such as a renal glomerulus.**—glomerular,** *adj*.

glomus /glō′məs/ *pl.* **glomera** [L, ball of thread], a small group of arterioles connecting directly to veins and having a rich nerve supply.

glomus cell, **1.** an epithelioid cell surrounding a coiled arteriovenous anastomosis of a glomus body. **2.** a modified smooth muscle cell.

glomus tumor, a frequently painful neoplasm involving the arteriovenous anastomoses of the skin. It contains many small vascular channels surrounded by glomus cells.



Glomus tumors *(Callen et al, 2000)*

gloss-. See **glosso-.**

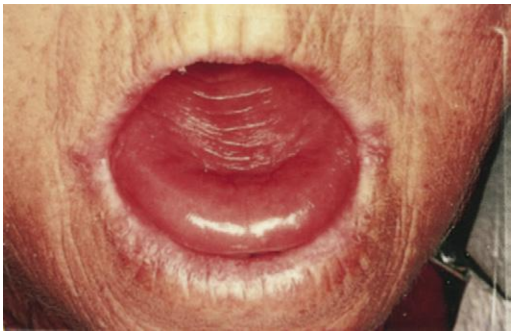
glossa. See **tongue.**

glossalgia. See **glossodynia.**

glossectomy /glosek′təmē/ [Gk, *glossa*, tongue, *ektomē*, excision], the surgical removal of all or a part of the tongue.

-glossia, **1.** suffix meaning "related to the tongue": *cacoglossia, megaloglossia, schistoglossia*. **2.** suffix meaning the "possession of a specified number of tongues": *aglossia, diglossia*.

glossitis /glosī′tis/ [Gk, *glossa*, tongue, *itis*], inflammation of the tongue. Acute glossitis, characterized by swelling, intense pain that may be referred to the ears, salivation, fever, and enlarged regional lymph nodes, may develop during an infectious disease or after a burn, bite, or other injury. Glossitis in which there is smooth atrophy of the surface and edges of the tongue is seen in pernicious anemia. Glossitis in which irregular, bright red patches appear on the tip or sides of the tongue **(Moeller's glossitis)** occurs in menopausal women. The condition causes pain or a burning sensation and sensitivity to hot or spicy foods; it often resists treatment. In congenital glossitis there is a flat or slightly elevated patch or plaque anterior to the circumvallate papillae in the midline of the dorsal surface of the tongue.



Severe atrophic glossitis *(Feldman, Friedman, and Brandt, 2010)*

glossitis parasitica. See **parasitic glossitis.**

glossitis rhomboidea mediana. See **median rhomboid glossitis.**

glosso-, gloss-, prefix meaning “tongue”: *glossocele, glossodynia, glossoplegia*.

glossodynia /glos′ōdin′ē·ə/ [Gk, *glossa* + *odyne*, pain], pain in the tongue caused by acute or chronic inflammation, abscess, ulcer, or trauma. Also called **glossalgia.**

glossodynia exfoliativa. See **Moeller’s glossitis.**

glossoepiglottic /glos′ō·ep′iglot′ik/, pertaining to the epiglottis and the tongue.

glossohyal. See **hyoglossal.**

glossolalia /glos′ōlā′lyə/ [Gk, *glossa* + *lalein*, to babble], speech in an unknown “language,” as in “speaking in tongues” during a state of religious ecstasy when the message being transmitted through the speaker is believed to be a message from a celestial spirit or from God.

glossoncus /glosong′kəs/ [Gk, *glossa* + *onkos*, swelling], a local swelling or general enlargement of the tongue.

glossopalatine arch. See **fauces.**

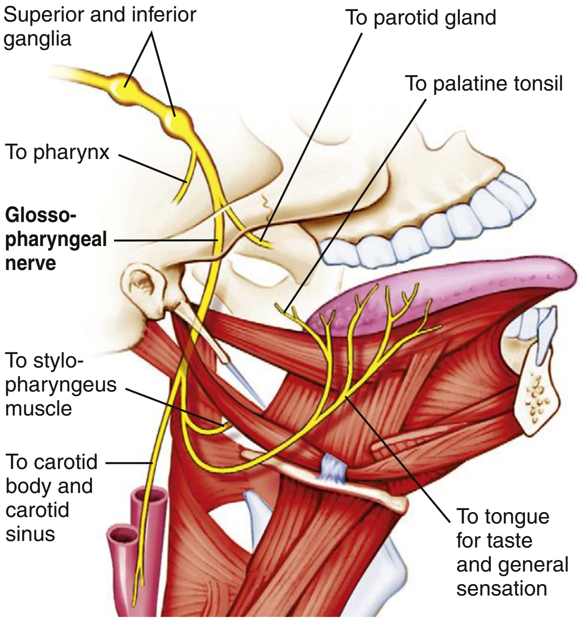
glossopathy /glosop′əthē/ [Gk, *glossa* + *pathos*, disease], a pathological condition or disease of the tongue, such as acute inflammation caused by a burn, bite, injury, or infectious disease; enlargement resulting from congenital lymphangioma; or a disorder produced by mycotic infection, malignant lesion, or congenital anomaly.

glossopexy /glos′əpek′sē/ [Gk, *glossa* + *pexis*, fixation], an adhesion of the tongue to the lip.

glossopharyngeal /glos′ōfərin′jē·əl/ [Gk, *glossa* + *pharynx*, throat], pertaining to the tongue and pharynx. See also **glossopharyngeal nerve.**

glossopharyngeal breathing (GPB), a technique of forcing air into the lungs with the pharynx and tongue muscles. The technique can be taught to patients whose respiratory muscles are weak.

glossopharyngeal nerve, either of a pair of cranial nerves essential to the sense of taste, sensation in some viscera, and secretion from certain glands. The nerve has both sensory and motor fibers that pass from the tongue, parotid gland, and pharynx; communicate with the vagus nerve; and connect with two areas in the brain. Also called **Hering’s nerve, nervus glossopharyngeus, ninth cranial nerve.**



Superior and inferior ganglia
To parotid gland
To palatine tonsil
To pharynx
Glossopharyngeal nerve
To stylopharyngeus muscle
To carotid body and carotid sinus
To tongue for taste and general sensation

Glossopharyngeal nerve

glossopharyngeal neuralgia, a disorder of unknown origin characterized by recurrent attacks of severe pain in the back of the pharynx, the tonsils, the base of the tongue, and the middle ear. It tends to affect more men than women, with an onset after 40 years of age. Attacks lasting from a few seconds to minutes may be triggered by swallowing. The symptoms may be similar to those of trigeminal neuralgia. Treatment is usually pharmaceutic, but surgery may be recommended to sever involved nerve tracts.

glossophytia /glos′əfit′ē·ə/ [Gk, *glossa* + *phyton*, plant], a condition of the tongue characterized by a blackish patch on the dorsum on which filiform papillae are greatly elongated and thickened like bristly hairs. The usually painless condition may be caused by heavy smoking or the extensive use of broad-spectrum antibiotics. See also **parasitic glossitis.**

glossoplasty /glos′ōplas′tē/ [Gk, *glossa* + *plassein*, to mold], a surgical procedure or plastic surgery on the tongue performed to correct a congenital anomaly, repair an injury, or restore a measure of function after excision of a malignant lesion.

glossoptosis /glos′optō′sis/ [Gk, *glossa* + *ptosis*, falling], the retraction or downward displacement of the tongue.

glossopyrosis /glos′ōpīrō′sis/ [Gk, *glossa* + *pyr*, fire, *osis*, condition], a burning sensation in the tongue caused by chronic inflammation, exposure to extremely hot or spicy food, or psychogenic glossitis.

glossorrhaphy /glosôr′əfē/ [Gk, *glossa* + *rhaphe*, seam], the surgical suturing of a wound in the tongue.

glossotrichia /glos′ətrik′ē·ə/ [Gk, *glossa* + *thrix*, hair], a condition of the tongue characterized by a hairlike appearance of the papillae. Also called **hairy tongue.**

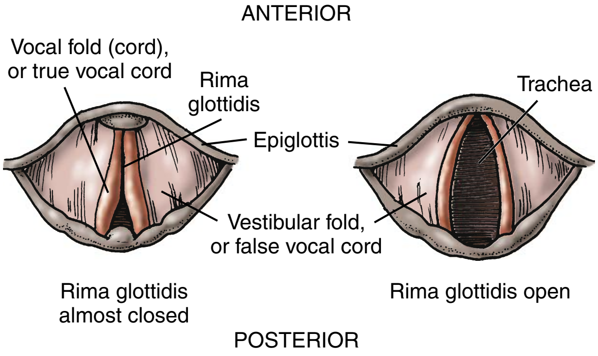
glossy skin [ONorse, *glosa*, smooth and shiny; AS, *scinn*], a shiny skin that is usually secondary to neuritis and may be associated with other integumentary disorders, including alopecia, skin fissuring, and ulceration. It usually begins as an erythematous area on an extremity, usually the hands.

glott-, prefix meaning “pertaining to the glottis”: *glottic, glottidas, glottis*.

glottal fry, the raspy or croaking (“froglike”) quality of the voice in its lowest register. It results from loose closure of the glottis that allows air to bubble through, giving rise to a series of low-pitched pops and rattles.

glottal stop /glot′əl stop/, **1.** a speech sound made by closure of the glottis or vocal folds and then an explosive release. **2.** an abnormal sound substitution with a guttural quality.

glottis *pl. glottises, glottides* [Gk, opening to larynx], **1.** also called **rima glottidis, true glottis.** a slitlike opening between the true vocal cords (plica vocalis). **2.** the phonation apparatus of the larynx, composed of the true vocal cords and the opening between them (rima glottidis). —*glottal, glottic, adj.*



ANTERIOR
Vocal fold (cord), or true vocal cord
Rima glottidis
Trachea
Epiglottis
Vestibular fold, or false vocal cord
Rima glottidis almost closed
Rima glottidis open
POSTERIOR

Glottis *(Ignatavicius and Workman, 2010)*

glottis spuria. See **false glottis.**

gloves, sterile or clean fitted coverings for the hands, usually with a separate sheath for each finger and thumb. Clean gloves are worn to protect health care personnel from urine, stool, blood, saliva, and drainage from wounds and lesions of patients and to protect patients from health care personnel who may have cuts. Sterile gloves are worn when there is contact with sterile instruments or a patient's sterile part.

glow curve, (in thermoluminescence dosimetry) the graphic representation of the emitted light intensity that increases with the increasing phosphor temperature.

GLP-1, abbreviation for **glucagon-like peptide 1.**

Glu, abbreviation for **glutamic acid.**

glucagon /glo͞o′kəgon/ [Gk, *glykys,* sweet, *agaein,* to lead], a polypeptide hormone, produced by alpha cells in the islets of Langerhans, that stimulates the conversion of glycogen to glucose in the liver. Secretion of glucagon is stimulated by hypoglycemia and by growth hormone from the anterior pituitary. A preparation of purified crystallized glucagon is used in the treatment of certain hypoglycemic states. Also called **hyperglycemic-glycogenolytic factor (HGF).**

glucagon-like peptide 1 (GLP-1), an appetite suppressing substance found in the brain and intestine. In the brain, GLP-1 acts as a satiety signal. In the intestine it slows emptying of the stomach and stimulates the release of insulin from the pancreas.

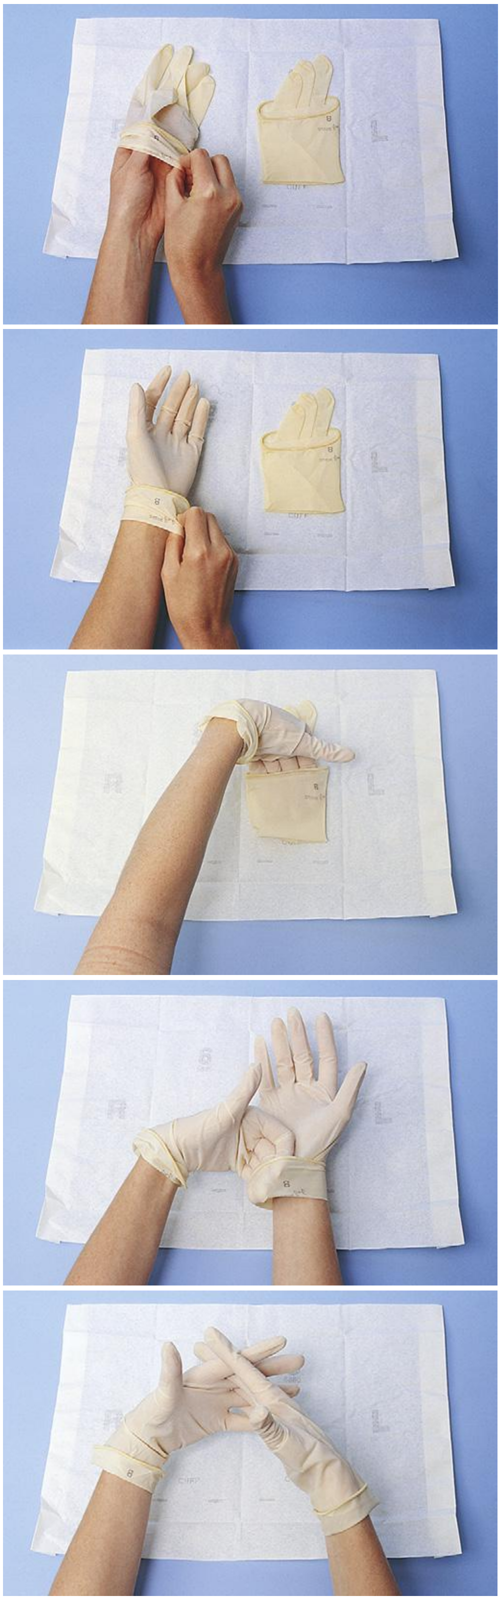
glucagonoma syndrome /glo͞o′kəgonō′mə/ [Gk, *glykys* + *agaein* + *oma,* tumor], a disease associated with a glucagon-secreting tumor of the islet cells of the pancreas. It is characterized by hyperglycemia, stomatitis, glossitis, anemia, weight loss, and a characteristic rash. Treatment is surgical removal of the tumor.

glucagon (recombinant), a form of recombinant DNA origin, having the same actions and uses as that of animal origin.

glucagon test, a blood test measuring the hormone glucagon that is used to help diagnose glucagonoma, glucagon deficiency, diabetes mellitus, pancreatic insufficiency, renal failure, and other conditions.

gluco-, glyco-, prefix meaning "sweetness or glucose": *glucofuranose, glucokinetic, glucosuria, glycocholic.*

glucocorticoid /glo͞o′kōkôr′təkoid/ [Gk, *glykys* + L, *cortex,* bark; Gk, *eidos,* form], an adrenocortical steroid hormone that increases gluconeogenesis, exerts an antiinflammatory effect, and influences many body functions. The most important of the three glucocorticoids is cortisol (hydrocortisone). Corticosterone is less active, and cortisone is inactive until converted to cortisol. Glucocorticoids promote the release of amino acids from muscle, mobilize fatty acids from fat stores, and increase the ability of skeletal muscles to maintain contractions and avoid fatigue. These hormones are known to stabilize mitochondrial and lysosomal membranes, increase the production of adenosine triphosphate, promote the formation of certain liver enzymes, and decrease antibody production and the number of circulating eosinophils. A deficiency of glucocorticoids is characterized by hyperpigmentation (bronzing) of the skin, fasting hypoglycemia, weight loss, and apathy. An excess is associated with elevated serum glucose levels, thinning of the skin, ecchymosis, osteoporosis, poor wound healing, increased susceptibility to infection, and obesity. Glucocorticoid secretion is stimulated by the adrenocorticotropic hormone of the anterior pituitary, which in turn is regulated by the corticotropin-releasing hormone of the hypothalamus and circulating cortiosol levels (negative feedback). Synthetic or semisynthetic glucocorticoids,

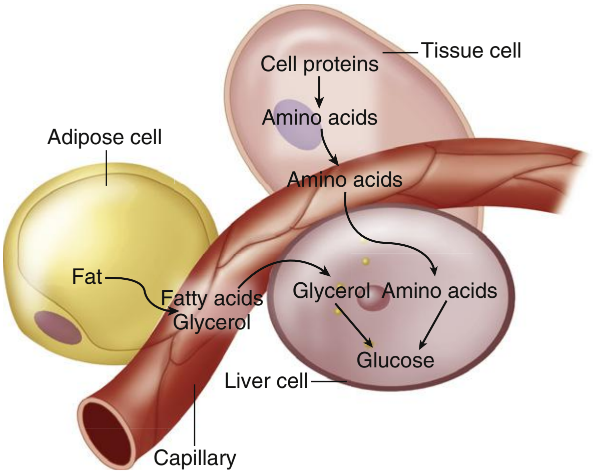


Technique for putting on sterile gloves *(Potter et al, 2011)* derived chiefly from cortisol, include prednisone, prednisolone, dexamethasone, methylprednisolone, triamcinolone, and betamethasone. Compare **mineralocorticoid.**

glucogenesis, giving rise to or producing glucose.

Glucometer, a trademark for a battery-powered instrument used to calculate blood glucose from as little as one drop of blood. Also called *blood glucose monitor.*

gluconeogenesis /glo͞o′kōnē′ōjen′əsis/, the formation of glucose from glycerol and proteins rather than from carbohydrates. Also called **glyconeogenesis.**



Gluconeogenesis *(Patton and Thibodeau, 2010)*

Glucophage, a trademark for an oral antidiabetic agent **(metformin hydrochloride).**

glucosamine sulfate, the sulfate salt of glucosamine, prepared artificially as a nutritional supplement and as a popular remedy for osteoarthritis.

glucosan /glo͞o′kəsan/ [Gk, *glykys,* sweet], any of a large group of anhydrous polysaccharides that on hydrolysis yield a hexose, primarily anhydrides of glucose. The glucosans include cellulose, glycogen, starch, and the dextrins.

glucose /glo͞o′kōs/ [Gk, *glykys,* sweet], a simple sugar found in certain foods, especially fruits, and a major source of energy present in the blood and animal body fluids. Glucose, when ingested or produced by the digestive hydrolysis of double sugars and starches, is absorbed into the blood from the intestines by a facilitated transport mechanism using carrier proteins. Excess glucose in circulation is normally polymerized within the liver and muscles as glycogen, which is hydrolyzed to glucose and liberated as needed. The determination of blood glucose levels is an important diagnostic test in diabetes and other disorders. Prepared glucose is a syrupy sweetening agent. Pharmaceutic preparations of glucose are widely used in the treatment of many disorders. Normal adult blood glucose levels range from 70 to 115 mg/dL (4 to 6 mmol/L), with generally higher levels after 50 years of age. See also **dextrose, glycogen.**

glucose electrode, a specialized electric terminal that contains incorporated enzyme for glucose determination.

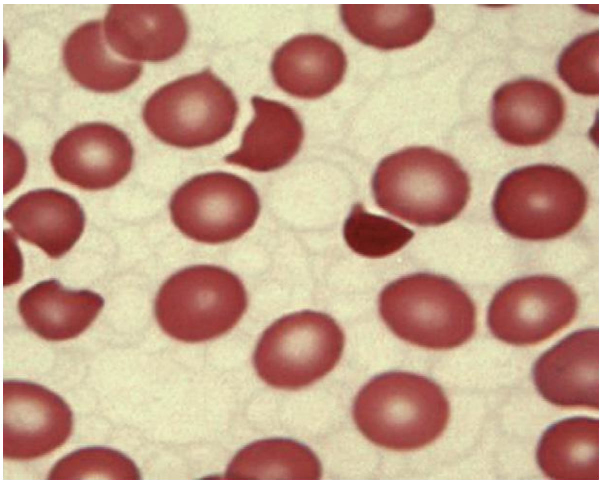
glucose-galactose malabsorption, a disorder of transport clinically characterized by the neonatal onset of profuse, acidic, watery diarrhea leading to severe dehydration and death if untreated, resulting from a selective defect in the intestinal transport of glucose and galactose. It can be treated by a glucose- and galactose-free diet.

glucose intolerance, inability to properly metabolize glucose, a type of carbohydrate intolerance. See also **diabetes mellitus, glucose tolerance test.**

glucose 1-phosphate, an intermediate compound in carbohydrate metabolism; specifically it is the product formed in glycogenolysis when glycogen phosphorylase cleaves a molecule of glucose from the glycogen storage molecule.

glucose 6-phosphate, an intermediate compound in carbohydrate metabolism. G6P is produced in the first step of glycolysis when a hexokinase enzyme regiospecifically phosphorylates glucose at carbon-6 hydroxyl group.

glucose-6-phosphate dehydrogenase (G6PD) deficiency, an inherited disorder characterized by red cells partially or completely deficient in G6PD, an enzyme critical in aerobic glycolysis. A sex-linked disorder, the defect is fully expressed in affected males despite a heterozygous pattern of inheritance. The disorder is associated with episodes of acute hemolysis under conditions of stress or in response to certain chemicals or drugs, particularly quinine. The anemia that results is a nonspherocytic hemolytic anemia. See also **congenital nonspherocytic hemolytic anemia, favism.**



Glucose-6-phosphate dehydrogenase (G6PD) disease *(Gilbert-Barness, 2007)*

glucose-6-phosphate dehydrogenase (G6PD) test, a blood test to diagnose G6PD deficiency in suspected individuals. Deficiency of this enzyme causes precipitation of hemoglobin and cellular membrane changes, possibly resulting in hemolysis of variable severity, a sex-linked trait carried on the X chromosome.

glucose tolerance test (GTT), a test of the body's ability to metabolize carbohydrates by administering a standard dose of glucose and measuring the blood and urine for glucose level at regular intervals thereafter. The patient usually eats a high-carbohydrate diet for the 3 days before the test and fasts the night before. A fasting blood glucose level is obtained the next morning, and then the patient drinks a dose of glucose based on his or her weight. Blood and urine are collected periodically for up to 6 hours. The glucose tolerance test is most often used to assist in the diagnosis of diabetes, hypoglycemia, or other disorders that affect carbohydrate metabolism.

glucosuria /glo͞o′kōso͝or′ē·ə/ [Gk, *glykys* + *ouron,* urine], abnormal presence of glucose in the urine resulting from the ingestion of large amounts of carbohydrate or from a metabolic disease, such as diabetes mellitus. See also **glycosuria.** —*glucosuric, adj.*

glucosyl, **1.** pertaining to glucose. **2.** a glucose radical.

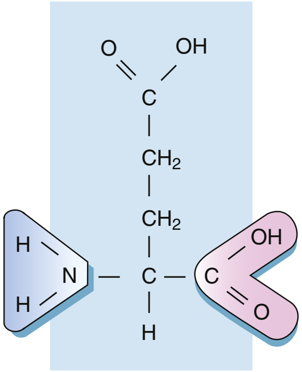
glucosyl cerebroside lipidosis. See **Gaucher's disease.**

Glucotrol, a trademark for an oral antidiabetic drug **(glipiZIDE).**

glue sniffing [Gk, *gloios* + ME, *sniffen*], the practice of inhaling the vapors of toluene, a volatile organic compound used as a solvent in certain glues. The glue is squeezed into a plastic bag, which is then placed over the nose and mouth. Intoxication and dizziness result. Prolonged accidental or occupational exposure or repeated recreational use may damage a variety of organ systems. Death has resulted from asphyxiation by the plastic bag.

glutamate /glo͞o′təmāt/, a salt of glutamic acid. In addition to being one of the 20 major amino acids incorporated into the peptide chains of proteins, it is a major excitatory amino acid of the central nervous system.

glutamic acid (Glu) /glo͞otam′ik/ [L, *gluten,* glue, *amine,* ammonia; *acidus,* sour], a nonessential amino acid that occurs widely in a number of proteins. Preparations of glutamic acid are used as aids for digestion. See also **amino acid, protein.**



Chemical structure of glutamic acid

glutamic acid decarboxylase autoantibody, an antibody found in patients with insulin-dependent diabetes mellitus. The antibody recognizes glutamic acid decarboxylase, an intracellular enzyme.

glutamic acidemia /glo͞otam′ik as′idē′mē·ə/, an inherited disorder of amino acid metabolism that causes an excessive level of glutamic acid. The precise enzyme defect is unknown. The condition is characterized by mental and physical retardation, seizures, and fragile hair growth.

glutamic acid hydrochloride, a gastric acidifier.

■ INDICATION: It is prescribed for the treatment of hypoacidity.

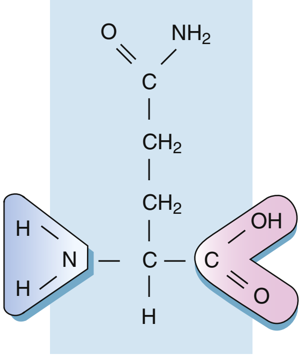
■ CONTRAINDICATIONS: Hyperacidity, peptic ulcer, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECT: The most serious adverse effect is systemic acidosis that results from overdose.

glutamic oxaloacetic transaminase. See **aspartate aminotransferase.**

glutamic pyruvic transaminase. See **alanine aminotransferase.**

glutamine (Gln) /glo͞o′təmēn/ [L, *gluten* + *amine,* ammonia], a nonessential amino acid found in the juices of many plants and in many proteins in the body. It functions as an amino donor for many reactions. It is also a nontoxic transport for ammonia because it is readily hydrolyzed to glutamic acid and free ammonia, the latter excreted in the urine. See also **amino acid, protein.**



Chemical structure of glutamine

glutaraldehyde /glo͞o′täral′dəhīd/, a histological fixative and sterilant for medical instruments.

glutargin /glo͞otär′gin/, arginine glutamate. See also **arginine.**

glutaricaciduria /glo͞otar′ikas′idyo͞o′rē·ə/, **1.** an autosomal-recessive disorder of amino acid metabolism characterized by accumulation and excretion of the dicarboxylic acid glutaric acid and occurring in two types. Type I is characterized by progressive dystonia and dyskinesia, hypoglycemia, mild ketosis and acidosis, opisthotonus, choreoathetosis, motor delay, mental retardation, hypotonia, and death within the first decade. Type II is caused by any of several related defects and is characterized by accumulation and excretion of various organic acids, hypoglycemia without ketosis, metabolic acidosis, and many phenotypic manifestations varying with the specific defect. A later age of onset is correlated with decreased severity whereas neonatal onset may be accompanied by congenital anomalies and is rapidly fatal. Type II is also called **multiple acyl CoA dehydrogenation deficiency. 2.** excretion of glutaric acid in the urine.

glutathione /glo͞o′təthī′ōn/ [L, *gluten* + Gk, *theione,* sulfur], a tripeptide of glutamic acid, cysteine, and glycine whose deficiency is commonly associated with hemolytic anemia. It functions by taking up and giving off hydrogen. It transports amino acids across cell membranes and conjugates to drugs enabling excretion.

gluteal /glo͞o′tē·əl/ [Gk, *gloutos,* buttocks], pertaining to the buttocks or to the muscles that form the buttocks.

gluteal fold, **1.** a fold of the buttock. **2.** the horizontal lower margin of the buttock at its junction with the thigh.

gluteal gait. See **Trendelenburg gait.**

gluteal reflex, contraction of the gluteus muscles elicited by stroking the back.

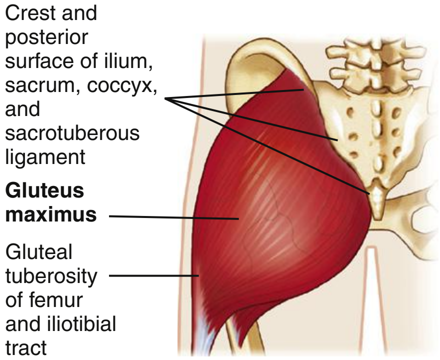
gluteal region, the region overlying the gluteal muscles.

gluteal tuberosity, a ridge on the lateral posterior surface of the femur to which is attached a fourth of the gluteus maximus.

gluten /glo͞o′tən/ [L, glue], the insoluble protein constituent of wheat and other grains (rye, oats, and barley). It is obtained from flour by washing out the starch and is used as an adhesive agent, giving to dough its tough, elastic character. For some people, ingestion of gluten results in potentially life-threatening malabsorption. See also **celiac disease, food sensitivity/ hypersensitivity reaction.**

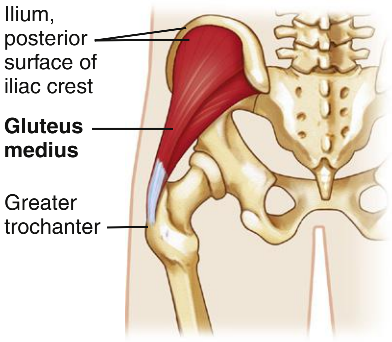
gluten-induced enteropathy. See **celiac disease.**

gluteus /glo͞otē′əs/, any of the three muscles that form the buttocks: the gluteus maximus, gluteus medius, and gluteus minimus. The **gluteus maximus** is a large muscle with an origin in the ilium, the sacrum, and the sacrotuberous ligament and an insertion in the gluteal tuberosity of the femur and the fascia lata. It acts to extend the thigh. The **gluteus medius** originates between the anterior and posterior gluteal lines of the ilium and inserts in the greater trochanter of the femur. It acts to abduct and medially rotate the thigh. The **gluteus minimus** originates between the inferior and anterior gluteal lines of the ilium and inserts in the greater trochanter of the femur. It acts to abduct the thigh.

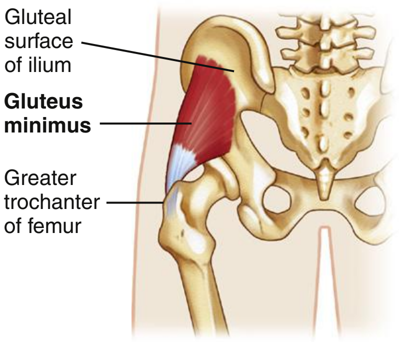


Crest and posterior surface of ilium, sacrum, coccyx, and sacrotuberous ligament
Gluteus maximus
Gluteal tuberosity of femur and iliotibial tract

Gluteus maximus muscle



Gluteus medius muscle



Gluteus minimus muscle

gluten. See **gliadin.**

Gly, abbreviation for **glycine.**

glyBURIDE /glī′bərīd/, an oral antidiabetic drug. ■ INDICATIONS: It is prescribed as an adjunct to diet and exercise to lower blood glucose levels of patients with type 2 (non-insulin-dependent) diabetes mellitus. ■ CONTRAINDICATIONS: Because of its long duration of action, it may produce prolonged hypoglycemia; there is also a risk of severe hypoglycemia in elderly, debilitated, or malnourished patients. The dosage may require adjustment for patients taking other drugs that increase blood glucose levels. ■ ADVERSE EFFECTS: Among the more serious adverse effects are nausea, hypoglycemia, and skin allergies.

glycate, the product of a nonenzymatic reaction between a sugar and a free amino group of a protein.

glycated hemoglobin. See **glycosylated hemoglobin.**

-glycemia, suffix meaning a "condition of sugar in the blood": *dysglycemia, hepatoglycemia, hyperglycemia.*

glycemic index, a ranking of foods based on the response of postprandial blood glucose levels as compared with a reference food, usually either white bread or glucose.

glycerin /glis′ərin/ [Gk, *glykys,* sweet], a sweet, colorless oily fluid that is a pharmaceutic grade of glycerol. Glycerin is used as a moistening agent for chapped skin, an ingredient of suppositories for constipation, and a sweetening agent and vehicle for drug preparations. Also spelled *glycerine.*

glycerol ($C_3H_8O_3$) /glis′ərôl/ [Gk, *glykys,* sweet], an alcohol that is a component of fats. Glycerol is soluble in ethyl alcohol and water. Also called *1, 2, 3-propanetriol.* See also **glycerin.**

glycerol kinase, an enzyme in the liver and kidneys that catalyzes the transfer of a phosphate group from adenosine triphosphate to form adenosine diphosphate and L-glycerol-3-phosphate.

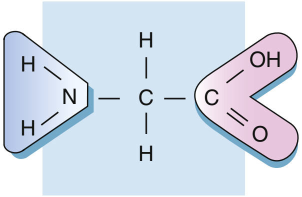
glyceryl alcohol. See **glycerin.**

glyceryl guaiacolate. See **guaifenesin.**

glyceryl triacetate. See **triacetin.**

glyceryl trinitrate. See **nitroglycerin.**

glycine (Gly) /glī′sin/ [Gk, *glykys* + L, *amine,* ammonia], a nonessential amino acid occurring widely as a component of animal and plant proteins. Synthetically produced glycine is used in solutions for irrigation, in the treatment of various muscle diseases, and as an antacid and dietary supplement. It is the only amino acid lacking an R group side chain and therefore also lacking stereochemistry. See also **amino acid, protein.**



Chemical structure of glycine

glyc(o) [word element, [Gr.]], *sweetness; glucose.*

glyco-. See **gluco-.**

glycocholic acid /glīkōkol′ik/ [Gk, *glykys,* sweet; L, *acidus,* sour], a substance in bile, formed by glycine and cholic acid, that aids in digestion and absorption of fats. Glycocholic acid is used as a food additive and an emulsifying agent. Also called **cholylglycine.**

glycogen /glī′kəjən/ [Gk, *glykys,* sweet, *genein,* to produce], a polysaccharide that is the major carbohydrate stored in animal cells. It is formed from repeating units of glucose and stored chiefly in the liver and, to a lesser extent, in muscle cells. Glycogen is depolymerized to glucose, which is released into the circulation as needed by the body. Also called **animal starch, hepatin, tissue dextrin.** See also **glucose.**

glycogenesis /glī′kōjen′əsis/, the synthesis of glycogen from glucose.

glycogenolysis /glī′kōjenol′isis/ [Gk, *glykys* + *genein* + *lysis,* loosening], the breakdown of glycogen to glucose.

glycogen storage disease [Gk, *glykys* + *genein* + L, *instaurare,* to renew, *dis,* opposite of; Fr, *aise,* ease], any of a group of inherited disorders of glycogen metabolism. An enzyme deficiency or defect in glycogen transport causes glycogen to accumulate in abnormally large amounts in various parts of the body. Biopsy and chemical analysis reveal the missing enzyme. Also called **glycogenosis.**

glycogen storage disease, type Ia. See **von Gierke's disease.**

glycogen storage disease, type Ib, a form of glycogen storage disease in which excessive amounts of glycogen are deposited in the liver and leukocytes. Some symptoms are similar to, but less severe than, those of **glycogen storage disease, type Ia** (von Gierke's disease). Additional symptoms include neutropenia and recurrent GI inflammatory disease. Biopsy of the affected organs reveals the absence of glucose-6-phosphatase translocase, an enzyme necessary for glycogen metabolism.

glycogen storage disease, type II. See **Pompe's disease.**

glycogen storage disease, type III. See **Cori's disease.**

glycogen storage disease, type IV. See **Andersen's disease.**

glycogen storage disease, type V. See **McArdle's disease.**

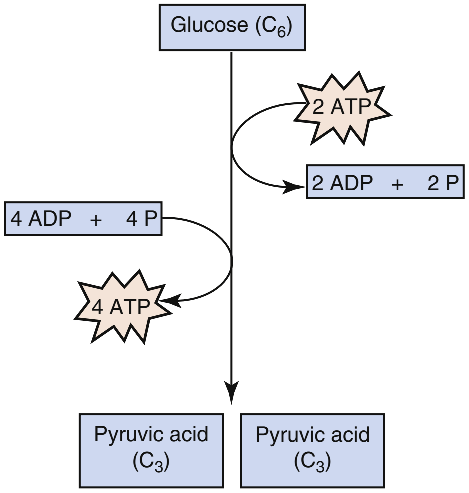
glycogen storage disease, type VI. See **Hers' disease.**

glycogen storage disease, type VII. See **Tarui's disease.**

glycohemoglobin. See **glycosylated hemoglobin.**

glycolipid /glī′kōlip′id/ [Gk, *glykys,* sweet, *lipos,* fat], a compound that consists of a lipid and a carbohydrate, usually galactose, found primarily in the tissue of the nervous system, especially the myelin sheath and the ganglion cells.

glycolysis /glīkol′isis/ [Gk, *glykys* + *lysis,* loosening], a series of enzymatically catalyzed reactions by which glucose and other sugars are broken down to yield lactic acid **(anaerobic glycolysis)** or pyruvic acid **(aerobic glycolysis).** The breakdown releases energy in the form of adenosine triphosphate (ATP). Also called **Embden-Meyerhof pathway.** See also **citric acid cycle, lactic acid.**



Aerobic glycolysis *(Applegate, 2011)*

glycolytic myopathy, any metabolic myopathy resulting from a defect of glycolytic enzyme activity, marked by exercise intolerance and cramping, the accumulation of glycogen in muscle, and recurrent myoglobinuria.

glycometabolism /glī′kōmətab′əliz′əm/, the metabolism of sugar in the animal body.

glyconeogenesis. See **gluconeogenesis.**

glycopenia /-pē′nē·ə/, **1.** See **hypoglycemia. 2.** a deficiency of sugar in the blood or tissues.

glycopeptides /-pep′tīdz/, a class of peptides that contain sugars linked with amino acids, as in bacterial cell walls.

glycophorin /-fôr′in/, one of a group of proteins (A-E) that project through the membrane of red blood cells (RBCs). The outside end of glycophorins A and B carries antigens of the MNS blood group. The sialic acid component of glycophorins contributes to the negative charge of the outer erythrocyte plasma membrane. Influenza virus can attach to sialic acid present on glycophorin A, B, C, D, and E and produce agglutination (does not enter RBCs). Malaria virus can attach to glycophorin A and C and infect RBCs. See also **blood group.**

glycoprotein /glī′kōprō′tēn/ [Gk, *glykys,* sweet, *proteios,* first rank], any of the large group of conjugated proteins in which the nonprotein substance is a carbohydrate. These include the mucins, the mucoids, and the chondroproteins.

glycoprotein IIb/IIIa, a transmembrane protein of platelets, an integrin that binds fibrinogen, von Willebrand's factor, and other adhesive ligands and plays a role in platelet aggregation and thrombus formation.

glycopyrrolate /glī′kōpir′əlāt/, an anticholinergic.

■ INDICATIONS: It is prescribed as an adjunct to ulcer therapy and parenterally to reduce secretions before surgery.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, obstruction of the genitourinary or GI tract, ulcerative colitis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, and hypersensitivity reactions.

glycoside /glī′kəsīd/ [Gk, *glykys,* sweet], any of several carbohydrates that yield a sugar and a nonsugar on hydrolysis. The plant *Digitalis purpurea* yields a glycoside used in the treatment of heart disease.

glycosphingolipids /glī′kōsfing′gōlip′ids/, compounds formed from carbohydrates and ceramide, a fatty substance, found in tissues of the central nervous system and also in erythrocytes. Deficiency of an enzyme needed to metabolize glycosphingolipids leads to a potentially fatal nervous system disorder.

glycosuria /glī′kōso͝or′ē·ə/ [Gk, *glykys* + *ouron,* urine], abnormal presence of a sugar, especially glucose, in the urine. Glycosuria can result from the ingestion of large amounts of carbohydrate, or it may be caused by endocrine or renal disorders. It is a finding most routinely associated with diabetes mellitus. —*glycosuric, adj.*

glycosyl /glī′kōsil/, the radical formed from a saccharide, such as glucose, by removal of a specific hydroxyl group.

glycosylated hemoglobin (GHb/Hb A_{1c}) /glīkō′silā′tid/, a hemoglobin A molecule with a glucose group on the *N*-terminal valine amino acid unit of the beta chain. The glycosylated hemoglobin concentration represents the average blood glucose level over the previous several weeks. In controlled diabetes mellitus the concentration of glycosylated hemoglobin is within the normal range, but in uncontrolled cases the level may be three to four times the normal concentration. Assays of Hb A_{1c}, which normally has a

4-month life span, reveal whether glucose levels have been properly controlled during a period of several weeks before the test. The normal range is 1.8% to 4.0% for children; 2.2% to 4.8% for adults. Also spelled *glycosylated haemoglobin*.

glycosylated hemoglobin (GHb, GHB) test, a blood test used to monitor diabetes treatment. It measures the amount of hemoglobin A_{1c} in the blood and provides an accurate long-term index of the patient's average blood glucose level.

glycosylation /glīkə′səlā′shən/, the formation of linkages with glycosyl groups, covalently attaching a carbohydrate to another molecule.

glycyl alcohol. See **glycerin.**

glycyrrhiza /glis′iri′zə/, licorice.

glycyrrhizic acid /glis′iriz′ik/, a sweet compound containing potassium and calcium salts derived from licorice root. It is used as an expectorant and as a flavoring for pharmaceutics. See also **licorice.**

GM, abbreviation for *Geiger-Müller.*

gm, abbreviation for **gram.**

GM-2, a carbohydrate found in much larger quantities in cancer cells than in normal cells, used in some experimental cancer therapy. When it is mixed with bacille Calmette-Guérin and injected into melanoma patients, some patients make antibodies against the cancer cells.

GM-CSF, abbreviation for **granulocyte-macrophage colony–stimulating factor.**

GMENAC, abbreviation for **Graduate Medical Education National Advisory Committee.**

GMP, abbreviation for **guanosine monophosphate.**

GN, abbreviation for **graduate nurse.**

GNA, abbreviation for **Gay Nurses' Alliance.**

gnath-. See **gnatho-.**

gnathalgia. See **gnathodynia.**

-gnathia, suffix meaning a "condition of the jaw": *brachygnathia, campylognathia, retrognathia*.

gnathic /nath′ik/ [L, *gnathos,* jaw], pertaining to the jaw or cheek.

gnathic index, the degree of prominence of the upper jaw, expressed as a percentage of the distance from basion to nasion.

gnathion /nā′thē·on/ [L, *gnathos,* jaw], the lowest point in the lower border of the mandible in the median plane. It is found on the bony mandibular border when palpated from below and naturally lies posterior to the tegumental border of the chin. It is a common reference point in the diagnosis and orthodontic treatment of various kinds of malocclusion and is an anthropometric landmark.

gnatho-, gnath-, prefix meaning "jaw": *gnathocephalus, gnathodynia, gnathoplasty.*

gnathodynamometer /nā′thōdī′nəmom′ətər/ [Gk, *gnathos* + *dynamis,* force, *metron,* measure], an instrument used for measuring the biting pressure of the jaws of an individual. Also called **occlusometer.**

gnathodynia /nā′thōdin′ē·ə/ [Gk, *gnathos* + *odyne,* pain], pain in the jaw, such as that commonly associated with an impacted wisdom tooth. Also called **gnathalgia.**

gnathology /nāthol′əjē/ [Gk, *gnathos* + *logos,* science], a field of dental or medical study that deals with the entire chewing apparatus, including its anatomical, histological, morphological, physiological, and pathological characteristics. Diagnostic, therapeutic, and rehabilitative procedures result from these studies.

gnathoschisis. See **cleft palate.**

gnathostatic cast /nā′thōstat′ik/ [Gk, *gnathos* + *statike,* weighing; ME, *casten*], a cast or mold of the teeth trimmed so that its occlusal plane is in its normal oral attitude when the cast is set on a horizontal surface. It is used in orthodontic diagnosis based on gnathostatics.

gnathostatics /nā′thōstat′iks/ [Gk, *gnathos* + *statike,* weighing], a technique of orthodontic diagnosis based on an analysis of the relationships between the teeth and certain reference points on the skull. See also **gnathostatic cast.**

Gnathostoma /nathos′tomə/ [Gk, *gnathos* + *stoma,* mouth], a genus of parasitic nematodes of the family Gnathostomatidae characterized by distinct jaws. *G. spinigerum* is parasitic in cats, dogs, and humans after they eat raw fish containing the larvae, causing gnathostomiasis. See also **gnathostomiasis.**

gnathostomiasis /nath′ōstōmī′əsis/ [Gk, *gnathos* + *stoma,* mouth + *osis,* condition], infection with the nematode *Gnathostoma spinigerum,* occurring when undercooked fish harboring the larvae is eaten. Because of its consumption of raw fish, the population of Southeast Asia, especially residents of Thailand and Japan, are particularly at risk. The larvae migrate, often in the subcutaneous tissue, causing a creeping eruption associated with intense eosinophilia. Occasionally they migrate to deeper tissues and cause abscesses or to the central nervous system, where they cause eosinophilic myeloencephalitis. The infection is treated by surgical removal or treatment with albendazole or ivermectin. See also **cutaneous larva migrans.**

gno-, prefix meaning "to know or discern": *gnosia, gnosis*.

-gnomonic, -gnomonical, suffix meaning "signs or experience in knowing or judging (a condition)": *pathognomonic, physiognomonic, thanatognomonic*.

-gnomy, suffix meaning the "science or means of judging" something specified: *craniognomy, pathognomy, physiognomy*.

-gnosia, suffix meaning a "(condition of) perceiving or recognizing": *acognosia, hypergnosia, topognosia*.

-gnosis, suffix meaning "knowledge": *acrognosis, diagnosis, topognosis*.

gnotobiotic /nō′tōbī·ot′ik/, pertaining to a germ-free animal or an animal or an environment in which all the microorganisms are known. See also **germ-free animal.**

GNP, abbreviation for **geriatric nurse practitioner.**

GnRH, abbreviation for **gonadotropin-releasing hormone.**

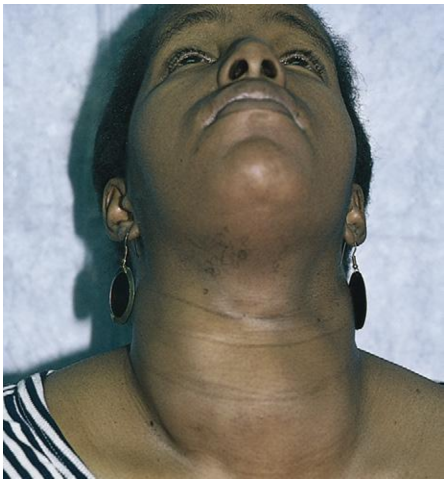
goal /gōl/ [ME, *gol,* limit], the purpose toward which an endeavor is directed, such as the outcome of diagnostic, therapeutic, and educational management of a patient's health problem.

goal-oriented movements, voluntary movements that are organized around behavioral goals, environmental context, and task specificity, as distinguished from reflexive movements.

GOAT, abbreviation for **Galveston Orientation and Amnesia Test.**

goblet cell [ME, *gobelet,* small bowl], one of the many specialized epithelial cells that secrete mucus and form glands of the epithelium of the stomach, the intestine, and parts of the respiratory tract. Also called **beaker cell, chalice cell.** See also **gland.**

goiter /goi′ter/ [L, *guttur,* throat], an enlarged thyroid gland, usually evident as a pronounced swelling in the neck. The enlargement may be associated with hyperthyroidism, hypothyroidism, or normal levels of thyroid function. It may be cystic or fibrous, containing nodules or an increased number of follicles. The goiter may surround a large blood vessel, or a part of the enlarged gland may be situated beneath the sternum or in the thoracic cavity. Treatment may include total or subtotal surgical removal, the administration of antithyroid drugs or radioiodine, or use of thyroid hormone to block the pituitary mechanism that releases thyroid-stimulating hormone. After thyroidectomy, maintenance therapy with thyroid hormone may be required. Also spelled *goitre*. See specific goiters. —*goitrous, adj*.



Goiter *(Swartz, 2009)*

goitrogenic glycoside /goi′trəjen′ik/, a glycoside that may cause hyperthyroidism or a goiter.

goitrous thyroiditis. See **Hashimoto's disease.**

gold (Au) [AS, *geolu,* yellow], a yellowish soft metallic element that occurs naturally as a free metal and as the telluride $AuAgTe_4$. Its atomic number is 79; its atomic mass is 196.97. Gold has been highly valued since antiquity and has been and is used for currency, for ornamentation, and as a dental restorative material. It is usually hardened by alloying it with small amounts of nickel or copper. It is highly resistive to oxidation but can be dissolved in aqua regia and aqueous potassium cyanide. Gold salts, in which gold is attached to sulfur, are often used in the treatment, or chrysotherapy, of patients with rheumatoid arthritis but cause serious toxicity in about 10% of patients and some toxicity in 25% to 50%. See also **chrysotherapy.**

gold-198, a radioactive gold antineoplastic.

■ INDICATIONS: It is prescribed for treatment of cancer of the prostate, cervix, and bladder and for reduction of fluid accumulation secondary to a cancer.

■ CONTRAINDICATIONS: Ulcerative tumors, pregnancy, lactation, or unhealed surgical wounds prohibit its use. It is not prescribed for patients less than 18 years of age.

■ ADVERSE EFFECT: The most serious adverse effect is radiation sickness.

Goldblatt kidney, an abnormal kidney in which constriction of a renal artery leads to ischemia and release of renin, a pressor substance associated with hypertension.

gold compound, a drug containing gold salts, usually administered with other drugs in the treatment of rheumatoid arthritis. Gold is potentially toxic and is administered only under the supervision of a specialist in chrysotherapy. Toxic reactions range from mild dermatoses to lethal poisoning. Various radioisotopes of gold have been used in diagnostic radiology and in radiological treatment of certain malignant neoplastic diseases.

Goldenhar's syndrome /gōl′dən·härz/ [Maurice Goldenhar, Swiss physician, 20th century], a congenital condition characterized by colobomas of the upper eyelid, dermoids on the eyeball, bilateral accessory auricular appendages anterior to the ears, and vertebral anomalies, frequently associated with characteristic facies, consisting of asymmetry of the skull, prominent frontal bossing, low hairline, mandibular hypoplasia, low-set ears, and sometimes smallness of the mouth on one side. Also called **OAV syndrome, oculoauriculovertebral dysplasia.**

goldenseal, a perennial herb found in the Ohio River valley.

■ USES: It is used for high blood pressure, poor appetite, infections, menstrual problems, minor sciatic pain, and muscle spasms. It is also used as an eye wash and by some hoping to hide the presence of marijuana, cocaine, or other illicit drugs in the urine. Goldenseal is ineffective at masking illicit drugs in urine tests. There is insufficient reliable information to gauge its efficacy for other uses.

■ CONTRAINDICATIONS: It is probably not safe when used at high doses or long term. The active constituent berberine can cause significant toxicity. Goldenseal is contraindicated in women who are pregnant (it is a uterine stimulant) or breastfeeding, and it should not be used in infants. It also should not be used in people with known hypersensitivity to this herb or with cardiovascular conditions such as heart block, arrhythmias, or hypertension. It should not be used locally for purulent ear discharge or in a ruptured ear drum.

gold foil, pure gold that has been rolled and beaten into a very thin sheet, used for making foil pellets, which are a direct dental restorative material. The main types of gold foil are cohesive, semicohesive, and noncohesive.

gold inlay, an intracoronal cast restoration of gold alloy that restores one or more tooth surfaces within the cusp prominences of a posterior tooth. It is held in place by the internal walls of the tooth and dental cements.

Goldman-Fox knife, a dental surgical instrument with a sharp cutting edge, designed for the incision and contouring of gingival tissue. Also called **Fox's knife.**

gold sodium thiomalate, an antirheumatic.

■ INDICATION: It is prescribed for the treatment of rheumatoid arthritis.

■ CONTRAINDICATIONS: Severe debilitation, systemic lupus erythematosus, renal or liver disease, blood dyscrasias, Sjögren's syndrome (in rheumatoid arthritis), or known hypersensitivity to this drug or to other gold or heavy metal salts prohibits its use.

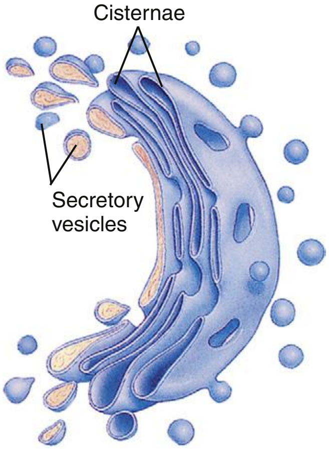
■ ADVERSE EFFECTS: Among the most serious adverse effects are various blood dyscrasias, renal damage, and allergic reactions. Dermatitis, stomatitis, and lesions of the mucous membranes also may occur.

gold standard, **1.** an accepted test that is assumed to be able to determine the true disease state of a patient regardless of positive or negative test findings or sensitivities or specificities of other diagnostic tests used. **2.** an acknowledged measure of comparison of the superior effectiveness or value of a particular medication or other therapy as compared with that of other drugs or treatments.

gold therapy. See **chrysotherapy.**

golfer's elbow, an informal term for inflammation of the medial epicondyle of the humerus, associated with repeated use of the wrist flexors.

Golgi apparatus /gôl′jē/ [Camillo Golgi, Italian histologist and Nobel laureate, 1843–1926; L, *ad,* toward, *praeparare,* to prepare], one of many small membranous structures found in most cells, composed of various elements associated with the formation of carbohydrate side chains of glycoproteins, mucopolysaccharides, and other substances. Saccules within each structure migrate through the plasma membrane and release substances associated with external and internal secretion. Also called **Golgi body, Golgi complex.**

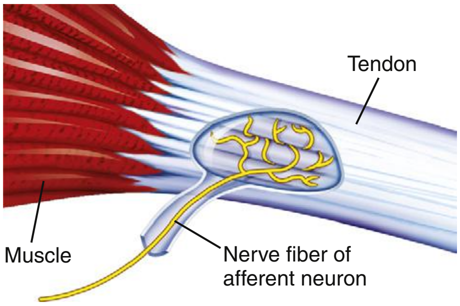


Golgi apparatus *(Thibodeau and Patton, 2007)*

Golgi-Mazzoni corpuscles /gôl′jē matsō′nē/ [Camillo Golgi; Vittori Mazzoni, Italian physiologist, 1880–1940], a number of thin capsules enveloping terminal nerve fibrils in the subcutaneous tissue of the fingers. They have thicker cores than Pacini's corpuscles but are similar special sensory end organs. Compare **Krause's corpuscles, Pacini's corpuscles, Ruffini's corpuscles.**

Golgi's cells [Camillo Golgi; L, *cella,* storeroom], **1. Golgi type I neurons,** nerve cells having long axons that leave the local neurophil area of the parent cell body, traverse the white matter, and project to the rest of the nervous system. **2. Golgi type II neurons,** nerve cells with short trajectory axons, like stellate cells of the cerebral and cerebellar cortex. They generally do not enter white matter but remain within the local neurophil in the cerebral and cerebellar cortices and the retina.

Golgi tendon organ [Camillo Golgi], a sensory nerve ending that is sensitive to both tension and excessive passive stretch of a skeletal muscle.

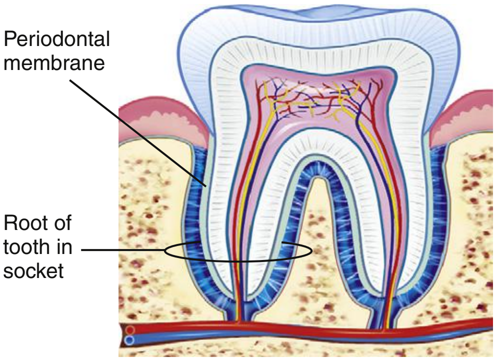


Golgi tendon organ

Golgi type I neurons, Golgi type II neurons. See **Golgi's cells.**

Goltz's syndrome. See **focal dermal hypoplasia.**

gomphosis /gomfō′sis/ *pl. gomphoses* [Gk, *gomphos,* bolt], an articulation by the insertion of a conical process into a socket, such as the insertion of a root of a tooth into an alveolus of the mandible or the maxilla. Gomphosis is not a connection between true bones but is considered a type of fibrous joint. Compare **sutura, syndesmosis.**



Gomphosis

gon-, gono-, gony-, **1.** prefix meaning "semen or seed": *gonococcin, gonophore, gonotome.* **2.** prefix meaning "knee": *gonycampsis, gonyectyposis, gonyoncus.*

gonad /gō′nad/ [Gk, *gone,* seed], a gamete-producing gland, such as an ovary or a testis. —*gonadal, adj.*

gonadal aplasia /gō′nədəl/, a congenital state in which there is defective development of the germinal tissues of the gonads.

gonadal cords, epithelial cells derived from the coelomic epithelium that penetrate the underlying mesenchyme, where they form cords. Also called **primordial sex cords.**

gonadal dose, the amount of radiation received by the gonads as a result of a radiographic examination. It may vary from less than 1 mrad for a dental or chest radiograph to 225 mrad for a lumbar spine radiograph. During pelvimetry a fetus receives 800 mrad.

gonadal dysgenesis, a general designation for a variety of conditions involving anomalies in the development of the gonads, such as Turner's syndrome, hermaphroditism, and gonadal aplasia.

gonadal shield, a specially designed contact or shadow shield used to protect the gonadal area of a patient from the primary radiation beam during radiographic procedures. It is generally used for patients who are potentially reproductive, including women less than 40 years of age and all males.

gonado-, prefix meaning relationship to the gonads.

gonadoblastoma /gō′nədōblastō′mə/ [Gk, *gone,* seed + *blastos,* germ + *-oma,* tumor], a rare benign type of germ cell tumor, usually occurring in patients with gonadal dysgenesis, and often bilateral. It contains all gonadal elements and is frequently associated with an abnormal chromosomal karyotype. It may give rise to a dysgerminoma or other more malignant germ cell tumor. See also **dysgerminoma, gonadal dysgenesis.**

gonadorelin acetate, the acetate ester of gonadorelin, having the same actions and uses as the hydrochloride salt. It is also used in the treatment of delayed puberty, female infertility, and amenorrhea; it is administered subcutaneously or intravenously.

gonadotrophic /gō′nədōtrof′ik/, **1.** pertaining to genitalia. **2.** capable of influencing the gonads. **3.** relating to the state in which the gonads exert influence on the body.

gonadotropic /gō′nədōtrop′ik/, acting on or stimulating the gonads. Also called **gonadotrophic.** See also **gonadotropin.**

gonadotropin /gō′nədōtrop′in/ [Gk, *gone* + *trophe,* nourishment], a hormonal substance that stimulates the function of the testes and the ovaries. The gonadotropic follicle-stimulating hormone and luteinizing hormone are produced and secreted by the anterior pituitary gland. In early pregnancy, human chorionic gonadotropin is produced by the placenta (basis for early pregnancy detection). It acts to sustain the function of the corpus luteum of the ovary, forestalling menstruation and thus maintaining pregnancy. Gonadotropins are prescribed to induce ovulation in infertility that is caused by inadequate stimulation of the ovary by endogenous gonadotropic hormones. Excessive stimulation of the ovary may result in vast enlargement of the gland, maturation of many follicles, multiple pregnancy, bleeding into the abdomen, and pain. While named for their effects on the ovaries, follicle-stimulating hormone and luteinizing hormone are also major gonadotropins in the testes, causing the Leydig cells to secrete testosterone and facilitating spermatogenesis. Also called *gonadotrophin*. **—gonadotropic, gonadotrophic,** *adj*.

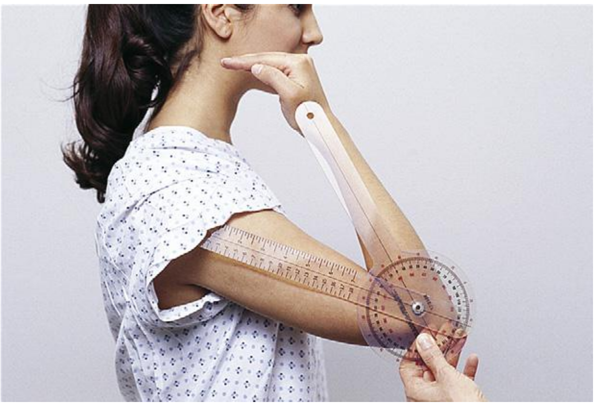
gonadotropin-releasing hormone (GnRH) [Gk, *gone*, seed, *trope*, a turn; ME, *relesen;* Gk, *hormaein*, to set in motion], a decapeptide hypophysiotropic hormone secreted by the hypothalamus. It stimulates the release of **luteinizing hormone** and **follicle-stimulating hormone** by the anterior pituitary.

gonial angle. See **angle of mandible.**

-gonic, suffix meaning "work required to facilitate a specified reaction": *dysgonic, endergonic, exergonic*.

gonio-, prefix meaning "angle": *goniocraniometry, goniometer, gonion*.

goniometer /gon′ē·om′ətər/, an instrument used to measure angles, particularly range-of-motion angles of a joint.



Goniometer *(Wilson and Giddens, 2009)*

goniometry /gon′ē·om′ətrē/ [Gk, *gonia*, angle, *metron*, measure], **1.** a system for measuring angles of a joint. **2.** a system for measuring angles during testing for various labyrinthine diseases that affect the sense of balance. One test uses a plank, one end of which may be raised to any desired height. The patient stands on the plank as one end is gradually raised, and the point at which he or she can no longer maintain balance is noted. —*goniometric, adj*.

gonion /gō′nē·on/ *pl*. *gonia* [Gk, *gōnia*, angle], an anthropometric landmark located at the most inferior, posterior, and lateral point on the external angle of the mandible, being the apex of the maximum curvature of the mandible, where the ascending ramus becomes the body of the mandible. See also **mandible.**

gonioscope /gō′nē·əskōp′/ [Gk, *gonia* + *skopein*, to look], a mirrored optical instrument used to examine the filtration angle of the anterior chamber of the eye. The mirrors permit visualization of the angle by means of a reflected image.

goniotomy /gōn′ē·ot′əmē/, an operation performed to remove any obstruction to the flow of aqueous humor in the front chamber of the eye. The procedure is commonly done in patients with congenital glaucoma.

gon(o) [word element, [Gr.]], combining form meaning *angle*.

gonoblast. See **germ cell.**

gonococcal /gon′əkok′əl/ [Gk, *gone*, seed, *kokkos*, berry], pertaining to or resembling gonococcus.

gonococcal pyomyositis [Gk, *gone*, seed, *kokkos*, berry, *pyon*, pus, *mys*, muscle, *itis*, inflammation], an acute inflammatory condition of a muscle caused by infection with ***Neisseria gonorrhoeae,*** characterized by abscess formation and pain. It is an unusual form of gonorrhea and must be differentiated from sarcoma. Diagnosis is made by the discovery of the gonococcal diplococci within the abscess when a bacterial culture of a specimen is prepared after exploratory surgery. The patient is then usually found to be asymptomatically infected in the urogenital organs. Antibiotic treatment, most often with ceftriaxone, is rapidly effective in curing the infection.

gonococcal salpingitis [Gk, *gone*, seed, *kokkos*, berry, *salpigx*, tube, *itis*, inflammation], an inflammation of the fallopian tubes caused by a gonococcal infection. Also called **gonorrheal salpingitis.**

gonococcal urethritis [Gk, *gone*, seed, *kokkos*, berry, *ourethra*, urethra, *itis*, inflammation], inflammation of the urethra caused by an infection of ***Neisseria gonorrhoeae.*** Also called **gonorrheal urethritis.**

gonococcus /gon′əkok′əs/ pl. **gonococci** [Gk, *gone* + *kokkos*, berry], a gram-negative intracellular diplococcus of the species ***Neisseria gonorrhoeae,*** the cause of gonorrhea; a nonmotile aerobic microorganism of the species *N. gonorrhoeae*. It is a parasite of the mucous membrane.

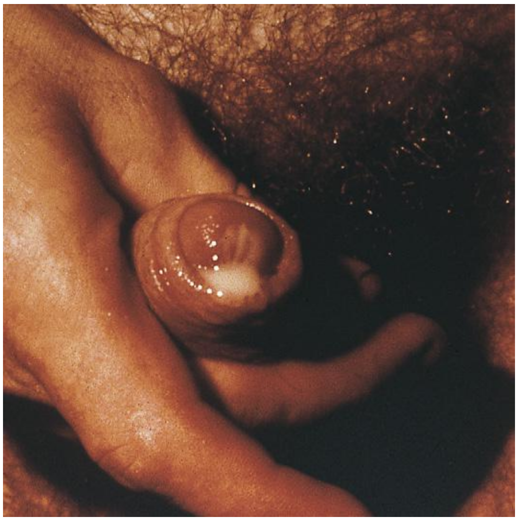
gonocyte. See **germ cell.**

gonorrhea /gon′ərē′ə/ [Gk, *gone* + *rhoia*, flow], a common sexually transmitted disease that most often affects the genitourinary tract and occasionally the pharynx or rectum. Infection results from contact with an infected person or with secretions containing the causative organism ***Neisseria gonorrhoeae.*** Infants born to infected women may acquire conjunctival infection from passage through the birth canal. Gonorrheal infections must be reported to local health departments in the United States. The Centers for Disease Control and Prevention estimate that more than 700,000 new infections occur annually. Also spelled *gonorrhoea*.**—gonorrheal, gonorrheic,** *adj*.

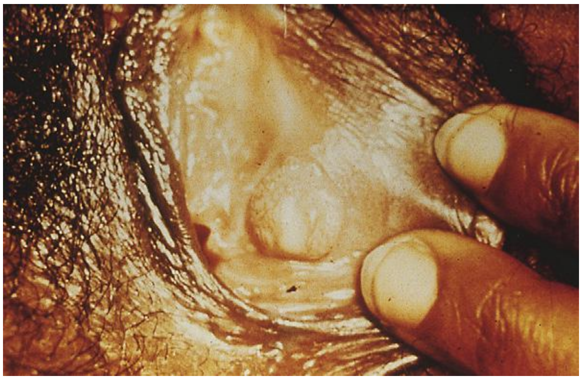
■ OBSERVATIONS: Urethritis; dysuria; purulent, greenish-yellow urethral or vaginal discharge; red or edematous urethral meatus; and itching, burning, or pain around the vaginal or urethral orifice are characteristic. The vagina may be massively swollen and red, and the lower abdomen may be tense and very tender. As the infection spreads, as occurs more commonly in women than in men, nausea, vomiting, fever, and tachycardia may occur as salpingitis, oophoritis, or peritonitis develops. Inflammation of the tissues surrounding the liver also may occur, causing pain in the upper right quadrant of the abdomen. Severe disseminated infection is also more common in women than in men and is characterized by signs of septicemia with polyarthritis, tender papillary lesions on the skin of the hands and feet, and inflammation of the tendons of the wrists, knees, and ankles. Gonococcal ophthalmia involves infection of the conjunctiva and may lead to scarring and blindness. Gonorrhea is diagnosed by bacteriological culture of the organism from a smear obtained from a specimen of exudate. In men a microscopic study of a Gram's-stained specimen of exudate that reveals gram-negative intracellular diplococci is diagnostic of gonorrheal infection, but this finding is not diagnostic in women.

■ INTERVENTIONS: The recommended regimen for uncomplicated gonorrhea is ceftriaxone, 125 mg, intramuscularly once or doxycycline, 100 mg, orally twice daily for 7 days. Generally patients with gonorrhea infections should be treated simultaneously for presumptive chlamydial infections. Alternative medications are ciprofloxacin, ofloxacin, cefixime, and azithromycin. Treatment failure of this regimen is rare; therefore a follow-up culture for test of cure is not essential. The routine instillation of 1% solution of silver nitrate or topical ophthalmic antibiotic into the eyes of the newborn provides effective prophylaxis against conjunctival infection in the newborn period that might otherwise result from contact with the infected secretions of an asymptomatic infected mother during vaginal delivery.

■ NURSING CONSIDERATIONS: It is important that the patient's sexual contacts be treated. Before administration of any antibiotic it is ascertained that the patient does not have any known sensitivity to the drug being given and that equipment and drugs are available to treat any hypersensitivity reaction that may occur. Precaution against spread of the disease is recommended through condom use or monogamous sexual relations.



Gonorrhea in the male patient *(Morse et al, 2010)*



Gonorrhea in the female patient *(Morse et al, 2010)*

gonorrheal /gon′ərē′əl/ [Gk, *gone,* seed, *kokkos*], pertaining to or resembling gonorrhea.

gonorrheal arthritis [Gk, *gone,* seed, *kokkos,* berry, *arthron,* joint, *itis,* inflammation], a blood-borne gonococcal infection of the joints. It may affect one or several joints, may occur as a chronic or acute form, and often leads to joint fusion. Infection may result in pus formation in an affected joint.

gonorrheal conjunctivitis, a severe, destructive form of purulent conjunctivitis caused by the gonococcus *Neisseria gonorrhoeae*. Prompt treatment by the IV administration of antibiotics is required to prevent scarring of the cornea and blindness. Newborns receive routine prophylaxis of a topical ophthalmic instillation of 1% solution of silver nitrate or an antibiotic ophthalmic ointment. The treatment has largely eradicated the infection in infants. See also **ophthalmia neonatorum.**

gonorrheal proctitis [Gk, *gone,* seed, *rhoia,* flow, *proktos,* anus, *itis,* inflammation], an inflammation of the rectum caused by an infection of gonorrhea.

gonorrheal salpingitis. See **gonococcal salpingitis.**

gonorrheal urethritis. See **gonococcal urethritis.**

gonorrheic. See **gonorrhea.**

-gony, suffix meaning "birth, origin, or procreation": *amphigony, merogony, zoogony.*

Gonyaulax catenella /gon′ē·ô′laks/, a species of toxin-producing planktonic protozoa ingested by shellfish along the coasts of North America that causes shellfish poisoning. It colors the sea red in an infected area. The phenomenon is called **red tide**. See also **shellfish poisoning.**

Goodell's sign /go͝odelz′/ [William Goodell, American gynecologist, 1829–1894], softening of the uterine cervix, a probable sign of pregnancy.

good faith and fair dealing, **1.** actions taken with the best interests of the patient in mind and without harmful intent. **2.** in employee relations, an implied covenant preventing an employer from terminating an employee solely to avoid paying the employee for services already performed.

Goodman's syndrome /good′mənz/ [Richard M. Goodman, Israeli physician, 20th century], an autosomal-recessive form of acrocephalopolysyndactyly characterized also by congenital heart defects, sidewards deviation and abnormal flexion of digits, and ulnar drift, but with unimpaired intelligence. Also called **Carpenter's syndrome, Noack's syndrome, Sakati-Nyhan syndrome.** See also **acrocephalopolysyndactyly.**

Goodpasture's syndrome /go͝od′pas·chər/ [Ernest W. Goodpasture, American pathologist, 1886–1960], a chronic relapsing pulmonary hemosiderosis, an autoimmune disease usually associated with glomerulonephritis and characterized by a cough with hemoptysis, dyspnea, anemia, and progressive renal failure. Mild forms may respond to corticosteroids or immunosuppressive drugs. Severe recurrent cases have a poor prognosis; hemodialysis and kidney transplantation are the only treatments.

Goodrich, Annie Warburton, (1866–1954), an American nursing educator who was instrumental in advancing nursing from an apprenticeship to a profession. She was superintendent of nurses at several New York hospitals before going to Teachers College, Columbia University, in 1914. In addition to teaching, she was associated with the Henry Street Settlement and the Nursing Department of the U.S. Army. In 1923 she became dean of the newly formed School of Nursing at Yale University, which awarded a degree similar to that awarded in other professions.

Good Samaritan legislation /səmar′itən/ [good Samaritan, from New Testament parable; L, *lex,* law, *lator,* proposer], laws enacted in most states to protect physicians, dentists, nurses, and some other health professionals from liability while rendering emergency medical or dental aid, unless there is proven willful wrong or gross negligence.

gooseflesh. See **pilomotor reflex.**

Gopalan's syndrome. See **burning feet syndrome.**

Gordon's elementary body [Mervyn H. Gordon, English physician, 1872–1953], a particle found in tissues containing eosinophils, once thought to be the viral cause of Hodgkin's disease. Also called **Gordon's encephalopathic agent.**

Gordon's reflex [Alfred Gordon, American neurologist, 1874–1953], **1.** an abnormal variation of Babinski's reflex, elicited by compressing the calf muscles, characterized by dorsiflexion of the great toe and fanning of the other toes. It is evidence of disease of the pyramidal tract. **2.** an abnormal reflex, elicited by compressing the forearm muscles, characterized by flexion of the fingers or of the thumb and index finger. It is seen in diseases of the pyramidal tract. Compare **Chaddock reflex, Oppenheim reflex.** See also **Babinski's reflex.**

Gordon's syndrome /gôr′dənz/ [Richard D. Gordon, Australian physician, 20th century], a type of pseudohypoaldosteronism with hypertension and hyperkalemia but without salt wasting, thought to be caused by abnormally increased absorption of chloride by the renal tubules. See also **pseudohypoaldosteronism.**

Gorham's disease /gor′əmz/ [Lemuel Whittington Gorham, American physician, 1885–1968], a gradual, but often complete, resorption of a bone or group of bones, which may be associated with multiple hemangiomas. It usually occurs in children or young adults, sometimes following trauma, but its cause is unknown.

Gosselin's fracture /gôslaNz′/ [Leon A. Gosselin, French surgeon, 1815–1847], a V-shaped break in the distal tibia, extending to the ankle.

GOT, abbreviation for **glutamic oxaloacetic transaminase.** See **aspartate aminotransferase.**

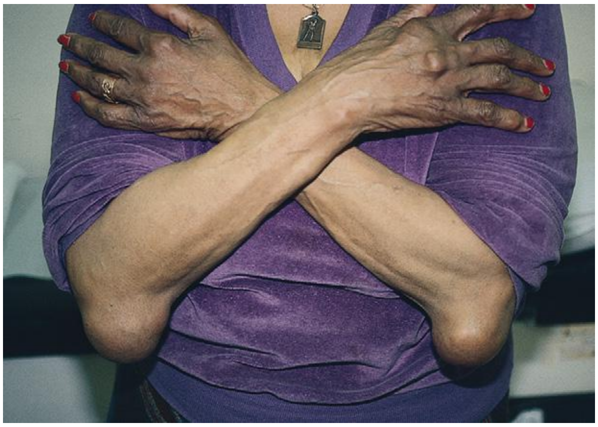
gotu kola, a creeping herb found in swamps of Africa, Sri Lanka, and Madagascar.

■ USES: It is taken systemically to treat venous insufficiency and for a variety of other reasons, including improving memory and intelligence, and it is used topically to treat chronic wounds and psoriasis. It may be effective for its topical indications and for treating venous insufficiency. There are insufficient reliable data for any of its other uses.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation or in children until more research is available. Those with known hypersensitivity to this herb or to members of the celery family should not use this product.

goundou /go͞on′do͞o/ [West African], a condition characterized by bony exostoses of the nasal and maxillary bones, usually occurring as a late sequela of yaws in people in Africa and Latin America. Also called **anakhré.** See also **yaws.**

gout [L, *gutta,* drop], a disease associated with an inborn error of uric acid metabolism that increases production or interferes with excretion of uric acid. Excess uric acid is converted to sodium urate crystals that precipitate from the blood and become deposited in joints and other tissues. Men are more often affected than premenopausal women. The great toe is a common site for the accumulation of urate crystals. The condition can cause exceedingly painful swelling of a joint, accompanied by chills and fever. The symptoms are recurrent. Episodes become longer each year. The disorder is disabling and, if untreated, can progress to the development of destructive joint changes, such as tophi. Treatment usually includes administration of colchicine, phenylbutazone, indomethacin, or glucocorticoid drugs and a diet that excludes purine-rich foods such as organ meats. It may include surgical removal of ulcerated tophi. Chronically, probenecid, allopurinol, or colchicine may be used to decrease uric acid levels. Acquired gout is a condition having the signs and symptoms of gout but resulting from another disorder or treatment for a different condition. Diuretic drugs can alter the concentration of uric acid so that uric acid salts precipitate from the blood and are carried to the joints. See also **chondrocalcinosis, Lesch-Nyhan syndrome, tophus.**



Gout *(Swartz, 2009)*

gouty /gou′tē/ [L, *gutta,* drop], pertaining to or resembling the condition of gout.

gouty arthritis. See **gout.**

Gowers' muscular dystrophy. See **distal muscular dystrophy.**

GP, abbreviation for **general practitioner.**

gp160, a glycoprotein found on the outer surface, or envelope, of the human immunodeficiency virus. It is composed of gp120, which protrudes from the envelope, and gp41, which is embedded in the envelope.

GPB, abbreviation for **glossopharyngeal breathing.**

GPT, abbreviation for **glutamic pyruvic transaminase.** See **alanine aminotransferase.**

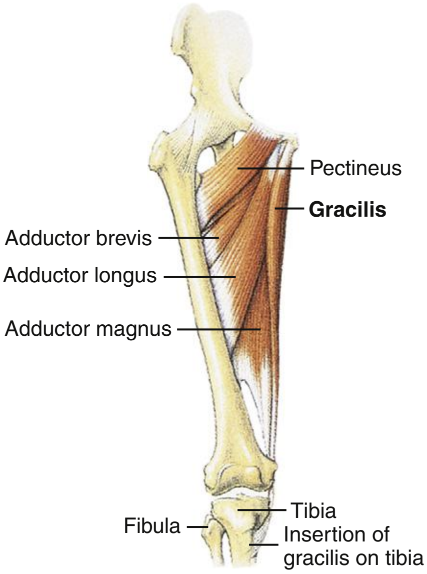
GPWW, abbreviation for **group practice without walls.**

gr, abbreviation for **grain.**

graafian follicle /grä′fē·ən, -grā′-/ [Reijnier de Graaf, Dutch physician, 1641–1673; L, *folliculus,* small bag], a mature ovarian vesicle, measuring about 10 to 12 mm in diameter, that ruptures during ovulation to release the ovum. Many primary ovarian follicles, each containing an immature ovum about 35 μm in diameter, are embedded near the surface of the ovary, just below the tunica albuginea. Under the influence of the follicle-stimulating hormone from the adenohypophysis, one ovarian follicle ripens into a graafian follicle during the proliferative phase of each menstrual cycle. The cells that form the graafian follicle are arranged in a layer three to four cells thick around a relatively large volume of follicular fluid. Within the follicle the ovum grows to about 100 μm in diameter, ruptures, and is swept into the fimbriated opening of the uterine tube. The cavity of the follicle collapses when the ovum is released, and the remaining follicular cells greatly enlarge to become the corpus luteum. If the ovum is fertilized, the corpus luteum grows and becomes the corpus luteum of pregnancy, which degenerates by the end of 9 months and has a diameter of about 30 mm. As the ovarian follicle ripens into the graafian follicle, it produces estrogen, which stimulates the proliferation of the endometrium and the enlargement of the uterine glands. The growing corpus luteum produces progesterone, which triggers endometrial gland secretion and prepares the uterus to receive the fertilized ovum. If the ovum is not fertilized, the graafian follicle forms the corpus luteum of menstruation, which degenerates before the next menstrual cycle, leaving the small scarred corpus albicans.

gracile /gras′il/, long, slender, and graceful.

gracilis /gras′ilis/, the most superficial of the five medial femoral muscles. It is a thin, flattened muscle that is broad proximally and narrow distally. It functions to adduct the thigh and flex the leg and to assist in the medial rotation of the leg after it is flexed. Compare **adductor brevis, adductor longus, adductor magnus, obturator externus.**



Gracilis muscle *(Patton and Thibodeau, 2010)*

gradation of activity /gradā′shən/, therapeutic activities that are appropriately paced and modified to demand maximal capacities at any point in progression or regression of the patient's condition.

graded exercise test (GXT), a test given a cardiac patient during rehabilitation to assess prognosis and quantify maximal functional capacity. The test is given before discharge to determine guidelines for activity programs at home and work during convalescence. See also **exercise electrocardiogram.**

gradient /grā′dē·ənt/ [L, *gradus,* step], **1.** the rate of increase or decrease of a measurable phenomenon, such as temperature or pressure. **2.** a visual representation of the rate of change of a measurable phenomenon; a curve.

gradient former, a device for the preparation of linear-density gradient medium in a column for gradient electrophoresis.

gradient gel electrophoresis, gel electrophoresis performed in a concentration gradient gel with progressively decreasing pore size.

gradient magnetic field, a magnetic field that changes in strength in a given direction. Such fields are used in magnetic resonance imaging (MRI) to select a region for imaging and to encode the location of MRI signals received from the object being imaged.

gradient plate technique, a method for isolating antibiotic-resistant bacteria mutants by exposing an agar plate containing concentration gradient of antibiotic to an inoculation of bacteria to be tested.

graduated bath /graj′o͞o·a′tid/ [L, *gradus,* step; AS, *baeth*], a bath in which the temperature of the water is slowly reduced.

graduated muscular contractions, controlled shortening of muscle units in properly timed and adequate response to a stimulus. The contractions may be induced by the central nervous system or by electric stimulation. Contractile force can be controlled by varying the number of units that contract or by increasing the frequency of contractions.

graduated resistance exercise. See **progressive resistance exercise.**

graduate medical education /graj′o͞o·it/, formal medical education pursued after receipt of the doctor of medicine (M.D.) or other professional degree in the medical sciences, usually as an intern, resident, or fellow.

Graduate Medical Education National Advisory Committee (GMENAC), a committee established by order of the Secretary of the Department of Health, Education, and Welfare (now the Department of Health and Human Services) to study the personnel issues in medicine. The committee issued its final report in September 1980. Among its conclusions was that the supply of nurses in expanded roles, including nurse practitioners and nurse midwives, should be increased.

graduate nurse (GN) [L, *gradus,* step, *nutrix,* nurse], a nurse who is a graduate of an accredited school of nursing, but not yet licensed.

Graduate Record Examination (GRE), an examination administered to graduates of institutions of higher learning. The scores are used as criteria for admission to master's and doctoral programs in many institutions and areas of specialization, including nursing. The examination tests verbal and mathematical aptitudes and abilities.

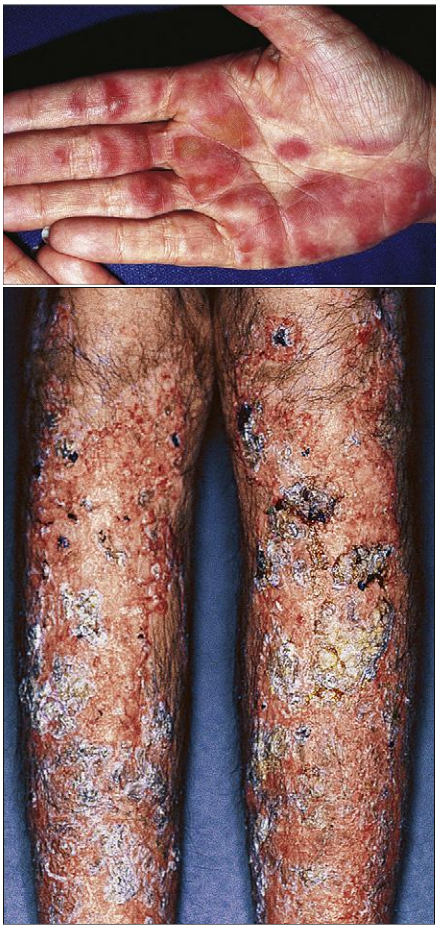
GRAE, abbreviation for **generally recognized as effective.**

graft [Gk, *graphion,* stylus], a tissue or an organ taken from a site or a person and inserted into a new site or person, performed to repair a defect in structure. The graft may be temporary, such as an emergency skin transplant for extensive burns, or permanent with the grafted tissue growing to become a part of the body. Skin, bone, cartilage, blood vessel, nerve, muscle, cornea, and whole organs, such as the kidney or the heart, may be grafted. Preoperative care focuses on a high-protein diet and vitamins to ensure optimal physical condition and on freedom from infection. With the patient under general or local anesthesia, the tissue is transferred and sutured into place. Rejection of a non-autograft is the major complication: fever, pain in the graft area, and evidence of loss of function 4 to 15 days after the procedure are indicative of rejection. Immunosuppressive drugs are given in large doses to suppress antibody production and rejection. Even if an early reaction is prevented, late rejection may occur 1 year or more after the graft is done. Also called **transplant.** See also **allograft, autograft, isograft, skin graft, xenograft.**

graft facilitation, a method for extending the survival of a graft by conditioning the recipient with an immunoglobulin-blocking factor, which suppresses graft rejection.

graft rejection, the immunological destruction of transplanted organs or tissues. The rejection may be based on both cell-mediated and antibody-mediated immunity against cells of the graft by a histoincompatible recipient. First-set rejection usually occurs within 10 days. Second-set rejection occurs within 1 week after a second graft with the same antigenic specificity as the first is placed in the same host.

graft-versus-host disease (GVHD), a rejection response of certain grafts, especially of bone marrow. It is commonly associated with inadequate immunosuppressive therapy of the donor, which allows immunocompetent cells in the donated tissue to recognize the recipient's tissues as foreign and to attack them. Because the recipient is totally immunosuppressed, the recipient's immune system cannot defend against the attack. Characteristic signs may include skin lesions with edema, erythema, ulceration, scaling, loss of hair, lesions of the joints and the heart, and hemolytic anemia with a positive Coombs' test reaction. Also called **graft-versus-host reaction, homologous disease.**



Acute graft-versus-host disease *(top)* and chronic graft-versus-host disease *(bottom)* *(Cohen, 2005)*

Graham's law /grā′əmz/ [Thomas Graham, English chemist, 1805–1869], the law stating that the rate of diffusion of a gas through a liquid (or the alveolar-capillary membrane) is directly proportional to its solubility coefficient and inversely proportional to the square root of its density.

Graham Steell murmur [Graham Steell, British physician, 1851–1942], an early diastolic murmur heard in the second intercostal space to the left of the sternum. It is associated with pulmonary valve regurgitation in pulmonary hypertension.

grain (gr) [L, *granum,* seed], the smallest unit of mass in avoirdupois, troy, and apothecaries' weights formerly based on the weight of a plump grain of wheat. The grain is the same and is equal to 65 mg. The troy and apothecaries' ounces contain 480 grains; the avoirdupois ounce contains 437.5 grains.

gram (g, gm) [L, *gramma,* small weight], a unit of mass in the metric system equal to 1/1000 kilogram, 15.432 grains, and 0.0353 ounce avoirdupois. 453.6 g = 1 lb. The preferred abbreviation is **g.**

-gram, -gramme, **1.** suffix meaning a "drawing" or a written record: *electroencephalogram, mammogram.* **2.** suffix identifying a basic unit of mass: *centigram, kilogram.*

gram calorie. See **calorie.**

gram-equivalent weight (gEq), an equivalent weight of a substance calculated as the gram mass that contains, replaces, or reacts (directly or indirectly) with the Avogadro number of hydrogen atoms. Because 1 atom of sulfur (atomic mass 32) combines with 2 atoms of hydrogen (atomic mass 1), the gram equivalent weight of sulfur is 32/2 = 16.

gram-molecular mass, a mass in grams numerically equal to the molecular weight of a substance or the sum of all the atomic masses in its molecular formula. For example, the gram-molecular weight of carbon dioxide (CO_2) is 12 (atomic mass of carbon) + (2 × 16) (atomic mass of oxygen), or 44 g. See also **mole, molecular weight.**

gram-negative [Hans C.J. Gram, Danish physician, 1853–1938; L, *negare,* to say no], having the pink color of the counterstain used in Gram's method of staining microorganisms. This property is a primary method of characterizing organisms in microbiology. Some of the most common gram-negative pathogenic bacteria are *Bacteroides fragilis,* ***Brucella abortus, Escherichia coli, Haemophilus influenzae, Klebsiella pneumoniae, Neisseria gonorrhoeae, Proteus vulgaris, Pseudomonas aeruginosa,*** *Salmonella typhi,* ***Shigella dysenteriae,*** and ***Yersinia pestis.***

gram-positive [Hans C.J. Gram; L, *positivus*], retaining the violet color of the stain used in Gram's method of staining microorganisms. This property is a primary method of characterizing organisms in microbiology. Some of the most common kinds of gram-positive pathogenic bacteria are ***Bacillus anthracis, Clostridium*** species, ***Mycobacterium*** leprae, *Mycobacterium tuberculosis,* ***Staphylococcus aureus, Streptococcus pneumoniae,*** and ***Streptococcus pyogenes.***

Gram's stain [Hans C.J. Gram], the method of staining microorganisms using a violet stain, followed by an iodine solution; decolorizing with an alcohol or acetone solution; and counterstaining with safranin. The retention of either the violet color of the stain or the pink color of the counterstain serves as a primary means of identifying and classifying bacteria. Also called **Gram's method.** See also **gram-negative, gram-positive.**

gram-variable, gram-positive bacteria that can become gram-negative after culturing.

grandiose /gran′dē·ōs′/ [L, *grandis,* great], **1.** pertaining to something or somebody imposing, impressive, magnificent; pompous and showy. **2.** pertaining to behavior or beliefs seen in a mania.

grandiosity. See **megalomania.**

grand mal seizure. See **tonic-clonic seizure.**

grand multipara /grand/ [L, *grandis,* great, *multus,* many, *parere,* to give birth], a woman who has carried six or more pregnancies to a viable stage.

grand rounds [L, *grandis* + *rotundus,* wheel], a formal conference in which an expert presents a lecture concerning a clinical issue intended to be educational for the listeners. In some settings, grand rounds may be formal teaching rounds conducted by an expert at the bedsides of selected patients.

granisetron /granis′etron/, an antiemetic used in conjunction with cancer chemotherapy or radiotherapy, administered orally or intravenously as the hydrochloride salt.

grant [ME, *granten,* to believe a request], a monetary award given to an institution, a project, equipment, or an individual by the federal government, a foundation, a private business, or an institution to provide financial support for research, service, or training. The applicant usually writes a formal application (proposal) for the grant, which is reviewed by the granting agency and compared with other proposals. The grantee is usually accountable to the grantor for reporting the outcomes as a result of the awarded resources.

granul-, prefix meaning "grains or granules": *granulase, granulocorpuscle, granulocytemia.*

granular /gran′yələr/ [L, *granulum,* little grain], **1.** macroscopically resembling or feeling like sand. **2.** microscopically appearing to have a few or many particles within or on its surface, such as a stained granular leukocyte. **—granularity,** *n.*

granular cast [L, *granulum,* little grain; ONorse, *kasta*], a mass of pathological debris composed of cells filled with protein and fatty granules.

granular conjunctivitis. See **trachoma.**

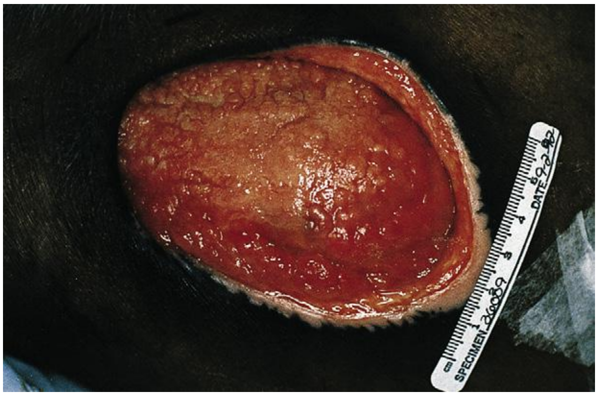
granular degeneration, swelling of cells caused by accumulation of intracellular water in response to cell injury. Also called **ballooning degeneration hydropic degeneration, cloudy swelling.**

granular endoplasmic reticulum. See **endoplasmic reticulum.**

granular induration, fibrosis of an organ, characterized by the formation of localized granular areas, as seen in cirrhosis of the liver.

granularity. See **granular.**

granulation tissue /gran′yəlā′shən/ [L, *granulum,* little grain], any soft pink fleshy projections that form during the healing process in a wound that does not heal by primary intention. The tissue consists of many capillaries surrounded by fibrous collagen. Overgrowth of granulation tissue causes proud flesh growing above the skin. See also **pyogenic granuloma.**



Granulation tissue *(Elkin, Perry, and Potter, 2007)*

granule /gran′yo͞ol/ [L, *granulum,* little grain], a particle, grain, or other small dry mass capable of free movement. Unlike powders, granules are usually free flowing because of small surface forces involved.

granulitis /gran′yəlī′tis/ [L, *granulum,* little grain; Gk, *itis,* inflammation], acute miliary tuberculosis.

granulocyte /gran′yo͝oləsīt′/ [L, *granulum* + Gk, *kytos,* cell], a type of leukocyte characterized by the presence of cytoplasmic granules. Includes **basophil, eosinophil, neutrophil,** and **monocyte.** Compare **agranulocyte.** *—granulocytic, adj.*

granulocyte colony–stimulating factor (G-CSF), a glycoprotein secreted by a variety of cells that stimulates the growth of hematopoietic stem cells and their differentiation into granulocytes. It is often used to treat patients who have become severely neutropenic as a result of chemotherapy or irradiation. See also **growth factor.**

granulocyte-macrophage colony–stimulating factor (GM-CSF), a glycoprotein secreted by macrophages that stimulates the growth of myeloid progenitor cells and their differentiation into granulocytes and macrophages. See also **growth factor.**

granulocyte transfusion, the use of specially prepared leukocytes for the treatment of severe granulocytopenia and for prophylaxis in the prevention of serious infection in patients with leukemia or those receiving cancer chemotherapy. The procedure has the same risks as a blood transfusion. Also called **buffy coat transfusion.**

granulocytic leukemia. See **myelocytic leukemia.**

granulocytic sarcoma. See **chloroma.**

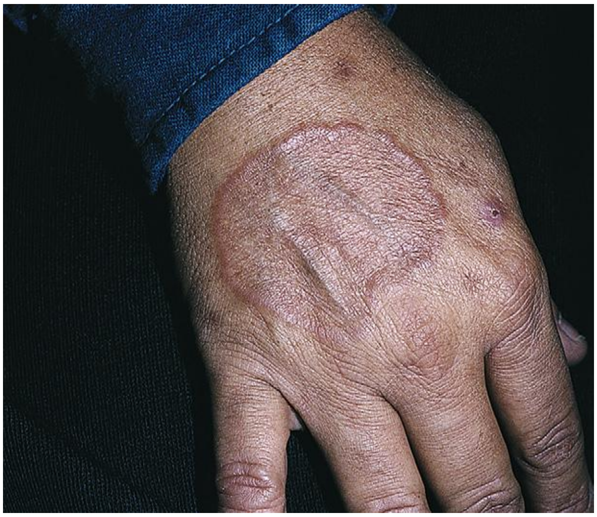
granulocytopenia /gran′yo͞olōsī′tōpē′nē·ə/ [L, *granulum* + Gk, *kytos,* cell, *penia,* poverty], an abnormal decrease in the total number of granulocytes in the blood. Also called **granulopenia, neutropenia.** Compare **granulocytosis.** See also **leukopenia.** *—granulocytopenic, adj.*

granulocytosis /gran′yo͞olōsītō′sis/ [L, *granulum* + Gk, *kytos,* cell, *osis,* condition], an abnormal increase in the total number of granulocytes in the blood, as occurs in response to infection. Compare **granulocytopenia.**

granuloma /gran′yo͝olō′mə/*pl. granulomas, granulomata* [L, *granulum* + Gk, *oma,* tumor], a chronic inflammatory lesion most commonly caused by histoplasmosis, a fungal infection. It is characterized by an accumulation of macrophages; epithelioid macrophages, with or without lymphocytes; and giant cells into a single, discrete enlarged mass. Granulomas most often occur in the lungs. They may resolve spontaneously, remain static, become gangrenous, spread, or act as a focus of infection. Treatment depends on the cause and probable course of the particular granuloma.

-granuloma, suffix meaning a “tumorlike mass or nodule of granulation tissue”: *paragranuloma, ulcerogranuloma, xanthogranuloma.*

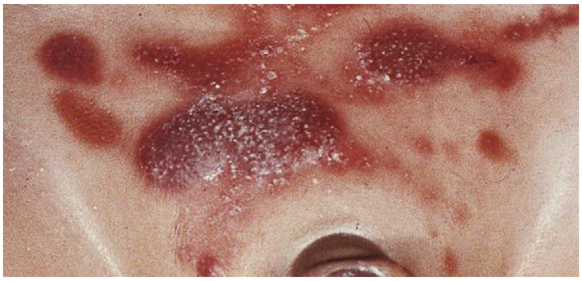
granuloma annulare, a self-limited chronic skin disease of unknown cause that consists of reddish papules or nodules arranged in a ring with a normal or sunken center. It most commonly occurs on the distal portions of the extremities in children.



Granuloma annulare *(Callen et al, 2000)*

granuloma fissuratum. See **acanthoma fissuratum.**

granuloma gluteale infantum, a skin condition of the neonate characterized by large elevated bluish or brownish red nodules on the buttocks. It often occurs as a secondary reaction to the application of strong steroid salves over time. The lesions routinely disappear within a couple of months after the use of the preparations is discontinued.



Granuloma gluteale infantum
(du Vivier, 2002/Courtesy Dr. David Atherton)

granuloma inguinale, a sexually transmitted disease characterized by ulcers of the skin and subcutaneous tissues of the groin and genitalia. It is caused by infection with *Calymmatobacterium granulomatis,* a small gram-negative rod-shaped bacillus. It occurs more frequently in men than in women and is associated with anal intercourse. Diagnosis is made by microscopic examination and identification of characteristic "safety-pin"-shaped bodies known as Donovan bodies in the cytoplasm of phagocytes taken from a lesion and dyed with Wright's or Giemsa stain or by histological examination of a biopsy specimen. Untreated, the lesions spread, deepen, multiply, and become secondarily infected, resulting in mutilation and destruction of genital tissue. Streptomycin is usually effective in treating the infection. All patients who have or are suspected of having granuloma inguinale are also tested for syphilis because concurrent infection is common. Also called **Donovanosis.**

granulomatosis /gran′yo͝olōmətō′sis/ [L, *granulum* + Gk, *oma,* tumor, *osis,* condition], a condition or disease characterized by the development of granulomas, such as **berylliosis, pulmonary Wegener's granulomatosis,** or **Wegener's granulomatosis.**

granulomatous /gran′yəlom′ətəs/ [L, *granulum,* little grain], pertaining to or resembling granulomas.

granulomatous amebic encephalitis, chronic encephalitis, usually seen in debilitated or immunocompromised patients, caused by infection with species of ***Acanthamoeba.*** It is marked by the formation of granulomas. Headache, seizures, nausea, and vomiting frequently occur.

granulomatous gastritis, chronic gastritis with granulomas of the stomach mucosa, seen with Crohn's disease, sarcoidosis, or certain other conditions.

granulomatous lipophagia [L, *granulum,* little grain; Gk, *lipos,* fat, *phagein,* to eat], a disease in which enlarged intestinal and mesenteric lymph spaces become filled with fats and fatty acids.

granulomatous prostatitis, prostatitis with granuloma formation, such as from infection with *Mycobacterium tuberculosis,* parasites, or fungi.

granulomatous thyroiditis. See **de Quervain's thyroiditis.**

granulopenia. See **granulocytopenia.**

granulopoiesis /gran′yo͝olōpōī·ē′sis/, the production or formation of granulocytes.

granulopoietin /gran′yo͞olō′pō·ē′tin/, a glycoprotein secreted by monocytes that controls the production of granulocytes by bone marrow. See also **granulocyte colony–stimulating factor.**

granulosa cell tumor /gran′yo͝olō′sə/ [L, *granulum,* little grain], a fleshy ovarian tumor with yellow streaks that originates in cells of the primordial membrana granulosa and may grow to a large size. Excessive production of estrogen, resulting in endometrial hyperplasia and menorrhagia, may be associated with the tumor. Also called **granulosa cell carcinoma.**

granulosa-lutein cells, lutein cells of the corpus luteum derived from granulosa cells.

granulosa-theca cell tumor, an ovarian tumor composed of granulosa (follicular) cells or theca cells or both. The tumor is associated with excessive production of estrogen and hyperplasia of the breast and endometrium. See also **luteoma.**

granulosis /gran′yo͝olō′sis/, any disorder characterized by an accumulation of granules in an area of body tissue, such as a skin eruption marked by tiny granules beneath the surface.

grapeseed, an herb found throughout the world.

■ USES: It is used as a chronic disease preventative and an antiinflammatory, and it is a source of essential fatty acids and antioxidant tocopherols. It is used orally for the prevention of atherosclerosis and cancer and in folk medicine for the treatment of circulatory disorders. It may improve venous tone; there are insufficient reliable data for any other indications.

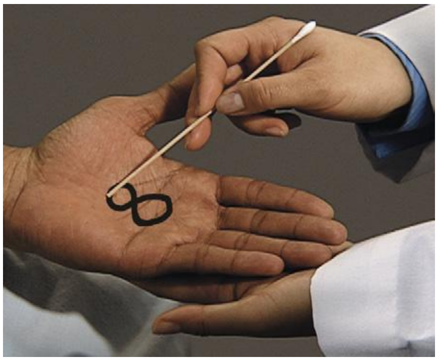
■ CONTRAINDICATIONS: Its use should be avoided during pregnancy and lactation and in children until more research is available.

-graph, **1.** suffix meaning the "product of drawing or writing": *hemophotograph, micrograph, retinograph.* **2.** suffix meaning a "machine for making something drawn": *clonograph, pneumograph, scopograph.*

graphanesthesia /graf′anəsthē′zhə/, inability to feel writing on the skin, usually caused by a central nervous system lesion, typically tested by writing numbers in the palm and asking the patient to tell the number. Also called **agraphesthesia.**

-grapher, suffix meaning "one who writes about" something specified: *nosographer, syphilographer.*

graphesthesia /graf′esthē′zhə/, ability to feel writing on the skin.



Testing for graphesthesia *(Seidel et al, 2011)*

-graphia, suffix meaning an "abnormality revealed through handwriting": *dysantigraphia, palingraphia.*

graphing /graf′ing/, the organization of data consisting of two or more variables along horizontal and vertical axes of a graph to show relationships between specific quantities or other specific factors.

graphite /graf′īt/ [L, *graphites,* from Gk, *graphis* a writing instrument], a form of native mineralized carbon whose dust causes a form of pneumoconiosis when it is inhaled. See also **pneumoconiosis.**

graphite pneumoconiosis /noo′mōkō′nē·ō′sis/, silicosis resulting from inhalation of graphite dust, which often contains up to 10 per cent silica. Also called **graphite fibrosis, graphitosis.**

grapho-, prefix meaning "writing": *graphocatharsis, graphomania, graphophobia.*

graphospasm. See **writer's cramp.**

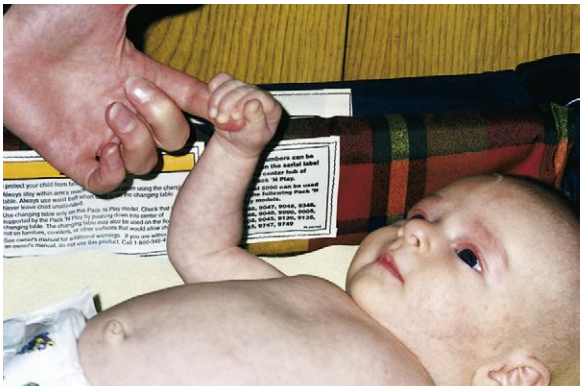
-graphy, suffix meaning a "kind of printing or process of recording": *arteriography, cardiography, dermagraphy.*

GRAS, abbreviation for **generally recognized as safe.**

Grashey method, a positioning method for producing true anteroposterior x-ray images of the scapulohumeral joint. The patient faces the x-ray tube with the affected shoulder centered to the midline of the image receptor (IR). The affected elbow is flexed, and the forearm is placed across the patient's chest. The opposite shoulder is angled 45 degrees away from the IR, and the central ray is directed perpendicularly through the affected shoulder joint.

grasping forceps, any forceps for grasping tissue and exerting traction, having finger rings and a locking mechanism.

grasp reflex [ME, *graspen,* grab; L, *reflectere,* to bend back], a reflex induced by stroking the palm or sole with the result that the fingers or toes flex in a grasping motion. The reflex is a pathological manifestation of diseases of the premotor cortex. In young infants the tonic grasp reflex is normal: the child can grasp the examiner's fingers so firmly that he or she can be lifted into the air. Also called **darwinian reflex.**

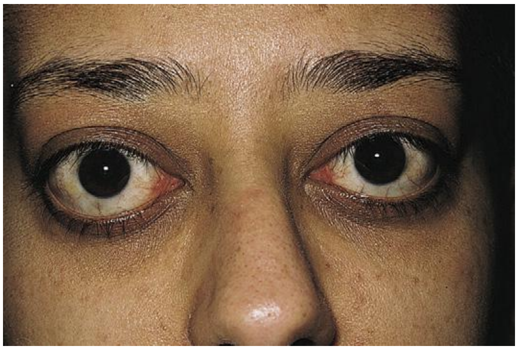


Grasp reflex in an infant *(Leifer, 2010)*

grass. See **cannabis.**

grass-line ligature [AS, *graes* + L, *linea,* thread, *ligare,* to bind], a fine cord made from the fibers of a grass-cloth plant, used in orthodontics for minor adjustments or movement of the teeth. The ligature exerts traction by shrinking when wetted by saliva.

Graves' disease /grāvz/ [Robert J. Graves, Irish physician, 1796–1853], a multisystem autoimmune disorder characterized by pronounced hyperthyroidism, usually associated with an enlarged thyroid gland and exophthalmos (abnormal protrusion of the eyeball). The origin is unknown, but the disease is familial and is usually associated with thyroid-stimulating autoantibodies that bind to TSH receptors and stimulate thyroid secretion. The disease, which is five times more common in women than in men, occurs most frequently when the individual is between 30 and 60 years of age and can arise after an infection or physical or emotional stress. Typical signs, which are related to hyperthyroidism, are nervousness, a fine tremor of the hands, weight loss, fatigue, breathlessness, palpitations, increased heat intolerance, increased metabolic rate, and GI motility. An enlarged thymus, generalized hyperplasia of the lymph nodes, blurred or double vision, localized myxedema, atrial arrhythmias, and osteoporosis may occur. The diagnosis may be established by tests that measure TSH, thyroxine, and triiodothyronine levels in serum. If necessary, radioactive iodine uptake in the gland is tested. Treatment may include prescription of antithyroid drugs, such as methimazole, propylthiouracil, and iodine preparations. Radioactive iodine may be administered, but hospitalization for a few days is recommended for patients treated with a large dose. Occasionally subtotal thyroidectomy may be indicated. In patients with inadequately controlled disease, infection or stress may precipitate a life-threatening thyroid storm. The exophthalmia may or may not resolve with the treatment of the disease. Also called **exophthalmic goiter, thyrotoxicosis, toxic goiter.**



Bilateral proptosis in Graves' disease
(Tyers and Collin, 2008)

Graves' orbitopathy /grāvz/ [Robert J. Graves, Irish physician, 1796–1853; L, *orbita,* wheel track + Gk, *pathos,* disease], the dysthyroid orbitopathy seen in Graves' disease. Also called *Graves' ophthalmopathy.*

gravid /grav′id/ [L, *gravidus,* pregnant], pregnant; carrying fertilized eggs or a fetus. **—gravidity, gravidness,** *n.*

gravid-, prefix meaning "pregnancy or pregnant": *gravida, graviditas, gravidocardiac.*

gravida /grav′idə/ [L, *gravidus,* pregnant], a woman who is pregnant. The patient may be identified more specifically as gravida I, if pregnant for the first time, or gravida II, if pregnant a second time.

-gravida, suffix meaning "pregnant woman with (specified) quantity of pregnancies": *nonigravida, plurigravida, unigravida.*

gravida I or 1. See **primigravida.**

gravida II or 2. See **secundigravida.**

gravida macromastia, overdevelopment of the breasts during pregnancy.

gravidarum chloasma /grav′ider′əm, gräv′idär′-/ [L, *gravidus,* pregnant; Gk, *chloazein,* to be green]. See chloasma.

gravidity, gravidness. See **gravid.**

gravidum gingivitis /grav′idəm/ [L, *gravidus,* pregnant, *gingiva,* gums, *itis,* inflammation], a type of gum inflammation that is associated with plaque formation during pregnancy. It may be associated with hormonal changes and poor oral care. Also called **pregnancy gingivitis, gingival hormonal enlargement,** or *hormonal gingivitis.*

gravid uterus [L, *gravidus,* pregnant, *uterus,* womb], a pregnant uterus.

gravimetric analysis. See **quantitative analysis.**

gravity /grav′itē/ [L, *gravis,* heavy], the universal effect of the attraction between any body of matter and any planetary body. The force of the attraction depends on the relative masses of the bodies and on the inverse of the square of the distance between them.

gravity-eliminated plane, a supported position or plane in which the effect of gravity is absorbed or neutralized. In evaluation of muscle strength, certain tests are conducted in the gravity-eliminated plane. Other tests may involve movements against the force of gravity.

gravity goniometer, an instrument used for measuring joint angles, consisting of a device that rests on or is strapped to the part to be measured and a dial that rotates behind a weighted pointer that remains vertical by force of gravity.

gray (Gy), the SI unit of absorbed radiation dose. One gray equals the energy equivalent of 1 J/kg of matter; 1 Gy equals 100 rad. See also **radiation absorbed dose.**

gray baby syndrome. See **gray syndrome.**

gray column, any of the three longitudinally oriented thickenings in the spinal cord, composed of gray nervous tissue and containing the nerve cell bodies. They are commonly referred to as *horns* because in transverse sections of the spinal cord they have the appearance of horns. See also **anterior horn, lateral horn, posterior horn.**

gray hepatization. See **hepatization.**

gray matter, the gray nervous tissue found in the cortex of the cerebrum and cerebellum and the core of the spinal cord. It is predominantly composed of neuron cell bodies and unmyelinated axons. The gray color is produced by cytoplasmic elements seen in all cell bodies and processes not covered by whitish myelin. Nuclei in the gray substance of the spinal cord function as centers for all spinal reflexes. Also called **gray substance.** Compare **white matter.** See also **cerebellum, cerebral cortex, cerebrum, spinal cord, spinal nerves.**

gray ramus communicans, the communicating branch of nerves that connects the sympathetic trunk or a ganglion to the anterior ramus and contains the postganglionic sympathetic fibers.

gray scale, the property in which intensity information in ultrasonography is recorded as changes in the brightness of the gray scale display.

gray scale display, in ultrasonography, a signal-processing method for selectively amplifying and displaying the level echoes from soft tissues at the expense of the larger echoes. Also called **compression amplification.**

gray substance. See **gray matter.**

gray syndrome, a toxic condition in neonates, especially premature infants, caused by a reaction to chloramphenicol. Because the body's mechanisms for detoxification and excretion of drugs are immature, the infant has limited ability to conjugate and thus eliminate the chloramphenicol. The condition is named for the characteristic ashen-gray cyanosis, which is accompanied by abdominal distension, hypothermia, vomiting, respiratory distress, and vascular collapse. The syndrome, which is fatal if the drug is continued, can be prevented by conservative dosages of the drug and by restriction of its use in women during late pregnancy or labor (because chloramphenicol readily crosses the placental barrier) and in lactating mothers. Also called **gray baby syndrome.**

GRE, abbreviation for **Graduate Record Examination.**

great auricular nerve [AS, large; L, *auricula,* little ear, *nervus,* nerve], one of a pair of cutaneous branches of the cervical plexus, arising from the second and the third cervical nerves. It is distributed to the skin of the face and the skin of the mastoid process. It also communicates with the lesser occipital nerve, the auricular branch of the vagus nerve, and the posterior auricular branch of the facial nerve.

great calorie. See **Calorie.**

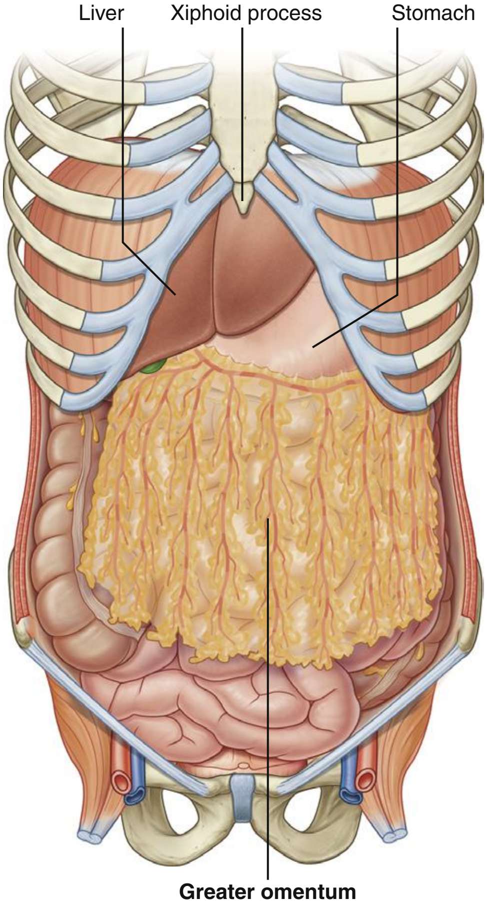
great cardiac vein, one of the five tributaries of the coronary sinus, beginning at the apex of the heart and ascending along the anterior interventricular sulcus to the base of the ventricles. It then curves left in the coronary sulcus, reaches the back of the heart, and opens into the left part of the coronary sinus. It receives various tributaries from the left atrium. The great cardiac vein drains the blood through its tributaries from the capillaries of the myocardium. Also called **vena cordis magna.** Compare **middle cardiac vein, small cardiac vein.**

great cerebral vein of Galen. See **Galen's vein.**

greater circulation. See **systemic circulation.**

greater multangular. See **trapezium.**

greater omentum [AS, *great,* large; L, *omentum,* entrails], a filmy, transparent double fold of the peritoneum, draping the transverse colon and coils of the small intestine. It is attached along the greater curvature of the stomach and the first part of the duodenum. It is a readily movable structure that spreads easily into areas of trauma, often sealing hernias and walling off infections that would otherwise cause general peritonitis, as can occur from a ruptured vermiform appendix. It also contains fat and keeps the intestines warm. Also called **gastrocolic omentum.** Compare **lesser omentum.**



Greater omentum *(Drake, Vogl, and Mitchell, 2010)*

greater palatine artery, a branch of the maxillary artery that supplies anterior regions of the medial wall and adjacent floor of the nasal cavity. It anastomoses with the septal branch of the sphenopalatine artery.

greater petrosal nerve, a branch of the facial nerve that innervates all the salivary glands above the level of the oral fissure, as well as all mucus glands in the nose and the lacrimal gland in the orbit.

greater saphenous vein, one of a pair of the longest veins in the body, which contains 10 to 20 valves along its course through the leg and the thigh before ending in the femoral vein. It begins in the medial marginal vein of the dorsum of the foot and ascends anteriorly to the tibial malleolus and up the medial side of the leg in relation to the saphenous nerve. It runs posteriorly to the medial condyles of the tibia and the femur and passes through the saphenous hiatus immediately before joining the femoral vein. It contains more valves in the leg than in the thigh and receives many cutaneous veins and numerous tributaries, such as those from the sole of the foot. Near the saphenous hiatus it is joined by the superficial epigastric vein, the superficial epigastric circumflex, and the superficial external pudendal veins. Also called **saphenous vein.** Compare **common iliac vein, femoral vein.**

greater sciatic foramen [AS, *great* + Gk, *ischiadikos,* hip joint; L, *foramen,* hole], a major route of communication between the pelvic cavity and the lower limb, formed by the greater sciatic notch in the pelvic bone, the sacrotuberous and sacrospinous ligaments, and the spine of the ischium.

greater sciatic notch [AS, *great,* large; Gk, *ischiadikos,* hip joint; OFr, *enochier,* notch], a notch on the posterior border of the hip bone between the posterior inferior iliac spine and the spine of the ischium.

greater trochanter, a large projection of the femur, to which are attached various muscles, including the gluteus medius, gluteus maximus, and obturator internus. The greater trochanter projects from the angle formed by the neck and body of the femur.

greater vestibular gland. See **Bartholin's gland.**

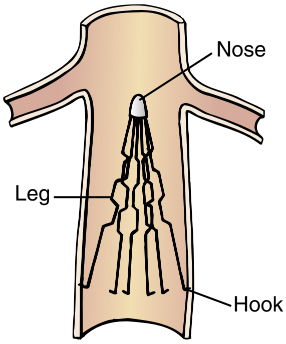
great foramen, a passage in the occipital bone through which the spinal cord enters the spinal column.

great membrane, the external components of a membrane, such as the layer of carbohydrate molecules on the outer surface.

great vessel, one of the large arteries and veins entering and leaving the heart. They include the aorta, the pulmonary arteries and veins, and the superior and inferior vena cava.

green cancer. See **chloroma.**

Greenfield filter [L. Greenfield, twentieth-century American surgeon], a filter placed in the inferior vena cava under fluoroscopic guidance. It is used in patients who are particularly vulnerable to pulmonary embolism, such as those diagnosed with deep venous thrombosis with contraindications to anticoagulation, to prevent venous emboli from entering the pulmonary circulation.



Greenfield filter *(Lewis et al, 2011)*

Greenfield's disease [Joseph G. Greenfield, British pathologist, 1884–1958], a disorder of the white matter of the brain tissue, characterized by an accumulation of sphingolipid in both parenchymal and supportive tissues and a diffuse loss of myelination. An infantile form usually begins by the third year of life, with symptoms that include loss of vision, rigidity, motor disorders, and mental deterioration. A juvenile form usually begins before 10 years of age and an adult form after 16 years of age; the adult form is marked by psychiatric symptoms that progress to dementia. See also **leukodystrophy.**

green fluorescent protein (GFP), a protein obtained from the jellyfish *Aequorea victoria* that emits a bright green fluorescence when illuminated. GFP is used to monitor gene expression, gene transfer across plasma membranes, and cell surface activity.

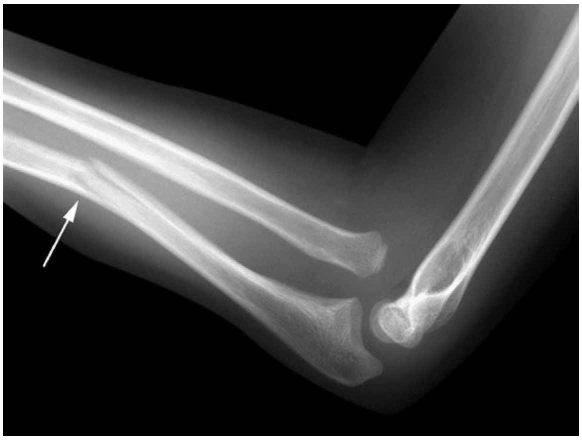
greenhouse effect, a theorized change in the earth's climate caused by accumulation of solar heat in the earth's surface and atmosphere. Human activity contributes increasing amounts of the so-called greenhouse gases, such as carbon dioxide, methane, and chlorofluorocarbon, to the atmosphere. Some of the particles and gases in the atmosphere also allow more sunlight to filter through to the earth's surface but reflect much of the radiant infrared energy that otherwise would escape through the atmosphere back into space. See also **global warming.**

Greenough microscope. See **stereoscopic microscope.**

green soap [AS, *grene* + L, *sapo*], a soft soap made from vegetable oils with sodium or potassium hydroxide in concentrations adjusted to retain glycerol. The soap actually may be any color, depending on the oils added.

green soap tincture [AS, *grene* + L, *sapo,* soap, *tinctura,* dyeing], an alcoholic solution of green soap with lavender oil added.

greenstick fracture [AS, *grene* + *stician*], an incomplete fracture in which the bone is bent but broken only on the outer arc of the bend. Children, especially those with rickets, are particularly likely to have greenstick fractures. Immobilization is usually effective, and healing is rapid. Also called **bent fracture, hickory stick fracture.** See also **fracture.**



Greenstick fracture
(Manaster, May, and Disler, 2007/Courtesy L. Das Narla, MD)

green tea, an herb that grows as a native shrub in Asia.
■ USES: It is used to prevent cancer and heart disease, for hypercholesterolemia, and as an antidiarrheal. It is effective as an antidiarrheal, and there is some epidemiological evidence of efficacy related to its other uses.
■ CONTRAINDICATIONS: It is contraindicated in those with known hypersensitivity to this product and in those with kidney inflammation, GI ulcers, insomnia, cardiovascular disease, and increased intraocular pressure.

green tobacco sickness, a nicotine-induced illness of tobacco harvest workers characterized by headache, dizziness, vomiting, and prostration, caused by skin contact with wet tobacco leaves.

-grel, suffix for a platelet antiaggregate.

grenz rays [Ger, *Grenze,* boundary; L, *radius,* ray], low-energy x-rays, used for treatment of skin conditions, that have very little penetrating ability and are frequently applied by dermatologists rather than by radiotherapists.

Greulich-Pyle method /groi′lish pīl′, gro͞o′lik-/, a technique for evaluating the bone age of children by using a single frontal radiograph of the left hand and wrist.

Grey Turner's sign [George Grey Turner, English surgeon, 1877–1951], bruising of the skin of the loin in acute hemorrhagic pancreatitis. Also called **Turner's sign.**

grid [ME, *gredire,* grate], a device used during a radiographic examination to absorb radiation that is not heading along a straight line from the x-ray source to the film. Such scattered radiation does not contribute useful information and thus constitutes a source of unwanted density. A **linear grid** consists of alternating parallel strips of radiopaque and radiolucent material. Linear grids may cause variations in image density because of primary-photon attenuation. Density is at a maximum in the center of the film and decreases toward the edges.

grid cutoff, an undesirable absorption of primary-beam x-rays by a grid, which prevents useful x-rays from reaching a radiographic film. It is an effect of improper grid positioning and occurs most commonly with linear grids.

grid ratio, (in radiology) the ratio of the height of the lead strips to the width of the interspacing of a grid.

grief [L, *gravis,* heavy], a nearly universal pattern of physical and emotional responses to bereavement, separation, or loss. It is time linked and must be differentiated from depression. The physical components are similar to those of fear, rage, and pain: Stimulation of the sympathetic portion of the autonomic nervous system can cause increased heart and respiratory rates, dilated pupils, sweating, bristling of the hair, increased blood flow to the muscles, and increased energy reserves. Digestion slows. The emotional components proceed in stages from alarm to disbelief and denial, to anger and guilt, to a search for a source of comfort, and, finally, to adjustment to the loss. The way in which a grieving person behaves is greatly affected by the culture in which he or she has been raised. See also **bereavement, parental grief.**

grief reaction, a complex of somatic and psychological symptoms associated with extreme sorrow or loss, specifically the death of a loved one. Somatic symptoms include feelings of tightness in the throat and chest with choking and shortness of breath, abdominal distress, lack of muscular power, and extreme tiredness and lethargy. Psychological reactions involve a generalized awareness of mental anguish and discomfort accompanied by feelings of guilt, anger, hostility, extreme restlessness, inability to concentrate, and lack of capacity to initiate and maintain organized patterns of activities. Such symptoms may appear immediately after a crisis, or they may be delayed, exaggerated, or apparently absent, depending on the degree of involvement of the relationship and the physical and mental status of the person. Although both the somatic and psychological reactions have the potential for developing into pathological conditions, appropriate adaptive behavior and normal responses, such as sobbing or talking about the dead person or tragedy, are methods of working through the acute grief and lead to successful resolution of the crisis. Most acute grief reactions are resolved within 4 to 6 weeks, although the period varies and may be much longer, especially in cases of unexpected and sudden death. Intervention by health care professionals, especially nurses, is necessary when individuals exhibit maladaptive behavioral patterns that prevent the resolution of grief and can lead to morbid reactions, including such accepted psychosomatic illnesses as asthma and ulcers.

grief resolution, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as adjustment to actual or impending loss. See also **Nursing Outcomes Classification.**

grief work facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assistance with the resolution of a significant loss. See also **Nursing Interventions Classification.**

grief work facilitation: perinatal death, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assistance with the resolution of a perinatal loss. See also **Nursing Interventions Classification.**

griffe des orteils. See **clawfoot.**

Grifulvin, a trademark for an antifungal **(griseofulvin).**

grinder's asthma /grīn′dərz/ [ME, *grinden,* to crush; Gk, panting], a condition characterized by asthmatic symptoms caused by inhalation of fine particles produced by industrial grinding processes. See also **pneumoconiosis.**

grinder's disease. See **silicosis.**

grinding-in, a clinical corrective grinding of one or more natural or artificial teeth to improve centric and eccentric occlusions. Compare **occlusal adjustment, selective grinding.**

grip and pinch strength, the measurable ability to exert pressure with the hand, fingers, or both. It is measured by having a patient forcefully squeeze, grip, or pinch dynamometers; results are expressed in either pounds or kilograms of pressure.

gripes /grīps/ [AS, *gripan,* to grasp], severe and usually spasmodic pain in the abdominal region caused by an intestinal disorder. Also called **griping.**

grippe. See **influenza.**

Grisactin, a trademark for an antifungal **(griseofulvin).**

griseofulvin /gris′ē·ōful′vin/, an antifungal.

■ INDICATIONS: It is prescribed in the treatment of certain fungal infections of the skin, hair, and nails.

■ CONTRAINDICATIONS: Liver dysfunction, porphyria, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effects are blood dyscrasias. Headache, GI symptoms, and rashes also may occur.

Griswald brace, an orthosis for the control of vertebral body compression fractures, designed with two anterior forces that are each equal to one half the posterior force to extend the spine. Also called **Jewett brace.**

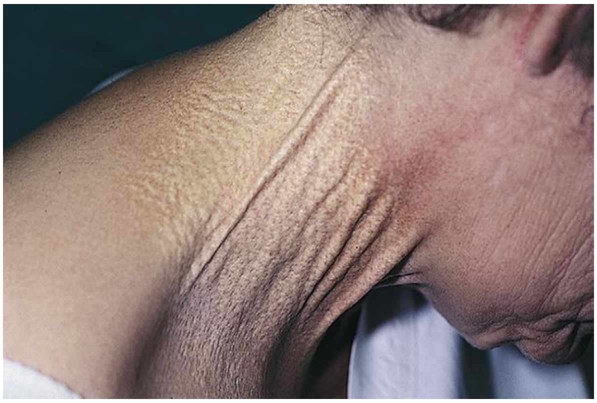
Grocco's sign, Grocco's triangle. See **Korányi's sign.**

grocer's itch [AS, *gican,* itch], a dermatitis caused by contact with mites found in grain, cheese, or dried foods. Also called *Glycoyphagus domesticus.*

groin [ME, *grynde*], each of two areas where the abdomen joins the thighs; the inguinal area.

grommet /grom′et/, a tube inserted through the tympanic membrane for drainage of the middle ear.

Grönblad-Strandberg syndrome /grōn′blad strand′bərg/ [Ester E. Grönblad, Swedish ophthalmologist, 1898–1942; James V. Strandberg, Swedish dermatologist, 1883–1942], an autosomal-recessive disorder of connective tissue characterized by premature aging and breakdown of the skin, gray or brown streaks on the retina, and hemorrhagic arterial degeneration, including retinal bleeding that causes vision loss. Angina pectoris and hypertension are common. Weak pulse, episodic cramplike pains in the calves, and fatigue with exertion may affect the extremities. The prognosis depends on vessel involvement, but life expectancy is shortened. Treatment is symptomatic. Also called **pseudoxanthoma elasticum.**



Grönblad-Strandberg syndrome *(Callen et al, 2000)*

groove [AS, *grafan,* to dig], a shallow, linear depression in various structures throughout the body, such as those that form channels for nerves along the bones, those in bones for the insertion of muscles, and those between certain areas of the brain.

grooved pegboard test, a method for evaluating psychomotor function by measuring how quickly a subject can insert pegs into grooved holes. The test is reported to be sensitive to the effects of various neurotoxins that can affect perception and dexterity.

Groshong catheter, a modification of the Hickman catheter with a valve that is closed when the catheter is not in use, used for long-term administration of substances such as antibiotics, total parenteral nutrition, or chemotherapeutic agents.

gross [OFr, *gros,* large], **1.** macroscopic, as in gross pathology; the study of tissue changes without magnification by a microscope. **2.** large or obese. Compare **microscopic.**

gross anatomy, the study of the organs or parts of the body large enough to be seen with the naked eye. Also called **macroscopic anatomy.**

Grossman principle, in tomography, the principle that when the fulcrum or axis of rotation remains at a fixed point, the focal plane is changed by raising or lowering the table top through this point to the desired height.

gross motor skills [Fr, *gros,* big; L, *movere,* Old Norse, *skilja,* to cut apart], the ability to use large muscle groups that coordinate body movements involved in activities such as walking, running, jumping, throwing, and maintaining balance.

gross sensory testing, an evaluation procedure that includes assessment of passive motion sense in the shoulder, elbow, wrist, and fingers and ability to localize touch stimuli to specific fingers. It usually precedes motor evaluation of a patient.

gross visual skills, the general ability of a person to track a large, bright object side to side or up to down without jerkiness, nystagmus, or convergence and to discriminate among various basic shapes and colors.

ground [AS, *grund*], **1.** (in electricity) a connection between the electric circuit and the ground, which becomes a part of the circuit. **2.** (in psychology) the background of a visual field that can enhance or inhibit the ability of a patient to focus on an object.

grounding pad, an inactive electrode, part of a monopolar electrocautery, that is attached to the patient and returns the current distributed from the active electrode to the generator through an attached cable to complete the electrical circuit.

ground itch, pruritic papules, urticarial vesiculopustular lesions secondary to penetration of the skin by hookworm larvae. The condition is prevalent in tropic and subtropic climates and may be prevented by wearing shoes and by establishing sanitary disposal of feces. See also **hookworm.**

ground state, **1.** the lowest energy level of a physical system. See also **fatigue state. 2.** the stable form of an atom or molecule.

ground substance. See **matrix.**

group [Fr, *groupe,* cluster], (in research) any set of items or people under study. See also **control group, experimental group.**

group B arbovirus. See ***Flavivirus.***

group dynamics [Fr, *groupe* + Gk, *dynamis,* force], the interactions and relationships that take place among group members as well as between the group and the rest of society. It includes interdependence of group members, collective problem solving and decision making, and group conformity.

grouper /grōōp′er/, any of various usually large marine fish of the genera *Epinephelus* and *Mycteroperca,* found in tropical waters. They are often eaten by humans, but sometimes contain ciguatoxin and can cause ciguatera.

group function, (in dentistry) the simultaneous contacting of opposing teeth in a segment or a unit, used to stabilize a full maxillary and mandibular denture during eccentric motion of the mandible in relation to the maxilla.

group-model HMO, a health maintenance organization (HMO) in which a contract is established with multispecialty medical groups for medical services. The HMO is responsible for marketing and developing contracts with enrollees and hospitals. Care is provided at hospitals where the physicians have admitting privileges or at ancillary facilities with which the HMO subcontracts.

group practice, two or more physicians, advanced practice nurses, and/or physician's assistants who work together and share facilities. The physicians may practice different specialties. Physicians who are part of a group often are prohibited from becoming independent contractors and earning money by providing medical care outside the group.

group practice without walls (GPWW), a medical practice formed to share economic risk, expenses, and marketing efforts. Physicians retain separate offices and finances. Often a central site is established to house administrative services and some or all ancillary services.

group specificity, an enzyme that is specific to both the type of bond and structure. See **specificity.**

group therapy, the application of psychotherapeutic techniques within a group of people (usually 10 or fewer) who experience similar difficulties. Generally a group leader directs the discussion of problems in an attempt to promote individual psychological growth and favorable personality change. The procedure provides opportunities for treating a greater number of people in a shorter time than would be possible with individual therapy, and it is used in clinics, in institutions, and in private practice. Group therapy has been found to be particularly effective in the treatment of various addictions. A kind of group therapy is **psychodrama.** See also **Gestalt therapy, psychotherapy, self-help group, transactional analysis.**

growing fracture [AS, *growan* + L, *fractura,* to break], a fracture, usually linear, in which consecutive radiographic images show a gradual separation of the fracture edges over time. The separation is often caused by the pressure of soft tissues, as when arachnoid tissues expand through the edges of a skull fracture.

growing pains, **1.** rheumatism-like pains that occur in the muscles and joints of children or adolescents usually at night and as a result of fatigue, emotional problems, postural defects, and other causes that are not related to growth and may be symptoms of various disorders. **2.** emotional and psychological problems experienced during adolescence.

growth^1 [AS, *growan,* to grow], **1.** an increase in the size of an organism or any of its parts, as measured in increments of weight, volume, or linear dimensions, that occurs as a result of hyperplasia or hypertrophy. **2.** the normal progressive anatomical, physiological development from infancy to adulthood that is the result of gradual and normal processes of accretion and assimilation. The total of the numerous changes that occur during the lifetime of an individual constitutes a dynamic and complex process that involves many interrelated components, notably heredity, environment, nutrition, hygiene, and disease, all of which are subject to a variety of influences. In childhood growth is categorized according to the approximate age at which distinctive physical changes usually appear and at which specific developmental tasks are achieved. Such stages include the prenatal period, infancy, early childhood (including the toddler and the preschool periods), middle childhood, and adolescence. There are two periods of accelerated growth: (1) the first 12 months, in which the infant triples in weight, increases the height at birth by approximately 50%, and undergoes rapid motor, cognitive, and social development; and (2) the second, and the months around puberty, when the child approaches adult height and secondary sexual characteristics emerge. Physical growth may be abnormally accelerated or slowed by a defect in the hypophyseal or pituitary gland. **3.** any abnormal localized increase of the size or number of cells, as in a tumor or neoplasm. **4.** a proliferation of cells, specifically a bacterial culture or mold. Compare **development, differentiation, maturation.**

growth^2, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as normal increase in bone size and body weight during growth years. See also **Nursing Outcomes Classification.**

growth charts, graphic displays of normal progressive changes in height, weight, and head circumference. They consider the range of growth as expressed in percentiles, or as standard deviation from the mean for average height, weight, and BMI for age. Head circumference measurements are common from birth to 2 years of age.

growth curve, a graphic display of data showing proliferation of cell numbers in a culture as a function of time.

growth factor, any protein that stimulates the division and differentiation of specific types of cells. Growth factors include platelet-derived growth factor; epidermal growth factor; nerve growth factor; and interleukins, a group of at least 15 proteins produced mainly by T cells but also by mononuclear phagocytes and other cells. Growth factors specifically involved in the division and differentiation of bone marrow stem cells are classified as colony-stimulating factors. Platelets are a rich source of growth factors, some of which may be involved in the cellular proliferation that occurs in diseases such as rheumatoid arthritis and glomerulonephritis. See also **cytokine.**

growth factor receptor, a plasma membrane-spanning protein that binds with a specific growth factor on the external surface of a cell and transduces a signal that triggers cell division.

growth failure, a lack of normal physical and psychological development that results from genetic, nutritional, pathological, or psychosocial factors. See also **failure to thrive, maternal deprivation syndrome.**

growth hormone (GH), a single-chain peptide secreted by the anterior pituitary gland in response to GH-releasing hormone. Its secretion is controlled in part by the hypothalamus. GH promotes protein synthesis in all cells, increases fat mobilization and use of fatty acids for energy, and decreases use of carbohydrate. Growth effects depend on the presence of thyroid hormone, insulin, and carbohydrate. Somatomedins, proteins produced chiefly in the liver, play a vital role in GH-induced skeletal growth. GH cannot cause elongation of long bones after the epiphyses close, however, so stature does not increase after puberty. GH accelerates the transport of specific amino acids into cells, stimulates the synthesis of messenger ribonucleic acid (RNA) and ribosomal RNA, influences the activity of several enzymes, increases the storage of phosphorus and potassium, and promotes a moderate retention of sodium. GH secretion, controlled almost exclusively by the central nervous system, occurs in bursts, with more than half of the total daily amount released during early sleep. Somatostatin, an anterior pituitary regulating hormone produced in the hypothalamus, inhibits GH secretion as well as secretion of insulin and gastrin. A deficiency of GH causes dwarfism; an excess results in gigantism in children or acromegaly in adults. Also called **somatotropic hormone, somatotropin.** See also **acromegaly, dwarfism, gigantism, somatostatin.**

growth hormone release inhibiting hormone. See **somatostatin.**

growth hormone–releasing hormone (GH-RH), a neuropeptide released by the hypothalamus that travels to the anterior pituitary to stimulate growth hormone release. Also called *somatocrinin*, **somatoliberin, somatotropin-releasing hormone.**

growth hormone (GH) test, a blood test, usually after an arginine infusion followed by insulin-induced hypoglycemia, used to identify growth hormone deficiency in adolescents who have short stature, delayed sexual maturity, or other growth deficiencies. It is also used to document the diagnosis of GH excess in gigantic or acromegalic patients and to screen for pituitary hypofunction.

growth phase, one of the stages in the growth of a neoplasm.

growth retardation, failure of an individual to develop at a normal rate of height and weight for his or her age. See also **intrauterine growth retardation.**

Grünfelder’s reflex /grYn′feldərz, grēn′-/, an involuntary dorsiflexion of the great toe with a fanlike spreading of the other toes, caused by continued pressure on the posterior lateral fontanel. The reflex occurs in children who have middle-ear disease.

grunting [ME, *grunten*], abnormal, short, deep, hoarse sounds in exhalation that often accompany severe chest pain. The grunt occurs because the glottis briefly stops the flow of air, halting the movement of the lungs and their surrounding or supporting structures. Grunting is most often heard in a person who has pneumonia, pulmonary edema, or fractured or bruised ribs. Atelectasis in the newborn also causes grunting, which results from the effort required to fill the lungs.

GSA, abbreviation for **Gerontological Society of America.**

GSD, abbreviation for **genetically significant dose.**

GSR, abbreviation for **galvanic skin response.**

GSW, abbreviation for **gunshot wound.**

G syndrome. See **Opitz syndrome.**

gt, abbreviation for **gutta.**

GTP, abbreviation for **guanosine triphosphate.**

GTPase, enzyme activity that catalyzes the hydrolysis of guanosine triphosphate to guanosine diphosphate and orthophosphate.

GTT, abbreviation for **glucose tolerance test.**

gtt, gtts, GTTS, abbreviation for **guttae.**

G tube. See **stomach tube.**

GU, abbreviation for **genitourinary.**

guaiac /gwī′ak/, a wood resin, formerly used as a reagent in laboratory tests for the presence of occult blood.

guaiacol poisoning. See **phenol poisoning.**

guaiac test, a test, using guaiac as a reagent, formerly performed on feces and urine for detecting occult blood in the intestinal and urinary tracts.

guaifenesin /gwī′əfen′əsin/, glyceryl guaiacolate, a white to slightly gray powder with a bitter taste and faint odor, widely used as an expectorant. Guaifenesin increases the flow of fluid in the respiratory tract, reducing the viscosity of bronchial and tracheal secretions and facilitating their removal by the cough reflex and ciliary action. It may increase the risk of hemorrhage in patients taking heparin.

guanabenz acetate /gwan′abenz/, a centrally acting alpha$_2$ adrenergic agonist that decreases sympathetic nervous system tone.

■ INDICATION: It is prescribed in the treatment of hypertension.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among adverse effects are dizziness, sedation, and dry mouth.

guanadrel /gwä′nädrel/, an adrenergic neuron blocking agent used in the treatment of hypertension, used as the sulfate salt.

guanadrel sulfate /gwan′ədril/, an antihypertensive agent.

■ INDICATION: It is prescribed in the treatment of hypertension in patients who do not respond to first-line agents, usually in combination with a diuretic.

■ CONTRAINDICATIONS: Pheochromocytoma, administration of monoamine oxidase inhibitors, frank congestive heart failure, or known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are orthostatic hypotension and syncope.

guanase. See **guanine deaminase.**

guanethidine sulfate /gwaneth′idēn/, a peripherally acting antiadrenergic antihypertensive.

■ INDICATION: It is prescribed in the treatment of moderate and severe hypertension.

■ CONTRAINDICATIONS: Heart failure, concomitant administration of monoamine oxidase inhibitors, pheochromocytoma, or known hypersensitivity to this drug prohibits its use. It should be avoided in elderly patients.

■ ADVERSE EFFECTS: Among the more serious adverse effects are orthostatic hypotension, salt and water retention, bradycardia, diarrhea, and inability to ejaculate.

guanine /gwan′ēn/, a purine base that is a component of DNA and RNA. In free or uncombined form it occurs in trace amounts in most cells, usually as a product of the enzymatic hydrolysis of nucleic acids and nucleotides. On hydrolysis it is first converted into xanthine and finally into uric acid. See also **adenine.**

guanine deaminase, an enzyme that catalyzes the hydrolysis of guanine to xanthine and ammonia. It is present in liver, kidney, spleen, and other tissues. Also called **guanase** /gwan′ās/.

guanosine /gwan′ōsēn/, a nucleoside composed of guanine and a sugar, D-ribose. It is a major component of the nucleotides guanosine monophosphate and guanosine triphosphate and of RNA. A related nucleoside, deoxyguanosine, is a major component of DNA.

guanosine deaminase. See **deaminase.**

guanosine monophosphate (GMP), a nucleotide that plays an important role in various metabolic reactions and in the formation of RNA from DNA templates.

guanosine triphosphate (GTP), a high-energy nucleotide, similar to adenosine triphosphate, that functions in various metabolic reactions, such as the activation of fatty acids and the formation of peptide bonds in protein synthesis.

guaranine /gwərä′nin/, caffeine.

guardian ad litem /ad lī′təm/ [L, *ad litem,* to litigate], (in law) a person who is appointed by a court to prosecute or defend a suit for an infant or an incapacitated person. A guardian ad litem is sometimes appointed when a person's life is in imminent danger and that person refuses treatment.

guardianship, a legal status that places the care and property of an individual in the hands of another person. Implementation of the law varies in different cases and jurisdictions. Some courts have held as legally incompetent mental patients who have jobs and live independently.

guarding. See **abdominal splinting.**

Guarnieri's bodies /go͞o′ärnyer′ēz/ [Giuseppi Guarnieri, Italian physician, 1856–1918], acidophilic inclusion bodies that are formed in the cytoplasm of cells infected with cowpox or vaccinia virus.

Gubbay test of motor proficiency, a screening test for the identification of developmental dyspraxia, consisting of eight activities, such as whistling, throwing a tennis ball, and fitting shapes into appropriate slots. The results of the test discriminate between impaired motor function and normal development in children.

gubernaculum, a fetal ligament that passes through the anterior abdominal wall and connects the inferior pole of each gonad with primordia of the scrotum in men and the labia majora in women.

Guedel's signs /go͞o′dəlz/ [Arthur E. Guedel, American anesthesiologist, 1883–1956], a system for describing the stages and planes of anesthesia based on physical signs observed in the patient. These stages are most applicable to inhalation anesthesia and are difficult to delineate when combination or modern anesthetics are given. See also **anesthesia.**

Guérin's fracture /gāraNz′/ [Alphonse F.M. Guérin, French surgeon, 1816–1895], a break in the maxilla. Also called **LeFort I fracture** /ləfôr′/.

guggul, an herb that is native to India.

■ USES: It is used for high LDL cholesterol, elevated triglycerides, and weight loss.

■ CONTRAINDICATIONS: Its use is contraindicated during pregnancy, because it can cause uterine contractions. It also should not be used during lactation, in children, and in those with known hypersensitivity to this product.

guided imagery^1 /gī′did/, a therapeutic technique in which the patient enters a relaxed state and focuses on an image related to the issue being confronted. The therapist uses the image as the basis of an interactive dialogue to help the person resolve the issue. It is used for a wide variety of indications, including relaxation and stress management, behavior modification, pain management, and the treatment of life-threatening and terminal illness.

guided imagery^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful use of imagination to achieve a particular state, outcome, or action or to direct attention away from undesirable sensations. See also **Nursing Interventions Classification.**

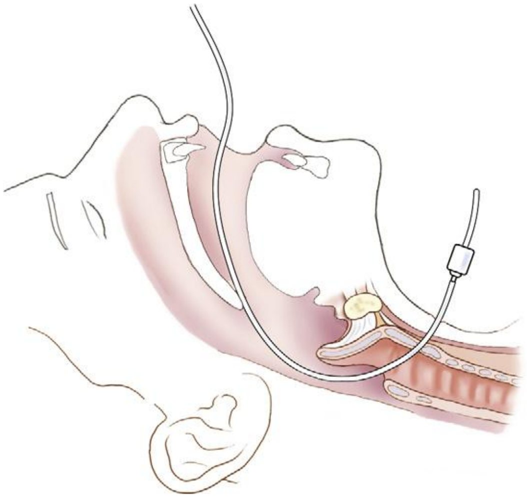
guide dog [ME, *guiden,* to guard; OE, *docga*], a dog trained to aid in the mobility of a blind or partially blind person. Guide dogs are usually recruited from certain compatible breeds and tested at 13 weeks of age. If qualified, the dog is then specially trained in private hands for 1 year and retested. Most dogs selected for training pass the final test. Guide dogs also may be trained to serve as "ears" for deaf persons. Also called **companion animal, Seeing Eye dog.**

guided reminiscence, in reminiscence therapy, the eliciting of recollections of past experiences by the use of open-ended questions.

guide plane [ME, *guiden,* to guard; L, *planum,* level ground], **1.** a part of an orthodontic appliance that has an established inclined plane for changing the occlusal relation of the maxillary and mandibular teeth and for permitting their movement to normal positions. **2.** a plane that is developed on the occlusal surfaces of occlusion rims for positioning the mandible in centric relation. **3.** two or more parallel vertical surfaces of abutment teeth shaped to direct the path of placement and removal of a partial denture.

guide-shoe marks, a radiographic image artifact caused by pressure of the guide shoes, the curved metal lips that guide x-ray film in automatic developing systems. The guide shoes leave scratches called ridge lines in the image.

guidewire /gīd′wī·ər/ [ME, *guiden,* to guard; AS, *wir*], a device used to position an IV catheter, endotracheal tube, central venous line, or gastric feeding tube or to localize a tumor during open breast biopsy.



Insertion of a guidewire *(Sanders et al, 2007)*

guiding, (in occupational therapy) a method in which therapists assist their patients in perceiving the environment by directing movement of their hands and bodies in functional activities. An example is hand-over-hand guiding in which the therapist's hand is over the patient's hand and assists in performance of a task.

Guillain-Barré syndrome /gēyan′bärā′/ [Georges Guillain, French neurologist, 1876–1951; Jean A. Barré, French neurologist, 1880–1967], an idiopathic, peripheral polyneuritis that may occur 1 to 3 weeks after a mild episode of fever associated with a viral infection or with immunization but that can also occur with no preceding illness. Symmetric pain and weakness affect the extremities, and paralysis may develop. The neuritis may spread to the trunk and face. Symptoms vary in intensity from mild to severe enough to require critical nursing care, including ventilator assistance. Treatment consists of supportive care and high IV doses of immunoglobulins. Recovery depends on the extent of neuritis and may take weeks to many months. Also called **acute febrile polyneuritis, acute idiopathic polyneuritis, infectious polyneuritis.**

■ OBSERVATIONS: Manifestations may range from mild to severe and generally develop 1 to 3 weeks after an upper respiratory or gastrointestinal infection. The first sign is symmetric muscle weakness in the distal extremities accompanied by paresthesia. This weakness spreads upward to the arms and trunk and then to the face. This ascension usually peaks about 2 weeks after onset. Deep tendon reflexes are commonly absent. Difficulty chewing, swallowing, and speaking may occur, and respiratory paralysis may develop. Signs of autonomic nervous system dysfunction, such as facial flushing, profuse diaphoresis, bowel and bladder atony, postural hypotension, hypertension, tachycardia, and heart block, may develop. Deep, aching muscle pain is also common. The diagnosis is based on history and clinical presentation. Lumbar puncture results typically reveal an increase in cerebrospinal fluid protein without an increase in lymphocyte count. Electromyography is markedly abnormal with reduced nerve conduction velocity. About 5% of those affected die of respiratory failure. Another 10% have permanent residual neurological deficits. About 90% of all survivors make a full recovery, but the recovery time may be as long as 3 years.

■ INTERVENTIONS: Treatment is supportive, with the use of IV immunoglobulins or plasmapheresis to counteract neurological defect and speed recovery of neurological deficit. Subcutaneous heparin is given to prevent thromboembolism. Tracheostomy and mechanical ventilation are necessary to treat respiratory paralysis, and breathing function tests should be performed and followed closely. Continuous cardiac monitoring is done to detect possible sinus tachycardia and/or bradyarrhythmias.

■ NURSING CONSIDERATIONS: Care for patients with Guillain-Barré disease is complex and multifaceted. In acute disease, nursing focus is on careful assessment of ascending paralysis and monitoring of respiratory function to ensure airway patency and adequate gas exchange. Continuing assessments are needed of corneal, gag, and swallow reflexes. Blood pressure is monitored for fluctuations; cardiac rate and rhythm are monitored for tachycardia, bradycardia, heart block, and asystole. Pain assessment and management are required for paresthesias, hyperesthesias, muscle cramps, and deep muscle aches. Complications related to autonomic dysfunction, paralysis, and immobility (e.g., pressure sores, thromboemboli, aspiration, urinary retention, fecal impaction, and nerve palsies) must be prevented. This includes a rigorous turning and positioning schedule, regular passive range-of-motion exercises, careful pulmonary toilet and feeding routines, application of thromboembolic stockings, and institution of bowel and bladder programs. Communication systems may be needed if the individual is on a ventilator or has facial paralysis. Emotional and social support are needed to reduce fear and anxiety. Rehabilitation may be indicated for recovery of functional abilities and long-term adaptation to permanent neurological deficit.

guilt [AS, *gylt,* delinquency], a feeling caused by tension between the ego and superego when one falls below the standards set for oneself, or a remorseful awareness of having done something wrong.

guilt work facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as helping another cope with painful feelings of actual or perceived responsibility. See also **Nursing Interventions Classification.**

guilty, (in criminal law) a verdict by the court that to a moral certainty it is beyond reasonable doubt that the defendant committed the crime and is responsible for the offense as charged.

guinea worm. See ***Dracunculus medinensis.***

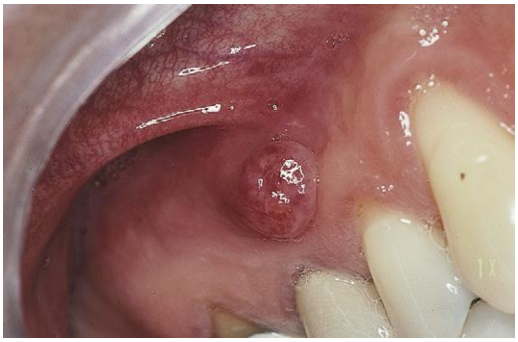
Guinea worm infection. See **dracunculiasis.**

Gulf War syndrome, a group of medical and psychological complaints, including fatigue, skin rash, memory loss, and headaches, experienced by men and women who served in the 1991 Persian Gulf War. Researchers observed similar physical effects in laboratory animals exposed to a mixture of cholinesterase inhibitor insecticides and pyridostigmine; soldiers were exposed to both agents during the war.

gullet. See **esophagus.**

gum, **1.** a sticky excretion from certain plants. **2.** a firm layer of flesh covering the alveolar processes of the jaws and the base of the teeth. See also **gingiva.**

gumboil [AS, *goma* gum + *byl*], an abscess of the gingiva and periosteum resulting from injury, infection, or dental decay. The gum is characteristically red, swollen, and tender. The abscess may rupture spontaneously, or it may require incision. Treatment may include antibiotics and hot mouthwashes. Also called **parulis.**

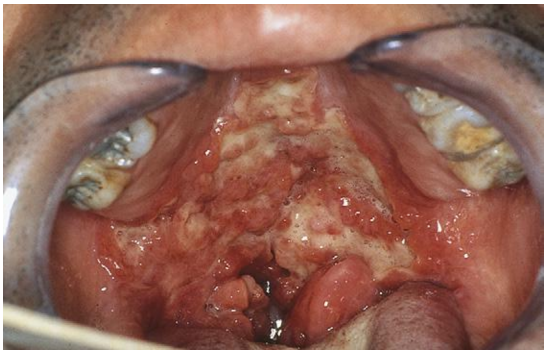


Gumboil *(Regezi, Sciubba, and Pogrel, 2000)*

gum camphor. See **camphor.**

gum line. See **gingival line.**

gumma /gum′ə/ *pl.* *gummas, gummata* [AS, *goma,* gum], **1.** a granuloma, characteristic of tertiary syphilis, varying from 1 mm to 1 cm in diameter. It is usually encapsulated and contains a central necrotic mass surrounded by inflammatory and fibrotic zones of tissue. Infectious organisms of the genus ***Treponema*** may be found in a gumma. The lesion may be localized or diffuse, occurring on the trunk, legs, and face and on various internal organs, especially the liver. It can also form in the brain, leading to neurological problems. Rupture of a gumma produces a shallow ulcer that heals slowly. **2.** a soft granulomatous lesion that sometimes accompanies tuberculosis.



Gumma on the palate *(Regezi, Sciubba, and Pogrel, 2000)*

gun-barrel vision. See **tunnel vision.**

Gunning's splint [Thomas B. Gunning, American dentist, 1813–1889; D, *splinte,* split], a splint used to support the maxilla and the mandible during jaw surgery.

Gunn's syndrome. See **jaw-winking.**

gunshot fracture [ME, *gunne* + AS, *sceotan,* to shoot; L, *fractura,* break], a fracture caused by a bullet or similar missile.

gunshot wound (GSW), penetration of the body by a bullet, commonly marked by a small entrance wound and a larger exit wound. The wound is usually accompanied by damage to blood vessels, bones, and other tissues. There is high risk of infection caused by exposure of the wound to the external environment and debris carried inside the body by the bullet. Additional complications depend on the part of the body wounded.

Gunson method, a method of radiographic examination of the pharynx and upper esophagus during swallowing. A dark-colored shoestring is tied around the patient's throat just above the thyroid cartilage. The movement of the larynx is then shown by the elevation of the shoestring as the thyroid cartilage moves anteriorly, followed immediately by displacement of the shoestring as the cartilage passes superiorly.

Günther's disease /gun′thərz/ [Hans Günther, German physician, 1884–1956], a rare congenital disorder of porphyrin metabolism that is associated with sunlight-induced skin lesions. See also **porphyria.**

gurgle [Fr, *gargouiller,* to gurgle], an abnormal coarse sound heard during auscultation, especially over large cavities or a trachea nearly filled with secretions.

gurney /gur′nē/, a cot with wheeled legs, used in hospitals to transport patients.

gurry /gur′ē/, *(informal)* the detritus incident to physical trauma or surgery, including body fluids, secretions, and tissue.

Gurvich radiation. See **mitogenetic radiation.**

gustation /gustā′shən/ [L, *gustare,* to taste], the sense and act of tasting foods, beverages, or other substances.

gustatory /gus′tətôr′ē/ [L, *gustare,* to taste], pertaining to the act or sense of taste or the organs of taste.

gustatory hallucination [L, *gustare,* to taste, *alucinari,* wandering mind], a false taste sensation of either food or beverage on the mucous membrane lining the empty mouth.

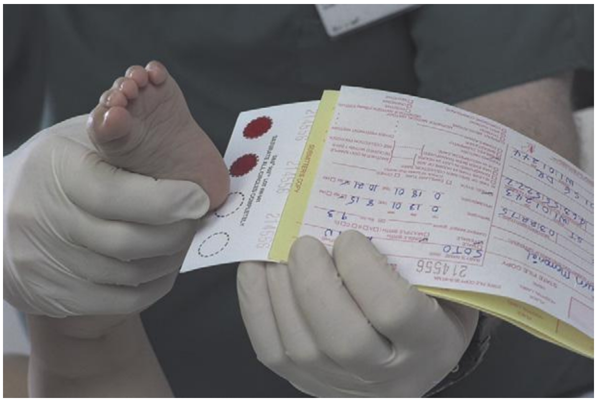
gustatory organ. See **taste bud.**

gustatory papilla [L, *gustare,* to taste, *papilla,* nipple], any of the small tissue elevations in the mouth that contain sense organs of taste, such as the circumvallate papilla of the tongue.

gut [AS, *guttas*], **1.** intestine. **2.** *(informal)* digestive tract. **3.** suture material manufactured from the intestines of sheep.

gut-associated lymphoid tissue, lymphoid tissue associated with the gut, including the tonsils, Peyer's patches, lamina propria of the GI tract, and appendix.

Guthrie's bacterial inhibition assay (GBIA) /guth′rēz/, a screening for phenylketonuria (PKU) used to detect the abnormal presence of phenylalanine metabolites in the blood. A small amount of blood is obtained and placed in a medium with a strain of *Bacillus subtilis,* a bacterium that cannot grow without phenylalanine. If phenylalanine metabolites are present, the bacteria reproduce, and the test result is positive, indicating that the patient has phenylketonuria. Routine screening of newborns for PKU is now mandatory in most of the United States. The Guthrie blood test has normally been done before discharging the newborn from the hospital. However, it is important to note that this test is not valid until the newborn has ingested an ample amount (for 2 or 3 days) of the amino acid phenylalanine, which is a constituent of both human and cow's milk. Also called **Guthrie test.** See also **phenylketonuria.**



Guthrie's bacterial inhibition assay *(Zakus, 2001)*

Guthrie test /guth′re/, a screening tool used with infants to determine the level of phenylalanine in the blood. Blood is placed on filter paper, which is then placed on agar plates with a strain of *Bacillus subtilis* that requires phenylalanine for growth. If there is excessive phenylalanine in the blood sample, a halo will form around the filter paper, and additional tests are required to determine the seriousness of the hyperphenylalaninemia.

gutta (gt) /gut′ə, go͞ot′ä/ [L, drop], one drop, or about 1 minim, of a medication.

guttae (gtt, gtts, GTTS) [L, drops], the plural of **gutta,** more than one drop, as in *guttae pro auribus*, or ear drops, or *guttae ophthalmicae*, or eyedrops.

gutta-percha /gut′ə pur′chə/ [Malay, *getah-percha*, latex sap], the coagulated rubbery sap of various tropical trees, used for temporarily sealing the dressings of prepared tooth cavities. When combined with fillers and coloring materials, it may be rolled into sheets and used to make temporary bases for dentures.

gutta-percha point, a small cone of gutta-percha, which, along with endodontic sealer, may be used to fill a root canal. The radiopacity of gutta-percha points permits them to be used also as probes for determining the depth and topographic characteristics of periodontal pockets and fistulas by means of radiography or dental imaging.

guttate psoriasis /gut′āt/ [L, *gutta*, drop; Gk, itch], an acute form of psoriasis that consists of teardrop-shaped red scaly papules and patches measuring 3 to 10 mm all over the body. A beta-hemolytic streptococcal pharyngitis or other upper respiratory infection may precipitate this reaction in susceptible individuals. Treatment is essential to prevent a more severe form of psoriasis. Compare **pustular psoriasis.** See also **psoriasis.**

guttural /gut′ərəl/ [L, *guttur*, throat], pertaining to or belonging to the throat, including low-pitched, raspy voice quality.

Guyon tunnel [Felix J. Guyon, French surgeon, 1831–1920], a fibroosseous tunnel formed in part by the pisohamate ligament of the hand. It contains the ulnar artery and nerve and may be the site of a compression injury.

GVHD, abbreviation for **graft-versus-host disease.**

GVHR, abbreviation for *graft-versus-host reaction*. See **graft-versus-host disease.**

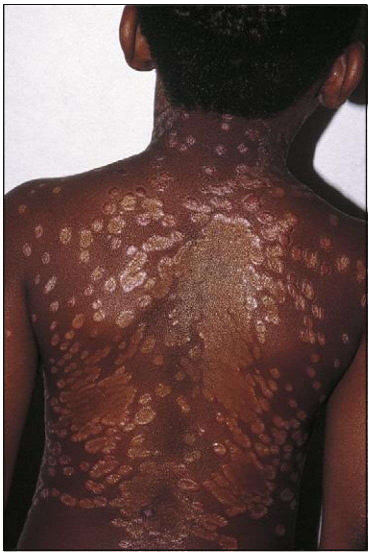
G-Well. See **lindane.**

GXT, abbreviation for **graded exercise test.**

Gy, abbreviation for the SI unit **gray.**

gymnema, an herb found in India and Africa.

■ USES: It is used to reduce high blood glucose levels; it may have some efficacy.



Guttate psoriasis *(White and Cox, 2006)*

■ CONTRAINDICATIONS: There is insufficient reliable information on the safety of gymnema. It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity to this product.

gymno-, prefix meaning "nakedness": *gymnocarpus, gymnocyte, gymnospore*.

gyn, **1.** *(informal)* abbreviation for **gynecologist. 2.** abbreviation for **gynecology.**

gyn-. See **gyneco-.**

-gyn. See **-gyne.**

gynaecoid pelvis. See **gynecoid pelvis.**

gynaecology. See **gynecology.**

gynaecomastia. See **gynecomastia.**

gynandrous /gīnan′drəs, jī-/ [Gk, *gyne*, woman, *aner*, man], describing a man or a woman who has some of the physical characteristics usually attributed to the other sex, as a female pseudohermaphrodite. Compare **androgynous.** —*gynandry, n.*

gyne-. See **gyneco-.**

-gyne, -gyn, suffix meaning "(specified) female characteristics": *androgyne, epigyne, trichogyne*.

gynec(o) [word element, [Gr.]], *woman*.

gyneco-, gyn-, gyne-, gyno-, prefix meaning "woman or female gender": *gynecoid, gynecomastia, gynotermon*.

gynecography /gī′nə-, jin′əkog′rəfē/, the radiographic examination of the female pelvic organs by means of intraperitoneal gas insufflation.

gynecoid obesity, obesity in which fat is localized in the lower half of the body, most frequently seen in women and having a better prognosis for morbidity and mortality than the android type. Compare **android obesity**.

gynecoid pelvis /gī′nəkoid, jin′ək-/ [Gk, *gyne* + *eidos*, form; L, *pelvis*, basin], a type of pelvis characteristic of the normal female and associated with the smallest incidence of fetopelvic disproportion. The inlet is nearly round, the sacrum is parallel to the posterior aspect of the symphysis pubis, the sidewalls are straight, and the ischial spines are blunt and do not encroach on the space in the true pelvis. It is the ideal pelvic type for childbirth. Also spelled **gynaecoid pelvis.**

gynecological /gī′nə-, jin′əkəloj′ik/ [Gk, *gynaikos*, of a woman], pertaining to gynecology, or the study of diseases of the female reproductive organs and the breasts. Also called *gynecologic*.

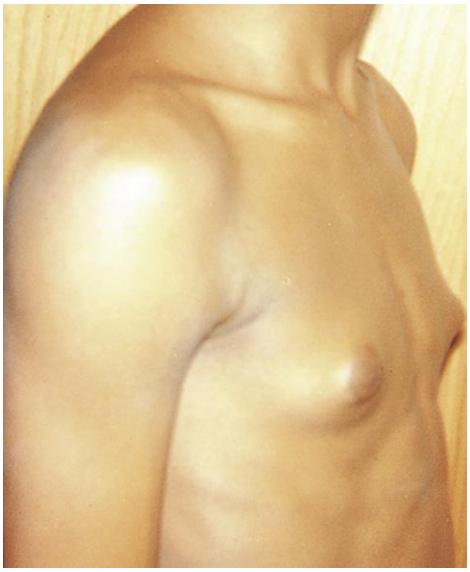
gynecological examination, pelvic examination.

gynecological operative procedures [Gk, *gynaikos*, of a woman; L, *operari*, to work, *procedere*, to proceed], surgical intervention on the female reproductive system. Gynecological and obstetric problems account for one fifth of all female visits to physicians; many require surgical correction.

gynecologist /gī′nəkol′əjist, jī′-, jin′-/, a physician who specializes in the health care of women, including diseases of their reproductive organs and breasts.

gynecology (gyn) /gī′nəkol′əjē, jī′-, jin′-/ [Gk, *gyne* + *logos*, science], the study of diseases of the female reproductive organs, including the breasts. Unlike most specialties in medicine, gynecology encompasses surgical and nonsurgical expertise. It is frequently studied and practiced in conjunction with obstetrics. Also spelled **gynaecology.** —*gynecologic*, **gynecological,** *adj*.

gynecomastia /gī′nəkōmas′tē·ə, jī′-, jin′-/ [Gk, *gyne* + *mastos*, breast], an abnormal enlargement of one or both breasts in males. Milk production may or may not be present. The condition is usually temporary and benign. It may be caused by hormonal imbalance; a tumor of an adrenal gland, testis, or pituitary; use of medication that contains estrogens or steroidal compounds; or failure of the liver to inactivate circulating estrogen, as in alcoholic cirrhosis. Less commonly the gynecomastia may be caused by a hormone-secreting tumor of the breast, lung, or other organ. It tends to subside spontaneously but, if marked, may be corrected surgically for cosmetic or psychological reasons. Biopsy may be performed to rule out cancer. Also spelled **gynaecomastia.** Also called *gynecomasty*.



Prepubertal gynecomastia *(Seidel et al, 2011/Courtesy Dr. Wellington Hung. Children's National Medical Center Washington, DC)*

Gyne-Lotrimin, a trademark for an antifungal **(clotrimazole).**

gynephobia /gī′nəfō′bē·ə, jī′-, jin′-/ [Gk, *gyne* + *phobos*, fear], an anxiety disorder characterized by a morbid fear of women or by a morbid aversion to the society of women. It is an obsessive, phobic phenomenon that occurs almost entirely in men and may usually be traced to some frightening experience involving women that occurred in childhood. Treatment consists of psychotherapy to uncover the causative emotional conflict, followed by behavior therapy, specifically systemic desensitization and flooding to reduce anxiety.

-gynic, -gynous, suffix meaning "human female or female characteristics": *androgynous, hologynic, monogynic, polygynic*.

gyno-. See **gyneco-.**

gynogamone /gī′nōgam′ōn/ [Gk, *gyne* + *gamos*, marriage], a chemical secreted by female gametes that is believed to attract male gametes.

-gynous. See **-gynic.**

gypsum /jip′səm/, a mineral composed mainly of crushed calcium sulfate hemihydrate. It is the main ingredient in making plaster of paris surgical casts, dental casts, and impressions for dentures. Gypsum dust has an irritant action on the mucous membranes of the respiratory tract and the conjunctiva.

gyrase /jī′rās/, an enzyme that promotes the unwinding of the closed circular deoxyribonucleic acid helix of bacteria.

gyri. See **gyrus.**

-gyria, suffix meaning "spiral or convolution": *oculogyria, polymicrogyria, ulegyria*.

-gyro, suffix meaning "circle or spiral": *gyrus*.

gyromagnetic ratio (γ), a value characteristic of any magnetic nucleus that determines the Larmor frequency, f_L, in a given magnetic field B ($f_L = \gamma B$).

gyrus /jī′rəs/ /jī′rī/ *pl*. **gyri** [Gk, *gyro*, circle], one of the winding convolutions of the cerebral hemisphere of the brain. They are caused by infolding of the cortex and are separated by the shallow grooves (sulci) or deeper grooves (fissures). See also **cerebral cortex.**

H

[H^+], symbol for **hydrogen ion.**

h, **1.** abbreviation for **haustus.** **2.** abbreviation for **hecto-.** **3.** abbreviation for **height.** **4.** abbreviation for *hora,* the Latin word for hour. **5.** abbreviation for *horizontal.* **6.** abbreviation for **hyperopia.** **7.** symbol for Planck's constant.

H, **1.** symbol for the element **hydrogen.** **2.** abbreviation for **henry.**

^{1}H, symbol for **protium,** an isotope of hydrogen.

^{2}H, symbol for **deuterium,** an isotope of hydrogen.

^{3}H, symbol for **tritium,** an isotope of hydrogen.

H_0, symbol for **null hypothesis.**

HA, abbreviation for **hepatitis A.**

HA-1A, a genetically engineered antibody used in the treatment of gram-negative bacteremia and septic shock. The antibody binds to bacterial lipopolysaccharide. It is relatively free of side effects.

HAAg, abbreviation for *hepatitis A antigen.* See **hepatitis A.**

HAART, abbreviation for **highly active antiretroviral therapy.**

Haas method, a technique for producing radiographic images of the interior of the skull. The patient rests the forehead and nose on the table so that the x-ray beam enters the skull near the base of the occipital bone and emerges on the frontal bone above the nasal bone.

habeas corpus /hā′bē·əs kôr′pəs/ [L, you have the body], a right retained by all psychiatric patients that provides for the release of individuals who claim they are being deprived of their liberty and detained illegally. A hearing for this determination takes place in a court of law, where the patient's sanity may be at issue.

Habermann's disease. See **Mucha-Habermann disease.**

habilitation /həbil′itā′shən/, the process of supplying a person with the means to develop maximum independence in activities of daily living through training, education, and/or treatment.

habit [L, *habitus,* condition], **1.** a customary or particular practice, manner, or mode of behavior. **2.** an involuntary pattern of behavior or thought. **3.** *colloquial,* the habitual use of drugs or narcotics. See also **habit spasm, habit training, habitus.**

habitat /hab′itat/ [L, *habitare,* to dwell], a natural environment where an organism, including a human being, may live and grow normally.

habit spasm, an involuntary twitching or tic. It usually involves a small muscle group of the face, neck, or shoulders and causes movements such as spasmodic blinking or rapid jerking of the head to the side. The movements are often generated by emotional conflicts rather than by organic disorder. They may serve as a release for tension or anxiety.

habit tic [L, *habitus,* condition; Fr, *tic*], a brief recurrent movement of a muscle group, such as a blink, grimace, or sudden head turning, that is of psychogenic rather than organic origin.

habit training, the process of teaching a child how to adjust to the demands of the external world by forming certain habits, primarily those related to eating, sleeping, elimination, and dress.

habitual abortion /həbich′o͞o·əl/ [L, *habituare,* to become used to], spontaneous termination of three successive pregnancies before the twentieth week of gestation. Habitual abortion can result from chronic infection, abnormalities of the conceptus, maternal hormonal dysfunction, or uterine abnormalities such as cervical incompetence. See also **cerclage, incompetent cervix.**

habitual dislocation [L, *habitus,* condition, *dis* + *locare,* to place], a dislocation that recurs repeatedly after reduction.

habitual fever. See **fever, habitual hyperthermia.**

habitual hyperthermia, a condition of unknown cause that occurs in young females, characterized by body temperatures of 99° F to 100.5° F regularly or intermittently for years, associated with fatigue, malaise, vague aches and pains, insomnia, bowel disturbances, and headaches. No organic cause can be found. The diagnosis is usually made only after a prolonged period of study and observation. No specific treatment is recommended. Reassurance and psychotherapy offer the best relief. Also called **habitual fever.**

habituation /həbich′o͞o·ā′shən/ [L, *habituare,* to become used to], **1.** an acquired tolerance gained by repeated exposure to a particular stimulus such as alcohol. **2.** a decline and eventual elimination of a conditioned response by repetition of the conditioned stimulus. **3.** psychological and emotional dependence on a drug, tobacco, or alcohol that results from the repeated use of the substance but without the addictive, physiological need to increase dosage. Also called **negative adaptation.** Compare **addiction.** **4.** internal readiness to demonstrate a consistent pattern of behavior guided by habits and roles; this readiness is associated with specific temporal, physical, or social environments.

habitus /hab′itəs/, a person's appearance or physique, as an athletic habitus. See also **habit.**

HACEK, acronym for *Haemophilus, Actinobacillus, Cardiobacterium, Eikenella,* and *Kingella,* microorganisms associated with infective endocarditis.

hacking cough [AS, *haeccan* + *cohettan*], a short, weak repeating cough, often caused by irritation of the larynx by a postnasal drip. It can also result from side effects of angiotensin-converting enzyme inhibitor therapy and smoking.

HAD, abbreviation for **HIV-associated dementia.**

Haeckel's law. See **recapitulation concept.**

haemangioma. See **hemangioma.**

haemarthros. See **hemarthros.**

haematemesis. See **hematemesis.**

haematocele. See **hematocele.**

haematocrit. See **hematocrit.**

haematocytoblast. See **hematocytoblast.**

haematology. See **hematology.**

haematoma. See **hematoma.**

haematomyelia. See **hematomyelia.**

haematuria. See **hematuria.**

haeme. See **heme.**

-haemia. See **-emia.**

haemochromatosis. See **hemochromatosis.**

haemoconcentration. See **hemoconcentration.**

haemodialysis. See **hemodialysis.**

haemodilution. See **hemodilution.**

haemofiltration. See **hemofiltration.**

haemoglobin. See **hemoglobin.**

haemoglobinometer. See **hemoglobinometer.**

haemoglobinopathy. See **hemoglobinopathy.**

haemoglobinuria. See **hemoglobinuria.**

haemolysin. See **hemolysin.**

haemolysis. See **hemolysis.**

haemolytic anemia. See **hemolytic anemia.**

haemoperfusion. See **hemoperfusion.**

haemopericardium. See **hemopericardium.**

haemoperitoneum. See **hemoperitoneum.**

haemophilia. See **hemophilia.**

Haemophilus /hēmof′iləs/ [Gk, *haima,* blood, *philein,* to love], a genus of gram-negative rod-shaped pathogenic bacteria, frequently found in the respiratory tract of humans and other animals. Examples are *H. influenzae,* which causes respiratory tract infections and one form of meningitis; *H. haemolyticus,* a hemolytic species pathogenic in the upper respiratory tract of humans; and *H. ducreyi,* which causes chancroid. *Haemophilus* species are generally sensitive to cephalosporins, tetracyclines, and sulfonamides.

Haemophilus influenzae, a small gram-negative nonmotile parasitic bacterium that occurs in two forms, encapsulated and nonencapsulated, and in six types, a, b, c, d, e, and f. Almost all infections are caused by encapsulated type b organisms. *H. influenzae* is found in the nasopharynx of approximately 75% of healthy children and adults. In children and in debilitated older people, severe destructive inflammation of the larynx, trachea, and bronchi may result from infection. Subacute bacterial endocarditis, purulent meningitis, and pneumonia also may be caused by it. Secondary infection by *H. influenzae* occurs in influenza and in many other respiratory diseases. Several *H. influenzae* B conjugate vaccines are available.

***Haemophilus influenzae* pneumonia,** bacterial pneumonia caused by infection with *H. influenzae,* seen mainly in young children and debilitated or immunocompromised adults. It sometimes progresses to life-threatening conditions such as meningitis, pericarditis, endocarditis, and epiglottitis that can cause obstruction of the airway.

haemoptysis. See **hemoptysis.**

haemorrhage. See **hemorrhage.**

haemorrhagic disease of newborn. See **hemorrhagic disease of newborn.**

haemorrhoid. See **hemorrhoid.**

haemorrhoidectomy. See **hemorrhoidectomy.**

haemosiderin. See **hemosiderin.**

haemostasis. See **hemostasis.**

haemostatic. See **hemostatic.**

haemothorax. See **hemothorax.**

hafnium (Hf) /haf′nē·əm/ [Hafnia, Medieval Latin name of Copenhagen, Denmark], a hard, brittle silver-gray metallic element of the third transition series. Its atomic number is 72; its atomic mass is 178.49. Elements in this group show some nonmetallic chemical characteristics.

Hagedorn needle /hä′gedôrn/ [Werner Hagedorn, German physician, 1831–1894], a flat surgical needle with a cutting edge near its point and a very large eye at the other end.

Hageman factor. See **factor XII.**

Haglund's deformity [Sims E.P. Haglund, Swedish orthopedist, 1870–1937], a foot disorder characterized by an enlarged posterosuperior lateral aspect of the calcaneus, often associated with an inverted subtalar joint. It is a common cause of posterior Achilles bursitis.

Hailey-Hailey disease. See **benign familial chronic pemphigus.**

Hainsworth, Margaret A., a nursing theorist who, with Mary Lermann Burke and Georgene Gaskill Eakes, developed the Theory of Chronic Sorrow to describe the ongoing feelings of loss that arise from illness, debilitation, or death.

hair [AS, *haer*], a filament of keratin consisting of a root and a shaft formed in a specialized follicle in the epidermis. There are three stages of hair development: **anagen,** the active growing stage; **catagen,** a short interlude between the growth and resting phases; and **telogen,** the resting (club) stage before shedding. Scalp hair grows at an average rate of 1 mm every 3 days, body and eyebrow hair at a much slower rate. Hair plucking does not stop hair growth. See also **hirsutism, lanugo.**

hair analysis [AS, *haer* + Gk, a loosening], chemical analysis of a hair sample to find possible evidence of exposure to a toxic substance. Molecules of lead compounds and other chemicals are absorbed and stored in hair shafts. Hair analysis is also used to determine possible causes of malnutrition. Samples for analysis are taken from areas close to the scalp to eliminate chances that toxic chemicals found in the hair may have been absorbed from air pollutants.

hair care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of neat, clean, attractive hair. See also **Nursing Interventions Classification.**

hair cycle, the successive phases of the production and then loss of hair, consisting of growth (anagen), regression (catagen), and quiescence (telogen).

hair follicle [AS, *haer* + L, *folliculus,* a small bag], a tubelike opening in the epidermis where the hair shaft develops and into which the sebaceous glands open.

hairline fracture [AS, *haer* + L, *linea* + *fractura*], a minor fracture that appears on x-ray film as a thin line between two segments of a bone. The segments remain in alignment and the fracture may not extend completely through the bone. A fatigue hairline fracture may develop without apparent injury and in the absence of trauma.

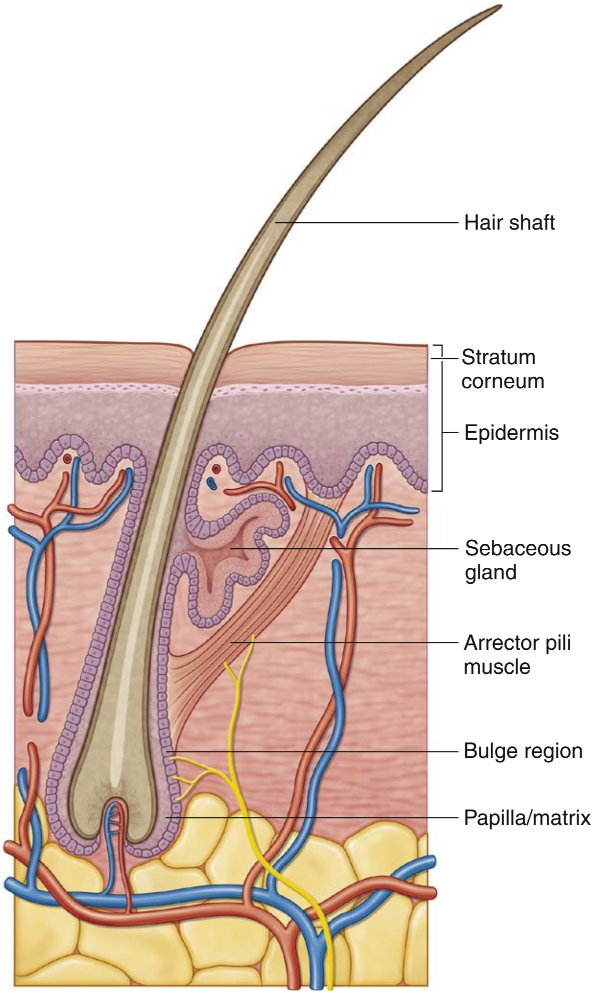
hair matrix carcinoma. See **basal cell carcinoma.**

hair pulling. See **trichotillomania.**

hair transplantation, a form of dermatological surgery and plastic surgery, performed to correct scalp hair deficiencies caused by hormonal changes, burns, or injuries. The procedure uses existing hair to fill in bald areas. Several sessions are usually required to achieve the level of hair fullness desired by the patient. The sessions consist of grafting the hair-bearing tissue over the bald area directly or using micrografts of follicles to restore the hairline. It is important that the patient have healthy hair growth on other parts of the head to serve as donor areas and that color, texture, and other aspects of a matching transplant be compatible.

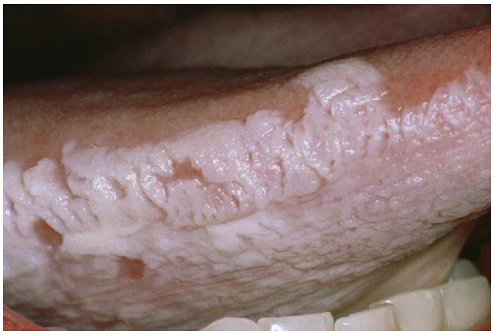
hairy-cell leukemia [AS, *haer* + L, *cella,* storeroom; Gk, *leukos,* white, *haima,* blood], an uncommon neoplasm of blood-forming tissues, characterized by pancytopenia, enlargement of the spleen, and many fine projections on the surface of reticulum cells in the blood and bone marrow. The disease occurs six times more frequently in men than in women and usually appears in the fifth decade with an insidious onset and a variable course marked by anemia, thrombocytopenia, and spontaneous bruising. Some cases may achieve long-term remission through alpha-interferon administration or chemotherapy using vincristine and prednisone. Also called **leukemic reticuloendotheliosis.**

hairy leukoplakia, a form of leukoplakia characterized by a white plaque that is markedly folded in appearance or smooth and is often visible on one or both lateral borders of the tongue. It is associated with severe immunodeficiency,



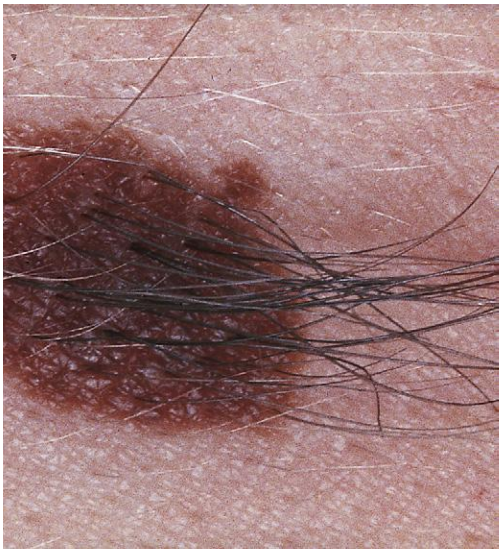
Hair follicle *(Robinson et al, 2010)*

occurs in human immunodeficiency virus–infected patients, and is believed to result from the Epstein-Barr virus. It has a high correlation with progression from herpes zoster virus infection to AIDS.



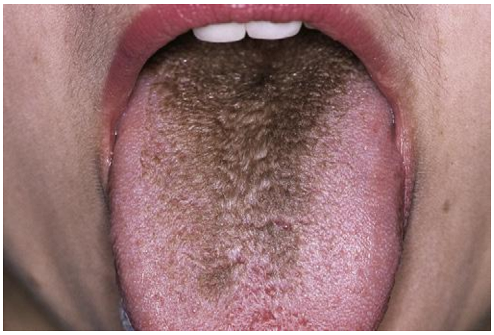
Hairy leukoplakia *(Regezi, Sciubba, and Jordan, 2008)*

hairy nevus [AS, *haer* + L, *naevus*, birthmark], a mole, usually pigmented, that has hairs growing from it.



Hairy nevus *(du Vivier, 2002)*

hairy tongue, a dark, pigmented overgrowth of the filiform papillae of the tongue that has a thickened, furry appearance. It is a benign and frequent side effect of use of some antibiotics. The condition gradually subsides, and no treatment is indicated. See also **glossotrichia.**



Hairy tongue *(Regezi, Sciubba, and Jordan, 2008)*

halcinonide /həlsin′ənīd/, a topical glucocorticoid.

- ■ INDICATION: It is prescribed topically for the treatment of inflammation.
- ■ CONTRAINDICATIONS: Viral and fungal diseases of the skin, impaired circulation, or known hypersensitivity to this drug or to steroid medication prohibits its use.
- ■ ADVERSE EFFECTS: Among the more serious adverse effects are skin reactions and systemic side effects that result from prolonged or excessive application.

Halcion, a trademark for a hypnotic agent **(triazolam).**

Haldol, a trademark for a tranquilizer **(haloperidol).**

half-life (t-½) [AS, *haelf* + *lif*], **1.** also called **radioactive half-life.** the time required for a radioactive substance to lose 50% of its activity through decay. Each radionuclide has a unique half-life. **2.** the amount of time required to reduce a drug level to half of its initial value. Usually the term refers to time necessary to reduce the plasma value to half of its initial value. After five half-lives, 97% of a single drug dose will be eliminated. See also **biological half-life, effective half-life.**

half-normal saline, a solution of 0.45% NaCl used for mucosal hydration. As the water in the solution evaporates, the saline concentration increases, achieving nearly normal saline concentration in the respiratory tract.

half-sibling, one of two or more children who have one parent in common (a half-brother or half-sister). Also called *half-sib*.

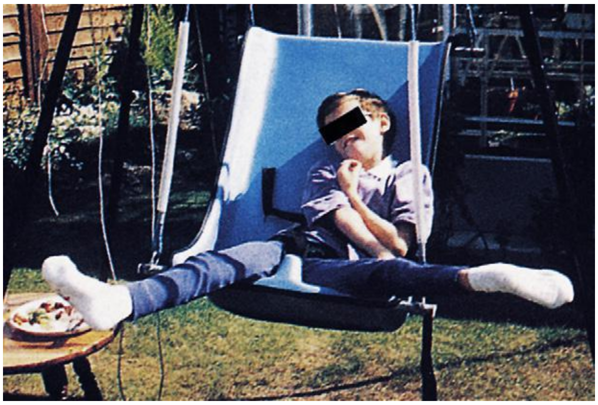
half-value layer (HVL), the amount of absorbing material required to attenuate a beam of radiation to half its original level. Quantities are indicated by length, as millimeters of aluminum or centimeters of soft tissue.

halfway house, a specialized treatment facility, usually for psychiatric patients who no longer require complete hospitalization but who need some care and time to adjust to living independently. Halfway houses are also used for substance abuse recovery.

halisteresis /həlis′tərē′sis/ [Gk, *hals,* salt, *steresis,* absence of], a theoretic process of bone resorption in which bone salts are removed by humoral mechanisms and returned to body tissue fluids, leaving behind a decalcified bone matrix. See also **osteolysis.**

halitosis /hal′itō′sis/ [L, *halitus,* breath; Gk, *osis,* condition], offensive breath resulting from poor oral hygiene; dental or oral infections; ingestion of certain foods, such as garlic or alcohol; use of tobacco; or some systemic diseases, such as the odor of acetone in diabetes and ammonia in liver disease.

Hallervorden-Spatz syndrome /hol′ərfôr′dən shpots/ [Julius Hallervorden, German neurologist, 1882–1965; H. Spatz, German neurologist, 1888–1969], a progressive degenerative neurological disease of children, with symptoms of parkinsonism. It is characterized by rigidity, athetosis, and dementia. The cause is an accumulation of iron pigments in the globus pallidus and substantia nigra. Treatment is similar to that of Parkinson's disease and Huntington's chorea.



Hallervorden-Spatz syndrome: abnormal posturing
(Newton, 1995)

hallex. See **hallux.**

Hall, Lydia E, (1906–1969), a nursing theorist who presented her Care, Core, and Cure Model in "Nursing: What Is It?" in *The Canadian Nurse* (1964). Hall believed that nursing functions differently in three overlapping circles that constitute aspects of patients. She labeled the circles *the body* (the care), *the disease* (the cure), and *the person* (the core). Hall viewed nursing in relation to the core aspect as concerned with the therapeutic use of self in communicating with the patient. Care is the nurturing, comforting component, the "hands-on" care of the patient. Cure is the aspect of nursing involved with treatments and administration of medications. Hall's concept includes adult patients who have passed the acute stage of illness and have rehabilitation and feelings of self-actualization as their goal.

Hallpike test. See **Dix-Hallpike test.**

halluces. See **hallux.**

hallucination /həlo͞o′sinā′shən/ [L, *alucinari,* to wander in mind], a sensory perception that does not result from an external stimulus and that occurs in the waking state. It can occur in any of the senses and is classified accordingly as auditory, gustatory, olfactory, tactile, or visual. It is a symptom of psychotic behavior, often noted during schizophrenia, as well as of other mental or organic disorders and conditions. —*hallucinate* /həlo͞o′sənāt/ *v., hallucinations, adj.*

hallucination management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promoting the safety, comfort, and reality orientation of a patient experiencing hallucinations. See also **Nursing Interventions Classification.**

hallucinatory neuralgia /həlo͞o′sənətôr′ē/, a feeling of localized pain that persists after an episode of severe throbbing pain has subsided.

hallucinogen /həlo͞o′sənəjen′, hal′əsin′əjən, hal′yəsin′əjən/ [L, *alucinari,* to wander in mind + Gk, *genein,* to produce], a substance that causes excitation of the central nervous system, characterized by hallucination, mood change, anxiety, sensory distortion, delusion, and depersonalization; increased pulse, temperature, and blood pressure; and dilation of the pupils. The ingestion of hallucinogenic substances may cause psychic dependence and depressive or suicidal psychotic states. Some kinds of hallucinogens are **lysergide, mescaline, phencyclidine hydrochloride,** and **psilocybin.**

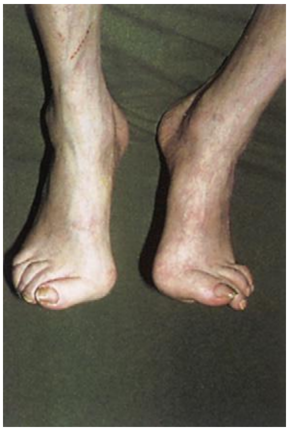
hallucinogenesis /-jen′əsis/ [L, *alucinari,* to wander in mind; Gk, *genein,* to produce], a cause or source of hallucinations.

hallucinosis /halo͞o′sinō′sis/ [L, *alucinari* + Gk, *osis,* condition], a pathological mental state in which awareness consists primarily or exclusively of hallucinations. A kind of hallucinosis is **alcoholic hallucinosis.**

hallux /hal′əks/ *pl.* **halluces** [L, *hallex,* large toe], the great toe. Also spelled **hallex.**

hallux rigidus, a painful deformity of the great toe, limiting motion at the metatarsophalangeal joint.

hallux valgus, a deformity in which the great toe is angled away from the midline of the body toward the other toes. In some cases the great toe rides over or under the other toes. Compare **hallux varus.**



Hallux valgus *(Moll, 1997)*

hallux varus, a deformity in which the great toe is angled away from the other toes. Compare **hallux valgus.**

halo- /hal′ō-/, prefix meaning "salt": *halogen.*

halobetasol /hal′oba′täsol/, a very high-potency synthetic corticosteroid used topically in the form of the propionate as an antiinflammatory and antipruritic agent.

halo cast. See **halo vest.**

halo effect, the beneficial effect of an interview or other encounter, as may occur in the course of a research project or a health care visit. The halo effect cannot be attributed to the content of the interview or to any specific act or treatment; it is the result of indefinable interpersonal factors present in the interaction.

halofantrine, an antimalarial.

■ INDICATION: It is used to treat mild to moderate malaria.

■ CONTRAINDICATION: Known hypersensitivity to halofantrine prohibits its use.

■ ADVERSE EFFECTS: Common side effects include nausea, vomiting, anorexia, diarrhea, and arrhythmias.

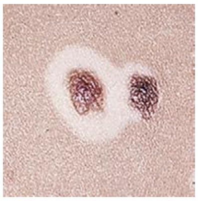
Halog, a trademark for a topical glucocorticoid **(halcinonide).**

halogen /hal′ōjən/ [Gk, *hals,* salt, *genein,* to produce], any member of group 17 (or Group VIIA) in the periodic table: fluorine, chlorine, bromine, iodine, and astatine. With the exception of astatine, they are found in seawater as the corresponding halide ion.

halogenated hydrocarbon /həloj′ənā′tid/ [Gk, *hals,* salt, *genein,* to produce, *hydor,* water; L, *carbo,* coal], a volatile liquid used as an inhalation anesthetic, administered in combination with oxygen and/or nitrous oxide. The only halogenated hydrocarbon used for anesthesia is halothane.

halogenoderma /hal′ōdur′mə/, skin changes caused by ingestion or injection of halogen, usually a bromide or an iodide.

halo nevus, a benign melanocytic nevus that appears as a central brown mole surrounded by a circle of depigmented skin. There are sometimes multiple nevi. Over a period of months the central nevus becomes flat and loses its pigment, leaving a round white macule. Eventually the halo repigments.



Halo nevus *(Callen et al, 2000)*

haloperidol /hal′ōper′ədôl/, a butyrophenone antipsychotic.

■ INDICATIONS: It is prescribed in the treatment of schizophrenia, in the control of tics and verbal utterance of Tourette's syndrome, in the treatment of severe behavioral problems in children, and as a sleep aid.

■ CONTRAINDICATIONS: Parkinson's disease, concurrent administration of central nervous system depressants, liver or renal dysfunction, severe hypotension, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: There is a wide range of adverse effects. Among the more serious adverse effects are hypotension and hypersensitivity reactions. It also has comparatively high risk for a variety of extrapyramidal effects, including pseudoparkinson signs and symptoms, tardive dyskinesia, dystonia, and akathisia.

halo sign [Gk, *halos,* circular floor; L, *signum,* mark], a halo effect produced in the radiograph of the fetal head between the subcutaneous fat and the cranium. It is said to be indicative of intrauterine death of the fetus.

Halotestin, a trademark for an androgen **(fluoxymesterone).**

halothane /hal′əthān/, an inhalation anesthetic.

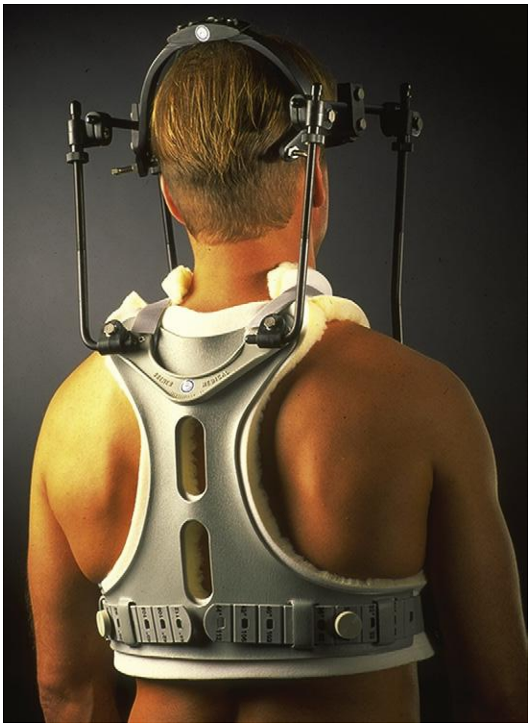
■ INDICATIONS: It is prescribed for induction and maintenance of general anesthesia.

■ CONTRAINDICATION: It is not recommended for obstetric anesthesia unless uterine relaxation is required.

■ ADVERSE EFFECTS: Among the more serious but rare adverse reactions are hepatic necrosis, cardiac arrest or arrhythmia, hypotension, malignant hyperthermia, nausea, and emesis.

halothane-related hepatitis, an adverse reaction of some patients to inhalation of halothane, a general anesthetic, characterized by hepatitis and a severe fever that develops several days after exposure to the anesthetic. The risk is higher for obese patients, possibly because body fat tends to store the chemical.

halo vest [Gk, *halos,* circular floor; AS, *kasta*], an orthopedic device used to help immobilize the neck and head, providing traction to the cervical spine. It incorporates a vest, usually with shoulder straps, and metal bars within the cast that connect the vest to secure pins to a band around the skull. The halo is attached to the skull by pins or screws. The halo vest is used to aid the healing of injuries and cervical dislocations and to position and immobilize a patient after cervical surgery.



Halo vest *(Courtesy DePuy Spine, a Johnson & Johnson Company, Raynham, Massachusetts)*

Halsted's forceps /hal′stedz/ [William S. Halsted, American surgeon, 1852–1922], **1.** a small pointed hemostatic forceps. See also **mosquito forceps. 2.** a forceps with slender jaws for grasping arteries and other blood vessels.

Halsted's suture [William S. Halsted], the union of two adjoining skin surfaces by a suture placed through the subcuticular fascia.

HALT, abbreviation for **Hypertension and Lipid Trial.**

hamamelis water. See **witch hazel.**

hamartoma, a new tissue growth resembling a tumor. It results from a defective overgrowth in tissue formation.

hamartoma syndrome. See **Cowden's disease.**

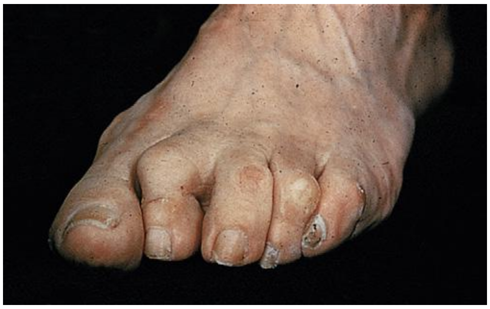
hamate bone /ham′āt/ [L, *hamatus,* hooked], a carpal (wrist) bone that rests on the fourth and fifth metacarpal bones and projects a hooklike process, the hamulus, from its palmar surface. Its dorsal surface is rough for ligamentous attachment. The hamate bone articulates with the lunate proximally, the fourth and fifth metacarpal distally, the triangular medially, and the capitate laterally. Also called **os hamatum, unciform bone.**

Hamman-Rich syndrome. See **interstitial pneumonia.**

Hamman's disease. See **pneumomediastinum.**

hammer finger [AS, *hamer* + *finger*], a permanently flexed terminal phalanx caused by an injury to the extensor tendon. Also called **mallet finger.**

hammer toe [AS, *hamer* + *ta*], a foot digit permanently flexed at the proximal phalangeal joint and hyperextended at the distal interphalangeal joint, producing a clawlike appearance. The anomaly may be present in more than one digit but is most common in the second toe. It may accompany clawfoot.



Hammer toe

(Seidel et al, 2011/Courtesy Charles W. Bradley, DPM, MPA, and Caroline Harvey, DPM, California College of Podiatric Medicine)

Hampton's hump [Aubrey O. Hampton, American radiologist, 1900–1955], a soft-tissue image in a radiograph of the lung that is a manifestation of a pulmonary infarction.

Ham's test, a rarely performed blood test used in the diagnosis of paroxysmal nocturnal hemoglobinuria.

hamstring muscle [AS, *hamm* + *streng*], any one of three muscles at the back of the thigh: medially the semimembranosus and the semitendinosus and laterally the biceps femoris.

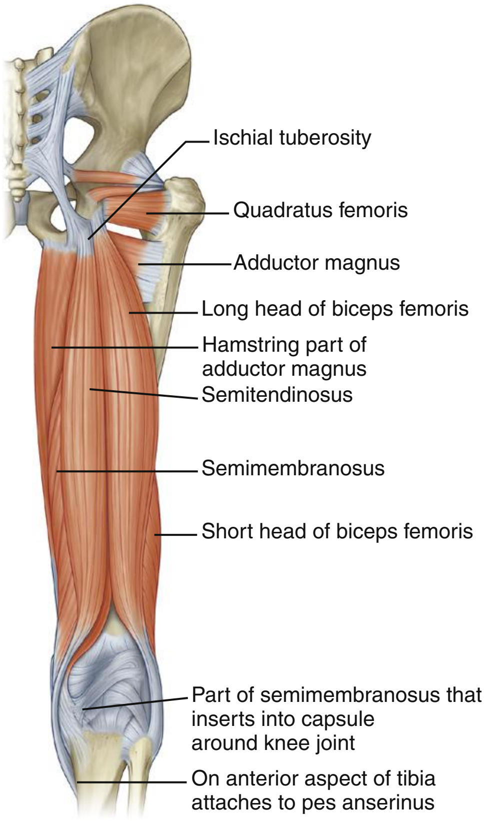
hamstring reflex, a normal deep tendon reflex elicited by tapping one of the hamstring tendons behind the knee, causing contraction of the tendon and flexion of the knee. The patient should be lying in the supine position with the knee and hip partially flexed and the leg supported by the examiner's hand. An accentuated hamstring reflex may result from a lesion of the pyramidal system above the level of the fourth lumbar nerve root. See also **deep tendon reflex.**

hamstring tendon, one of the three tendons from the three hamstring muscles in the back of the thigh. The one lateral and the two medial hamstring tendons connect the hamstring muscles to the knee.

hamular notch. See **pterygomaxillary notch.**

hamulus /ham′yo͞o·ləs/ *pl. hamuli* [L, little hook], **1.** a general term denoting a hook-shaped process. **2.** hook of the hamate.

hand [AS, *hand*], the part of the upper limb distal to the forearm. It is the most flexible part of the skeleton and has a total of 29 bones, 8 forming the carpus, 5 forming the metacarpus, 14 forming the phalangeal section, and 2 sesamoid bones. Also called **manus.**



Ischial tuberosity
Quadratus femoris
Adductor magnus
Long head of biceps femoris
Hamstring part of adductor magnus
Semitendinosus
Semimembranosus
Short head of biceps femoris
Part of semimembranosus that inserts into capsule around knee joint
On anterior aspect of tibia attaches to pes anserinus

Hamstring muscles *(Drake, Vogl, and Mitchell, 2010)*

Lunate
Trapezoid
Trapezium
Scaphoid
Ulna
Radius

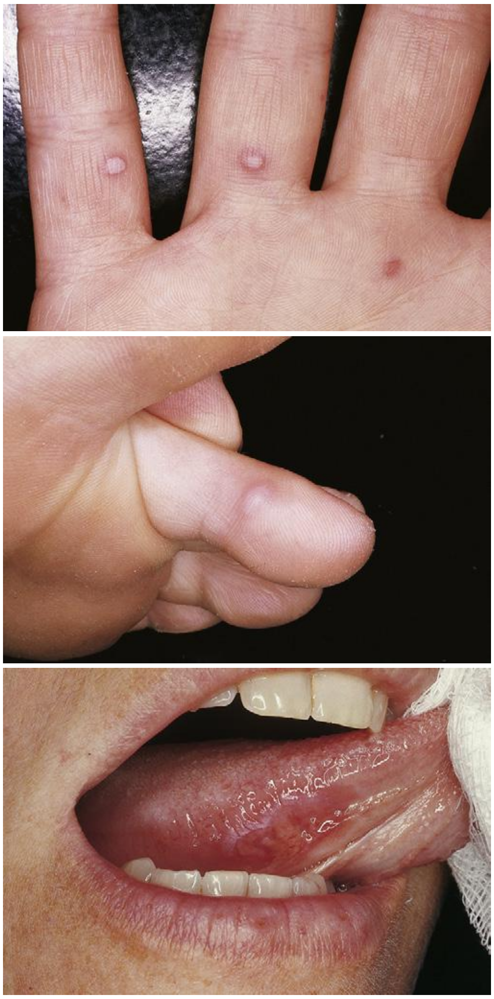
Bones of the hand *(Frank, Long, and Smith, 2012)*

handblock [AS, *hand* + Fr, *bloc*], a device made of a wood block several inches high with a firm handle that can assist a disabled patient in sitting push-ups, which can enhance transfers or mobility in bed. Also called **push-up block.**

hand condenser, (in dentistry) an instrument for compacting amalgams or gold foil, using force applied by the operator, with or without supplementary force from a mallet wielded by an assistant.

handedness /han′didnes/ [AS, *hand* + *ness,* condition], a preference for use of either the left or right hand. The preference is related to cerebral dominance: left-handedness corresponds to dominance of the right side of the brain, and vice versa. Also called **chirality, laterality.**

hand-foot-and-mouth disease, a viral infection usually caused by coxsackie A virus but also by enterovirus 71. It is characterized by the appearance of painful ulcers and vesicles on the mucous membranes of the mouth and on the hands and feet. The disease is very contagious and mainly affects children, including infants. There is no specific treatment. It is spread through contact with oral secretions (respiratory droplets) or stool. Lesions usually resolve in 1 week. Antiseptic mouthwashes and simple analgesics can be used to relieve discomfort of eating. It should not be confused with foot-and-mouth disease, which is primarily an animal disease.



Hand-foot-and-mouth disease

(Regezi, Sciubba, and Jordan, 2008/Courtesy Dr. Steven K. Young)

handicapped /han′dikapt/ [*hand in cap,* a seventeenth-century game with forfeits], referring to a person who has a congenital or acquired mental or physical defect that interferes with normal functioning of the body system or the ability to be self-sufficient in modern society. Compare **disability.**

handpiece /hand′pēs/, a handheld extraoral or intraoral device for holding rotary instruments in a dental engine or condensing points in mechanical condensing units. It can be driven by an arm, cable, belt, or tube to a power source, such as a motor, directly to a motor, or to an air-pressure driven motor.

hand scaling, the manual removal of plaque and calculus from the surface of a tooth by an instrument.

Hand's disease /handz/, an idiopathic condition, classified as a rare disease by the U.S. National Institutes of Health, in which lipids accumulate in the body and manifest as histiocytic granuloma in bone. It occurs most commonly in children 1 to 3 years of age. Also called *Hand-Schüller-Christian disease*.

hanging drop preparation [ME, *hangen,* to hang; AS, *dropa,* to fall; L, *praeparer,* to make ready], a technique used for the examination and identification of certain microorganisms, such as spirochetes or trichomonads. The technique requires a coverslip, a microscope, and a special slide that has a central concavity. A specimen suspected of containing the microorganism is diluted with a sterile isotonic solution. A drop of this fluid mixture is placed on a glass coverslip, which is then inverted carefully and placed over the slide so that the drop is hanging from the slip into the concavity in the slide. The delicate structures and the method of movement characteristic of the species may then be viewed through the microscope.

hangman's fracture, a break in the posterior elements of the cervical vertebrae with dislocation of C2.

hangnail [AS, *angnaegl,* troublesome nail], a piece of partially disconnected epidermis of the cuticle or nail fold. Tearing the skin fragment causes a red, painful, easily infected sore. Early treatment is to trim the hangnail close with nail clippers. For inflamed cases an antibiotic ointment and protective bandage are used.

hangover, a popular term for a group of disagreeable physical effects, including nausea, thirst, fatigue, headache, and irritability, resulting from the heavy consumption of alcohol and/or certain drugs.

Hanhart's syndrome /hän′härts/ [Ernst Hanhart, Swiss physician, 1891–1973], any of several syndromes of variable inheritance, characterized chiefly by severe micrognathia, high nose root, small eyelid fissures, low-set ears, and variable absence of digits or limbs, usually below the elbow or knee.

Hanot's disease /hanōz′/ [Victor C. Hanot, French physician, 1844–1896], primary biliary cirrhosis. See also **biliary cirrhosis.**

Hansel stain, a stain used to detect eosinophils in urine or other body fluids, the eosinophils staining red against a background of blue.

Hansen's bacillus [Gerard H.A. Hansen, Norwegian physician, 1841–1912; L, *bacillum,* a small rod], the acid-fast *Mycobacterium leprae,* which is the cause of leprosy.

Hansen's disease. See **leprosy.**

Hantaan virus, a virus of the genus *Hantavirus* that causes severe epidemic hemorrhagic fever (Korean hemorrhagic fever) in Asia. See also ***Hantavirus.***

Hantavirus, a genus of RNA viruses in the Bunyaviridae family. *Hantavirus* is the cause of several different forms of hemorrhagic fever with renal syndrome. Some people appear to be more susceptible than others who are presumed to have had similar exposure to the virus. About half of all reported cases have been fatal. A *Hantavirus* infection begins with flulike symptoms and may be mistaken for other diseases. Some patients were diagnosed originally as having hepatitis or inflammation of the pancreas, or both. The disease can be spread by several common rodent species via rodent excreta. Most U.S. cases have been reported in the western United States, but confirmed hantavirus cases have also been found in the New York City suburbs. *Hantavirus* includes the Hantaan, Seoul, Puumala, Prospect Hill, Sin Nombre, and Porogia strains. See also **hemorrhagic fever.**

hantavirus pulmonary syndrome, a sometimes fatal febrile illness caused by a virus of the genus ***Hantavirus,*** characterized by variable respiratory symptoms followed by acute respiratory distress, sometimes progressing to respiratory failure.

hapadnavirus /hapad′nəvī′rəs/, a family of viruses that can cause liver infections. One example is hepatitis B, which proliferates in the nuclei of liver cells and causes a persistent infection.

-haphia. See **-aphia.**

haplo-, prefix meaning “single,” “simple”: *haploderma.*

haploid /hap′loid/ [Gk, *haploos,* single, *eidos,* form], having only one complete set of nonhomologous chromosomes. Also **monoploid, monoploidic. —haploidy,** *n.*

haploid nucleus [Gk, *haploos,* single, *eidos,* form; L, *nucleus,* nut], a nucleus possessing only half the normal somatic number of chromosomes. It may occur in a germ cell after meiosis and before fertilization. Also called **hemikaryon.**

haploidy. See **haploid.**

Hapsburg jaw, a lower jaw (mandible) that projects forward in advance of the upper jaw (maxilla), resulting in a skeletal Class III malocclusion according to **Angle’s classification of malocclusion.** The term relates to the Hapsburg royal family in which that facial pattern was dominant.

Hapsburg lip, an overdeveloped, thick lower lip, which often accompanies the Hapsburg jaw (a jaw that projects forward). This kind of lip was characteristic of many members of the royal German-Austrian family that produced several European rulers between 1278 and 1918.

hapten /hap′tən/ [Gk, *haptein,* to grasp], a small molecule that acts as an antigen by combining with particular bonding sites on an antibody. By itself it cannot induce an immune response, but when bonded to a carrier protein may cause an immune response.

haptics /hap′tiks/ [Gk, *haptein,* to grasp], the science concerned with studying the sense of touch. *—haptic, adj.*

haptoglobin /hap′tōglō′bin/ [Gk, *haptein,* to grasp; L, *globus,* ball], a plasma protein that irreversibly binds free hemoglobin and is removed by macrophages conserving iron. The quantity of haptoglobin is increased in certain chronic diseases and inflammatory disorders and is decreased or absent in hemolytic anemia. Normal adult findings range from 100 to 150 mg/dL. Compare **transferrin.** See also **hemoglobinemia, hemoglobinuria.**

haptoglobin test, a blood test primarily used to detect hemolysis, the intravascular destruction of red blood cells. Abnormally low levels of haptoglobin may indicate hemolytic anemias, whereas high levels are found in primary liver disease, many inflammatory diseases, acute myocardial infarction, and some cancers.

harborage transmission /här′bərij/, a mode of infection transmission in which the organism does not undergo morphological and physiological changes in the vector.

hard chancre [AS, *heard* + Fr, *canker*], a syphilitic chancre or primary lesion that develops at the site of a syphilis infection. The lesion begins as a small red papule that gradually hardens and erodes into an extremely contagious, although painless, ulcer. A secretion exuded by the sore contains ***Treponema pallidum,*** the organism that is the causative agent of syphilis in humans.

hard contact lens [AS, *heard* + L, *contingere,* to touch, *lentil*], a polymethylmethacrylate, or rigid gas-permeable, contact lens that retains its form without support, in contrast with a soft contact lens, which readily yields to pressure.

hard data, information about a patient that is obtained by observation and measurement, including laboratory data, as opposed to information collected by interview of the patient or others.

hard disk, a computer data storage medium that consists of a rigid disk with an electromagnetic coating allowing information to be transcribed onto and from it. Permanently mounted in a dust-proof container, a hard disk has a storage capacity many times that of a diskette. Also called *hard drive*. Compare **diskette.**

hardening /här′dəning/ [AS, *heard,* hard], **1.** See **induration, sclerosis. 2.** the procedure of rendering tissue firm, so that it may be more readily cut for purposes of microscopic examination.

hardening of the arteries. See **arteriosclerosis.**

hard fibroma, a neoplasm composed of fibrous tissue in which few cells are present. Also called **fibroma durum.**

hard metal disease, pneumoconiosis caused by inhalation of fine particles of cobalt, usually in conjunction with tungsten carbide. In early stages reversible hyperplasia and metaplasia of the bronchial epithelium are seen. Later, subacute alveolitis and then chronic interstitial fibrosis develop. Also called **cobalt lung.**

hardness /härd′nəs/ [AS, *heard,* hard], **1.** a quality of water produced by soluble salts of calcium and magnesium or other substances that form a precipitate with soap and thus interfere with its cleansing power. **2.** the quality of firmness produced by cohesion of the particles composing a substance, as evidenced by its inflexibility or resistance to indentation, distortion, or scratching.

hardness of x-rays, the relative energy or penetrating power of x-rays. In general, the hardness increases as the wavelength of the x-rays decreases. Also called **hard radiation.** Compare **soft radiation.**

hard nevus. See **epidermal nevus.**

hard palate [AS, *heard,* hard; L, *palatum*], the bony portion of the roof of the mouth, continuous posteriorly with the soft palate and bounded anteriorly and laterally by the alveolar arches and the gums. The hard palate is covered with stratified squamous epithelium and furnished with numerous palatal glands lying between the mucous membrane and the surface of the bone. Compare **soft palate.**

hard radiation. See **hardness of x-rays.**

hard soap, a detergent soap made with olive oil and sodium hydroxide.

HARD syndrome. See **Walker-Warburg syndrome.**

hardware, the tangible parts of a computer, such as chips, boards, wires, transformers, and peripheral devices. See also **software.**

hardware bug. See **bug.**

hard water [AS, *heard* + *waeter*], water that contains certain cations, particularly calcium and magnesium, that precipitate with soap solutions. The term is generally applied to tap water, and the degree of hardness varies with the source and previous treatment.

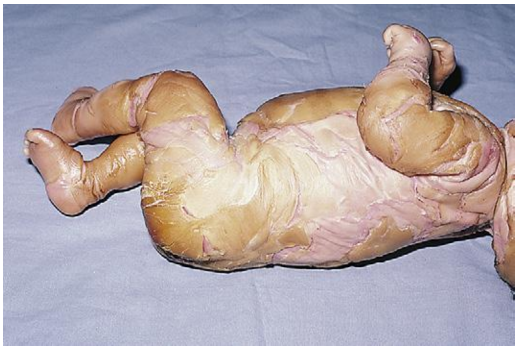
Hardy-Weinberg equilibrium principle /här′dē wīn′ bərg/ [G. H. Hardy, English mathematician, 1877–1947; Wilhelm Weinberg, German physician, 1862–1937; L, *aequilibris,* equal weight, *principium,* a beginning], a principle stating that the frequency of alleles and genotypes remains relatively unchanged from generation to generation in a large, interbreeding population characterized by random mating, Mendelian inheritance, and the absence of migration, mutation, and selection. Under such conditions, the ratio of individuals homozygous for a dominant allele to those heterozygous to those homozygous for a recessive allele is 1:2:1. See also **genetic equilibrium.**

harelip. See **cleft lip.**

hare's eye. See **lagophthalmos.**

harlequin color /här′lək(w)in/ [It, *arlecchino,* goblin; L, *color,* hue], a temporary flushing of the skin on one lower side of the body with pallor on the other side. Commonly seen in normal young infants, it disappears as the child matures.

harlequin fetus, an infant whose skin at birth is completely covered with thick, horny scales that resemble armor and are divided by deep red fissures. The condition is the most severe form of lamellar exfoliation of the newborn, and the infant is stillborn or dies within a few days of birth.



Harlequin fetus *(Callen et al, 2000)*

harlequin ichthyosis, the ichthyosis affecting a harlequin fetus. See also **ichthyosis.**

harlequin snake. See **coral snake.**

Harrington rod /har′ingtən/ [Paul R. Harrington, American orthopedic surgeon, b. 1911], one of the rigid, contoured metal rods inserted surgically, along with metal hooks, in the posterior elements of the spine to provide distraction and compression in treatment of scoliosis and other deformities.

Harrison's groove [Edward Harrison, English physician, 1776–1838], a deformity of the thorax that develops as a result of the pull of the diaphragm on ribs weakened by rickets or some other calcium deficiency disorder.

Harris tube [Franklin Harris, American surgeon, b. 1895], a mercury-weighted single-lumen tube used for gastric and intestinal decompression; no longer in use because of the danger of mercury poisoning.

Hartmann's curet [Arthur Hartmann, German physician, 1849–1931], a curet used for the removal of adenoids. See also **curet.**

Hartmann's pouch, a bulbous region of the neck of the gallbladder. When a gallstone lodges in this area, the gallbladder cannot empty normally and contractions of the gallbladder wall produce severe pain.

Hartmann's solution. See **Ringer's lactate solution.**

Hartnup's disease [Hartnup, family name of first patients diagnosed in England, 1956], a rare autosomal-recessive genetic metabolic disorder characterized by pellagra-like skin lesions, transient cerebellar ataxia, and hyperaminoaciduria. It is caused by defects in intestinal absorption and renal reabsorption of neutral amino acids. Bacterial degradation of unabsorbed amino acids in the gut leads to the absorption of breakdown products and their appearance in urine; the unavailability of tryptophan leads to a deficiency of niacin, the antipellagra vitamin. Common symptoms of the disease are dry, scaly, well-circumscribed skin lesions; glossitis; stomatitis; diarrhea; psychiatric problems; and pronounced photosensitivity. Brief exposure to the sun may cause erythema, edema, and vesiculation. Treatment consists of oral nicotinamide, a high-protein diet containing proteins composed of more easily absorbed small peptides, and avoidance of sun exposure.

Harvard pump, a trademark for a small pump that can be adjusted to deliver small amounts of medication in solution through an IV infusion set. It is commonly used to administer oxytocin in the induction or augmentation of labor. Compare **Abbott pump.**

harvest fever. See **leptospirosis.**

harvest mite. See **chigger.**

Hashimoto's disease /hä′shimō′tōz/ [Hakaru Hashimoto, Japanese surgeon, 1881–1934], a progressive autoimmune thyroid disorder, characterized by the production of antibodies in response to thyroid antigens and the replacement of normal thyroid structures with lymphocytes and lymphoid germinal centers. The disease shows a marked hereditary pattern, but it is 20 times more common in women than in men. It occurs most frequently between 30 and 50 years of age but may arise in young children. The thyroid, typically enlarged, pale yellow, and lumpy on the surface, shows dense lymphocytic infiltration and follicular hyperplasia. The goiter is usually asymptomatic, but occasionally patients have difficulty swallowing and a feeling of local pressure. The thymus is usually enlarged, and regional lymph nodes often show hyperplasia. A definitive diagnosis can be made if a fluorescent scan shows a decrease or absence of thyroid-stable iodine and if the result of a hemagglutination test for thyroid antigens is positive. Replacement therapy with thyroid hormone is indicated for patients with thyroid deficiency and can prevent further enlargement of the goiter. Also called *Hashimoto's struma, Hashimoto's thyroiditis,* **lymphocytic thyroiditis,** *struma lymphomatosa.*

Hashimoto's disease
(Belchetz and Hammond, 2003)

hashish. See **cannabis.**

hashitoxicosis /hash′itok′siko′sis/, excessive functional activity of the thyroid gland in patients with Hashimoto's disease, in whom decreased thyroid function would ordinarily be expected.

Hasner's fold. See **lacrimal fold.**

hatchet /hach′ət/, a bibeveled or single beveled cutting dental hand instrument having its cutting edge in line with the axis of its blade. It is used for breaking down tooth structure undermined by caries, smoothing cavity walls, removing unsupported enamel, and sharpening line and point angles.

hatha yoga, the area of raja yoga best known in the West, based on physical purification and strengthening as a means of self-transformation. It encompasses a system of over 1000 asanas (postures), designed to promote mental and physical well-being and to allow the mind to focus and become free from distraction for long periods of meditation, along with pranayama (breath control). A number of styles of yoga founded on hatha yoga have been developed.

haustrum /hôs′trəm/ *pl. haustra* [L, *haustor,* drawer], a general term denoting a recess or sacculation, as of the colon.

haustus (h) /hôs′təs/, a draught of medicine, a quantity ordered as a single dose.

HAV, abbreviation for *hepatitis A virus*. See **hepatitis A.**

Haverhill fever /hā′vəril/ [Haverhill, Massachusetts, disorder first diagnosed, 1925], a febrile disease caused by infection with ***Streptobacillus moniliformis,*** usually transmitted by the bite of a rat but sometimes transmitted by secretion from the mouth, nose, or urine of an infected rodent. The spirochete-like bacterium is normally present in rat saliva. Characteristically the wound from the bite heals, but within 10 days fever, chills, vomiting, headache, and muscle and joint pain occur, followed within 3 days by a rash. Treatment with antibiotics is effective. *S. moniliformis* is identified by laboratory analysis using fluorescent antibody screening. Also called **streptobacillary rat-bite fever.**

Havers' glands. See **haversian glands.**

haversian canal /havur′shən/ [Clopton Havers, English physician, 1650–1702], one of the many tiny longitudinal canals in bone tissue, averaging about 0.05 mm in diameter. Each contains blood vessels, connective tissue, nerve filaments, and occasionally lymphatic vessels. The canals are interconnected and part of an intricate network. See also **haversian canaliculus, haversian system, Volkmann's canal.**

haversian canaliculus /kan′əlik′yələs/ [Clopton Havers], any of the many tiny passages radiating from the lacunae of bone tissue to larger haversian canals. See also **haversian canal, haversian system.**

haversian glands [Clopton Havers; L, *glans,* acorn], extrasynovial fat pads that may project into the joint space. Also called **Havers' glands.**

haversian lamella [Clopton Havers; L, *lamella,* a small plate], one of a series of lamellae (circular layers) arranged around the central haversian canal of an osteon, or cylindrical unit of bone structure. Also called *Havers' lamella*.

haversian system [Clopton Havers], a circular unit of bone tissue, consisting of concentric rings of osteocytes and lamellae in the bone around a central blood vessel canal. See also **haversian canal, haversian canaliculus, Volkmann's canal.**

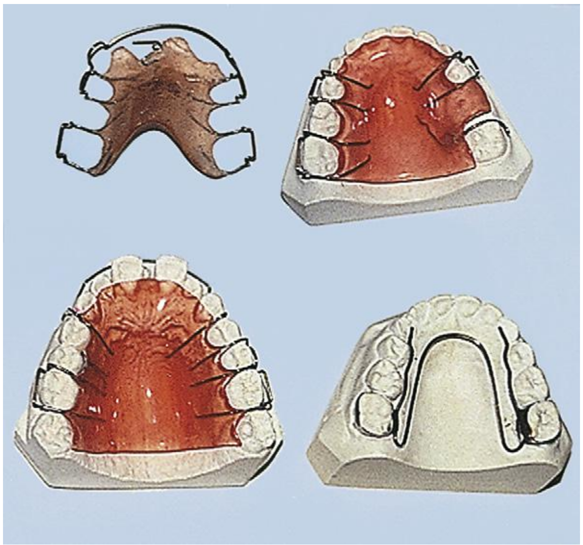
Havers' lamella. See **haversian lamella.**

Hawley retainer /hô′lē/ [C.A. Hawley, American dentist, early 20th century], an orthodontic appliance consisting of a removable labial wire and an acrylic biteplate resting against the palate, used to stabilize teeth after their movement or as a basis for tooth movement by providing anchorage for other attachments. Also called *Hawley appliance*.

hawthorn, an herbal product taken from a bush or tree found throughout the United States, Canada, Europe, and Asia.

■ USES: It is used for poor circulation, chest pain, irregular heartbeat, high blood lipids, and high blood pressure. Several studies have shown beneficial effects of hawthorn in heart failure; there are insufficient reliable data for its other uses.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation or in children. It is also contraindicated in those with known hypersensitivity to this herb or other members of the Rosaceae family.



Examples of Hawley retainers

(Bird and Robinson, 2012)

Hawthorne effect /hô′thôrn/, a general unintentional, usually beneficial, effect on a person, a group of people, or the function of the system being studied. It is the effect of an encounter, as with an investigator or health care provider, or of a change in a program or facility, as by painting of an office or change in the lighting system. The Hawthorne effect is likely to confound the results of a study or investigation because it is usually present and difficult to identify. It was named for a study in industrial management at the Hawthorne (Illinois) facility of the Western Electric Company.

hay fever [AS, *heawan,* to hew; L, *febris,* fever], *(informal)* an acute, seasonal, allergic rhinitis stimulated by tree, grass, or weed pollen. Also called **pollen coryza, pollinosis.** See also **allergic rhinitis, organic dust.**

Hayflick limits [Leonard Hayflick, American microbiologist, b. 1928; L, *limes,* border], the concept that the life span of living organisms is limited by the number of times that somatic cells will subdivide. On the basis of human cells in cultures, where divisions occur about 50 times, it is estimated that the average human life span is limited to around 115 years. See also **deliberate biological programming.**

Hay-Wells syndrome /hā welz/ [R.J. Hay, British dermatologist, 20th century; Robert Stuart Wells, British dermatologist, 20th century], an autosomal-dominant syndrome of ectodermal dysplasia, cleft lip and palate, and ankyloblepharon. It is also characterized by hypodontia, palmar and plantar keratoderma, partial anhidrosis, sparse wiry hair, and sometimes otological defects. Also called **AEC syndrome, ankyloblepharon–ectodermal dysplasia–clefting syndrome.**

hazard /haz′ərd/ [Fr, *hasard,* chance], a condition or phenomenon that increases the probability of a loss. A hazard can increase the chances of a loss that does not necessarily result in illness or injury. *—hazardous, adj.*

hazardous materials, substances or materials that have been determined by the government to pose an unreasonable risk to health, safety, or property when transported in commerce, such as toxins, marine pollutants, and substances at high temperatures.

Hb, abbreviation for **hemoglobin.**

HB, abbreviation for **hepatitis B.**

Hb A, abbreviation for **hemoglobin A.**

Hb A_2, abbreviation for **hemoglobin A_2.**

HBAg, abbreviation for *hepatitis B antigen.*

Hb C, abbreviation for **hemoglobin C.**

HBE, abbreviation for **His bundle electrogram.**

Hb F, abbreviation for **hemoglobin F.**

HBIG, abbreviation for **hepatitis B immune globulin.**

HBP, abbreviation for **high blood pressure.** See **hypertension.**

Hb S, abbreviation for **hemoglobin S.**

HBsAG, abbreviation for **hepatitis B surface antigen.** See **Australia antigen.**

Hb SC, abbreviation for **hemoglobin SC.**

HBV, abbreviation for *hepatitis B virus.* See **hepatitis B.**

HC, abbreviation for **hepatitis C.**

HCFA, abbreviation for **Health Care Financing Administration.**

HCG, abbreviation for **human chorionic gonadotropin.** See **chorionic gonadotropin.**

H chain, heavy chain, any of the large polypeptide chains of five classes that, paired with the L or light chains, make up the antibody molecule of an immunoglobulin. Heavy chains bear the antigenic determinants that differentiate the classes of immunoglobulins. See also **heavy chain disease.**

HCl, **1.** formula for **hydrochloric acid.** **2.** formula for *hydrogen chloride.*

HCP, abbreviation for **hereditary coproporphyria.** See **coproporphyria.**

HCV, abbreviation for *hepatitis C virus.* See **hepatitis C.**

HD, **1.** abbreviation for **hepatitis D.** **2.** abbreviation for **hemodialysis.**

HDCV, abbreviation for **human diploid cell rabies vaccine.**

H deflection, a deviation observed on the His bundle electrogram that represents activation of the bundle of His.

HDI, abbreviation for **high-definition imaging.**

HDL, abbreviation for **high-density lipoprotein.**

HDL-C, abbreviation for *high-density-lipoprotein cholesterol.* See **cholesterol.**

HDV, abbreviation for *hepatitis D virus.* See **hepatitis D.**

He, symbol for the element **helium.**

HE, abbreviation for **hepatitis E.**

head [AS, *heafod*], **1.** the uppermost extremity, containing the brain, special sense organs, mouth, nose, ears, and related structures. Most of the tissues are enclosed within the skull, composed of 28 bones. At birth the head is about half the size of an adult head; the greatest changes after infancy involve growth of the facial area. **2.** a rounded, usually proximal portion of some long bones.

headache /hed′āk/ [AS, *heafod* + *acan,* to hurt], a pain in the head from any cause. Kinds of headaches include **cluster headache, functional headache, histamine headache, migraine headache, organic headache, sinus headache,** and **tension headache.** Also called **cephalalgia, cephalgia.**

head and neck cancer, any malignant neoplasms of the upper aerodigestive tract, facial features, and structures in the neck, which appear as masses, ulcerations, or flat lesions that usually produce early symptoms. See also specific cancers.

head banging, a form of physical exertion observed during some temper tantrums. It usually occurs near the peak of excitement and may be associated with other physical or muscular movements.

head bobbing, a sign of respiratory distress in an infant. It occurs when the infant uses the scaleni and sternocleidomastoid muscles to assist ventilation. The contraction of these muscles causes the head to bob because the neck extensor muscles are not strong enough to stabilize the head.

head box, a clear plastic chamber that fits over a patient's head with an adjustable seal around the neck for mechanical ventilation. Humidified gas enters the chamber, and excess gas is released through an outlet valve. The device may help prevent the need for intubation.

headcap. See **headgear.**

head, eye, ear, nose, and throat (HEENT), a specialty in medicine concerned with the anatomical, physiological, and pathological characteristics of the head, eyes, ears, nose, and throat and with the diagnosis and treatment of disorders of those structures.

headgear /hed′gēr/, a harnesslike device fitting over the top of the head, back of the head, or both, serving as a source of resistance for extraoral anchorage for an orthodontic appliance. Also called **headcap.**

head injury, any traumatic damage to the head resulting from blunt or penetrating trauma of the skull. Blood vessels, nerves, and meninges can be torn. Bleeding, edema, and ischemia may result. See also **concussion.**

head kidney. See **pronephros.**

head louse. See **lice,** ***Pediculus humanus capitis.***

head nurse. See **nurse manager.**

head of rib, the head of a rib that articulates with a vertebral body.

head process, a strand of cells that extends forward from the primitive node in the early stages of embryonic development in vertebrates. It is the precursor of the notochord and forms the primitive axis around which the embryo develops. Also called **notochordal plate.**

heads-up tilt table test (HUTT), a method of evaluating patients with neurocardiac syncope. After baseline signs are recorded with the patient in the supine position, the patient is tilted to an 80-degree angle for 30 minutes, or until neurocardiac syncope signs appear.

head-tilt, chin-lift airway technique, a method of providing maximum airway opening in an unconscious person. With the victim lying on his or her back, the rescuer pushes down on the victim's forehead with the palm of the hand, tilting the victim's head back. With the other hand, the rescuer lifts the victim's lower jaw near the chin. The technique opens the airway by moving the tongue away from the back of the throat and the epiglottis away from the opening of the trachea. This technique is not recommended if a cervical spine injury is suspected.

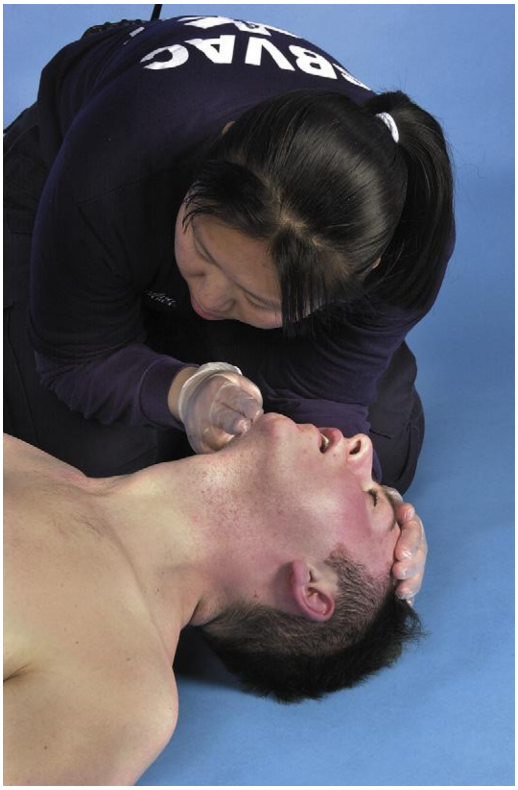
head traction. See **cervical traction.**

Heaf test /hēf/ [Frederick R.G. Heaf, English physician, 1894–1973], a tuberculin skin test that uses a multiple puncture technique. See also **tuberculin test.**

healing [AS, *haelan,* to cure], the act or process in which the normal structural and functional characteristics of health are restored to diseased, dysfunctional, or damaged tissues, organs, or systems of the body. See also **intention, wound repair.**

healing by third intention, a method of closing a grossly contaminated wound in which the wound is left open until contamination has been markedly reduced and inflammation has subsided and then is closed by first intention. Also called *delayed primary closure.*

health [AS, *haelth*], a condition of physical, mental, and social well-being and the absence of disease or other abnormal condition. It is not a static condition. Constant change and adaptation to stress result in homeostasis. René Dubos, often quoted in nursing education, says, "The states of health or disease are the expressions of the success or failure experienced by the organism in its efforts to respond adaptively



Head-tilt, chin-lift airway technique
(Henry and Stapleton, 2010)

to environmental challenges." See also **high-level wellness, homeostasis.**

health assessment, an evaluation of the health status of an individual by performing a physical examination after obtaining a health history. Various laboratory tests may also be ordered to confirm a clinical impression or to screen for dysfunction. The depth of investigation and the frequency of the assessment vary with the condition and age of the client and the facility in which the assessment is performed. The person's response to any dysfunction present is observed and noted. The techniques of the health assessment include inspection, palpation, percussion, and auscultation.

health behavior, an action taken by a person to maintain, attain, or regain good health and to prevent illness. Health behavior reflects a person's health beliefs. Some common health behaviors are exercising regularly, eating a balanced diet, and obtaining necessary inoculations.

health belief model, a conceptual framework that describes a person's health behavior as an expression of health beliefs. The model was designed to predict a person's health behavior, including the use of health services, and to justify intervention to alter maladaptive health behavior. Components of the model include the person's own perception of susceptibility to a disease or condition, the perceived likelihood of contracting that disease or condition, the perceived severity of the consequences of contracting the condition or the disease, the perceived benefits of care and barriers to preventive behavior, and the internal or external stimuli that result in appropriate health behavior by the person.

health beliefs, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal convictions that influence health behaviors. See also **Nursing Outcomes Classification.**

health beliefs: perceived ability to perform, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the personal conviction that one can carry out a given health behavior. See also **Nursing Outcomes Classification.**

health beliefs: perceived control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the personal conviction that one can influence a health outcome. See also **Nursing Outcomes Classification.**

health beliefs: perceived resources, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the personal conviction that one has adequate means to carry out a health behavior. See also **Nursing Outcomes Classification.**

health beliefs: perceived threat, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the personal conviction that a threatening health problem is serious and has potential negative consequences for lifestyle. See also **Nursing Outcomes Classification.**

health care consumer, any actual or potential recipient of health care, such as a patient in a hospital, a client in a community mental health center, or a member of a prepaid health maintenance organization.

Health Care Financing Administration (HCFA), the branch of the U.S. Department of Health and Human Services responsible for administering the Medicare and Medicaid programs. HCFA sets the coverage policy, payment, and other guidelines and directs the activities of government contractors (e.g., carriers and fiscal intermediaries).

health care industry, the complex of preventive, remedial, and therapeutic services provided by hospitals and other institutions, nurses, doctors, dentists, medical administrators, government agencies, voluntary agencies, noninstitutional care facilities, pharmaceutic and medical equipment manufacturers, and health insurance companies.

health care information exchange, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing patient care information to other health professionals. See also **Nursing Interventions Classification.**

health care provider, any individual, institution, or agency that provides health services to health care consumers.

health care proxy [AS, *haelth* + ME, *caru,* sorrow; L, *procuratio,* a deputy], a person designated to make health care decisions for a patient who has become incapacitated.

health care system, the complete network of agencies, facilities, and all providers of health care in a specified geographic area. Nursing services are integral to all levels and patterns of care, and nurses form the largest number of providers in a health care system.

health certificate, a statement signed by a health care provider that attests to the state of health of a person.

health consumer. See **health care consumer.**

health councils, (in Canada) organizations that plan and allocate health care facilities to optimize limited funding resources.

health culture, a system that attempts to explain and treat sickness and to maintain health. Health cultures are a component of the larger culture or tradition of a people and may be a popular or folk system or a technical or scientific one.

health economics, a social system that studies the supply and demand of health care resources and the effect of health services on a population.

health education[1], educational programs directed to the general public that attempt to improve, maintain, and safeguard the health of the community.

health education[2], a nursing intervention from the Nursing Interventions Classification (NIC) defined as developing and providing instruction and learning experiences to facilitate voluntary adaptation of behavior conducive to health in individuals, families, groups, or communities. See also **Nursing Interventions Classification.**

health hazard [AS, *haelth* + OFr, *hasard*], a danger to health resulting from exposure to environmental pollutants, such as asbestos or ionizing radiation, or to a life-style choice, such as cigarette smoking or chemical abuse.

health history, (in nursing and medicine) a collection of information obtained from the patient and from other sources concerning the patient's physical status as well as his or her psychological, social, and sexual function. The history provides a database on which a diagnosis, a plan for management of the diagnosis, treatment, care, and follow-up observation of the patient may be made. The first part of the history describes the chief complaint; the history of the present illness, including its signs and symptoms, onset and character; and any factors or behaviors that aggravate or ameliorate the symptoms. The patient's own words often serve as the best description and may be quoted. The second part of the history comprises an account of previous illnesses and health-promotion behaviors, allergies, transfusions, immunizations, screening tests, and hospitalizations. An occupational history, describing the patient's work and exposure to stress, toxins, radiation, or other occupational hazards, may be included. The effect of the current illness on the patient's work is also noted. A social history is taken in which the patient's social, cultural, environmental, and familial milieu are outlined, focusing on aspects that might have an effect on the current illness. In some instances a sexual history may be relevant. A review of systems may follow or be incorporated into the health history. Kinds of history include **complete health history** and **interval health history.** Also called **functional assessment.** See also **family history, occupational history, past health, present health, review of systems, sexual history.** Also called **personal and social history.**

health information administrator, a graduate of a baccalaureate degree program in health information management who contributes to the development or management of computer-based clinical and administrative record systems.

health information technician, a graduate of an associate degree program who performs tasks related to computer-based management of health care data.

Health Insurance Portability and Accountability Act (HIPAA), an act of Congress, passed in 1996, that affords certain protections to persons covered by health care plans, including continuity of coverage when changing jobs, standards for electronic health care transactions, and privacy safeguards for individually identifiable patient information.

health literacy enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting individuals with limited ability to obtain, process, and understand information related to health and illness. See also **Nursing Interventions Classification.**

health maintenance, a systematic program or procedure planned to prevent illness, maintain maximum function, and promote health. It is central to health care, especially to nursing care at all levels (primary, secondary, and tertiary) and in all patterns (preventive, episodic, acute, chronic, and catastrophic).

health maintenance organization (HMO), a type of group health care practice that provides basic and supplemental health maintenance and treatment services to voluntary enrollees who prepay a fixed periodic fee that is set without regard to the amount or kind of services received. In addition to diagnostic and treatment services, including hospitalization and surgery, an HMO often offers supplemental services, such as dental, mental, and eye care, and prescription drugs. Federal financial support for the establishment of HMOs was provided under Title XIII of the 1973 U.S. Public Health Service Act.

health nurse, a community or visiting nurse assigned primarily to promote health maintenance and preventive health measures within the community.

health orientation, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal commitment to health behaviors as lifestyle priorities. See also **Nursing Outcomes Classification.**

health physicist, a health scientist who directs research, training, and management of programs in which patients and health professionals are exposed to potential hazards associated with the use of diagnostic and therapeutic equipment, such as radioactive materials.

health physics, the study of the effects of ionizing radiation on the body and the methods for protecting people from the undesirable effects of the radiation. Health physics is concerned with the development and evaluation of methods, techniques, materials, and procedures to be used to protect people from these untoward effects. Also called **medical physics.**

health policy, **1.** a statement of a decision regarding a goal in health care and a plan for achieving that goal. For example, to prevent an epidemic, a program for inoculating a population is developed and implemented. **2.** a field of study and practice in which the priorities and values underlying health resource allocation are determined.

health policy monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as surveillance and influence of government and organization regulations, rules, and standards that affect nursing systems and practices to ensure quality care of patients. See also **Nursing Interventions Classification.**

health professional, any person who has completed a course of study in a field of health, such as a registered nurse, physical therapist, or physician. The person is usually licensed by a government agency or certified by a professional organization.

health promoting behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to sustain or increase wellness. See also **Nursing Outcomes Classification.**

health-related services, actions of a health facility other than providing medical care that may contribute directly or indirectly to the physical or mental health and well-being of patients, such as personal or social services.

health resources, all materials, personnel, facilities, funds, and anything else that can be used for providing health care and services.

Health Resources and Services Administration (HRSA), a U.S. federal agency with responsibility for improving health care access for people who are uninsured, isolated, or medically vulnerable. HRSA also oversees organ, tissue, and bone marrow donation. It supports programs that prepare against bioterrorism, compensates individuals harmed by vaccination, and maintains databases that protect against health care malpractice and health care waste, fraud, and abuse.

health risk, a disease precursor associated with a higher than average morbidity or mortality rate. Disease precursors include demographic variables, certain individual behaviors, familial and individual histories, and certain physiological changes.

health risk appraisal, a process of gathering, analyzing, and comparing an individual's characteristics prognostic of health with those of a standard age group, thereby predicting the likelihood that a person may prematurely experience a health problem associated with higher than average morbidity and mortality rates.

health screening[1], a program designed to evaluate the health status and potential of an individual. In the process it may be found that a person has a particular disease or condition or is at greater-than-normal risk of its development. Health screening may include taking a personal and family health history and performing a physical examination, tests, laboratory tests, or radiological examination and may be followed by counseling, education, referral, or further testing.

health screening[2], a nursing intervention from the Nursing Interventions Classification (NIC) defined as detecting health risks or problems by means of history, examination, and other procedures. See also **Nursing Interventions Classification.**

health seeking behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to promote optimal wellness, recovery, and rehabilitation. See also **Nursing Outcomes Classification.**

health service area, a geographic region designated under the U.S. National Health Planning and Resources Development Act of 1974, by means of such factors as geographic features, political boundaries, population, and health resources, for the effective planning and development of health services.

health supervision, health teaching, counseling, or monitoring the status of a patient's health other than for physical care. Such supervision occurs in health care agencies, clinics, physicians' offices, or a patient's home. Compare **care of the sick.**

health system guidance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating a patient's location and use of appropriate health services. See also **Nursing Interventions Classification.**

health systems agency (HSA), a body established under the terms of the U.S. National Health Planning and Resources Development Act of 1974. Health planning agencies are intended to provide networks of health planning and resource development services in each of several health service areas established by the Act. Health systems agencies are nonprofit. They may include private organizations, public regional planning bodies, local government agencies, and consumers. See also **health systems plan.**

health systems plan, a plan specifying long-range goals of a health services area. Health systems plans are prepared by health systems agencies. See also **health policy.**

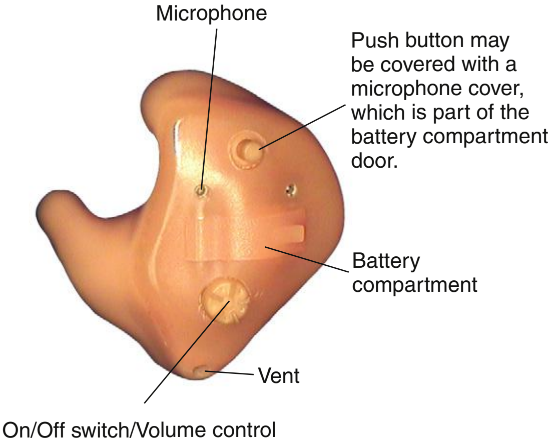
health unit coordinator, a person who ensures the efficient operation of hospital and medical offices by performing administrative and clerical tasks, such as maintaining medical records, scheduling appointments and medical tests, transcribing doctor's orders, keeping supplies stocked, and communicating with other health care professionals.

healthy, a condition of physical, mental, and social well-being and of absence of disease or another abnormal condition.

Healthy People 2020, a government-sponsored statement of national health objectives in 28 focus areas designed to identify and reduce the most significant preventable health threats within the United States. The overall goals of the program are to increase the quality and length of life and to eliminate health disparities.

hearing [AS, *hieran*], the sense that enables sound to be perceived. It is a major function of the ear. Any reduction in the ability to perceive sounds results in hearing loss, which can range from mild impairment to complete **deafness.**

hearing aid, an electronic device that amplifies sound used by people with impaired hearing. The device consists of a microphone, a battery power supply, an amplifier, and a receiver. The microphone receives sound waves directed toward the person with hearing loss, then converts the sound waves to electrical impulses that are amplified with the aid of the power supply, and the receiver converts the electrical impulses back into sound vibrations. Newer, programmable hearing aids can be customized on the basis of the characteristics of an individual's hearing loss.



Microphone
Push button may be covered with a microphone cover, which is part of the battery compartment door.
Battery compartment
Vent
On/Off switch/Volume control

Hearing aid
(Courtesy Siemens Hearing Instruments, Inc.)

hearing compensation behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as actions to identify, monitor, and compensate for hearing loss. See also **Nursing Outcomes Classification.**

hearing handicap, a measure of the impact of hearing loss on an individual's everyday experiences and the psychosocial impact of a hearing loss.

hearing impairment, loss of hearing that adversely affects an individual's ability to communicate.

hearing loss, an inability to perceive the normal range of sounds audible to an individual with normal hearing. Hearing loss may be greater at some frequencies than others, or all frequencies may be equally affected. **Conductive hearing loss** is a result of damage to the outer or middle ear, whereas **sensorineural hearing loss** results from damage to the cochlea or auditory nerve. The loss is measured in decibels and may be described as mild, moderate, severe, or profound.

heart [AS, *heorte*], the muscular cone-shaped hollow organ, about the size of a clenched fist, that pumps blood throughout the body and beats normally about 70 times per minute by coordinated nerve impulses and muscular contractions. Enclosed in pericardium, it rests on the diaphragm between the lower borders of the lungs, occupying the middle of the mediastinum. It is covered ventrally by the sternum and the adjoining parts of the third to the sixth costal cartilages. The organ is about 12 cm long, 8 cm wide at its broadest part, and 6 cm thick. The weight of the heart in men averages between

Mixed hearing loss

Types of hearing loss *(Black and Hawks, 2009)*

280 and 340 g and in women, between 230 and 280 g. The layers of the heart, starting from the outside, are the epicardium, the myocardium, and the endocardium. The chambers include two ventricles with thick muscular walls, making up the bulk of the organ, and two atria with thin muscular walls. A septum separates the ventricles and extends between the atria (interatrial septum), dividing the heart into the right and the left sides. The left side of the heart pumps oxygenated blood into the aorta and on to all parts of the body. The right side receives deoxygenated blood from the vena cava and pumps it into the pulmonary arteries. The valves of the heart include the tricuspid valve, the bicuspid (mitral) valve, the semilunar aortic valve, and the semilunar pulmonary valve. The sinoatrial node in the right atrium of the heart (under the control of the medulla oblongata in the brainstem) initiates the cardiac impulse, causing the atria to contract. The atrioventricular (AV) node near the septal wall of the right atrium spreads the impulse over the AV bundle (bundle of His) and its branches, causing the ventricles to contract. Both atria contract simultaneously, followed quickly by the simultaneous contraction of the ventricles. The sinoatrial node of the heartbeat sets the rate. Other factors affecting the heartbeat are emotion, exercise, hormones, temperature, pain, and stress. See also **endocardium, epicardium, heart valve, myocardium.**

heart attack. See **myocardial infarction.**

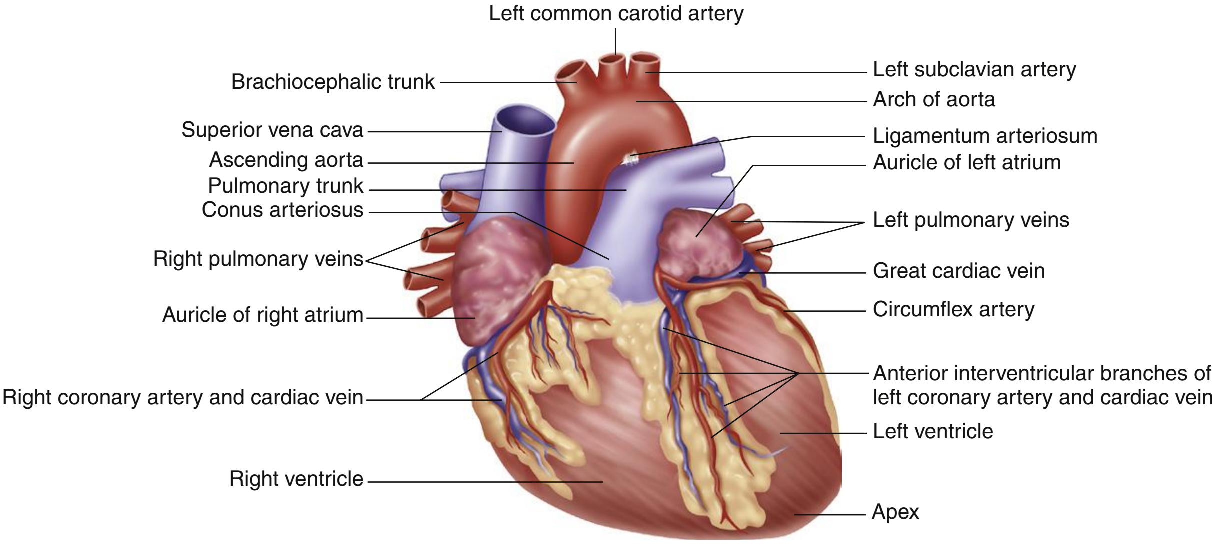
heartbeat, a complete cycle of cardiac muscle contraction and relaxation.

heart block, an interference with the normal conduction of electrical impulses that control activity of the heart muscle. Heart block is usually specified by the location of the block and the type, such as a first-degree atrioventricular (AV) block, in which atrial impulses are delayed by a fraction of a second before being conducted to the ventricles. Heart block can occur in the sinus node, atria, AV node, AV bundle, fascicles, or a combination of these structures. See also **atrioventricular block, bundle branch block, cardiac conduction defect, infranodal block, intraatrial block, intraventricular block, sinoatrial block.**

heartburn, a painful burning sensation in the esophagus just below the sternum. Heartburn is usually caused by the reflux of gastric contents into the esophagus but may result from gastric hyperacidity or peptic ulcer. Antacids relieve the symptoms but do not cure the condition. Also called **pyrosis.** See also **gastroesophageal reflux, hiatal hernia.**

heart disease risk factor [AS, *heorte,* heart; L, *dis* + Fr, *aise,* ease, *risquer,* chance of injury; L, *facere,* to make], one of several hereditary, life-style, and environmental influences that increase one's chance of developing heart disease. Examples include cigarette smoking, high blood pressure, diabetes, obesity, high cholesterol level, lack of routine exercise, and hereditary factors as signified by family history.

heart failure, a condition in which the heart cannot pump enough blood to meet the metabolic requirements of body tissues. Many of the symptoms associated with heart failure are caused by the dysfunction of organs other than the heart, especially the lungs, kidneys, and liver. Ventricular dysfunction is usually the basic disorder in congestive heart failure. It often triggers compensatory mechanisms that preserve cardiac output but produce symptoms and signs such as dyspnea, orthopnea, rales, and edema. Heart failure is closely associated with many forms of heart disease, most of which initially affect the left side of the heart. Hence, clinicians commonly divide associated heart failure into



Left common carotid artery
Brachiocephalic trunk
Left subclavian artery
Arch of aorta
Superior vena cava
Ligamentum arteriosum
Ascending aorta
Auricle of left atrium
Pulmonary trunk
Conus arteriosus
Left pulmonary veins
Right pulmonary veins
Great cardiac vein
Circumflex artery
Auricle of right atrium
Anterior interventricular branches of left coronary artery and cardiac vein
Right coronary artery and cardiac vein
Left ventricle
Right ventricle
Apex

Anterior view of the heart *(Patton and Thibodeau, 2010)* left-sided heart failure and right-sided heart failure. Peripheral edema is associated with right-sided heart failure, and dyspnea and other respiratory disorders with left-sided heart failure. Heart failure in infants and children is usually the result of congenital heart disease but also may be caused by myocarditis and ectopic tachycardia. Rheumatic mitral disease and aortic valve disease frequently cause congestive heart failure in young adults. Mitral valve disease, especially mitral stenosis, is the most common cause of heart failure in young adults and affects more young women than men. The common causes of heart failure after 40 years of age are coronary atherosclerosis with myocardial infarction, anemia, diastolic hypertension, hypervolemia, valvular heart disease, pulmonary disease, renal disease, and diffuse myocardial disease. Some individuals may suffer heart failure caused by a combination of congenital heart disease and acquired disease. After 50 years of age, a common cause of heart failure, especially in men, is calcific aortic stenosis. Some of the extracardiac signs of heart failure are ascites, bronchial wheezing, hydrothorax, edema, liver enlargement, moist rales, and splenomegaly. Cardiac signs associated with heart failure are abnormalities in the jugular venous pulsation, the carotid pulse, and the apex wave on cardiographic tracings. Treatment for heart failure commonly involves reduction of the heart's workload, administration of drugs such as beta-blockers, digitalis to increase myocardial contractility and cardiac output, salt-restricted diet, diuretics, angiotensin-converting enzymes to decrease afterload, and surgical intervention. Also called **cardiac failure.** See also **compensated heart failure, congestive heart failure.**

heart-hand syndrome. See **Holt-Oram syndrome.**

heart-lung machine, an apparatus consisting of a pump and an oxygenator that takes over the functions of the heart and lungs, especially during open heart surgery. The blood is shunted from the venous system through an oxygenator and returned to the arterial circulation.

heart massage. See **cardiac massage.**

heart murmur. See **cardiac murmur.**

heart rate, the frequency with which the heart beats, calculated by counting the number of QRS complexes or ventricular beats per minute. See also **pulse.**

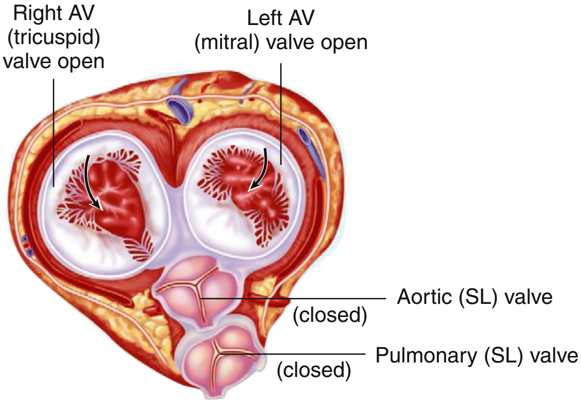
heart scan, a radiographic scan of the heart, performed after the injection of a radioactive material into a vein. It is used for determining the size, shape, and location of the heart; for diagnosing pericarditis; and for viewing the chambers of the heart. See also **echocardiography, electrocardiography.**

heart sound, a noise produced within the heart during the cardiac cycle that can be heard over the precordium. It may reveal abnormalities in cardiac structure or function. Cardiac auscultation is performed systematically from the apex to the base of the heart or from base to apex, using a stethoscope to listen, initially with the diaphragm and then with the bell of the instrument. Standard heart sounds include **S_1,** produced by the closure of the atrioventricular valves; **S_2,** produced by the closure of the semilunar valves; **S_3;** and **S_4.** Additional heart sounds include clicks, gallops, murmurs, rubs, and snaps.

heart surgery, any surgical procedure involving the heart, performed to correct acquired or congenital defects, replace diseased valves, open or bypass blocked vessels, or graft a prosthesis or a transplant. Two major types of heart surgery are performed: closed and open. The closed technique is done through a small incision, without use of the heart-lung machine. In the open technique the heart chambers are open and fully visible, and blood is detoured around the surgical field by the heart-lung machine. Preoperative care focuses on correcting metabolic imbalances and cardiac and pulmonary ailments and on performing diagnostic and laboratory tests. General anesthesia is used, the chest cavity is opened, and the heart-lung machine is connected. Hypothermia also is used to decrease the metabolic rate and the need of the tissues for oxygen. After surgery, constant observation is required in an intensive care unit for signs of hemorrhage and shock, cardiac arrhythmias, sudden chest pain, organ failure, and pulmonary edema. The blood pressure and all pulses, respirations, and venous and pulmonary artery pressures and cardiac rhythm (ECG) are monitored. If the blood pressure is high enough to ensure cerebral profusion, the head of the patient's bed is elevated to a semi-Fowler's position to encourage chest drainage and lung expansion. The patient is quickly extubated. Oxygen is provided. Chest tube drainage, urinary output, and temperature are noted hourly; IV infusions and sometimes blood transfusions are given. Narcotics help control pain so the patient can effectively cough, deep breathe, and become quickly mobile. Antibiotics are given to prevent infection. Mortality rate is highest during the first 48 hours after surgery. Common kinds of heart surgery include **coronary bypass** and **endarterectomy.** See also **arrhythmia, fibrillation, heart-lung machine, hypothermia, pulmonary edema.**

heart transplantation [AS, *hoerte* + L, *transplantare*], the surgical removal of a donor heart and transfer of the organ to a recipient. The donor heart is usually obtained from an accident victim who was healthy before dying, and it is used to replace the severely diseased heart of another person. Most recipients survive for more than 1 year, and nearly three-fourths are able to return to work. Total ischemic time for the transplanted heart is less than 6 hours between donor and recipient. The heart is transplanted with anastomoses of the aorta, pulmonary artery, and atria; venous return is provided by an anastomosis between the recipient's right atrium and that of the transplanted organ.

heart valve, one of the four structures within the heart that prevent backflow of blood by opening and closing with each heartbeat. The valves include two semilunar valves, the aortic and pulmonary; the mitral or bicuspid valve; and the tricuspid valve. The valves permit blood flow in only one direction; any of the valves may become defective, permitting the backflow associated with heart murmurs. Also called **cardiac valve.** See also **heart, mitral valve, semilunar valve, tricuspid valve.**



Heart valves *(Patton and Thibodeau, 2010)*

heat and moisture exchanger, a device placed within the patient's breathing circuit and the endotracheal tube, used to preserve moisture and heat. Fresh gas flow can evaporate moisture from mucous membranes in the respiratory tract.

heat/cold application, a nursing intervention from the Nursing Interventions Classification (NIC) defined as stimulation of the skin and underlying tissues with heat or cold for the purpose of decreasing pain, muscle spasms, or inflammation. See also **Nursing Interventions Classification.**

heat cramp [AS, *haetu* + *crammian,* to fill], any cramp or painful spasm of the voluntary muscles in the arm, leg, or abdomen caused by depletion in the body of both water and salt. It usually occurs after vigorous physical exertion in an extremely hot environment or under other conditions that cause profuse sweating and depletion of body fluids and electrolytes. The victim should be moved to a cooler place and given salt-containing fluids. Also called **cane-cutter's cramp, fireman's cramp, miner's cramp, stoker's cramp.** See also **heat exhaustion.**

heated nebulization, a method of inhalation therapy that uses a heating device with a nebulizer that produces a spray with a higher water content than that of a cold atomizer. The mist may be administered through a mask or in a tent.

heat exhaustion, an abnormal condition characterized by weakness, vertigo, nausea, muscle cramps, and loss of consciousness, caused by depletion of body fluid and electrolytes that results from exposure to intense heat or inability to acclimatize to heat. Body temperature is near normal; blood pressure may drop but usually returns to normal as the person is placed in a recumbent position. The skin is cool, damp, and pale. The person usually recovers with rest and replacement of water and electrolytes. Also called **heat prostration.** Compare **heat hyperpyrexia.** See also **heat cramp.**

heat exposure treatment, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a patient overcome by heat due to excessive environmental heat exposure. See also **Nursing Interventions Classification.**

heat hyperpyrexia, a severe and sometimes fatal condition resulting from failure of the temperature-regulating capacity of the body, caused by prolonged exposure to sun or to high temperature. Reduction or cessation of sweating is sometimes an early symptom. Body temperature of 105° F or higher, tachycardia, hot and dry skin, headache, altered mental status, and seizures may occur. Treatment includes cooling, sedation, and fluid replacement. Also called **heatstroke, sunstroke, thermic fever.** See also **hyperpyrexia.** Compare **heat exhaustion.**

heat labile [L, *labilis,* liable to slip], readily destroyed by heat. See also **thermolabile.**

heat-labile antibody, an immunoglobulin that loses its ability to interact with antigens when heated above 56° C.

heat prostration. See **heat exhaustion.**

heat rash, a finely papular or vesicular inflammation of the skin that results from prolonged exposure to heat and high humidity. Tingling and prickling sensations are common. Prevention and treatment include cool, dry temperatures; ventilation; and absorbent powders. See also **miliaria.**

heat shock protein (HsP), an intracellular protein that increases in concentration during metabolic stress, such as exposure to heat. HsPs affect protein assembly, folding, sorting, and uptake into organelles. There are various kinds of HsPs, each performing different functions.

heatstroke. See **heat hyperpyrexia.**

heaves /hēvz/ [AS, *hebban,* to lift], **1.** a chronic pulmonary disease, similar to human pulmonary emphysema, characterized by wheezing, coughing, and dyspnea on exertion. The cause of the condition is unknown. **2.** *(informal)* vomiting and retching.

heavy chain, a high-molecular-weight polypeptide that is part of an immunoglobulin molecule. Different types of heavy chains characterize the various categories of immunoglobulins (Igs), such as IgG and IgA.

heavy chain disease [AS, *heafig* + L, *catena,* chain; *dis,* opposite of; Fr, *aise,* ease], a plasma cell disorder characterized by a proliferation of immunoglobulin heavy chains. Excessive levels of alpha, gamma, delta, and mu chains are produced, and effects tend to vary according to the predominant type of heavy chain. Alpha heavy chain disease mainly affects children living in the Middle East, causing diffuse abdominal lymphoma and malabsorption disorders. Most gamma heavy chain disease patients are elderly men who have symptoms resembling those of malignant lymphoma: enlarged liver and spleen, fever, anemia, and increased susceptibility to infections. Delta heavy chain disease is rare and marked by symptoms similar to those of multiple myeloma. Mu heavy chain disease presents symptoms of chronic lymphocytic leukemia, and treatment is symptomatic.

heavy function, increased functional activity of the teeth, which enhances occlusal force.

heavy hydrogen. See **deuterium.**

heavy metal, a metallic element with a specific gravity five or more times that of water. The heavy metals include antimony, arsenic, bismuth, cadmium, cerium, chromium, cobalt, copper, gallium, gold, iron, lead, manganese, mercury, nickel, platinum, silver, tellurium, thallium, tin, uranium, vanadium, and zinc. Small amounts of many of these elements are common and necessary in the diet. Large amounts of any of them may cause poisoning.

heavy metal nephropathy, the kidney damage resulting from any of various forms of heavy metal poisoning, usually in the form of tubulointerstitial nephritis. The most common metals involved are cadmium, lead, and mercury.

heavy metal poisoning, poisoning caused by the ingestion, inhalation, or absorption of various toxic heavy metals. Kinds of heavy metal poisoning include **antimony poisoning, arsenic poisoning, cadmium poisoning, lead poisoning,** and **mercury poisoning.** See also **heavy metal.**

heavy vaginal bleeding. See **vaginal bleeding.**

Signs and symptoms of heat-related illness

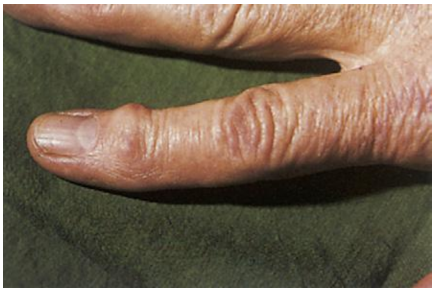
	General weakness	*Muscle cramps*	*Respiratory rates*	*Pulse rates*	*Skin condition*	*Sweat*	*Loss of responsiveness*
Heat cramps	Yes	Yes	Vary	Vary	Normal	Heavy	Seldom
Heat exhaustion	Yes	No	Rapid, shallow	Weak	Cold, clammy	Heavy	Sometimes
Heat stroke	Yes	No	Deep, then shallow	Full, rapid	Dry, hot	Little or none	Often

From Chapleau W: *Emergency first responder: making the difference*, ed 2, St Louis, 2012, Mosby Jems.

heavy water, water in which the hydrogen component is deuterium (^2H), or heavy hydrogen. It has properties different from those of ordinary water. Because of its ability to absorb neutrons, heavy water is used as a moderator in nuclear reactions. Also written as D_2O.

hebephrenia, hebephrenic schizophrenia. See **disorganized schizophrenia.**

Heberden's node /hē′bərdənz/ [William Heberden, English physician, 1710–1801; L, *nodus,* knot], an abnormal cartilaginous or bony enlargement of a distal interphalangeal joint of a finger, usually occurring in degenerative diseases of the joints. Compare **Bouchard's node.**



Heberden's nodes *(Moll, 1997)*

hebetude /heb′itōōd′/ [L, *hebeo,* to be blunt], a state of dullness or lethargy, characteristic of some forms of schizophrenia.

heboid paranoia. See **paranoid schizophrenia.**

hectic fever, a fever that recurs each day, with profound sweating, chills, and facial flushing.

hecto- (h) [Gk, *hekaton,* one hundred], prefix in the metric system indicating 100 units. For example, 1 hectometer equals 100 meters.

-hedonia, suffix meaning "(condition of) pleasure, cheerfulness": *anhedonia, hyphedonia, parhedonia.*

-hedron, suffix meaning a "geometric figure with (specified) sides": *decahedron, octahedron, polyhedron.*

heedfulness of affected side, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to acknowledge, protect, and cognitively integrate affected body part(s) into self. See also **Nursing Outcomes Classification.**

heel [AS, *hela*], the posterior part of the foot, formed by the largest tarsal bone, the calcaneus.

heel cup, a plastic device designed to help relieve the pain of a heel spur or contusion by pushing the fat pad of the heel under the calcaneus to increase the cushioning effect.

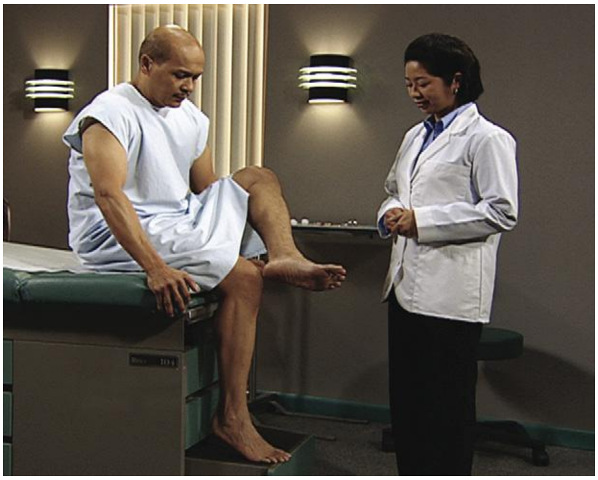
heel effect, the x-ray intensity greater at the cathode end of the x-ray field and lower at the anode end because of absorption in the target material.

heel-knee test [AS, *hela* + *cneow,* knee; L, *testum,* crucible], a method of assessing coordination of movements of the extremities. In the test the patient, lying supine, is asked to touch the knee of one leg with the heel of the other.

heel lift, a foot orthosis, usually made of sheets of cork, to correct a dysfunction that results from anatomical limb length differences or decreased flexibility.

heel puncture [AS, *hela* + L, *punctura*], a method of obtaining a blood sample from a newborn or premature infant by a puncture in the lateral or medial areas of the plantar surface of the heel. Care must be exercised to prevent puncture of the posterior curvature of the heel and to make the puncture as shallow as feasible.

heel-shin test [AS, *hela* + *scinu,* shin; L, *testum,* crucible], a cerebellar test for assessing coordination of movements of the extremities. In the test, the patient, lying supine, is asked to pass the heel of one leg slowly down the shin of the other leg from the knee to the ankle.



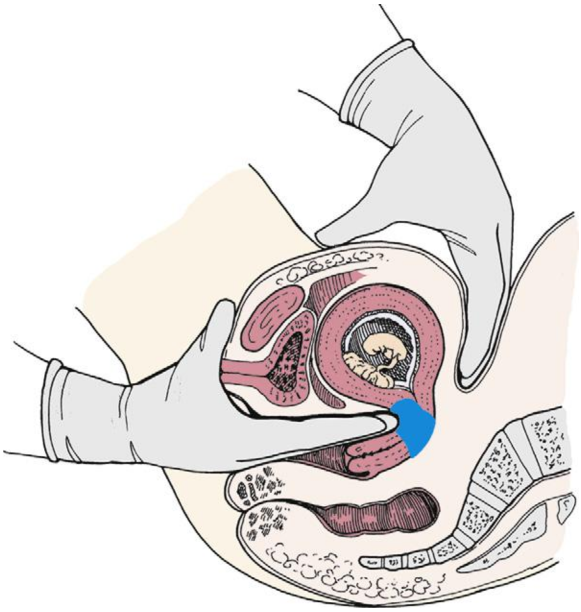
Heel-shin test *(Seidel et al, 2011)*

heel spur. See **calcaneal spur.**

HEENT, abbreviation for **head, eye, ear, nose, and throat.**

Hegar's dilators /hā′gərz/ [Alfred Hegar, German gynecologist, 1830–1914], a series of bougies used to dilate the cervical canal and urethra. See also **bougie.**

Hegar's sign [Alfred Hegar; L, *signum,* sign], a softening of the isthmus of the uterine cervix that occurs early in gestation. It is a probable sign of pregnancy.

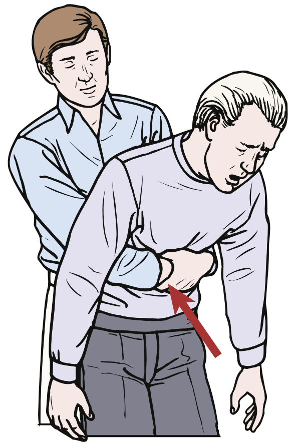


Hegar's sign *(Lowdermilk and Perry, 2012)*

height (h, ht) /hīt/ [AS, *hiehtho*], the vertical measurement of a structure, organ, or other object from bottom to top, when it is placed or projected in an upright position.

height of contour, the greatest convexity of a tooth surface, viewed from a predetermined position.

Heimlich maneuver /hīm′lik, -lish/ [H.J. Heimlich, American physician, b. 1920; Fr, *manjuvre,* work done by hand], an emergency procedure for dislodging a bolus of food or another obstruction from the trachea to prevent asphyxiation. The choking person is grasped from behind by the rescuer, whose fist, thumb side in, is placed just below the victim's xiphoid with the other hand placed firmly over the fist. The rescuer then pulls the fist firmly and abruptly upward into the epigastrium, forcing the obstruction up the trachea. If repeated attempts do not clear the airway, an emergency cricothyrotomy may be necessary. Also spelled *Heimlich manoeuvre*. Also called **abdominal thrust.**



Heimlich maneuver *(Lewis et al, 2011)*

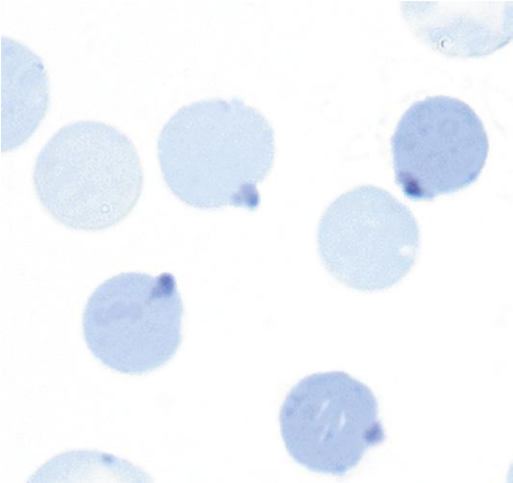
Heimlich sign [H.J. Heimlich; L, *signum*], a universal distress signal that a person is choking and unable to speak, made by grasping the throat with a thumb and index finger, thereby attracting the attention of others nearby. Also called **universal choking signal.**

Heimlich valve, a small one-way valve used for chest drainage that empties into a flexible collection device and prevents return of gases or fluids into the pleural space. The Heimlich valve is less than 13 cm (5 inches) long and facilitates patient ambulation. It can be used in many patients instead of a traditional water seal drainage system.

Heinz bodies /hīnts/ [Robert Heinz, German pathologist, 1865–1924], irregularly shaped bits of altered hemoglobin found in the red blood cells of people who are hypersensitive to certain chemicals, such as aniline, phenylhydrazine, and primaquine.

Helen, Sister (Helen Bowden), a nurse who received her education in England and became the first director of the newly formed Bellevue Hospital Training School for Nurses in New York in 1873. Although she had not trained under Florence Nightingale, she set up the Bellevue school according to Nightingale's principles. She was a member of the All Saints Sisterhood. After several years at Bellevue, having established one of the leading nursing schools in the United States, she went to South Africa.

helical computed tomography, computed tomography that combines continuous gantry rotation with continuous table movement to form a helical or spiral path of scan data. Because this method scans a volume of tissue rather than a series of individual slices of tissue, small lesions can be easily detected. Also called **spiral computed tomography.**

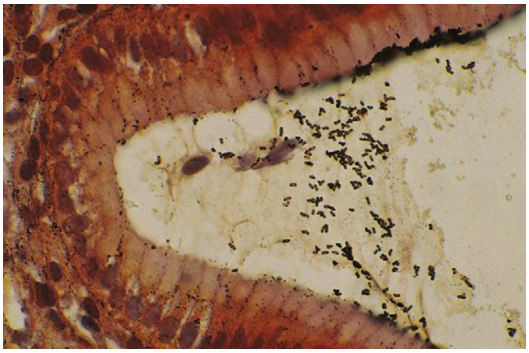


Heinz bodies *(Carr and Rodak, 2008)*

helical virus /hel′ikəl/, a virus in which the protein capsid appears in a coiled pattern.

Helicobacter /hel′ikōbak′tər/ [Gk, *helix* coil + *bakterion,* small staff], a genus of gram-negative, rod-shaped, microaerophilic bacteria of the family Spirillaceae, consisting of motile, spiral organisms with multiple sheathed flagella; formerly classified in the genus ***Campylobacter.*** The bacteria are found in the gastric mucosal layer; many people are infected without showing any symptoms. *H. pylori* is the causative agent of stomach ulcers, gastritis, and duodenitis. It causes 90% of duodenal ulcers and 80% of gastric ulcers. Infection significantly increases the risk of developing gastric cancer or mucosal-associated-lymphoid type lymphoma. Antibiotics can eliminate infection and ulcer.

Helicobacter pylori**,** a species of spiral or straight gram-negative bacteria with multiple sheathed flagella found in the gastric mucosa of humans and other animals and associated with gastric and peptic ulcers as well as gastric cancers. Formerly called ***Campylobacter pylori.***



Helicobacter pylori *(Kumar, Abbas, and Fausto, 2005)*

***Helicobacter pylori* antibodies test,** a test to detect the presence of *H. pylori*. The most accurate method of testing is microscopic examination of a gastric mucosal biopsy specimen. Other kinds of tests include breath test, rapid urease testing, and serological testing.

***Helicobacter pylori* gastritis,** gastritis caused by the presence of *H. pylori* in the stomach mucosa. *H. pylori* may be present for many years as chronic gastritis before finally causing an attack of acute gastritis.

helicopod gait /hel′ikōpod′/ [Gk, *helix,* coil, *pous,* foot], a manner of walking in which the feet trace half circles. It is associated with some mental disorders. Also called *helicopodia*.

helicotrema, a narrow slit at the apex of the cochlea where the two canals of the cochlear duct, the **scala vestibuli** and the **scala tympani,** communicate.

heliotherapy. See **solar therapy.**

heliox therapy, inhalation of a gaseous mixture of oxygen and helium to provide relief from the shortness of breath associated with upper airway obstructive disease. It reduces turbulence in the airway.

helium (He) /hē′lē·əm/ [Gk, *helios,* sun], a colorless, odorless gaseous element; the second lightest element. Its atomic number is 2; its atomic mass is 4.00. Helium is one of the rare or inert gases and does not combine with other elements. It occurs in the atmosphere at concentrations of five parts per million. Because of its lightness and lack of flammability, it is also used to lift airships and balloons. In the liquid state it is used for low-temperature activities. The main physiological and medical uses of helium are in respiratory therapy and testing and the prevention of nitrogen narcosis and decompression sickness in hyperbaric environments. Helium is one third as soluble in lipids as is nitrogen. That characteristic accounts for its preferred use in hyperbaric atmospheres, such as those associated with deep-sea diving. A mixture of 80% helium and 20% oxygen is commonly breathed by deep-sea divers to prevent gas emboli and by patients undergoing treatment to clear obstruction of the respiratory tract. Problems associated with such uses involve the high velocity of acoustic transmission in helium and the high thermal conductivity of the gas. These characteristics produce voice distortions and hypothermia in persons who inhale it. The low density of helium reduces the effort of breathing any gas mixture of which it is a component. Helium is used in pulmonary function testing to calculate the diffusion and residual capacities of the lungs.

helium therapy, the use of helium-oxygen gas mixtures to treat patients with airway obstruction. Because of its low density, helium can negotiate an obstruction more easily than nitrogen can, so less driving pressure is required to move the gas mixture in and out of the lungs.

helix /hē′liks/ [Gk, coil], **1.** a coiled, spiral-like formation characteristic of many organic molecules, such as DNA and certain proteins.. **2.** the large outside rim of the auricle.

Hellerwork structural integration, a bodywork technique that consists of deep pressure on soft tissues to improve alignment, movement reeducation to avoid unnecessary stress on the body structure, and dialogue with a practitioner to enhance the individual's awareness of how attitude affects structure and movement pattern.

Hellin's law, a generalized formula for calculating the ratio of multiple births in any population, stating that if twin births occur at the rate of $1{:}N$, then the rate of triplet births is approximately $1{:}N^2$, the rate of quadruplet births is approximately $1{:}N^3$, and so on. The value of N varies greatly but is generally close to 80. Also called *Hellin-Zeleny law*.

HELLP syndrome /help/, abbreviation for a form of severe preeclampsia, a hypertensive complication of late pregnancy. The letters stand for *h*emolysis, *e*levated *l*iver function, and *l*ow *p*latelet level.

helmet cells, fragmented red blood cells that appear "scooped out" so they resemble helmets. They are found in patients with micro-angiopathic hemolytic anemia and thrombotic thrombocytopenic purpura. Helmet cells can also be seen in blood samples of people with prosthetic heart valves and in individuals with unstable hemoglobin conditions that produce Heinz bodies.

helminth /hel′minth/ [Gk, *helmins,* worm], a worm, especially one of the pathogenic parasites of the division Metazoa, including flukes, tapeworms, and roundworms.

-helminth, suffix meaning "worm": *nemathelminth, platyhelminth*.

helminthemesis /hel′minthem′əsis/ [Gk, *helmins,* worm, *emesis,* vomiting], the vomiting of intestinal worms.

helminthiasis /hel′minthī′əsis/ [Gk, *helmins,* worm, *osis,* condition], a parasitic infestation of the body by helminths that may be cutaneous, visceral, or intestinal. Ascariasis, bilharziasis, filariasis, hookworm, and trichinosis are common forms of the disease.

helminthic /helmin′thik/ [Gk, *helmins,* worm], pertaining to worms.

helminthology /hel′minthol′əjē/, a branch of medicine concerned with parasitic worms.

helper factor, a protein produced by helper T lymphocytes that stimulates proliferation of and antibody production by other lymphocytes.

helper T cell, a T lymphocyte that promotes the immune response of other lymphocytes to foreign antigens by releasing soluble proteins called helper factors. It is essential in determining B cell antibody class switching and maximizing bacteriocidal activity of phagocytes, as well as in growth and activation of cytotoxic T cells. Helper T cells have no cytotoxic or phagocytic activity. See also **T cell.**

helper virus, a virus that allows the replication of a co-infecting defective virus by supplying or restoring viral gene activity or allowing the defective virus to form a protein coat. Hepatitis B acts as a helper virus to delta agent, a defective RNA virus.

helplessness /help′ləsnəs/, a feeling of a loss of control or ability, usually after repeated failures, or of being immobilized or frozen by circumstances beyond one's control, with the result that one is unable to make autonomous choices.

Helsinki Accords /helsing′kē/, a declaration signed by the representatives of 35 member nations of the Conference on Security and Cooperation in Europe in Helsinki, Finland, on August 1, 1975. The declared goals of the nonbinding document comprised four principal aspects of European security: economic cooperation, humanitarian issues, contact between the East and West, and provision for a later follow-up conference (held in Belgrade in 1978). Follow-up conferences were planned in part to allow the member nations to monitor each other's performance on humanitarian issues, such as the right to self-determination of all people and respect for fundamental freedoms, including thought, conscience, and religion or belief, without regard to race, language, sex, or religion. The Helsinki Accords grew from the precedent set by the judgments at the Nuremberg tribunals—that crimes against humanity are offenses subject to criminal prosecution. The principle and the practice of informed consent in health care grew from this precedent. Also called *Helsinki Declaration*. See also **Nuremberg tribunal.**

hema-, hemat-, prefix meaning "blood": *hematoma, hematophyte*.

Hemabate, a trademark for a prostaglandin abortifacient, also used to treat refractory postpartum bleeding (carboprost tromethamine).

hemacytometer /-he′məsītom′ətər/ [Gk, *haima,* blood, *kytos,* cell, *metron,* measure], a device for visually counting the number of cells in a known volume of blood or other fluid.

hemadsorption /hē′madsôrp′shən, hem′-/ [Gk, *haima,* blood; L, *ad* to, *sorbere,* to swallow], the adherence of red blood cells to other cells or surfaces; a process in which a substance or an agent, such as certain viruses and bacilli, adheres to the surface of an erythrocyte. The process occurs naturally, or it may be induced for laboratory identification of bacteriological specimens.

hemagglutination /hē′məglo͞o′tinā′shən, hem′-/ [Gk, *haima* + L, *agglutinare,* to glue], the agglutination of erythrocytes by an antigen-antibody reaction.

hemagglutination inhibition (HI), **1.** the inhibition of virus-induced hemagglutination as a procedure for identifying hemagglutinating viruses. HI is used in the diagnosis of infections by certain viruses, such as rubella, herpes zoster, and herpes simplex. **2.** a method for measuring the concentration of soluble antigens in biological specimens in which the specimen is incubated first with homologous antibodies and then with antigen-coated erythrocytes.

hemagglutinin [Gk, *haima* + L, *agglutinare*], a type of antibody that agglutinates red blood cells. It is classified according to the source of cells agglutinated as autologous (from the same organism), homologous (from an organism of the same species), and xenogeneic (from an organism of a different species).

hemangi-, prefix meaning "condition of the blood vessel structure or a collection of blood vessels": **hemangioma, hemangiectasis.**

hemangiectasis, dilation of a blood vessel.

hemangioblast /hēman′jē·ōblast′/, an embryonic mesodermal cell that gives rise to vascular endothelium and blood-forming cells.

hemangioblastoma /hēman′jē·ōblastō′mə/ *pl. hemangioblastomas, hemangioblastomata* [Gk, *haima* + *angeion,* vessel, *blastos,* germ, *oma,* tumor], a brain tumor composed of a proliferation of capillaries and of disorganized clusters of capillary cells or angioblasts, usually occurring in the cerebellum.

hemangioendothelioma /hēman′jē·ō·en′dōthē′lē·ō′mə/ *pl. hemangioendotheliomas, hemangioendotheliomata* [Gk, *haima* + *endon,* inside, *thele,* nipple, *oma,* tumor], **1.** also called **angioendothelioma.** a tumor, consisting of endothelial cells, that grows around an artery or a vein. The benign form occurs in children and is usually cured by local excision. The tumor rarely becomes malignant. **2.** malignant hemangioendothelioma. See also **angiosarcoma.**

hemangiofibroma /-fībrō′mə/ [Gk, *haima,* blood; L, *fibra,* fiber; Gk, *oma,* tumor], a tumor that has the characteristics of both a hemangioma and a fibroma.

hemangioma /hēman′jē·ō′mə/ *pl. hemangiomas, hemangiomata* [Gk, *haima* + *angeion,* small vessel, *oma*], a benign tumor consisting of a mass of blood vessels. Also spelled **haemangioma.**

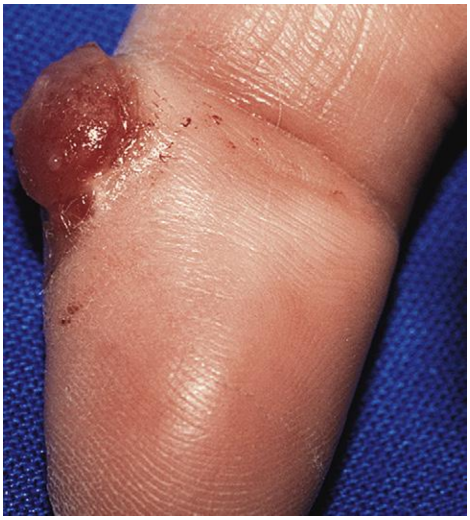
hemangioma simplex. See **capillary hemangioma.**

hemangioma-thrombocytopenia syndrome, a blood disorder usually occurring in the first few months of life in which severe thrombocytopenia and other evidence of intravascular coagulation are accompanied by rapidly expanding hemangiomas of the trunk, extremities, and abdominal viscera, sometimes associated with bleeding and anemia. Bleeding is thought to result from the trapping and destruction of platelets within the tumor and depletion of circulating clotting factors. Also called **Kasabach-Merritt syndrome.**

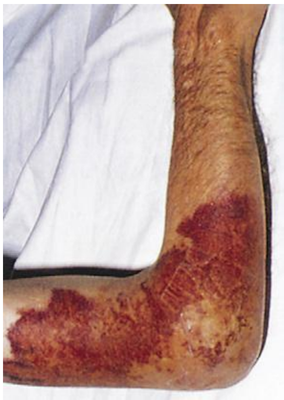
hemangiosarcoma. See **angiosarcoma.**

hemapoiesis /hem′əpō·ē′sis/ [Gk, *haima,* blood, *poiein,* to make], the formation of blood cells.

hemarthros /hem′är′thrəs/ [Gk, *haima,* blood, *arthron,* joint], the extravasation of blood into a joint. Also spelled **haemarthros.**



Hemangioma
(James, Berger, and Elston, 2011)



Hemarthros *(Moll, 1997)*

hemarthrosis, blood in a joint cavity; also called hemarthros.

hematemesis /hē′mətem′əsis, hem′-/ [Gk, *haima* + *emesis,* vomiting], vomiting of bright red blood, indicating rapid upper GI bleeding, commonly associated with esophageal varices or peptic ulcer. The rate and the source of bleeding are determined by endoscopic examination. Any blood found in the stomach is removed by nasogastric suction. Treatment requires replacement of blood by transfusion, administration of IV fluids for maintenance of fluid and electrolyte balance, and possible gastric lavage. Surgery may be necessary. The patient is usually very anxious and needs quiet, warmth, and reassurance. Also spelled **haematemesis.** See also **gastrointestinal bleeding.**

hematic. See **hemic.**

hematinic /hem′ətin′ik/, a therapeutic agent that produces an increase in the number of erythrocytes and/or hemoglobin concentration in erythrocytes, such as iron or B complex vitamins.

hematinuria /hem′ətino͝or′ē·ə/ [Gk, *haima,* blood, *ouron,* urine], a dark-colored urine resulting from the presence of hematin or hemoglobin. See also **hemoglobinuria.**

hemat(o) [word element, Gr.], combining form for terms relating to blood or blood vessels.

hematocele /hem′ətōsēl′/, a cystlike accumulation of blood within the tunica vaginalis of the scrotum. It is usually caused by injury and may require surgery if the blood is not readily resorbed. Also spelled **haematocele.**

hematochezia /hem′ətōkē′zhə/ [Gk, *haima* + *chezo,* feces], the passage of blood in the feces. The cause is usually bleeding in the colon or rectum, but it may result from the loss of blood higher in the digestive tract although blood passed from the stomach or small intestine generally loses its red coloration. Cancer, colitis, and ulcers are among causes of hematochezia. Compare **melena.**

hematocrit /hemat′ōkrit/ [Gk, *haima* + *krinein,* to separate], a measure of the packed cell volume of red cells, expressed as a percentage of the total blood volume. The normal range is between 43% and 49% in men and between 37% and 43% in women. Also spelled **haematocrit.** See also **complete blood count, differential white blood cell count.**

hematocrit reading. See **packed cell volume.**

hematocyte /hem′ətōsīt/ [Gk, *haima,* blood, *kytos,* cell], a blood cell, particularly a red blood cell. Also called **hemocyte.**

hematocytoblast /hem′ətōsī′təblast′/ [Gk, *haima,* blood, *kytos,* cell, *blastos,* germ], a large nucleated reticuloendothelial cell found in bone marrow. It is believed to be a common precursor of various blood elements. Also called **hemocytoblast.**

hematogenesis /-jen′əsis/ [Gk, *haima,* blood, *genein,* to produce], the formation of blood cells or an increase in the production of blood elements. Also called **hemapoiesis.**

hematogenic shock. See **hemorrhagic shock.**

hematogenous /hēmətoj′ənəs/ [Gk, *haima* + *genein,* to produce], originating or transported in the blood.

hematogenous pigment [Gk, *haima,* blood, *genein,* to produce; L, *pingere,* to paint], the red color of erythrocytes caused by the presence of hemoglobin.

hematogenous tuberculosis [Gk, *haima,* blood, *genein,* to produce; L, *tuberculum,* a small swelling; Gk, *osis,* condition], a form of tuberculosis that is blood borne.

hematoid /hem′ətoid/, bloodlike or resembling blood.

hematologic, hematological. See **hematology.**

hematologic death syndrome /hem′ətōloj′ik/, a group of clinical signs and symptoms of radiation damage to the blood cells. The condition is characterized by nausea, vomiting, fever, diarrhea, infections, anemia, leukopenia, and hemorrhage. It can result from exposure to a dose of 200 to 1000 rad. The mean survival time for a person with hematologic death syndrome is estimated at between 10 and 60 days.

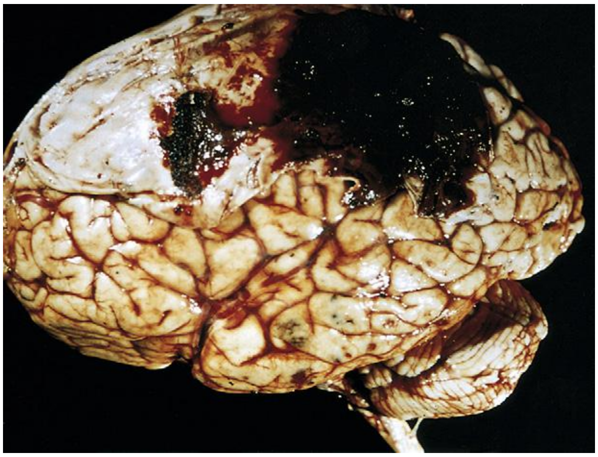
hematologic effect, the response of blood cells to radiation exposure. All types of blood cells are destroyed by radiation, and the degree of cell depletion increases with increasing dose. Lymphocytes are affected first and are reduced in number within minutes or hours after exposure. Erythrocytes are less sensitive than other types of blood cells and may not show radiation effects for several weeks.

hematologist /hē′mətol′əjist, hem′-/, a medical specialist in the field of blood cells and blood-forming organs.

hematology /hē′mətol′əjē, hem′-/ [Gk, *haima* + *logos,* science], the scientific study of blood and blood-forming tissues. Also spelled **haematology. —hematologic, hematological,** *adj.*

hematolysis. See **hemolysis.**

hematoma /hē′mətō′mə, hem′-/ *pl. hematomas, hematomata* [Gk, *haima* + *oma,* tumor], a collection of extravasated blood trapped in the tissues of the skin or in an organ, resulting from trauma or incomplete hemostasis after surgery. Initially there is frank bleeding into the space; if the space is limited, pressure slows and eventually stops the flow of blood. The blood clots, serum collects, the clot hardens, and the mass becomes palpable to the examiner and is often painful to the patient. A hematoma may be drained early in the process and bleeding arrested with pressure or, if necessary, with surgical ligation of the bleeding vessel. Considerable blood may be lost, and infection is a serious complication. Also spelled **haematoma.**



Epidural hematoma *(Kumar et al, 2007/Courtesy Dr. Raymond D. Adams, Massachusetts General Hospital)*

-hematoma, suffix meaning a "swelling containing blood": *cephalhematoma, episiohematoma, othematoma.*

hematometra /hē′mətōmē′trə/, an accumulation of fluid or menstrual blood in the uterine cavity.

hematometry /hem′ətom′ətrē/, an examination of a blood sample to determine the number, type, and properties of blood cells and platelets and the amount of hemoglobin.

hematomyelia /hē′mətōmē′lē·ə/ [Gk, *haima* + *meylos,* marrow], the appearance of frank blood in the fluid of the spinal cord. Also spelled **haematomyelia.**

hematopathology /-pəthol′əjē/, the division of pathology that specializes in blood cell diseases and diseases of the blood forming organs.

hematopericardium. See **hemopericardium.**

hematoperitoneum /-per′itənē′əm/ [Gk, *haima,* blood, *peri,* near, *tenein,* to stretch], the effusion of blood into the peritoneal cavity.

hematophagous /hem′ətof′əgəs/, **1.** pertaining to the feeding on blood by insects or other parasites. **2.** pertaining to the destruction of erythrocytes by phagocytes.

hematopoiesis /hē′mətōpō·ē′sis, hem′-/ [Gk, *haima* + *poiein,* to make], the normal formation and development of blood cells in the bone marrow. In severe anemia and other hematologic disorders, cells may be produced in organs outside the marrow (extramedullary hematopoiesis). See also **erythropoiesis. —hematopoietic,** *adj.*

hematopoietic, related to the formation of blood.

hematopoietic growth factor /-pō·et′ik/, one of a group of proteins, including erythropoietin, interleukins, and colony-stimulating factors, that promote the proliferation of blood cells.

hematopoietic malignancies, diseases such as leukemia that arise as a result of unregulated clonal proliferation of hematologic cells.

hematopoietic stem cell, an actively dividing cell that is capable of self-renewal and of differentiation into any blood cell lineage.

hematopoietic syndrome, a group of clinical features associated with effects of radiation on the blood and lymph tissues. It is characterized by nausea and vomiting, anorexia, lethargy, hemolysis and destruction of the bone marrow, and atrophy of the spleen and lymph nodes.

hematopoietic system [Gk, *haima,* blood, *poiein,* to make; L, *systema*], body organs and tissues involved in the formation and functioning of blood elements; includes the bone marrow and spleen.

hematospermia /-spur′mē·ə/, the presence of blood in the semen. Causes include vascular congestion, infection of the seminal vesicles, coitus interruptus, sexual abstinence, and frequent coitus. The condition is rarely serious and may respond to antibiotic therapy.

hematothorax. See **hemothorax.**

hematoxylin-eosin /hē′mətok′silin/ [*Haematoxylon campechianum,* logwood; Gk, *eos,* dawn], a stain commonly used to treat tissue sections on microscope slides.

hematuria /hē′mətŏŏr′ē·ə, hem′-/ [Gk, *haima* + *ouron,* urine], abnormal presence of blood in the urine. It is symptomatic of many renal diseases and disorders of the genitourinary system and is detected by microscopic examination of urine sediment and chemical analysis using a reagent chemical. Also spelled **haematuria.** —*hematuric, adj.*

heme /hēm/ [Gk, *haima,* blood], the pigmented iron-containing nonprotein part of the hemoglobin molecule. There are four heme groups in a hemoglobin molecule, each consisting of a cyclic structure of four pyrrole residues, called protoporphyrin, and an iron ion in the center. Heme binds and carries oxygen in the red blood cells, releasing it to tissues. Also spelled **haeme.** See also **hemoglobin, porphobilinogen, protoporphyrin.**

heme iron, iron occurring in a heme complex, as in hemoglobin and myoglobin. Dietary sources of iron, are meat, fish, and poultry.

hemeralopia /hem′ərəlō′pē·ə/ [Gk, *hemera,* day, *alaos,* blind, *ops,* eye], an abnormal visual condition in which bright light causes blurring of vision. Hemeralopia is an unpleasant side effect of certain anticonvulsant medications, including trimethadione, prescribed in treatment of children with petit mal epilepsy. Also called **day blindness, night sight.** —*hemeralopic, adj.*

hemi-, prefix meaning "half": *hemiataxia, hemiopia, hemiplegia.*

-hemia. See **-emia.**

hemiacephalus /hem′ē·āsef′ələs/ [Gk, *hemi,* half, *a,* without, + *kephale,* head], a fetus in which the brain and most of the cranium are lacking. See also **anencephaly.**

hemiachromatosia /hem′ē·ak′rōmətō′zhə/, a state of being color-blind in only one half of the visual field.

hemialgia /hem′ē·al′jē·ə/, pain that affects one side of the body.

hemiamblyopia /hem′ē·am′blē·ō′pē·ə/ [Gk, *hemi,* half, *amblys,* dull, *ops,* eye], blindness in half of the normal visual field. Also called **hemianopia.**

hemianalgesia /hem′ē·an′əljē′sē·ə/ [Gk, *hemi,* half, *a,* without, + *algos,* pain], a loss of feeling or sensitivity to pain affecting half of the body or one side of the body.

hemianesthesia /hem′ē·an′esthē′zhə/ [Gk, *hemi* + *anaisthesia,* absence of feeling], a loss of feeling on one side of the body.

hemianopia, hemianopsia. See **hemiamblyopia.**

hemiarthroplasty /hem′ē·är′thrəplas′tē/, a surgical procedure for repair of an injured or diseased hip joint involving replacing the head of the femur with a prosthesis without reconstruction of the acetabulum.

hemiataxia /hem′ē·ətak′sē·ə/, a loss of muscle control affecting one side of the body, usually as a result of a stroke or cerebellar injury. The condition may be ipsilateral or contralateral.

hemiazygous vein /hem′ē·əzī′gəs/ [Gk, *hemi* + *a,* without, + *zygon,* yoke], one of the tributaries of the azygous vein of the thorax. It starts in the left ascending lumbar vein, enters the thorax through the left crus of the diaphragm, ascends on the left side of the vertebral column as high as the ninth thoracic vertebra, and passes dorsal to the aorta to enter the azygous. The hemiazygous vein receives about four of the caudal intercostal veins, the left subcostal vein, and some of the esophageal and mediastinal veins.

hemiballismus. See **ballismus.**

hemiblock, a failure to conduct a cardiac impulse down one division of the left bundle branch, such as an anterior superior or a posterior inferior hemiblock.

hemic /hem′ik, hē′mik/, pertaining to blood. Also **hematic.**

hemicellulose /hem′ēsel′yŏŏlōs/ [Gk, *hemi* + L, *cellula,* little cell], any of a group of polysaccharides that constitute the chief part of the skeletal substances of the cell walls of plants. They resemble cellulose but are soluble and more easily extracted and decomposed. See also **dietary fiber.**

hemicephalia /-sefā′lyə/ [Gk, *hemi* + *kephale,* head], a congenital anomaly characterized by the absence of half of the cerebrum, caused by severe arrest of brain development in the fetus. The cerebellum and basal ganglia may be present in rudimentary form.

hemicephalus [Gk, *hemi,* half, *kephale,* head], a fetus with congenital absence of half of the cerebrum.

hemicolectomy /hem′ikōlek′təme/ [Gk, *hemi* half + *kolon,* colon + *ektome,* excision], excision of approximately half of the colon.

hemicrania /-krā′nē·ə/ [Gk, *hemi* + *kranion,* skull], **1.** a headache, usually migraine, that affects only one side of the head. **2.** a congenital anomaly characterized by the absence of half of the skull in the fetus; incomplete anencephaly.

hemicraniectomy /-kran′ē·ek′təmē/ [Gk, *hemi,* half, *kranion,* skull, *ektomē,* excision], a surgical procedure in which part or all of one half of the skull is excised and reflected as a preliminary step to certain types of brain operations.

hemidiaphragm /-dī′əfram/, either the left or right functional half of the diaphragm. Although the diaphragm is a single anatomical unit, it is divided by the union of its central tendon and the pericardium into separate leaves, each with its own nerve supply, and each hemidiaphragm can function independently.

hemidystrophy /-dis′trəfē/, a condition in which the two sides of the body do not develop equally.

hemiectromelia /hem′ē·ek′trōmē′lyə/ [Gk, *hemi* + *ektosis,* miscarriage, *melos,* limb], a congenital anomaly characterized by the incomplete development of the limbs on one side of the body. —*hemiectromelus, n.*

hemiepilepsy /hem′ē·ep′əlepsē/, a form of epilepsy that affects only one side of the body.

hemifacial spasm. See **convulsive tic.**

hemigastrectomy /-gastrek′təmē/, surgical removal of one half of the stomach.

hemigeusia, absence of the sense of taste on one side of the tongue.

hemiglossal /-glos′əl/, pertaining to one side of the tongue. Also **hemilingual.**

hemignathia /hem′ēnā′thē·ə/ [Gk, *hemi* + *gnathos,* jaw], **1.** a congenital anomaly characterized by incomplete development of the lower jaw on one side of the face. **2.** a condition of having only one jaw. —*hemignathus, n.*

hemihyperplasia /-hī′pərplā′zhə/ [Gk, *hemi* + *hyper,* excessive, *plassein,* to form], overdevelopment or excessive growth of half of a specific organ or part or all of the organs and parts on one side of the body.

hemihypertonia /-hī′pərtō′nē·ə/ [Gk, *hemi* + *hyper* + *tonikos,* stretching], exaggerated tension in the muscles on one side of the body. In one form of the disorder, spasms may occur occasionally in different muscle groups on one side of the body.

hemihypertrophy /-hīpur′trəfē/ [Gk, *hemi* + *hyper* + *trophe,* nourishment], an unusual enlargement or overgrowth of half of the body or half of a body part.

hemihypoplasia /-hī′pōplā′zhə/ [Gk, *hemi* + *hypo,* under, *plassein,* to form], partial or incomplete development of half of a specific organ or part or all of the organs and parts on one side of the body.

hemikaryon. See **haploid nucleus.**

hemilaminectomy /hem′ilam′inek′təme/ [Gk, *hemi,* half; L, *lamina,* plate; Gk, *ektome,* excision], surgical removal of one side of the vertebral lamina.

hemilateral /-lat′ərəl/, pertaining to one side.

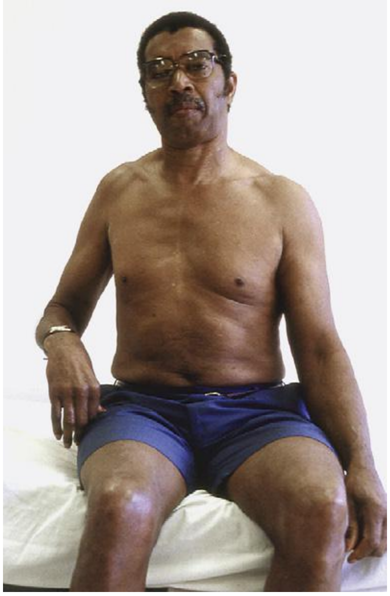
hemilingual. See **hemiglossal.**

hemimelia /-mē′lyə/ [Gk, *hemi* + *melos*], a developmental anomaly characterized by the absence or gross shortening of the lower portion of one or more of the limbs. The condition may involve either or both of the bones of the distal arm or leg and is designated according to which is absent or defective, as fibular, radial, tibial, or ulnar hemimelia. See also **ectromelia, phocomelia.**

hemiopia /hem′ē·ō′pē·ə/ [Gk, *hemi,* half, *ops,* eye], a condition involving only one eye or half the visual field.

hemipagus /hemip′əgəs/ [Gk, *hemi* + *pagos,* fixture], symmetric twins who are conjoined at the thorax.

hemiparesis /-pərē′sis/ [Gk, *hemi* + *paralyein,* to be palsied], muscular weakness of one half of the body. Compare **hemiplegia.**



Typical posture associated with hemiparesis.
(Frownfelter and Dean, 2006)

hemiparesthesia /-per′esthē′zhə/ [Gk, *hemi,* half, *para,* beside, *aisthesis,* sensation], a numbness or other abnormal or impaired sensation that is experienced on only one side of the body.

hemiplegia /hem′iplē′jə/ [Gk, *hemi* + *plege,* stroke], paralysis of one side of the body. Kinds of hemiplegia include **cerebral hemiplegia, facial hemiplegia,** and **spastic hemiplegia.** Also called **unilateral paralysis.** Compare **diplegia, paraplegia, tetraplegia.** —*hemiplegic, adj.*

hemiplegic gait /-plē′jik/ [Gk, *hemi,* half, *plege,* stroke; ONorse, *gata,* a way], a manner of walking in which an affected limb moves in a semicircle with each step.

hemisection /-sek′shən/ [Gk, *hemi,* half; L, *sectare,* to cut], half of a body or other object divided along a longitudinal plane, producing two lateral halves. Also called *bisection.*

hemisectomy /hem′ēsek′tämē/, amputation of one root of a two-rooted mandibular tooth. See also **apicoectomy, hemisection.**

hemisomus /hem′isō′məs/ [Gk, *hemi* + *soma,* body], a fetus or individual in whom one side of the body is malformed, defective, or absent.

hemisphere /hem′isfir/ [Gk, *hemi* + *sphaira,* sphere], **1.** one half of a sphere or globe. **2.** the lateral half of the cerebrum or of the cerebellum. —*hemispheric, adj.*

hemispherectomy /hem″i·sfēr·ek′tə·mē/, resection of one hemisphere of the brain, most often performed to treat intractable seizure disorders in children. Although this surgery results in some physical debilitation, such as loss of use of the hand opposite the resected hemisphere and some visual dysfunction, it does not affect cognitive abilities.

hemiteras /hem′ēter′əs/ *pl. hemiterata* [Gk, *hemi* + *teras,* monster], any individual with a congenital malformation that is not so severe or disabling as to be classified as a teratic condition. —*hemiteratic, adj.*

hemithorax /-thôr′aks/, one side of the chest.

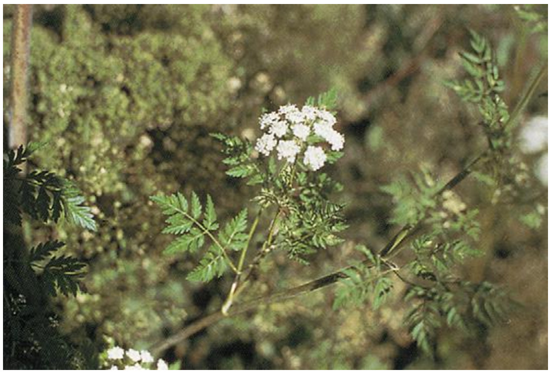
hemithyroidectomy /-thī′roidek′təmē/, surgical removal of one lobe of the thyroid gland.

hemivertebra /-vur′təbrə/, an abnormal condition characterized by the congenital failure of a vertebra to develop completely. It is possibly caused by the complete failure of the growth center of one vertebral body. Usually half of the vertebra involved is completely or partially developed, and the other half is absent. One or more vertebrae may be involved. The different conditions produce varying degrees of balanced or unbalanced scoliosis. As a result of the developmental abnormality of the spine, a wedge-shaped vertebra develops, and adjacent vertebral bodies expand to fit the deformity or tilt to accommodate wedge-shaped articulation. Hemivertebra may be classified according to the degree of developmental failure of involved vertebral growth centers. When two vertebral bodies are involved and growth centers on the same side fail to develop, moderate to severe unbalanced congenital scoliosis results. When growth centers fail to develop on opposite sides, balanced congenital scoliosis results. Singular hemivertebra may cause few if any signs and symptoms. Depending on the degree of congenital scoliosis involved, any associated deformity may become more apparent with growth. Other types of hemivertebra, especially those involving unbalanced congenital scoliosis, usually progress markedly with growth and have a relatively poor prognosis unless early spinal fusion prevents further spinal curvature. No treatment may be required for the form of the condition associated with balanced congenital scoliosis.

hemizona assay, an in vitro test of sperm function in which a human zona pellucida is divided in half and one half is incubated with sperm from a donor known to be normal and the other half with sperm from the patient being tested. The number of sperm bound to each half is calculated, and that from the patient's sperm is divided by that from the donor's sperm. A figure of less than 0.60 indicates abnormal patient sperm.

hemizygote /-zī′gōt/ [Gk, *hemi* + *zygon,* yoke], an individual, organism, or cell that has only one allele for a specific characteristic. The trait specified by the allele is expressed regardless of whether the allele is dominant or recessive. Such alleles include those on the single X chromosome in males, which have no corresponding alleles on the Y chromosome. —*hemizygosity, n., hemizygotic, hemizygous, adj.*

hemlock, the common name for *Conium maculatum,* a plant indigenous to most of Europe and the source of a poisonous alkaloid, coniine. It is considered unsafe for any use, but an extract of the leaves and flowers of conium has been used as a respiratory sedative and its hydrochloride salts have been used as an antispasmodic. Also called **conium.**



Poison hemlock *(Auerbach, 2012)*

Hemlock Society, a group who provide information about euthanasia and suicide for terminally ill patients.

hemo-, prefix relating to blood or blood vessels.

hemoagglutination. See **hemagglutination.**

hemoagglutinin. See **hemagglutinin.**

hemobilinuria /hē′mōbil′ino͝or′ē·ə/, the presence of the brown pigment urobilin in the blood and urine.

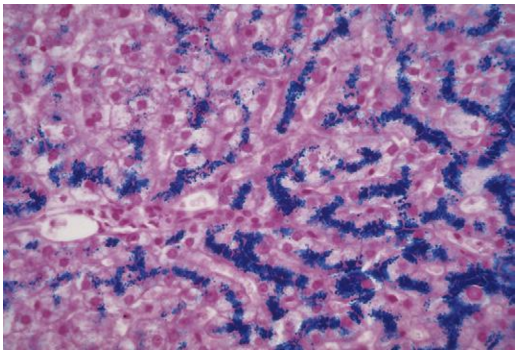
hemoblastic leukemia. See **stem cell leukemia.**

hemochromatosis /hē′mōkrō′mətō′sis, hem′-/ [Gk, *haima,* blood, *chroma,* color, *osis,* condition], an inherited disease of iron metabolism, characterized by excess iron deposits throughout the body. Hepatomegaly, skin pigmentation, diabetes mellitus, and cardiac failure may occur. Multiple phlebotomies are required to deplete excess iron. Also spelled **haemochromatosis.** Compare **hemosiderosis.** See also **iron metabolism, siderosis, thalassemia.**

hemoclip, a malleable metal clip used to ligate small blood vessels during surgery and to mark the location of body structures in radiographic procedures.

hemoconcentration /-kon′səntrā′shən/ [Gk, *haima* + L, *cum,* together with, *centrum,* center], an increase in the number of red blood cells resulting from either a decrease in plasma volume or increased production of erythrocytes. Also spelled **haemoconcentration.**

hemocyanin /hē′mōsī′ənin/, an oxygen-carrying protein molecule present in certain lower animals, particularly arthropods and mollusks. The molecule is similar to the hemoglobin molecule of human blood but uses copper atoms, rather than iron, and is less efficient than hemoglobin in requiring many more atoms to bind a single molecule of oxygen.



Genetic hemochromatosis *(Kumar et al, 2007)*

hemocyte. See **hematocyte, hematocytoblast.**

hemocytoblast. See **hematocytoblast.**

hemocytoblastic leukemia. See **stem cell leukemia.**

hemocytology /-sītol′əjē/ [Gk, *haima,* blood, *kytos,* cell, *logos,* science], the study of the components of blood.

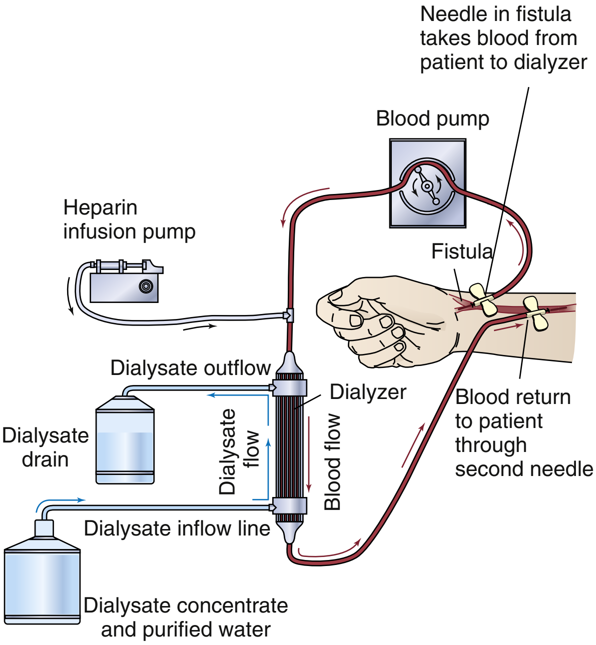
hemodiafiltration /-dī′əfiltrā′shən/, a technique similar to hemofiltration, used to treat uremia by convective transport of the solute rather than diffusion.

hemodialysis /hē′mōdī·al′isis, hem′-/ [Gk, *haima* + *dia,* apart, *lysis,* loosening], a procedure in which impurities or wastes are removed from the blood, used in treating patients with renal failure and various toxic conditions. The patient's blood is shunted from the body through a machine for diffusion and ultrafiltration and then returned to the patient's circulation. Hemodialysis requires access to the patient's bloodstream, a mechanism for the transport of the blood to and from the dialyzer, and a dialyzer. Also spelled **haemodialysis.** See **arteriovenous fistula, external shunt.**

■ METHOD: Access may be achieved by an external shunt or an arteriovenous fistula. The external shunt is constructed by inserting two cannulas through the skin into a large vein and a large artery. When hemodialysis is not being performed, the cannulas are joined, allowing the blood to flow from artery to vein. When hemodialysis is being performed, the cannulas are separated, allowing the arterial blood to flow to the dialyzer and the dialyzed blood to return from the dialyzer to the circulation through the cannula in the vein. An arteriovenous fistula is created by the anastomosis of a large vein to an artery. Large-bore needles are threaded into superficial vessels enlarged by the increased flow caused by the fistula. Various dialyzers may be used. Hemodialysis takes from 3 to 8 hours depending on the patient's condition, weight, and laboratory values and may be necessary daily in acute conditions or two to three times a week in chronic renal failure.

■ INTERVENTIONS: A decrease in blood flow through the shunt may cause clotting. Therefore any factor that may result in a slowing of the flow should be avoided. Some of these factors are systemic hypotension, infection of the shunt or fistula, compression of the shunt or fistula, thrombophlebitis, and prolonged inflation of a blood pressure cuff. Infection is prevented in the area around an external shunt by placing a sterile dressing over the shunt and changing the dressing daily. Before the procedure is begun, the patient is told how long it will take, what pain or discomfort may be expected, what will be felt afterward, what food or activity will be allowed during the procedure, and whether family or friends may be present during treatment. Headache, nausea, and muscle cramps are common, especially during the procedure and for a few hours afterward. The patient usually feels best on the day after hemodialysis. Rest, an antiemetic, and a mild analgesic may make the procedure more comfortable. Most patients need emotional support and some physical assistance during hemodialysis. The physical status of the patient is monitored frequently throughout. Blood pressure, pulse, and blood tests for electrolyte and acid-base balance are performed. Normal saline solution may be administered to counteract hypotension that results from rapid removal of fluid from the intravascular compartment. The patient is weighed before and after the treatment to determine the amount of fluid lost during the procedure. An anticoagulant is usually given to prevent coagulation of the blood in the dialyzer, cannulas, or catheters. To prevent hemorrhage, protamine sulfate may be administered after the procedure to reverse the effect of the anticoagulant. Any treatment that causes tissue trauma, such as dental extraction, venipuncture, or intramuscular injection, is not recommended during or immediately after dialysis.

■ OUTCOME CRITERIA: Infection and clotting of the shunt and erosion of the skin around the shunt are frequent complications with an external shunt; therefore the method that uses an arteriovenous fistula is more common. The discomfort before, during, and just after dialysis; the prolonged time of relative immobility during the procedure; and the dietary restrictions necessary in renal insufficiency all cause considerable stress in the patient. Adjustments in the patterns of daily life are necessary and require the assistance of professionals with experience and training.



Needle in fistula takes blood from patient to dialyzer
Blood pump
Heparin infusion pump
Fistula
Dialysate outflow
Dialyzer
Blood return to patient through second needle
Dialysate drain
Dialysate flow
Blood flow
Dialysate inflow line
Dialysate concentrate and purified water

Hemodialysis *(Lewis et al, 2011)*

hemodialysis access, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as functionality of a dialysis access site. See also **Nursing Outcomes Classification.**

hemodialysis technician, a health professional who has received special training in the operation of hemodialysis equipment and treatment of patients with kidney failure.

hemodialysis therapy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of extracorporeal passage of the patient's blood through a dialyzer. See also **Nursing Interventions Classification.**

hemodialyzer. See **dialyzer.**

hemodilution /-dilo͞o′shən/ [Gk, *haima*, blood; L, *diluare*, to wash away], a condition in which the concentration of erythrocytes or other blood elements is lowered, usually resulting from an increase in plasma volume, often secondary to the use of plasma. Also spelled **haemodilution.**

hemodynamic regulation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as optimization of heart rate, preload, afterload, and contractility. See also **Nursing Interventions Classification.**

hemodynamics /-dīnam′iks/ [Gk, *haima* + *dynamis*, force], the study of the physical aspects of blood circulation, including cardiac function and peripheral vascular physiological characteristics.

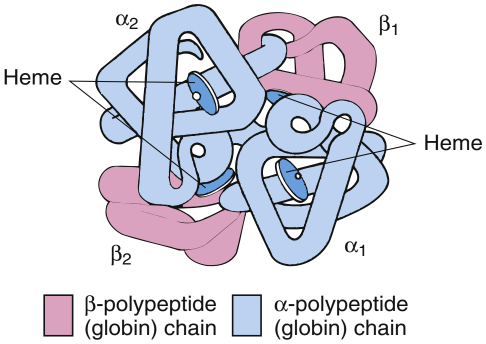
Hemofil M, a trademark for human antihemophilic factor.

hemofiltration /-filtrā′shən/, a type of hemodialysis in which there is convective transport of the solute through ultrafiltration across the membrane. It is reported to be more effective than diffusion in removing higher–molecular weight solutes from the blood, particularly in the treatment of uremia. Also spelled **haemofiltration.**

hemofiltration therapy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the cleansing of an acutely ill patient's blood via a hemofilter controlled by the patient's hydrostatic pressure. See also **Nursing Interventions Classification.**

hemoglobin (Hb, Hgb) /hē′məglō′bən/ [Gk, *haima* + L, *globus*, ball], a complex protein-iron compound in the blood that carries oxygen to the cells from the lungs and carbon dioxide away from the cells to the lungs. Each erythrocyte contains 200 to 300 molecules of hemoglobin, each molecule of hemoglobin contains four heme groups, and each heme carries one molecule of oxygen. A hemoglobin molecule contains four globin polypeptide chains. Each polypeptide chain is composed of 141 to 146 amino acids. The absence, replacement, or addition of only one amino acid modifies the properties of the hemoglobin. Different kinds of hemoglobin are identified by their specific combination of polypeptide chains. Normal adult hemoglobin is composed of alpha and beta chains. About 2% of adult hemoglobin is composed of alpha and delta chains, called hemoglobin A_2 (Hb A_2). Fetal hemoglobin is composed of alpha and gamma globin. The normal concentrations of hemoglobin in the blood are 12 to 16 g/dL in women and 13.5 to 18 g/dL in men. In an atmosphere of high oxygen concentration, such as in the lungs, hemoglobin binds with oxygen to form oxyhemoglobin. In an atmosphere of low oxygen concentration, such as in the peripheral tissues of the body, oxygen is replaced by carbon dioxide to form carboxyhemoglobin. Hemoglobin releases carbon dioxide in the lungs and picks up oxygen for transport to the cells. Also spelled **haemoglobin.** See also **carboxyhemoglobin, complete blood count, erythrocyte, erythropoiesis, heme, hemoglobinopathy, hemolysin, oxyhemoglobin.**

hemoglobin A (Hb A), normal adult hemoglobin composed of alpha and beta globin chains. Also called **adult hemoglobin.** Compare **hemoglobin F.** See also **hemoglobinopathy.**



Molecular structure of hemoglobin

(Huether and McCance, 2008)

hemoglobin A_{1c}. See **glycosylated hemoglobin.**

hemoglobin A_2 (Hb A_2), a normal hemoglobin present in small amounts in adults, characterized by the substitution of delta chains for beta chains. Its concentration in the blood increases in various hematologic diseases. It normally constitutes 1.5% to 3.5% of the total hemoglobin.

hemoglobin Bart's, an abnormal hemoglobin composed of four gamma chains having high oxygen affinity in homozygous alpha thalassemia. Hemoglobin Bart's does not support life, most fetuses are stillborn. Hemoglobin Bart's is often found mixed with hemoglobin H, resulting in alpha-thalassemia.

hemoglobin C (Hb C), an autosomal recessive qualitative hemoglobinopathy in which lysine is substituted for glutamic acid at position 6 of the beta globin chain. Deoxygenated red cells crystallize to form a hexagonal "bar of gold" crystal that slows their passage. Target cells are prominent. Hemoglobin C migrates slowly in hemoglobin electrophoresis, a trait used to identify its presence.

hemoglobin C disease, an inherited hemoglobinopathy caused by hemoglobin C. The heterozygous form is asymptomatic; homozygous hemoglobin C disease causes a mild to moderate hemolytic anemia. In the homozygous form, target cells and hemoglobin C crystals are seen in microscopic examination of a blood film. See also **hemoglobin C, hemoglobin SC disease.**

hemoglobin E, a qualitative hemoglobinopathy in which lysine becomes substituted for glutamic acid at position 26 of the beta chain. Prevalent in Africa and Southeast Asia, especially Thailand. The homozygous state causes a mild to moderate anemia. The heterozygous state is clinically silent.

hemoglobin E disease [Gk, *haima,* blood; L, *globus,* ball; *E;* Gk, *dis,* not; Fr, *aise,* ease], a mild form of anemia caused by a genetic abnormality of the hemoglobin molecule. Worldwide it is the third most common form of hemoglobin disorder, primarily affecting people of Southeast Asian and African descent.

hemoglobin electrophoresis, a test to identify various abnormal hemoglobins in the blood, including certain genetic disorders, such as sickle cell anemia.

hemoglobinemia /hē′mōglō′binē′mē·ə, hem′-/, presence of free hemoglobin in the blood plasma, usually associated with intravascular hemolysis.

hemoglobin F (Hb F), normal fetal hemoglobin. Hb F is replaced by hemoglobin A in the first weeks after birth. Hb F has an increased capacity to carry oxygen and is present in increased amounts in sickle cell disease, thalassemia, and hereditary persistence of hemoglobin F.

hemoglobin G, any of various abnormal hemoglobins with an amino acid substitution on the alpha chain. The most common one is hemoglobin G Philadelphia.

hemoglobin Gower, a normal hemoglobin present in early embryonic life and disappearing before birth. It occasionally consists entirely of epsilon chains (ε_4), but the usual forms are hemoglobin Gower-1, consisting of two zeta and two epsilon chains ($\zeta_2\varepsilon_2$), and hemoglobin Gower-2, consisting of two alpha and two epsilon chains ($\alpha_2\varepsilon_2$).

hemoglobin H, hemoglobin composed of four beta chains, found in alpha thalassemia. Infants may be born with a mixture of hemoglobin H and hemoglobin Bart's.

hemoglobin H disease, alpha-thalassemia in individuals heterozygous for hemoglobin H, characterized by chronic hemolytic anemia associated with splenomegaly. Red blood cell microcytosis and hypochromia are accompanied by inclusion bodies resembling Heinz bodies, detectable by supravital staining.

hemoglobin Kansas, an abnormal hemoglobin with threonine substituted for asparagine at position 102 of the beta chain, resulting in decreased oxygen affinity and cyanosis.

hemoglobin Köln, an unstable hemoglobin that has methionine substituted for valine at position 95 of the beta chain, usually resulting in hemolytic anemia with Heinz bodies in the erythrocytes.

hemoglobin M, hemoglobin in which the iron, normally in the bivalent ferrous state is oxidized the the trivalent ferric state, usually as a result of smoking or other inflammatory conditions, rarely an inherited hemoglobinopathy.

hemoglobin M disease [Gk, *haima,* blood; L, *globus,* ball; *M;* Gk, *dis,* not; Fr, *aise,* ease], a mild to moderate anemia in which a percentage of the hemoglobin contains iron in the Fe^{+++} state and is unable to combine with oxygen. The patient may experience cyanosis. See also **methemoglobin.**

hemoglobinometer /-om′ətər/ [Gk, *haima,* blood; L, *globus,* ball; Gk, *metron,* measure], any of several types of instruments designed to measure the concentration of hemoglobin in a blood sample. Some convert hemoglobin to stable measurable cyanmethemoglobin, others employ a detergent such as sodium dodecyl sulfate to lyse red blood cells and release hemoglobin for measurement. Also spelled **haemoglobinometer.**

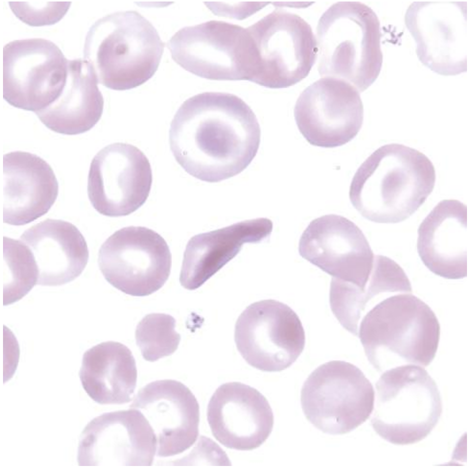
hemoglobinometry /he′moglobĭnom′ĕtre/, measurement of blood hemoglobin concentration, usually with a hemoglobinometer after the hemoglobin has been converted to cyanmethemoglobin or freed from red blood cells by sodium dodecyl sulfate.

hemoglobinopathy /hē′mōglō′binop′əthē, hem′-/ [Gk, *haima* + L, *globus,* ball; Gk, *pathos,* disease], a group of inherited disorders characterized by structural variations of the hemoglobin molecule. An abnormality may occur in the heterozygous or the homozygous form. The alteration appears as the substitution of one or more amino acids in the globin portion of the molecule at selected positions in the two alpha or two beta polypeptide chains. Although more than 100 variants have been described, only hemoglobins S and C are commonly seen. In the heterozygous form the normal adult pigment, hemoglobin A, and the variant both appear in the red cell. Little or no clinical manifestation of disease may be present. In the homozygous form only the variant hemoglobin is present, and the characteristic symptoms of that hemoglobinopathy appear. Mixed heterozygous forms are also known to occur. The normal hemoglobin A may be absent, and two or three hemoglobin variants may be present. Hemoglobinopathies include **hemoglobin C disease, hemoglobin SC disease,** and **sickle cell anemia.** Also spelled **haemoglobinopathy.** Compare **thalassemia.** See also **hemoglobin, hemoglobin A, sickle cell thalassemia, sickle cell trait.**

hemoglobin Portland, a normal hemoglobin present in the fetus late in the first trimester of pregnancy, consisting of zeta and gamma chains ($\zeta_2\gamma_2$). It disappears in utero.

hemoglobin S (Hb S), hemoglobinopathy characterized by the substitution of the amino acid valine for glutamic acid at position 6 in the beta chain of the hemoglobin molecule. Hemoglobin S migrates to between hemoglobin C and hemoglobin A in hemoglobin electrophoresis. As the hemoglobin S become deoxygenated, red cells become sickle-shaped, occluding capillaries. If the proportion of Hb S to Hb A is large, as in sickle cell anemia, local infarction occurs. See also **sickle cell anemia, sickle cell crisis, sickle cell trait.**

hemoglobin SC (Hb SC) disease, a genetic anemia in which abnormal alleles, one for hemoglobin S and one for hemoglobin C, are inherited. The disorder is characterized by a clinical course considerably less severe than that of sickle cell anemia despite the absence of normal hemoglobin. Also called **sickle cell–hemoglobin C disease.** See also **hemoglobin C disease, sickle cell anemia.**



Hemoglobin SC disease *(Carr and Rodak, 2008)*

hemoglobin SD disease, a genetically determined anemia in which the erythrocytes contain both hemoglobin S and hemoglobin D, with symptoms like those of mild sickle cell anemia. Also called **sickle cell–hemoglobin D disease.** See also **sickle cell anemia.**

hemoglobin Seattle, an abnormal hemoglobin in which glutamic acid replaces alanine at position 76 of the beta chain, decreasing the hemoglobin molecule's affinity for oxygen.

hemoglobin (Hb, Hgb) test, a blood test that measures the total amount of hemoglobin in the peripheral blood, which reflects the number of red blood cells in the blood. The test is normally performed as part of a complete blood count. Abnormal levels indicate anemia, erythrocytosis, and sickle cell disease, among others.

hemoglobinuria /-o͝or′ē·ə/ [Gk, *haima* + L, *globus,* ball; Gk, *ouron,* urine], abnormal presence in the urine of hemoglobin that is not attached to red blood cells. Hemoglobinuria can result from various autoimmune diseases or episodic hemolytic disorders. It can be diagnosed by using a dipstick reagent that is sensitive to free hemoglobin. Kinds of hemoglobinuria include **cold hemoglobinuria, march hemoglobinuria,** and **nocturnal hemoglobinuria.** Also spelled **haemoglobinuria.** Also called **toxic hemoglobinuria. — hemoglobinuric,** *adj.*

hemoglobinuric /-o͝or′ik/ [Gk, *haima,* blood; L, *globus,* ball; Gk, *ouron,* urine], pertaining to the presence of hemoglobin in the urine.

hemogram /hē′məgram/ [Gk, *haima* + *gramma,* record], a written or graphic record of a differential blood count that emphasizes the size, shape, special characteristics, and numbers of the solid components of the blood. See also **complete blood count.**

hemolith /-lith/, a calculus in the wall of a blood vessel.

hemolysin /himol′əsin/ [Gk, *haima* + *lysis,* loosening], any one of the numerous substances that lyse or dissolve red blood cells. Hemolysins are produced by bacterial strains, including staphylococci and streptococci, and are contained in venoms and vegetables. Bacterial hemolysins are divided into those that are filterable and those that cluster around the bacterial colony on a culture medium containing red blood cells. Hemolysins appear to aid the invasive power of bacteria. Also spelled **haemolysin.** See also **hemoglobin, hemolysis.**

hemolysis /himol′isis/ [Gk, *haima* + *lysis,* loosening], the breakdown of red blood cells and the release of hemoglobin that occur normally at the end of the life span of a red cell. Hemolysis may occur in antigen-antibody reactions, metabolic abnormalities of the red cell that significantly shorten red cell life span, and mechanical trauma, such as cardiac prosthesis. Dilution of the blood by IV administration of excessive amounts of hypotonic solutions, which causes progressive swelling and eventual rupture of the erythrocyte, also results in hemolysis. Also spelled **haemolysis.** Also called *hematolysis*. See also **hemolysin, hemolytic anemia, transfusion reaction. —** *hemolytic, adj.*

hemolytic anemia /-lit′ik/ [Gk, *haima* + *lysis* + *a,* without, + *haima,* blood], a disorder characterized by acute or chronic premature destruction of red blood cells. Anemia may be partially compensated by bone marrow production. The condition may be associated with some infectious diseases, certain inherited red cell disorders, or neoplastic diseases. It may be a response to drugs or other toxic agents. Also spelled **haemolytic anemia.** Compare **aplastic anemia, congenital nonspherocytic hemolytic anemia, iron deficiency anemia, myelophthisic anemia.** See also **anemia, hemolysis, spherocytosis.**

hemolytic antibody, an antibody capable of causing membrane damage and lysis of red blood cells in the presence of complement.

hemolytic disease of the fetus and newborn, alloimmune hemolytic anemia caused by placental transfer of IgG blood group antibodies from an immunized mother to the fetus, whose red cells carry an antigen inherited from the father. Hemolysis of fetal red cells can cause severe anemia, jaundice, and enlargement of the liver and spleen, which, without intervention, can lead to hypoxia, cardiac failure, generalized edema, respiratory distress, and death.

hemolytic jaundice, a yellowish discoloration of the skin and conjunctiva caused by a breakdown of red blood cells, which causes excessive amounts of bilirubin. See also **hyperbilirubinemia.**

hemolytic jaundice of the newborn. See **icterus gravis neonatorum.**

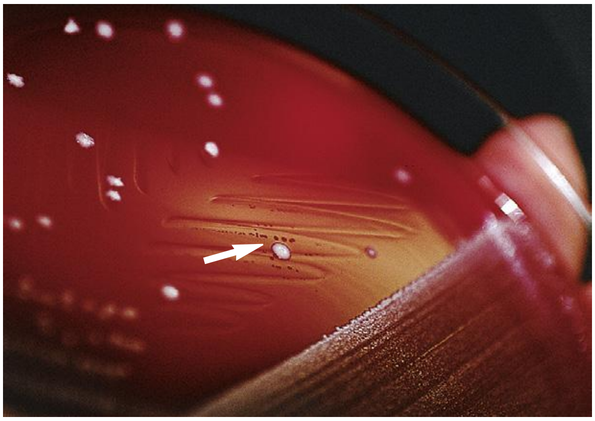
hemolytic uremic syndrome, a kidney disorder marked by renal failure, microangiopathic hemolytic anemia, and platelet deficiency. The syndrome, the cause of which is unknown, usually occurs in infancy. With conservative management, including dialysis, most infants and children recover. The prognosis in adults is uncertain.

hemoperfusion /-pərfyo͞o′zhən/, the perfusion of blood through a sorbent device, such as activated charcoal or resin beads, rather than through dialysis equipment. Hemoperfusion may be used in treating uremia, liver failure, and certain forms of drug toxicity. Also spelled **haemoperfusion.**

hemopericardium /-per′ikär′dē·əm/ [Gk, *haima* + *peri,* near, *kardia,* heart], an accumulation of blood within the pericardial sac surrounding the heart that may result in cardiac tamponade. Also spelled **haemopericardium.** Also called **hematopericardium** /hē′mətōper′ikär′dē·əm/.

hemoperitoneum /-per′itōnē′əm/ [Gk, *haima* + *peri,* around, *tenein,* to stretch], the presence of extravasated blood in the peritoneal cavity caused by surgical procedures, necrotizing tumors, fistulas, or laparoscopy procedures. Also spelled **haemoperitoneum.**

hemophil /hē′mōfil/ [Gk, *haima,* blood, *philein,* to love], **1.** bacteria of the genus ***Haemophilus,*** which thrive in culture media containing blood. **2.** an organism thriving on blood. Also spelled *haemophil.*

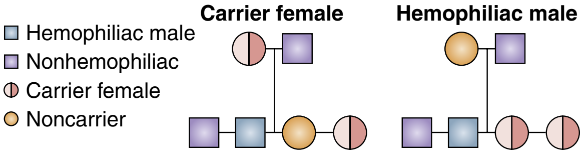


Hemophil *(Forbes, Sahm, and Weissfeld, 2007)*

hemophilia /hē′mōfē′lyə, hem′-/ [Gk, *haima* + *philein,* to love], a group of hereditary bleeding disorders characterized by a deficiency of one of the factors necessary for coagulation of the blood. The two most common forms of the disorder are hemophilia A and hemophilia B. Hemophilia A (classic hemophilia) is the result of a deficiency or absence of coagulation factor VIII. Hemophilia B (Christmas disease) results from a deficiency of factor IX. Hemophilia C (Rosenthal disease) is a factor XI deficiency. The clinical severity of the disorder varies with the extent of the deficiency. Anatomical bleeding—bleeding into joints, muscles, and soft tissue—is typical of hemophilia. Greater than usual loss of blood during dental procedures, epistaxis, hematoma, and hemarthrosis are common problems in patients with hemophilia. Also spelled **haemophilia.** See also **von Willebrand disease,** specific blood factors. **—hemophiliac,** *n.,* **hemophilic,** *adj.*

■ OBSERVATIONS: The primary presenting sign in hemophilia is excessive, poorly controlled bleeding. The rate of bleeding depends on the amount of factor activity and the severity of the injury that caused the bleeding. A factor activity level below 1% can cause spontaneous bleeding or severe bleeding from even minor trauma. When the factor activity level is more than 5%, bleeding is usually caused by trauma and is more easily controlled. The bleeding is anatomical involving subcutaneous and muscle tissue, or deep bleeding into joints and organ systems. Laboratory tests reveal a normal prothrombin time, a prolonged partial thromboplastin time, and a normal platelet function. Assays are used to determine the factor affected and the level of factor activity. A common cause of death is intracranial bleeds, which occur in about 10% of hemophiliacs and are fatal 30% of the time. Other complications of repeat bleeds include joint and musculoskeletal deformities, pericardial tamponade, airway compression, and uncontrolled hemorrhage.

■ INTERVENTIONS: Replacement of deficient factors with recombinant factor products or plasma-derived factor concentrates is the primary treatment. This may be used as prophylaxis or to stop bleeding episodes. Desmopressin acetate is used to stimulate factor VIII in mild hemophilia A. Aminocaproic acid is given in cases of persistent bleeding unresponsive to treatment. Pain is controlled with acetaminophen or codeine. Aspirin and NSAID use and intramuscular injections should be avoided because they may precipitate bleeding. Extreme care must be exercised when these individuals need surgery or dental work.



Inheritance patterns in hemophilia *(Beare and Myers, 1998)*

hemophilia A, a hereditary blood disorder usually expressed in males that is transmitted as an X-linked recessive mutation causing a deficiency of coagulation factor VIII. Hemophilia A is sometimes named classic hemophilia. See also **coagulation factor, hemophilia.**

hemophilia B, a hereditary blood disorder, transmitted as an X-linked recessive trait and caused by a deficiency of factor IX. The condition is clinically similar to but less severe than hemophilia A. Also called **Christmas disease.** See **coagulation factor, hemophilia.**

hemophilia C, a hereditary blood disorder, transmitted as an X-linked recessive trait and caused by a deficiency of factor XI, the plasma thromboplastin antecedent. The condition is clinically similar to but may be less severe than hemophilia A. Also called *Rosenthal's syndrome.* See also **coagulation factor, hemophilia.**

hemopneumopericardium /hē′mōno͞o′mōper′ikär′dē·əm/ [Gk, *haima,* blood, *pneuma,* air, *kardia,* heart], an accumulation of blood and air in the pericardium. Also called **pneumohemopericardium.**

hemopneumothorax /hē′mōno͞o′mōthôr′aks/ [Gk, *haima,* blood, *pneuma,* air, *thorax,* chest], an accumulation of blood and air in the pleural cavity.

hemoptysis /himop′tisis/ [Gk, *haima* + *ptyein,* to spit], coughing up of blood from the respiratory tract. Blood-streaked sputum often is present in minor upper respiratory infections or bronchitis. More profuse bleeding may indicate ***Aspergillus*** infection, lung abscess, tuberculosis, or bronchogenic carcinoma, in which the blood loss is caused by erosion of the pulmonary vessels. To prevent worry, the patient should be informed that hemoptysis is normal after some endoscopic procedures. Radiographic examination, endoscopy, and bronchoscopy are often used to diagnose hemoptysis. Also spelled **haemoptysis.**

hemorheology /-rē·ol′əjē/ [Gk, *haima,* blood, *rhoia,* flow, *logos,* science], the study of the effects of blood flow pressure on the cellular components of blood and on the walls of blood vessels. Also spelled **hemorrheology.**

hemorrhage /hem′ərij/ [Gk, *haima* + *rhegnynei,* to gush], a loss of a large amount of blood in a short period, either externally or internally. Hemorrhage may be arterial, venous, or capillary.

■ OBSERVATIONS: Symptoms of massive hemorrhage are related to hypovolemic shock: rapid, thready pulse; thirst; cold, clammy skin; sighing respirations; dizziness; syncope; pallor; apprehension; restlessness; and hypotension. If bleeding is contained within a cavity or joint, pain will develop as the capsule or cavity is stretched by the rapidly expanding volume of blood.

■ INTERVENTIONS: Effort is directed to stopping the hemorrhage. If hemorrhage is external, pressure is applied directly to the wound or to the appropriate pressure points. The part of the body that is wounded may be elevated. Ice, applied directly to the wound, may slow bleeding by causing vasoconstriction. Body temperature may be maintained by keeping the person covered and flat. If an extremity is wounded, and if the bleeding is severe, a tourniquet may be applied proximal to the wound. Also spelled **haemorrhage.** —*hemorrhagic, adj.*

hemorrhage control, a nursing intervention from the Nursing Interventions Classification (NIC) defined as reduction or elimination of rapid and excessive blood loss. See also **Nursing Interventions Classification.**

hemorrhagic cholecystitis, cholecystitis with hemorrhage into the gallbladder. It is usually acalculous, but sometimes there are gallstones. Also called *hemocholecystitis*.

hemorrhagic cystitis, bladder inflammation with a large amount of blood in the urine secondary to chemotherapy, radiation, mechanical trauma, or passage of a kidney stone.

hemorrhagic diathesis /-raj′ik/, an inherited predisposition to any of a number of abnormalities characterized by excessive bleeding. See also **Fanconi's syndrome, hemophilia, von Willebrand disease.**

hemorrhagic disease of newborn, a bleeding disorder of neonates that is usually caused by a deficiency of vitamin K. Also spelled **haemorrhagic disease of newborn.**

hemorrhagic familial angiomatosis. See **hereditary hemorrhagic telangiectasia.**

hemorrhagic fever, a group of viral infections characterized by fever, chills, headache, malaise, and respiratory or GI symptoms, followed by capillary hemorrhages and, in severe infection, by oliguria, kidney failure, hypotension, and possibly death. Many forms of the disease occur in specific geographic areas. See also **dengue fever, dengue hemorrhagic fever shock syndrome, Ebola virus disease, Lassa fever, Marburg virus disease.**

hemorrhagic gastritis, a form of acute gastritis usually caused by a toxic agent, such as alcohol, aspirin or other drugs, or bacterial toxins that irritate the lining of the stomach. Nausea, vomiting, and epigastric distress may persist after the irritant is removed. Treatment is symptomatic.

hemorrhagic infarct [Gk, *haima,* blood, *rhegnynei,* to gush; L, *infarcire,* to stuff], an area of necrosis that has accumulated so much blood that it resembles a red, swollen bruise.

hemorrhagic jaundice [Gk, *haima,* blood, *rhegnynei,* to gush; Fr, *jaune,* yellow], a form of jaundice that occurs in Weil's disease or other forms of **leptospirosis** in which capillary injury and anemia are present.

hemorrhagic lung. See **adult respiratory distress syndrome.**

hemorrhagic measles [Gk, *haima,* blood, *rhegnynei,* to gush; ME, *masalas*], a severe form of measles characterized by bleeding into the skin and mucous membranes. See also **black measles.**

hemorrhagic pericarditis [Gk, *haima,* blood, *rhegnynei,* to gush, *peri,* near, *kardia,* heart, *itis,* inflammation], inflammation of the pericardium accompanied by a bloody effusion. The condition is frequently caused by tuberculosis or a tumor.

hemorrhagic plague [Gk, *haima,* blood, *rhegnynei,* to gush; L, *plaga,* stroke], a severe form of bubonic plague in which bleeding occurs under the skin. Also called **bubonic plague.**

hemorrhagic pleurisy [Gk, *haima,* blood, *rhegnynei,* to gush, *pleuritis*], an inflammation of the pleura in which effusion of blood into the tissues occurs.

hemorrhagic purpura [Gk, *haima,* blood, *rhegnynei,* to gush; L, *purpura,* purple], bruises or purple skin discolorations of 1 cm diameter or greater suggesting systemic bleeding, usually associated with diminished strength of vascular walls, thrombocytopenia, von Willebrand disease, and platelet disorders. See **thrombocytopenic purpura, thrombopenic purpura.**

hemorrhagic scurvy. See **infantile scurvy.**

hemorrhagic shock, shock associated with the sudden and rapid loss of significant amounts of blood. Severe traumatic injuries often cause such blood losses. This results in inadequate perfusion to meet the metabolic demands of cellular function. Death occurs within a relatively short time unless transfusion quickly restores normal blood volume. Hemorrhagic shock often accompanies secondary shock. Compare **primary shock.**

hemorrhagic urticaria [Gk, *haima,* blood, *rhegnynei,* to gush; L, *urtica,* nettle], a skin eruption characterized by bleeding in the wheals, usually as a complication of another disease such as nephritis. In some cases the bleeding occurs first and the wheals become superimposed. Also called **urticaria hemorrhagica.**

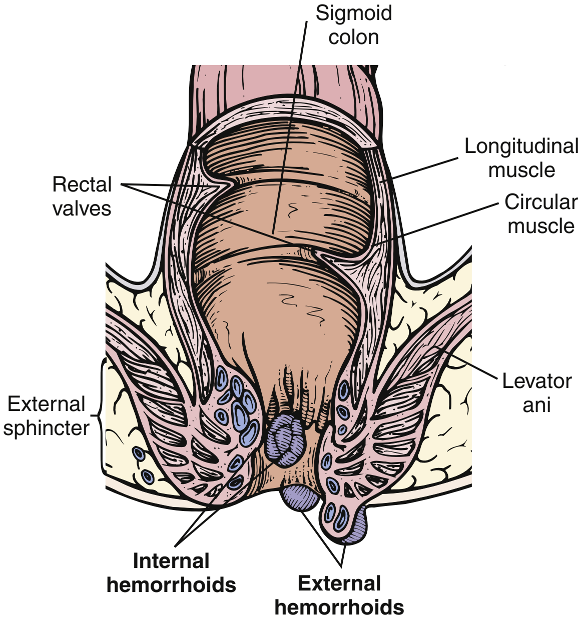
hemorrheology. See **hemorheology.**

hemorrhoid /hem′əroid/ [Gk, *haima* + *rhoia,* flow], a varicosity in the lower rectum or anus caused by congestion in the veins of the hemorrhoidal plexus. Also spelled **haemorrhoid.** —*hemorrhoidal, adj.*

■ OBSERVATIONS: Internal hemorrhoids originate above the internal sphincter of the anus. If they become large enough to protrude from the anus, they become constricted and painful. Small internal hemorrhoids may bleed with defecation. External hemorrhoids appear outside the anal sphincter. They are usually not painful, and bleeding does not occur unless a hemorrhoidal vein ruptures or thromboses.

■ INTERVENTIONS: Treatment includes local application of a topical medication to lubricate, anesthetize, and shrink the hemorrhoid. Sitz baths and cold or hot compresses are also soothing. The hemorrhoids may require sclerosing by injection, ligation, or surgical excision. Ligation is increasingly the preferred treatment because it is simple and effective and does not require anesthesia. The hemorrhoid is grasped with a forceps, and a rubber band is slipped over the varicosity, causing tissue necrosis and sloughing of the hemorrhoid, usually within 1 week.

■ NURSING CONSIDERATIONS: Straining to defecate, constipation, and prolonged sitting contribute to the development of hemorrhoids. The client is counseled about ways to prevent these predisposing factors. Because pregnancy is associated with an increased incidence of hemorrhoids, pregnant women, as well as individuals who have cirrhosis of the liver, are advised to avoid constipation.



Hemorrhoids *(Lewis et al, 2011)*

hemorrhoidal tag, an anal skin tag that was originally part of hemorrhoidal tissue.

hemorrhoidectomy /hem′əroidek′təmē/ [Gk, *haimorrhois*, a vein that discharges blood, *ektomē*, excision], the removal of dilated veins in the anal region to mitigate pain and bleeding. Most hemorrhoidectomies are outpatient procedures. Rubber band ligation, which can be done through an anoscope without sedation, is the most popular outpatient therapy. Surgery may be indicated for larger symptomatic external and internal hemorrhoids. The patient is usually placed in the lithotomy or jackknife position and receives spinal, caudal, epidural, or local anesthesia. Possible postoperative complications include constipation, pain, fecal impaction, hemorrhage, infection, and urinary retention. Also spelled **haemorrhoidectomy.**

hemosalpinx /hē′mōsal′pinks/ [Gk, *haima*, blood, *salpinx*, tube], a collection of menstrual blood in a fallopian tube.

hemosiderin /hē′mōsid′ərin/ [Gk, *haima* + *sideros*, iron], an iron-rich pigment that is a product of red cell hemolysis. Iron is often stored in this form. Also spelled **haemosiderin.**

hemosiderosis /hē′mōsid′ərō′sis, hem′-/ [Gk, *haima* + *sideros*, iron, *osis*, condition], an increased deposition of iron in a variety of tissues, usually in the form of hemosiderin and usually without tissue damage. It is often associated with diseases involving chronic, extensive destruction of red blood cells, such as thalassemia major. Compare **hemochromatosis, sideroblastic anemia.** See also **ferritin, iron transport, siderosis, thalassemia, transferrin.**

hemostasis /himos′təsis, hē′məstā′sis/ [Gk, *haima* + *stasis*, halting], **1.** the process of maintaining the blood in a fluid state within the confines of the circulatory system. A complex interaction of processes consisting of vasoconstriction, platelet aggregation, thrombin and fibrin generation, coagulation regulation, and fibrinolysis. Also spelled **haemostasis.** Compare **blood clotting.** See also **platelet, thrombus, vasoconstriction.** **2.** the arrest of the escape of blood by compression or ligation.

hemostat, an instrument used as a clamp that stops hemorrhage by compressing a bleeding vessel. See **Halsted's forceps.**

hemostatic /-stat′ik/ [Gk, *haima* + *stasis*, halting], pertaining to a procedure, device, or substance that arrests the flow of blood. Direct pressure, tourniquets, and surgical clamps are mechanical hemostatic measures. Cold applications, including the use of an ice bag on the abdomen to halt uterine bleeding and irrigation of the stomach with an iced solution to check gastric bleeding, are hemostatic. Gelatin sponges, solutions of thrombin, and microfibrillar collagen, which cause the aggregation of platelets and the formation of clots, are used to arrest bleeding in surgical procedures. Aminocaproic acid is administered orally or intravenously in the treatment of excessive bleeding caused by systemic hyperfibrinolysis. Phytonadione (vitamin K_1) is used in the prevention and treatment of hemorrhagic disease in newborns and the treatment of prothrombin deficiency induced by anticoagulants or other drugs. Also spelled **haemostatic.**

hemostatic forceps. See **artery forceps.**

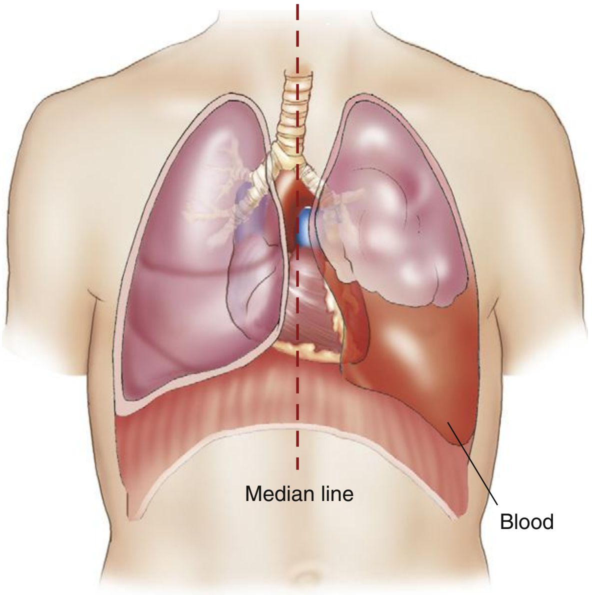
hemotherapeutics /-ther′əpyo͞o′tiks/, a form of treatment that involves the use of fresh blood plasma or serum. Also called **hemotherapy.**

hemothorax /hē′mōthôr′aks, hem′-/ [Gk, *haima* + *thorax*, chest], an accumulation of blood and fluid in the pleural cavity, between the parietal and visceral pleura, usually the result of trauma. Blood can also accumulate in the thoracic cavity as a result of erosion of pulmonary vessels, the rupture of blebs, or granulomas. Hemothorax also may be caused by the rupture of small blood vessels in inflammation caused by pneumonia, tuberculosis, or tumors. Shock from hemorrhage, pain, and respiratory failure follow if emergency care is not available. Also spelled **haemothorax.**

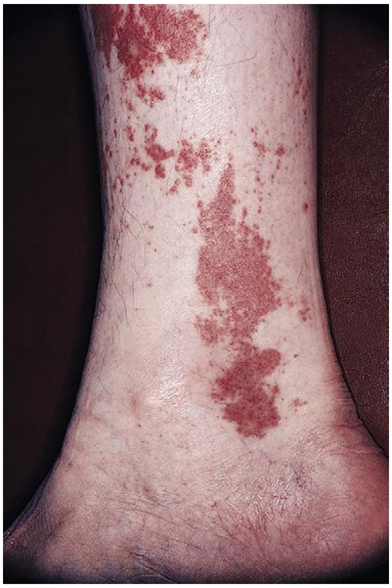
hemotroph /hē′mətrof/, the total nutritive substances supplied to the embryo from the maternal circulation after the development of the placenta. Also spelled **hemotrophe.** Also called **hemotrophic nutrition.** Compare **embryotroph.** —*hemotrophic, adj.*

Henderson-Hasselbalch equation [Lawrence J. Henderson, American chemist, 1878–1942; Karl A. Hasselbalch, Danish biochemist, 1874–1962], the relationship among pH, the pK_a of a buffer system, and the ratio of the concentrations of the weak acid and its conjugate base.

Henderson, Virginia, (1897–1996), a nursing theorist who introduced a holistic approach to the profession in 1966. The theory is based on the concepts that the body and mind are inseparable, no two individuals are alike, and the role of nursing is independent of the functions of the physician. The Henderson theory proposes that 14 components of basic nursing care contribute to the health of a patient. They relate to (1) breathing, (2) eating and drinking, (3) elimination, (4) movement and posture, (5) sleep and rest, (6) clothing,



Hemothorax *(Leonard, 2009)*



Henoch-Schönlein purpura *(Callen et al, 2000)*

(7) maintenance of body temperature, (8) cleaning and grooming of the body, (9) avoidance of environmental dangers and injury, (10) communication, (11) worship, (12) work, (13) play and recreation, and (14) learning and discovery.

Henle's fissure /hen′lēz/ [Friedrich Gustav Henle, German anatomist, 1809–1885], one of many patches of connective tissue between the muscle fibers of the heart.

Henle's loop. See **loop of Henle.**

Henoch-Schönlein purpura /hen′ôkh shœn′līn/ [Eduard H. Henoch, German physician, 1820–1910; Johannes L. Schönlein, German physician, 1793–1864], a self-limited hypersensitivity vasculitis, chiefly of children, characterized by purpuric skin lesions that appear predominantly on the lower abdomen, buttocks, and legs and are usually associated with pain in the knees and ankles. Other joint involvement, GI bleeding, and hematuria are also common findings. The disease lasts up to 6 weeks and has no sequelae if renal involvement is not severe. Immunosuppressive drugs, such as corticosteroids, may help relieve the nephropathy. Also called **anaphylactoid purpura, Henoch-Schönlein syndrome, Schönlein-Henoch purpura.**

Henoch-Schönlein purpura nephritis, a type of glomerulonephritis sometimes seen with Henoch-Schönlein purpura. Clinical characteristics usually resemble those of IgA nephropathy, and a rapidly progressive form can lead to renal failure.

Henoch-Schönlein syndrome. See **Henoch-Schönlein purpura.**

henry (H) [Joseph Henry, American physicist, 1797–1878], an International System unit of electrical inductance equal to 1 volt-second per ampere.

Henry's law [William Henry, English chemist, 1774–1836], (in physics) a law stating that the solubility of a gas in a liquid is proportional to the pressure of the gas if the temperature is constant and the gas does not chemically react with the liquid.

Henschen method, a technique for positioning a patient's head in a true lateral position to produce a radiographic image of the mastoid and petrous portions of the head.

Hensen's knot, Hensen's node. See **primitive node.**

hen worker's lung. See **pigeon breeder's lung.**

HEP, abbreviation for **hepatoerythropoietic porphyria.**

HEPA, abbreviation for *h*igh-*e*fficiency *p*articulate *a*ir filters.

hepadnavirus /hĕpad′nävi′rus/, any member of a family of DNA viruses that causes hepatitis B in humans and other animals. The human pathogens are in the genus ***Orthohepadnavirus.***

heparin /hep′ərin/ [Gk, *hēpar,* liver], a naturally occurring mucopolysaccharide that acts in the body as an antithrombin factor to prevent intravascular clotting. The substance is produced by basophils and mast cells, which are found in large numbers in the connective tissue surrounding capillaries, particularly in the lungs and liver. In the form of sodium salt, heparin is used therapeutically as an anticoagulant. See also **heparin sodium.**

heparin-induced thrombocytopenia with thrombosis (HIT), arterial and venous clots that may develop after five days of unfractionated heparin therapy; caused by the production of anti-heparin-platelet factor 4 antibodies.

heparin lock flush solution (USP) [Gk, *hēpar,* liver; OE, *loc* + ME, *fluschen* + L, *solutus,* dissolved], a sterile solution of heparin sodium, saline solution, and benzyl alcohol that is intended for use in maintaining patency in IV equipment. It is not used in anticoagulant therapy.

heparin rebound, the reactivation of heparin effect that occurs from 5 minutes to 5 hours after neutralization with protamine sulfate.

heparin sodium, an anticoagulant.

■ INDICATIONS: It is prescribed in the treatment and prophylaxis of a variety of thromboembolic disorders. It inhibits its blood clotting and prevents recurring coronary artery occlusion.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is given only when frequent monitoring of the coagulation status of the patient's blood is possible.

■ ADVERSE EFFECTS: The most serious adverse reaction is hemorrhage. Vasospastic disorders may occur.

hepat-. See **hepato-.**

hepatectomy /hep′ətek′təmē/ [Gk, *hēpar,* liver, *ektomē,* excision], a surgical procedure performed to remove a portion of the liver.

-hepatia, suffix meaning "(condition of the) liver or its functioning": *anhepatia, dyshepatia, hypohepatia*.

hepatic /hepat′ik/ [Gk, *hēpar,* liver], pertaining to the liver.

hepatic acinus, a functional unit of the liver, smaller than a portal lobule; a diamond-shaped mass of liver parenchyma surrounding a portal tract.

hepatic adenoma, a rapidly growing tumor of the liver that may become very large and rupture, causing a lethal internal hemorrhage. The incidence is frequently associated with the use of oral contraceptives.

hepatic amebiasis, a disorder characterized by enlargement and tenderness of the liver that is often associated with amebic dysentery. The inflammation results from direct infection with ***Entamoeba histolytica,*** ingested in water or food contaminated with human feces. See also **amebiasis, amebic dysentery.**

hepatic amyloidosis, a type of primary amyloidosis in which amyloid fibrils invade the liver, causing hepatomegaly. The prognosis is grave, with many patients dying within a year.

hepatic bile, a "C" form of bile obtained from a duodenal drainage tube after the gallbladder has been emptied.

hepatic cells. See **hepatic cord.**

hepatic coma, a neuropsychiatric manifestation of extensive liver damage caused by chronic or acute liver disease. Either endogenous or exogenous waste toxic to the brain is not neutralized in the liver before being shunted back into the peripheral circulation of the blood, or substances required for cerebral function are not synthesized in the liver and therefore are not available to the brain. Commonly, ammonia, a by-product of protein metabolism that is toxic to the brain, is not converted to urea by the liver. The condition is characterized by variable consciousness, including lethargy, stupor, and coma; a tremor of the hands; personality change; memory loss; hyperreflexia; and hyperventilation. Respiratory alkalosis, mania convulsions, and death may occur. The outcome varies according to the pathogenesis of the condition and the treatment. Also called **portal systemic encephalopathy.** See also **cirrhosis, hepatitis.**

■ INTERVENTIONS: Treatment in most cases includes cleansing enemas, low-protein diet, parenteral hydration with a balanced electrolyte solution, and specific treatment for the underlying cause. It may also include the use of neomycin orally to kill off bacteria and thus prevent elevated blood urea nitrogen levels.

hepatic cord, a mass of cells, arranged in irregular radiating columns and plates, spreading outward from the central vein of the hepatic lobule. The cells are many-sided and contain one or sometimes two distinct nuclei. Many such cords join to form the parenchyma of the liver lobule. Each cell usually contains granules, some protoplasmic and others consisting of glycogen, fat, or an iron compound. Also called **hepatic cells.**

hepatic dyspepsia, a digestive difficulty caused by a liver disorder.

hepatic encephalopathy. See **hepatic coma.**

hepatic fistula, an abnormal passage from the liver to another organ or body structure.

hepatic insufficiency, a failure or partial failure of normal liver function.

hepatic ischemia, injury to liver cells resulting from a deficiency of blood or oxygen, caused by hypotension from decreased cardiac output, shock, or some other cause. Also called *hypoxic hepatitis, ischemic hepatitis,* **shock liver.**

hepatic keratitis. See **dendritic keratitis.**

hepatic lobes [Gk, *hēpar,* liver, *lobos,* lobes], the large divisions of the liver: caudate, quadrate, left, and right.

hepatic node, a node in one of three groups of lymph glands associated with the abdominal and pelvic viscera supplied by branches of the celiac artery. The hepatic nodes are divided into the hepatic and subpyloric groups. The hepatic group, on the stem of the hepatic artery, extends along the common bile duct, between the two layers of the lesser omentum, as far as the porta hepatis. The subpyloric group comprises about five nodes closely relating to the division of the gastroduodenal artery. Both groups receive materials from the stomach, the duodenum, the liver, the gallbladder, and the pancreas. Their efferent vessels join the celiac set of preaortic nodes. Compare **gastric node, pancreaticolienal node.**

hepatico-. See **hepato-.**

hepaticoduodenostomy /hepat′ikōdo͞o′ōdənos′təmē/, surgical establishment of a passageway between the hepatic duct and the duodenum.

hepaticoenterostomy /hepat′ikō·en′teros′təmē/, surgical establishment of a passageway between the hepatic duct and the intestine.

hepaticolithotomy /-lithot′əmē/, an incision made in the hepatic bile duct for the removal of gallstones.

hepaticolithotripsy /-lith′ətrip′sē/, a surgical procedure in which gallstones in the bile duct are crushed for removal.

hepatic porphyria. See **porphyria.**

hepatic portal circulation. See **portal circulation.**

hepatic portal vein, a large vein through which all venous blood from the gastrointestinal system enters the inferior surface of the liver. The vein then ramifies like an artery to distribute blood to small endothelial-lined hepatic sinusoids, which form the vascular exchange network of the liver.

hepatic pulse, pulsation of the liver, such as may occur in tricuspid incompetence.

hepatic vein catheterization, the introduction of a long, fine catheter into a hepatic venule for the purpose of recording intrahepatic venous pressure. The catheter is inserted through a vein in the arm and is passed through the right atrium, inferior vena cava, and hepatic vein into the small hepatic vessel.

hepatic veins [Gk, *hēpar,* liver; L, *vena*], the three main veins, the right, middle, and left, that drain the blood returned from the liver into the inferior vena cava.

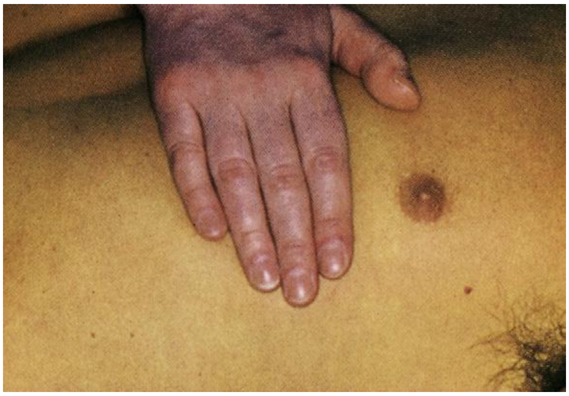
hepatin. See **glycogen.**

hepatitis /hep′ətī′tis/ [Gk, *hēpar* + *itis,* inflammation], an inflammatory condition of the liver, characterized by jaundice, hepatomegaly, anorexia, abdominal and gastric discomfort, abnormal liver function, clay-colored stools, and tea-colored urine. The condition may be caused by bacterial or viral infection, parasitic infestation, alcohol, drugs, toxins, or transfusion of incompatible blood. It may be mild and brief or severe, fulminant, and life-threatening. The liver usually is able to regenerate its tissue, but severe hepatitis may lead to cirrhosis and chronic liver dysfunction. Compare **anicteric hepatitis.** See also **viral hepatitis.**

hepatitis A (HA), a viral hepatitis caused by the hepatitis A virus (HAV), a picornovirus, characterized by slow onset of signs and symptoms. The virus may be spread through fecally contaminated food or water. The infection most often occurs in young adults and is usually followed by complete recovery. Disease duration is from 15 to 45 days. Relapses 6 to 12 months after the initial diagnosis are seen in 15% of the patients. Prophylaxis with immune globulin is effective in household and sexual contacts. A vaccine for immunization is available. Utilize standard precautions for diapered or incontinent patients. Also called **acute infective hepatitis.** See also **viral hepatitis.**

hepatitis A vaccine inactivated, an inactivated whole virus vaccine derived from an attenuated strain of hepatitis A virus grown in cell culture administered intramuscularly.

hepatitis B (HB), a viral hepatitis caused by the hepatitis B virus (HBV), a hepadnavirus. The virus is transmitted by transfusion of contaminated blood or blood products, by sexual contact with an infected person, by the use of contaminated needles and instruments, or in utero. It can cause acute and chronic hepatitis. Ninety-five percent of patients clear the infection and develop antibodies to HBV. The remaining 5% who are unable to clear the virus develop chronic infections that put them at risk for long-term complications. Severe infection may cause prolonged illness, destruction of liver cells, cirrhosis, increased risk of liver cancer, or death. A vaccine is available and recommended for infants, teenagers, and adults at risk for exposure. Treatment may involve transplantation. Also called **serum hepatitis.** See also **viral hepatitis.**



Jaundice in a patient with hepatitis
(Emond, Welsby, and Rowland, 2003)

hepatitis B immune globulin (HBIG), a passive immunizing agent.

■ INDICATION: It is prescribed for postexposure prophylaxis against infection by the hepatitis B virus.

■ CONTRAINDICATIONS: Known hypersensitivity to the drug or to gamma globulin prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are severe hypersensitivity reactions. Pain and inflammation at the site of injection may also occur.

hepatitis B surface antigen. See **Australia antigen.**

hepatitis B vaccine, a vaccine prepared from the blood plasma of asymptomatic human carriers of hepatitis B virus. A series of three doses is recommended to achieve immunity. The vaccine is advised particularly for people who are likely to have contact with blood or fluids of affected people, such as nurses, physicians, dentists, dental hygienists, and laboratory personnel.

hepatitis B vaccine (recombinant), a genetically engineered vaccine produced in yeast cells by recombinant deoxyribonucleic acid technology.

hepatitis B vaccine inactivated, a preparation of formalin-treated hepatitis B surface antigen isolated from plasma of human carriers of hepatitis B. It has been superseded by the recombinant form of the vaccine in the United States.

hepatitis C (HC), a type of hepatitis transmitted most commonly by blood transfusion or percutaneous inoculation, as when IV drug users share needles or when drug users share straws for nasal inhalation of cocaine. It is transmitted less commonly by sexual intercourse. The disease progresses to chronic hepatitis in up to 80% of the patients acutely infected, culminating in cirrhosis. Diagnosis is made through identification of antibodies of HCV or PCR. Treatment is alpha-interferon and ribavarin. Those infected with hepatitis C can remain asymptomatic for 10 to 20 years. Because hepatitis C carriers are vulnerable to severe hepatitis if they contract hepatitis A or B, vaccination against hepatitis A and B is recommended. Also called *parenterally transmitted non-A non-B hepatitis*.

hepatitis D (HD), a form of acute or chronic hepatitis, caused by the hepatitis delta virus, that occurs only in patients co-infected with hepatitis B. Hepatitis D virus (HDV) relies on hepatitis B virus (HBV) replication and cannot replicate independently. The disease usually develops into a chronic state. Diagnosis is made by detecting serum antibodies to HDV. It is transmitted sexually and through needle sharing. The only treatment is prevention of HBV. Also called **delta hepatitis.**

hepatitis E (HE), a self-limited type of hepatitis occurring primarily in Asia and Africa, acquired by ingestion of fecally contaminated water or food. Symptoms are similar to those of hepatitis A. Also called *enterically transmitted non-A non-B hepatitis*.

hepatitis F (HF), a hypothetical virus linked to hepatitis, possibly a mutation of the hepatitis B virus. The most recent finding was in 1994, when novel viral particles were discovered in the feces of posttransfusion patients without hepatitis A, B, C, or E. When injected into the bloodstream of rhesus monkeys, these particles caused hepatitis. When further investigations failed to confirm the existence of the virus, it was delisted as a cause of infectious hepatitis. Also called **Toga virus.**

hepatitis G (HG), a form of hepatitis, caused by the hepatitis G virus (HGV), that is transmitted by infected blood or blood products. It can also be transmitted by sharing personal items contaminated with the virus, by vertical transmission (mother to newborn), and by various sexual activities. Infection is of widespread occurrence and causes generally asymptomatic to mild disease. It is seen in patients after drug transfusions, in patients undergoing hemodialysis, and in IV drug abusers. It is also seen in infants born to infected mothers. The virus is not primarily replicated in the liver and may only be associated with hepatitis rather than the cause of infection.

hepatitis virus studies, a series of tests used to detect antigens and antibodies to hepatitis B surface antigen (HBsAg), hepatitis B surface antibody (HBsAb), hepatitis B core antibody (HBcAb), hepatitis B e-antigen (HBeAg), hepatitis B e-antibody (HBeAb), and hepatitis C antibodies (HCV IgG).

hepatization /hep′ətīzā′shən/ [Gk, *hepatizein,* like the liver], transformation of lung tissue into a solid mass resembling the liver, as in early pneumococcal pneumonia, in which consolidation and effusion of red blood cells in the alveoli produce **red hepatization.** In later stages of pneumococcal pneumonia, when white blood cells fill the alveoli, the consolidation becomes **gray hepatization,** or **yellow hepatization,** when infiltrated by fat deposits.

hepato-, hepat-, hepatico-, prefix meaning "liver": *hepatobiliary, hepatocarcinogenic, hepatocellular.*

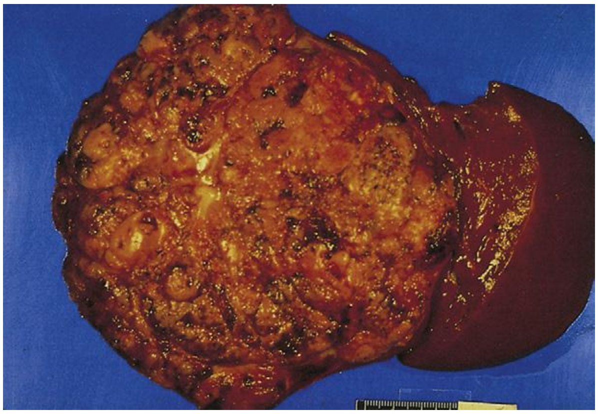
hepatobiliary capsule. See **Glisson's capsule.**

hepatoblastoma /hep′ətō′blastō′mə/, a cancer of the liver that tends to occur in children. It is usually detected during examination for causes of failing health and for the presence of a mass in the upper abdomen. Hepatoblastoma may be associated with precocious puberty.

Characteristics of hepatitis viruses

	Incubation period	*Mode of transmission*	*Sources of infection and spread of disease*	*Infectivity*
Hepatitis A virus (HAV)	15-50 days (average 28)	Fecal-oral (fecal contamination and oral ingestion)	Crowded conditions (e.g., day care); poor personal hygiene; poor sanitation; contaminated food, milk, water, and shellfish; persons with subclinical infections; infected food handlers; sexual contact; IV drug users	Most infectious during 2 wk before onset of symptoms; infectious until 1-2 wk after the start of symptoms
Hepatitis B virus (HBV)	45-180 days (average 56-96)	Percutaneous (parenteral)/permucosal exposure to blood or blood products Sexual contact Perinatal transmission	Contaminated needles, syringes, and blood products; sexual activity with infected partners; asymptomatic carriers Tattoo/body piercing with contaminated needles; bites	Before and after symptoms appear; infectious for 4-6 mo; in carriers continues for patient's lifetime
Hepatitis C virus (HCV)	14-180 days (average 56)	Percutaneous (parenteral)/mucosal exposure to blood or blood products High-risk sexual contact Perinatal contact	Blood and blood products, needles and syringes, sexual activity with infected partners	1-2 wk before symptoms appear; continues during clinical course; 75%-85% go on to develop chronic hepatitis C
Hepatitis D virus (HDV)	2-26 wk; HBV must precede HDV; chronic carriers of HBV are always at risk	Can cause infection only when HBV is present; routes of transmission same as for HBV	Same as HBV	Blood is infectious at all stages of HDV infection
Hepatitis E virus (HEV)	15-64 days (average 26-42 days)	Fecal-oral Outbreaks associated with contaminated water supply in developing countries	Contaminated water; poor sanitation; found in Asia, Africa, and Mexico; not common in United States and Canada	Not known; may be similar to HAV

From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St Louis, 2011, Mosby.



Hepatoblastoma *(Skarin, 2010)*

hepatocarcinogen /-kärsin′əjən/, an agent that causes carcinoma of the liver.

hepatocarcinoma. See **malignant hepatoma.**

hepatocele [Gk, *hēpar,* liver, *kele,* hernia], a hernia of a portion of the liver through the diaphragm or the abdominal wall.

hepatocellular carcinoma. See **malignant hepatoma.**

hepatocellular jaundice /-sel′yələr/, jaundice resulting from disease or injury to liver cells.

hepatocholangitis /hep′ətōkō′lanjī′tis/, an inflammation of both the liver and the bile ducts.

hepatocyte /hep′ətōsīt/ [Gk, *hēpar* + *kytos,* cell], a parenchymal liver cell that performs all the functions ascribed to the liver.

hepatocyte growth factor (HGF), a potent mitogen and inducer of hepatocyte proliferation, produced in the liver by cells other than hepatic cells and in many other organs by cells of the mesenchyme. It is also multifunctional and regulates cell growth and motility.

hepatoduodenal ligament /hep′ətōdo͞o′ədē′nəl, -do͞o·od′inəl/ [Gk, *hēpar* + L, *duodeni,* twelve fingers], the portion of the lesser omentum between the liver and the duodenum, containing the hepatic artery, the common bile duct, the portal vein, the lymphatics, and the hepatic plexus of nerves. These structures are enclosed within a fibrous capsule between the two layers of the ligament. Compare **hepatogastric ligament.**

hepatoerythropoietic porphyria (HEP) /hep′ə·tō·ərith′rōpoi·et′ik/ [Gk, *hēpar,* liver + *erythros,* red + *poiein,* to make], a severe homozygous form of **porphyria cutanea tarda** (PCT) believed to result from an autosomal-dominant defect in the same enzyme activity as PCT. It is clinically identical to PCT, but onset is in early childhood, and activity of the affected enzyme in liver, erythrocytes, and fibroblasts is virtually absent.

hepatogastric ligament /hep′ətōgas′trik/ [Gk, *hēpar* + *gaster,* stomach], the portion of the lesser omentum between the liver and the stomach. Compare **hepatoduodenal ligament.**

hepatogenous jaundice /hep′ətoj′ənəs/ [Gk, *hēpar,* liver, *genein,* to produce; Fr, *jaune,* yellow], a type of jaundice caused by a condition of the liver.

hepatogram /hep′ətōgram′/, **1.** a sphygmographic tracing of the liver pulse. **2.** a radiographic image of the liver.

hepatography /hep′ətog′rəfē/, **1.** the recording of the liver pulse. **2.** the radiographic or isotope scintigraphic visualization of the liver.

hepatojugular /hep′ətōjug′yo͞olər/ [Gk, *hēpar,* liver; L, *jugulum,* neck], pertaining to the liver and the jugular vein.

hepatojugular reflux [Gk, *hēpar* + L, *jugulum,* neck], an increase in jugular venous pressure when pressure is applied for 30 to 60 seconds over the abdomen, suggestive of right-sided heart failure.

hepatolenticular degeneration /həpat′ōlentik′yo͞olər/ [Gk, *hēpar* + L, *lens,* lentil], an abnormal autosomal-recessive condition associated with defective copper metabolism in the body, characterized by decreased serum ceruloplasmin and copper levels and increased secretion of urinary copper. In individuals with this condition, tissue deposits of copper associated with hepatic cirrhosis, deep marginal pigmentation of the cornea (known as **Kayser-Fleischer rings**), and extensive degeneration of the central nervous system, especially the basal ganglions, develop. Also called **Wilson's disease.**

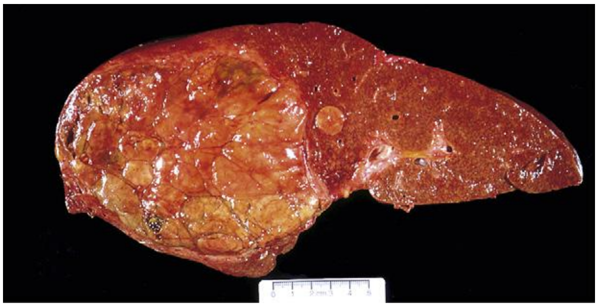
hepatolienal fibrosis. See **congestive splenomegalia.**

hepatolithiasis /-lithī′əsis/, the presence of stones in the liver.

hepatologist /hep′ətol′əjist/, a physician who specializes in diseases of the liver.

hepatology /hep′ətol′əjē/, the branch of medicine that is concerned primarily with diseases of the liver.

hepatoma /hep′ətō′mə/ *pl. hepatomas, hepatomata* [Gk, *hēpar* + *oma,* tumor], a primary malignant tumor of the liver, which is relatively rare in the United States, characterized by hepatomegaly, pain, hypoglycemia, weight loss, anorexia, and ascites, as well as elevated serum alpha-fetoprotein levels, portal hypertension, and jaundice in the plasma. It occurs most commonly in the sixth decade, and its incidence is higher in African-Americans than in Caucasians. It occurs most frequently in association with hepatitis or cirrhosis of the liver and in those parts of the world where the mycotoxin aflatoxin is found. It is treated with surgical resection when isolated to one lobe of the liver. The prognosis is poor. Chemotherapy and liver transplantation are used in some centers.



Subdural hepatoma *(Kumar, Abbas, and Fausto, 2005)*

hepatomegaly /hep′ətōmeg′əlē/ [Gk, *hēpar* + *megas,* large], abnormal enlargement of the liver that is usually a sign of disease, often discovered by percussion and palpation as part of a physical examination. In hepatomegaly the liver is easily palpable below the ribs in the right upper quadrant of the abdomen and may be tender to the touch. Hepatomegaly may be caused by hepatitis or other infection; fatty infiltration, as in alcoholism; biliary obstruction; or malignancy.

hepatonecrosis /-nekrō′sis/, **1.** the death of liver cells. **2.** gangrene of the liver.

hepatopancreatic ampulla /-pan′krē·at′ik/ [Gk, *hēpar* + *pan,* all, *kreas,* flesh], the dilation formed by the junction of the pancreatic and bile ducts as they open into the lumen of the duodenum. Also called **ampulla of the bile duct, ampulla of Vater, Vater's ampulla.**

hepatopulmonary syndrome, arterial hypoxemia caused by pulmonary vasodilation in conjunction with chronic liver disease, usually occurring as a result of portal hypertension in cirrhosis.

hepatorenal /hep′ətōrē′nəl/ [Gk, *hēpar,* liver; L, *ren,* kidney], pertaining to the liver and the kidneys.

hepatorenal syndrome, a type of kidney failure characterized by a gradual loss of function without signs of tissue damage. It is associated with hepatitis or cirrhosis of the liver; its exact cause is unknown.

hepatosplenomegaly /-splē′nōmeg′əlē/ [Gk, *hēpar,* liver, *splen* + *megas,* large], enlargement of the spleen and liver.

hepatotoxic /-tok′sik/, destructive to the liver.

hepatotoxicity /hep′ətōtoksis′itē/ [Gk, *hēpar* + *toxikon,* poison], the tendency of an agent, usually a drug or alcohol, to have a destructive effect on the liver.

hepatotropic /hep′ə-totrop′ik/, having a special affinity for or exerting a specific effect on the liver.

hepatotropic virus, a virus that primarily affects the liver, such as the hepatitis viruses.

Hepatovirus /hep′ə-tovi′rus/, the hepatitis A viruses, a genus of Picornaviruses.

hepatoxin /-tok′sin/, a poison that damages parenchymal cells of the liver.

hepta-, hept-, prefix meaning "seven": *heptachromic, heptadactylia, heptavalent.*

heptachlor poisoning /hep′təklôr′/ [Gk, *hepar,* seven, *chloros,* green; L, *potio,* drink], a form of chlorinated organic insecticide poisoning.

heptaploid. See **polyploid.**

heptavalent /hep′tivā′lənt/, pertaining to a chemical that has a valence of 7. Also **septivalent.**

herald patch. See **pityriasis rosea.**

herb /(h)urb/ [L, *herba,* grass], **1.** any plant that is used for culinary or medicinal purposes. **2.** a leafy plant without a wooden stem. **3.** a plant with aerial parts that do not persist from one year to the next.

herbalist /hur′bəlist/, **1.** a person who specializes in the study of herbs. **2.** a dealer in medicinal herbs.

herbal medicine, the use of medicinal products containing as active ingredients exclusively plant material and/or vegetable drug preparations used to treat various health conditions. Herbal medicine is a major form of treatment for more than 70% of the world's population. Also called **phytotherapy.**

herb bath [L, *herba,* grass; AS, *baeth*], a medicinal bath taken in water containing a mixture of aromatic herbs.

herbicide /er′-, her′bisīd/, an agent that is destructive to weeds or causes an alteration in their normal growth.

herbicide poisoning /her′bisīd/ [L, *herba,* grass, *caedere,* to kill], a poisoning caused by the ingestion, inhalation, or absorption of a substance intended for use as a weed killer or defoliant. Many of the commonly used agricultural herbicides can produce symptoms ranging from skin irritation to hypotension, liver and kidney damage, and coma or convulsions. Estimated fatal doses may be as small as 1 to 10 g. Some herbicides contain extremely toxic substances;

poisoning is characterized by dysphagia, burning stomach pain, throat constriction, diarrhea, or other severe symptoms.

herbivore /hərbivōr/ [L, *herba,* grass, *vorare,* to devour], an animal that subsists mostly or entirely on plants.—*herbivorous, adj.*

herb tea, a medicinal beverage prepared by the infusion of a water-soluble extract of leaves, roots, bark, or other parts of an herb. The vegetable matter is commonly macerated and steeped in boiling water, which is strained and served hot. Cold water may be used for herbs containing readily soluble active principles.

herd immunity [ME, *heord,* group; L, *immunis,* free from], the level of disease resistance of a community or population.

herd instinct [ME, *heord* + L, *instinctus,* impulse], the basic need of social animals, including humans, for the companionship of peers and a tendency to find compatibility with the behavioral standards of others in the group.

hereditability /həred′itəbil′itē/ [L, *hereditas,* inheritance], the degree to which a specific trait is controlled by inheritance.

hereditary /həred′iter′ē/ [L, *hereditas,* inheritance], transmitted from parent to offspring; inborn; inherited. Compare **acquired, congenital, familial.**

hereditary angioedema, an inherited autosomal-dominant disorder characterized by the episodic appearance of nonpitting edema involving any part of the body, including mucosal surfaces. The attacks last 48 to 72 hours and can be life-threatening if edema obstructs the airway.

hereditary ataxia, one of a group of inherited degenerative diseases of the spinal cord, cerebellum, and often other parts of the nervous system, characterized by tremor, spasm, muscle wasting, skeletal change, and sensory disturbances resulting in impaired motor activity. Kinds of hereditary ataxia include **ataxia-telangiectasia syndrome** and **Friedreich's ataxia.**

hereditary brown enamel. See **amelogenesis imperfecta.**

hereditary coproporphyria. See **coproporphyria.**

hereditary deforming chondroplasia. See **diaphyseal aclasis.**

hereditary disorder. See **inherited disorder.**

hereditary elliptocytosis. See **elliptocytosis.**

hereditary enamel hypoplasia. See **amelogenesis imperfecta.**

hereditary essential tremor. See **essential tremor.**

hereditary fructose intolerance. See **fructose intolerance.**

hereditary hemochromatosis, an autosomal-recessive disorder of metabolism that involves the deposition of iron-containing pigments in the tissues. Iron accumulation is lifelong, with symptoms that include joint or abdominal pain, weakness, and fatigue appearing usually in the fifth or sixth decades of life. If untreated, the disorder may lead to bronzing of the skin, arthritis, diabetes, cirrhosis, or heart disease. It typically affects men more often than women. See also **hemochromatosis.**

hereditary hemorrhagic telangiectasia, a vascular anomaly, inherited as an autosomal-dominant trait, characterized by hemorrhagic telangiectasia of the skin and mucosa. Small red-to-violet lesions are found on the lips, oral and nasal mucosa, tongue, and tips of fingers and toes. The thin, dilated vessels may bleed spontaneously or as a result of only minor trauma, and this condition becomes progressively more severe. Bleeding from superficial lesions is often profuse and may result in severe anemia. No specific treatment is known, but accessible bleeding lesions may be treated with pressure, styptics, and topical hemostatics. Transfusions may be indicated for acute hemorrhage, and iron deficiency anemia may require continuous treatment. Also called **hemorrhagic familial angiomatosis, Osler-Weber-Rendu syndrome, Rendu-Osler-Weber syndrome.**

hereditary hyperuricemia. See **Lesch-Nyhan syndrome.**

hereditary multiple exostoses, a rare familial dyschondroplastic disease in which bony protuberances form on the shafts of the long bones and eventually develop into caps of cartilage covering the ends of the bones. The affected joints lose their mobility, and the bones stop growing. The disease begins in childhood and has no cure. Very rarely a chondrosarcoma may develop from the cap of an exostosis. See also **Ollier's dyschondroplasia.**

hereditary opalescent dentin. See **dentinogenesis imperfecta.**

hereditary oral disease, any abnormal condition characterized by genetic defects of structures in or around the mouth, such as deformed dentition, ankyloglossia, hereditary gingival fibromatosis, or cleft palate. Many hereditary oral diseases, including Crouzon's disease, sickle cell anemia, gargoylism, familial amyloidosis, and achondroplasia, are associated with generalized defects as well as oral and facial characteristics.

hereditary osteoonychodysplasia. See **nail-patella syndrome.**

hereditary protoporphyria. See **porphyria.**

hereditary renal adysplasia, an autosomal-dominant condition in which a kidney is severely dysplastic, nonfunctional, and often ectopic. If bilateral, as in the oligohydramnios sequence, the infant usually dies soon after birth.

hereditary spherocytosis. See **spherocytic anemia.**

hereditary tyrosinemia. See **tyrosinemia.**

heredity /həred′itē/ [L, *hereditas,* inheritance], **1.** the process by which particular traits or conditions are genetically transmitted from parents to offspring, causing resemblance of individuals related by descent. It involves the separation and recombination of genes during meiosis and fertilization and the further interaction of developmental influences and genetic material during embryogenesis. **2.** the total genetic constitution of an individual; the sum of the qualities inherited from ancestors and the potentialities of transmitting these qualities to offspring.

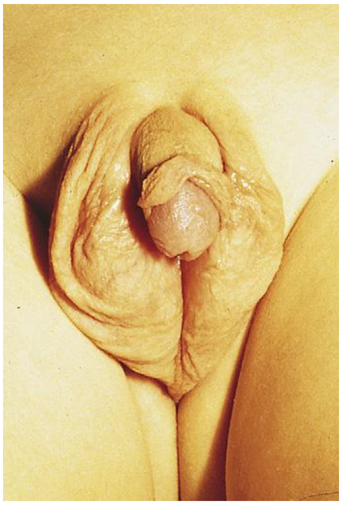
heredo-, prefix meaning "hereditary": *heredobiological, heredosyphilitic, heredotrophedema.*

Hering-Breuer reflex /her′ing broi′ər/ [Heinrich E. Hering, German physiologist, 1866–1948; Joseph Breuer, Austrian physician, 1842–1925], a neural mechanism that terminates inspiration and initiates expiration. The reflex is triggered by impulses that originate in stretch receptors of the bronchi and bronchioles in response to distension of the airway, increased intratracheal pressure, or pulmonary inflation. The impulses travel via afferent fibers of the vagus nerves to the medullary respiratory center. The Hering-Breuer reflex is well developed at birth and is hyperactive in conditions of restrictive ventilatory insufficiency.

Hering's nerve. See **glossopharyngeal nerve.**

Hermansky-Pudlak syndrome /hərmän′skē po͝od′läk/ [F. Hermansky, Czechoslovakian internist, 20th century; P. Pudlak, Czechoslovakian internist, 20th century], an autosomal-recessive form of oculocutaneous albinism, with a hemorrhagic diathesis secondary to a platelet defect and accumulation of a ceroid-like substance in the reticuloendothelial system, oral mucosa, and urine.

hermaphroditism /hərmaf′rədītiz′əm/ [Gk, *Hermaphroditos,* son of Hermes and Aphrodite], a rare condition resulting from a chromosomal abnormality in which both testicular and ovarian tissue exist in the same person. The testicular tissue contains seminiferous tubules or spermatozoa, and the ovarian tissue contains follicles or corpora albicantia. Also called **hermaphrodism.** Compare **pseudohermaphroditism.** —*hermaphroditic, adj.*



Hermaphroditism *(Zitelli and Davis, 2007)*

hermetic /hərmet′ik/ [Gk, *Hermes*], from use in alchemy, pertaining to sealing a container so as to make it airtight.

hernia /hur′nē·ə/ [L, rupture], protrusion or projection of an organ through an abnormal opening in the muscle wall of the cavity that surrounds it. A hernia may be congenital, may result from the failure of certain structures to close after birth, or may be acquired later in life as a result of obesity, muscular weakness, surgery, or illness. Kinds of hernia include **abdominal, diaphragmatic, femoral, hiatal, inguinal,** and **umbilical.** See also **herniorrhaphy.**

hernial /hur′nē·əl/, pertaining to or resembling a hernia.

hernial ring, a ring through which a hernia protrudes, such as a dilated internal inguinal ring.

hernial sac [L, *hernia,* rupture; Gk, *sakkos,* sack], a pouch of peritoneum into which organs or other tissues pass to form a hernia.

herniated /hur′nē·ā′tid/, pertaining to a tear or abnormal bulge of an organ or organ part through a retaining tissue.

herniated disk, a rupture of the fibrocartilage surrounding an intervertebral disk, releasing the nucleus pulposus that cushions the vertebrae above and below. The resultant pressure on spinal nerve roots may cause considerable pain and damage the nerves, resulting in restriction of movement. The condition most frequently occurs in the lumbar region. Also called *herniated intervertebral disk, herniated nucleus pulposus,* **ruptured intervertebral disk, slipped disk.**

herniation /hur′nē·ā′shən/, a protrusion of a body organ or portion of an organ through an abnormal opening in a membrane, muscle, or other tissue. See also **hernia, hiatal hernia.**

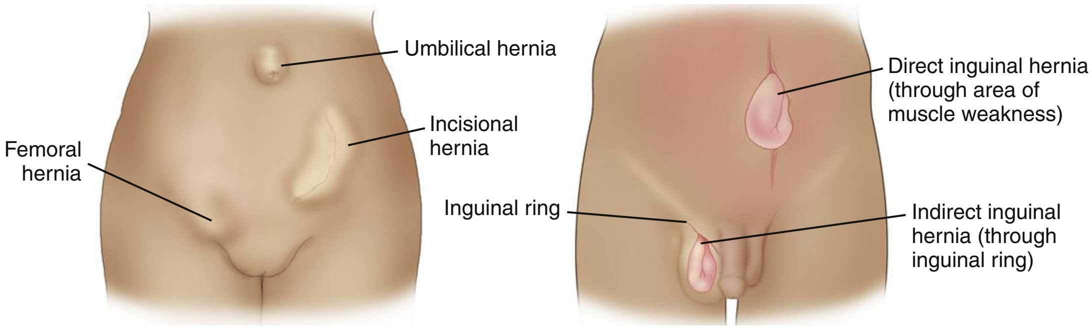
herniography /hur′nē·og′rəfē/, the radiographic examination of a hernia after it has been injected with a contrast medium.

herniorrhaphy /hur′nē·ôr′əfē/, the surgical repair of a hernia.

herniotomy /hur′nē·ot′əmē/ [L, *hernia* + Gk, *temnein,* to cut], a surgical procedure to reduce a hernia.

heroin /her′ō·in/ [Ger, *heroine,* originally trademark for diacetylmorphine], a morphine-like drug with no currently acceptable medical use in the United States. Heroin is included in Schedule I of the Controlled Substances Act of 1970. Like other opium alkaloids, it can produce analgesia, respiratory depression, GI spasm, and physical dependence. It produces its major effects on the central nervous system and bowel and alters the endocrine and autonomic nervous systems. Heroin, which loses much of its analgesic power when taken orally, is more powerful than morphine and acts more rapidly. Repeated use of this drug produces tolerance to most of the acute opioid effects; physical dependence develops concurrently with tolerance. Withdrawal from heroin after relatively few exposures commonly produces acute abstinence syndrome. Withdrawal signs are usually observed shortly before the next planned dose and commonly include anxiety, restlessness, irritability, and craving for another dose. Other withdrawal signs that may appear 8 to 15 hours after the last dose include lacrimation, perspiration, yawning, and restless sleep. On awakening from such sleep the severely addicted heroin user may experience withdrawal signs, such as vomiting, pain in the bones, diarrhea, convulsions, and cardiovascular collapse. Withdrawal signs usually peak at between 36 and 48 hours and gradually subside during the following 10 days. Methadone is commonly used as a substitute drug in the treatment of heroin addiction (methadone maintenance therapy). Also called **diacetylmorphine.**

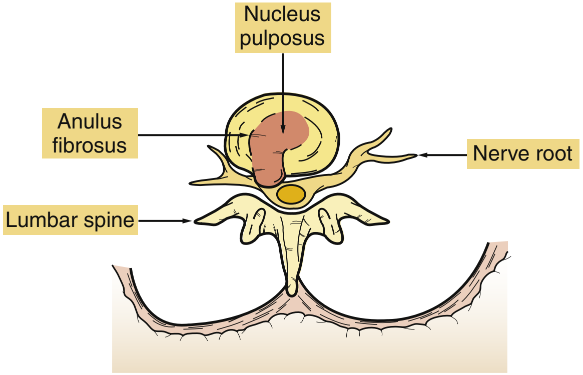
herpangina /hur′panjī′nə/ [Gk, *herpein,* to creep; L, *angina,* quinsy], a viral infection, usually of young children, characterized by sore throat, headache, anorexia, and pain in the abdomen, neck, and extremities. Febrile convulsions and vomiting may occur in infants. Papules or vesicles may form in the pharynx and on the tongue, the palate, or the tonsils. The lesions evolve into shallow ulcers that heal spontaneously. The disease usually runs its course in less than



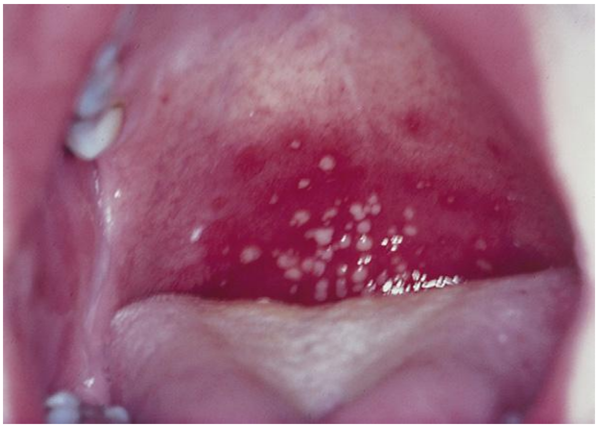
Umbilical hernia
Incisional hernia
Femoral hernia
Inguinal ring
Direct inguinal hernia (through area of muscle weakness)
Indirect inguinal hernia (through inguinal ring)

Common locations of hernias *(Leonard, 2012)*

1 week. Treatment is symptomatic. The cause is often infection by a strain of coxsackie virus, typically coxsackie virus A. If similar shallow, blister-like lesions appear on the soles of the feet or the palms of the hands, it is called hand-foot-and-mouth disease.



Herniated disk



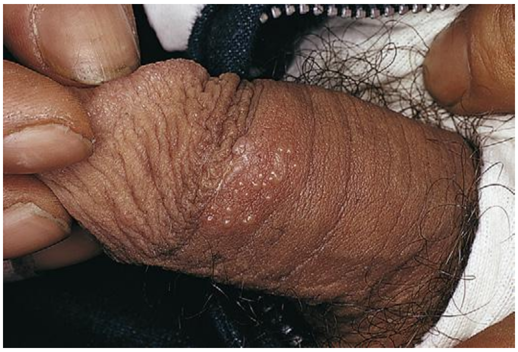
Herpangina *(Cohen, Powderly, and Opal, 2010)*

herpes genitalis /hur′pēz jen′ital′is/ [Gk, *herpein,* to creep; L, *genitalis,* genitalia], a chronic infection caused by type 2 herpes simplex virus (HSV2), usually transmitted by sexual contact. It causes painful vesicular eruptions on the skin and mucous membranes of the genitalia of males and females. When acquired during pregnancy, HSV2 may be transmitted through the placenta to the fetus and to the newborn by direct contact with infected tissue during birth. It can be a precursor of cervical cancer.

■ OBSERVATIONS: In the male, herpes genitalis infections may resemble penile ulcers. A small group of vesicular lesions surrounded by erythematous tissue may occur on the glans or prepuce. The lesions erupt into superficial ulcers that often heal in 5 to 7 days, although they also may become the sites of secondary infections. The lesions are painful and are often associated with a burning sensation, urinary dysfunction, fever, malaise, and swelling of the lymph nodes in the inguinal area. The female patient may exhibit the same or similar systemic effects, and members of both sexes may complain of painful sexual intercourse. In the female, herpes genitalis lesions are likely to appear as multiple superficial eruptions on the surfaces of the cervix, vagina, or perineum. There may be a discharge from the cervix. Vaginal lesions may appear as mucous patches with grayish ulcerations. Laboratory tests from smears of fluid taken from the base of lesions show a positive Tzanck reaction with multiple nucleated giant cells, which distinguishes HSV2 infections from other venereal diseases. Infection tends to recur.

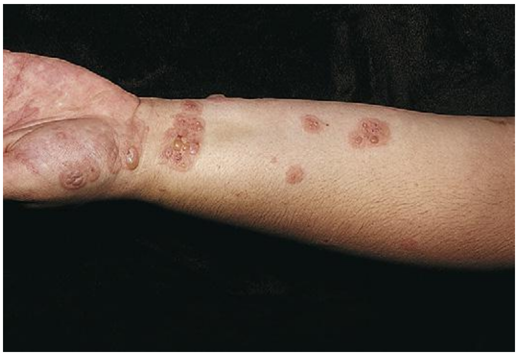
■ INTERVENTIONS: Acyclovir taken orally results in partial control of the symptoms and signs of herpes episodes. The drug accelerates healing but does not eradicate the infection. The antiviral agents valacyclovir, penciclovir, and famciclovir may suppress reaction and also may lessen the severity and duration of the outbreak.

■ NURSING CONSIDERATIONS: The nurse teaches patients with genital herpes about the potential for recurrent episodes of lesions and advises them to abstain from sexual activity while the lesions are present. Sexual transmission has been documented during phases when no lesions were present. Women of childbearing age with genital herpes should inform their health care provider if they become pregnant.



Herpes genitalis *(Swartz, 2009)*

herpes gestationis [Gk, *herpein* + L, *gestare,* to bear], a generalized pruritic vesicular or bullous rash that appears in the second or third trimester of pregnancy and disappears several weeks after delivery. The lesions often recur with succeeding pregnancies and are associated with premature birth and increased fetal mortality rate. Herpes gestationis has no relation to herpesvirus infection.



Herpes gestationis *(Callen et al, 2000)*

herpes labialis. See **herpes simplex.**

herpes menstrualis [Gk, *herpein,* to creep; L, *menstruare*], a form of herpes simplex that tends to erupt during menstrual periods.

herpes simplex [Gk, *herpein* + L, *simplex,* uncomplicated], an infection caused by a herpes simplex virus (HSV), which has an affinity for the skin and nervous system and usually produces small, transient, irritating, and sometimes painful fluid-filled blisters on the skin and mucous membranes. HSV1 **(oral herpes**, **herpes labialis, cold sore)** infections tend to occur in the facial area, particularly around the mouth and nose; HSV2 (herpes genitalis) infections are usually limited to the genital region.

■ OBSERVATIONS: The initial symptoms of an HSV1 infection usually include burning, tingling, or itching sensations about the edges of the lips or nose within 1 or 2 weeks after contact with an infected person. Several hours later, small red papules develop in the irritated area. Later, small vesicles, or fever blisters, filled with fluid erupt. Several small vesicles may merge to form a larger blister. The vesicles generally are associated with itching, pain, or similar discomfort. Other effects often include a mild fever and enlargement of the lymph nodes in the neck. Laboratory analysis of the vesicular fluid usually shows the presence of herpesvirus particles and the absence of pyogenic bacteria. Within 1 week after the onset of symptoms, thin yellow crusts form on the vesicles as healing begins. In skin areas that are moist or protected and in severe cases, healing may be delayed. HSV2 infections in adolescence are associated with an increased incidence of cervical cancer in adulthood.

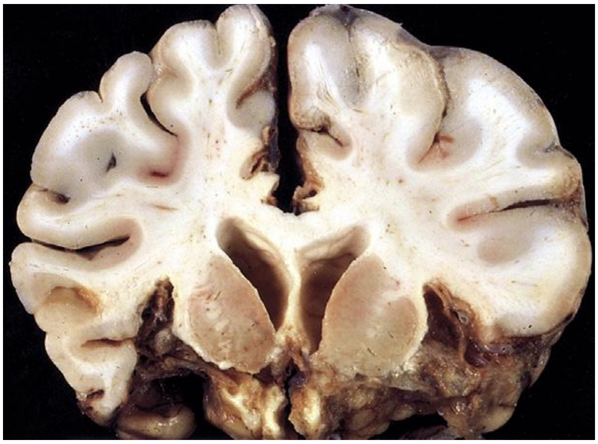
■ INTERVENTIONS: Treatment of herpes simplex is symptomatic. The lesions may be washed gently with soap and water to reduce the risk of secondary infection. Topical penciclovir cream may speed healing. When secondary infections have begun, antibiotics are prescribed. Although there is no cure, treatment includes oral acyclovir or valacyclovir.

■ NURSING CONSIDERATIONS: Because herpesviruses are extremely contagious, the nurse follows all appropriate procedures in contacts with patients to avoid acquiring and transmitting the infection. Washing the hands and wearing disposable gloves when in contact with oral secretions or genitalia help prevent transmission of the virus. Once acquired, the virus tends to remain latent in the tissues of the nervous system and may be reactivated by a variety of stimuli, including a febrile illness, physical or emotional stress, exposure to sunlight, or ingestion of certain foods or drugs. Topical sunscreen preparations offer some protection against exposure to the sun, and patients are advised to avoid repeated exposure to stimuli to which they are sensitive. The complications of herpetic infections may include encephalitis, herpes simplex keratitis, and gingivostomatitis. In cases involving systemic complications, IV acyclovir, blood transfusions, IV solutions, and other therapy may be required. In uncomplicated cases the herpes attack is usually self-limiting and runs its course in 3 weeks or less.

herpes simplex encephalitis, a necrotizing inflammation of the brain that follows an infection with herpes simplex virus. It is a common acute form of encephalitis and is similar to other viral encephalitis infections. Repeated seizures occur early in the course, and there is severe hemorrhagic necrosis. Affected areas of the brain are usually the orbital portions of the frontal lobes and the inferomedial portions of the temporal lobe. Persons of any age may be infected, but cerebral sequelae (caused by HSV2) are more likely to occur in infants. The mortality rate varies, but even desperately ill patients may recover completely.

herpes simplex keratitis. See **ocular herpes.**

herpes simplex (HSV) test, a blood test or microscopic culture done to detect types 1 and 2 of the herpes simplex virus. HSV1 is primarily responsible for the oral lesions known as "cold sores" whereas HSV2 is a sexually transmitted viral infection of the urogenital tract, although crossover of the two types can occur. Culture is the more accurate of the two types of tests.



Herpes simplex encephalitis *(Kumar et al, 2007)*

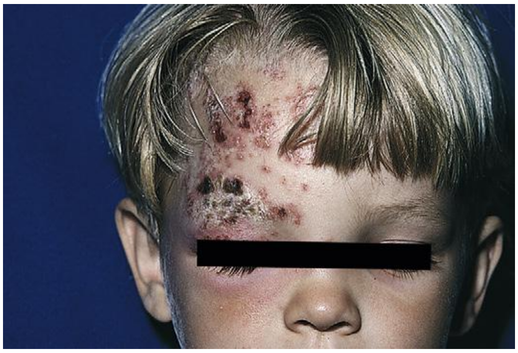
herpesvirus /hur′pēzvī′rəs/ [Gk, *herpein* + L, *virus,* poison], viruses from the family Herperviridae. At least seven species of herpesvirus are known to be infectious to man: herpes simplex viruses 1 and 2, varicella zoster virus, Epstein-Barr virus, cytomegalovirus, human herpesvirus 6, and human herpesvirus 7.

herpesvirus hominis. See **herpes simplex.**

herpesvirus simiae encephalomyelitis, an infection of the central nervous system by a B form of herpes simplex virus that usually affects simians. Persons most likely to be infected by the monkey virus are veterinarians and animal laboratory workers. Some cases of simian B virus may be life threatening.

herpes zoster /zos′tər/ [Gk, *herpein* + *zoster,* girdle], an acute infection caused by reactivation of the latent varicella zoster virus, which mainly affects adults. The cause of reactivation is unknown, but it is linked to stress, aging, and immune impairment. It is characterized by the development of painful vesicular skin eruptions that follow the underlying route of cranial or spinal nerves inflamed by the virus. Prompt treatment with antivirals can speed healing and reduce the risk of postherpetic neuralgia. Also called **shingles.** See also **herpes simplex, varicella zoster virus.**

herpes zoster ophthalmicus, a form of herpes zoster in which the virus invades the gasserian ganglion, causing pain and skin eruptions along the ophthalmic branch of the fifth cranial nerve. There also may be involvement of the third cranial nerve. The infection frequently leads to corneal ulceration or other ocular complications. Also called **ophthalmic herpes zoster.**



Herpes zoster ophthalmicus *(Callen et al, 2000)*

herpes zoster oticus, a herpes zoster infection of the eighth cervical (vestibulocochlear) nerve ganglia and geniculate ganglion, causing severe pain in the external ear structures and pain or paralysis along the facial nerve. The disease also may cause hearing loss and vertigo. The vertigo is usually transient, but the hearing loss and facial paralysis may be permanent. Vesicular eruptions may occur along the external ear canal and ear pinna. Treatment is generally symptomatic, with diazepam administered for vertigo, analgesics for pain, and corticosteroids for other symptoms. Acyclovir may be prescribed.

herpes zoster virus. See **chickenpox.**

herpetic encephalitis /hərpet′ik/ [Gk, *herpein,* to creep + *enkephalos,* brain + *itis,* inflammation], the most common form of acute encephalitis, caused by a herpesvirus and characterized by hemorrhagic necrosis of parts of the temporal and frontal lobes. Onset is over several days and involves fever, headache, seizures, stupor, and often coma, frequently with a fatal outcome.

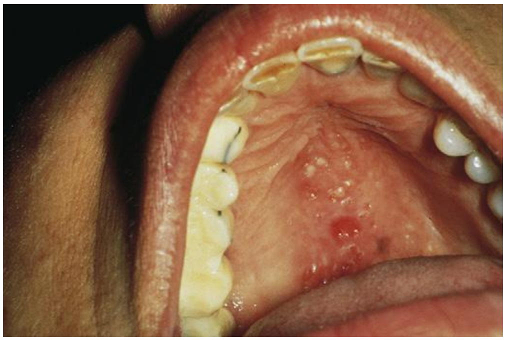
herpetic gingivostomatitis, primary herpetic gingivostomatitis is the most common viral infection of the gum tissue due to herpes simplex type I virus (HSV-1) presenting with fragile vesicles that rapidly progress to painful ulcerations of the gingival tissue. Primary infection also presents with fever, lymphadenopathy, and fatigue. Herpes infections are transmitted by physical contact and typically arise in early childhood. Recurrent herpetic gingivostomatitis occurs in 15%-45% of the infected population. Treatment includes antiviral medications initiated within the first 3 symptomatic days of lesion onset. See **gingivostomatitis.**

herpetic keratitis. See **dendritic keratitis.**

herpetic neuralgia /hərpet′ik/ [Gk, *herpein,* to creep, *neuron,* nerve, *algos,* pain], a form of neuralgia with intractable pain that develops at the site of a previous eruption of herpes zoster. It more frequently occurs in the elderly.

herpetic sore throat, a herpes inflammation that develops in the region of the pharynx.

herpetic stomatitis [Gk, *herpein,* to creep, *stoma,* mouth, *itis,* inflammation], a form of inflammation of the mouth caused by a herpesvirus infection, also characterized by ulcers.

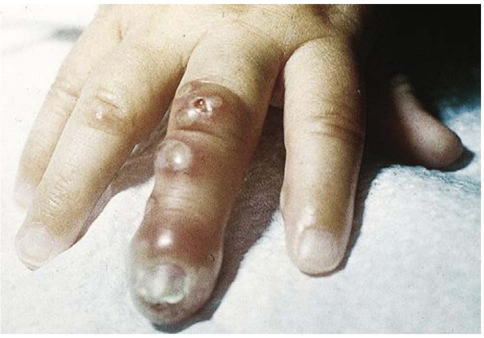


Herpetic stomatitis *(Swartz, 2009)*

herpetic whitlow, cutaneous herpes simplex on the terminal segment of a finger, resulting in formation of deep coalescing vesicles with tissue destruction.

herpetiform /hərpet′ifôrm′/ [Gk, *herpein* + L, *forma,* form], having clusters of vesicles that resemble the skin lesions of some herpesvirus infections.

Herplex, a trademark for a topical antiviral **(idoxuridine).**



Herpetic whitlow *(Stone and Gorbach, 2000/Courtesy Dr. Mark Drapkin, Newton Wellesley Hospital)*

Hers' disease /herz, hurz/ [H. G. Hers, 20th-century Belgian physiologist; L, *dis,* opposite of; Fr, *aise,* ease], an uncommon metabolic disorder of glycogen storage involving a deficiency of glycogen phosphorylase. It is characterized by hepatomegaly and an accumulation of abnormally large amounts of glycogen in the liver as a result of its inability to break down glycogen. The condition is inherited as an autosomal-recessive trait. There is no known treatment. Also called **glycogen storage disease, type VI.** See also **glycogen storage disease.**

hertz (Hz) /hurts, herts/ [Heinrich R. Hertz, German physicist, 1857–1894], a unit of measurement of wave frequency equal to 1 **cycle per second**.

HERV, abbreviation for **human endogenous retroviruses.**

Herxheimer's reaction /herks′hī′mərz/ [Karl Herxheimer, German dermatologist, 1861–1944], an increase in symptoms after administration of a drug. The reaction was originally discovered in penicillin treatment of syphilis, but it has been found to occur with other diseases as well.

Herzog taping protocol, a procedure for immobilizing and balancing a foot with tape after a musculoskeletal injury. The protocol consists of step-by-step instructions for applying tape, beginning with the lateral aspect of the head of the fifth metatarsal and continuing through the lateral plantar aspect of the foot.

Heschl's gyrus /hesh′əl/ [Richard L. Heschl, Austrian pathologist, 1824–1881; Gk, *gyros,* turn], any of several small gyri that run transversely on the upper surface of the temporal operculum of the insula of the cortex.

hesperidin /hesper′idin/, a crystalline flavone glycoside present in most citrus fruits, especially in the spongy casing of oranges and lemons.

Hesselbach's hernia /hes′əlbaks, -bäkhs/ [Franz K. Hesselbach, German surgeon, 1759–1816], a protrusion of diverticula through the femoral sheath, usually associated with direct inguinal hernia.

Hesselbach's triangle. See **inguinal triangle.**

hetastarch /het′əstärch/, a plasma volume expander.

■ INDICATIONS: It is prescribed to treat hypovolemia in shock and is used in leukapheresis to help increase the yield of granulocytes.

■ CONTRAINDICATIONS: Severe bleeding, severe heart or kidney dysfunction with oliguria or anuria, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are influenza-like symptoms, muscle pain, edema, and anaphylaxis.

heter-. See **hetero-.**

heterauxesis. See **allometric growth.**

hetero-, heter-, prefix meaning "another or different": *heteroalbumose, heterochronia, heterogamy.*

heteroallele /het′ərō·əlēl′/ [Gk, *heteros,* different, *alleolon,* of one another], one of a pair of alleles at a specific locus on homologous chromosomes that differs from the other of the pair. —*heteroallelic, adj.*

heteroantibody /het′ərō·an′tibod′ē/, an antibody that recognizes an antigen from a species other than that of the antibody producer.

heteroantigen /he′tərō·an′təjən/, an antigen that originates in a different species and is foreign to the antibody producer.

heteroblastic /het′əroblas′tik/ [Gk, *heteros* + *blastos,* germ], developing from different germ layers or kinds of tissue rather than from a single type. Compare **homoblastic.**

heterocellular /-sel′yələr/, pertaining to a structure formed by more than one kind of cell.

heterocephalus /-sef′ələs/ [Gk, *heteros* + *kephale,* head], a malformed fetus that has two heads of unequal size. —*heterocephalic, heterocephalous, adj.*

heterochromatin /-krō′mətin/ [Gk, *heteros,* different, *chroma,* color], the part of a chromosome that is inactive in gene expression but may function in controlling metabolic activities, transcription, and cell division. It stains most intensely during interphase and usually remains in a condensed state throughout the cell cycle. It consists of two types: constitutive heterochromatin, which is present in all cells and is characteristic of the Y chromosome, and facultative heterochromatin, which is present in the inactivated X chromosome of the mammalian female. Compare **euchromatin.** See also **chromatin.** —*heterochromatic, adj.*

heterochromatinization /-krō′mətīnəzā′shən/, the transformation of genetically active euchromatin into genetically inactive heterochromatin. It occurs during the inactivation of one of the X chromosomes in the mammalian female during the early stages of embryogenesis. See also **Lyon hypothesis.**

heterochromia iridis /het′ər·ōkrō′mē·ə ī′ridis/ [Gk, *heteros,* different + *chroma,* color + *iris,* rainbow], difference of color in the two irides or in different areas of the same iris.

heterochromosome /-krō′məsōm/, a sex chromosome. See also **heterotypic chromosomes.** —*heterochromosomal, adj.*

heterocytotropic antibody /-sī′tətrop′ik/, an antibody of immunoglobulin class E that has a greater affinity for antigens when fixed to mast cells of a different species than to those of the antibody producer.

heterodidymus /het′ərōdid′iməs/ [Gk, *heteros* + *didymos,* twin], a conjoined twin fetus in which the parasitic elements consist of a head, neck, and thorax attached to the thoracic wall of the autosite. Also called **heterodymus.**

heteroduplex /-do͞o′pleks/ [Gk, *heteros* + L, *duoplicare,* to double], a DNA molecule in which the two strands are derived from different individuals, with the result that some base pairs may not be complementary.

heteroduplex mapping, a method for determining the location of insertions, deletions, and other heterogeneities in the two strands of a DNA molecule.

heterodymus. See **heterodidymus.**

heteroenzyme /het′ərō·en′zīm/, a functionally identical enzyme from a different species.

heteroeroticism /het′ərō·irot′isiz′əm/ [Gk, *heteros,* different, *eros,* love], sexual feeling or activity directed toward another individual. Also called **alloeroticism, alloerotism, heteroerotism.** Compare **autoeroticism.**

heterofermentation /-fur′məntā′shun/, fermentation that produces major products that are different.

heterogamete. See **anisogamete.**

heterogametic /-gamet′ik/, pertaining to the sex that produces gametes of different kinds, in terms of their sex chromosomes. In human beings the male, who possesses X-bearing and Y-bearing sperm, is the heterogametic sex.

heterogamy /het′ərog′əmē/ [Gk, *heteros* + *gamos,* marriage], **1.** See **anisogamy.** **2.** See **heterogenesis,** def 1. —*heterogamous, adj.*

heterogeneic antigen, xenogeneic antigen.

heterogeneity /-jənē′itē/, **1.** a quality of being dissimilar in kind. **2.** a state of having different characteristics and qualities.

heterogeneous /het′əroj′ənəs/ [Gk, *heteros,* different, *genos,* kind], **1.** consisting of dissimilar elements or parts; unlike; incongruous. **2.** not having a uniform quality throughout. Compare **homogeneous. —heterogeneity,** *adj.*

heterogenesis /-jen′əsis/ [Gk, *heteros* + *genein,* to produce], **1.** also called **heterogamy,** *heterogeny, heterogony.* reproduction that differs in successive generations, such as the alternation of sexual and asexual reproduction, so that offspring have characteristics different from those of the parents. In the asexual stage, it often involves one or more parthenogenetic or hermaphroditic generations, often with various hosts, as in the case of many trematode parasites. **2.** See **asexual reproduction. 3.** See **abiogenesis.** Compare **homogenesis.** See also **metagenesis.** —*heterogenetic, heterogenic, adj.*

heterogenous /het′əroj′ənəs/ [Gk, *heteros* + *genos,* kind], **1.** having a nonuniform composition throughout. **2.** derived or developed from another source or from two different sources.

heterogenous vaccine [Gk, *heteros,* different, *genein,* to produce; L, *vaccinus,* cow], a vaccine made against the same species of pathogen from a source other than the patient's own tissues.

heterograft. See **xenograft.**

heteroimmunization /-im′yənīzā′shun/, immunization of an individual with antigens from a different species.

heteroinfection /-infek′shən/ [Gk, *heteros,* different; L, *inficere,* to stain], infection by a microorganism originating outside the body.

heterolactic acid fermentation /-lak′tik/, bacterial fermentation that produces a mixture of lactic acid and other products.

heterologous. See **xenogeneic.**

heterologous anaphylaxis /het′ərol′əgəs/ [Gk, *heteros,* differen, *logos,* relation, *ana,* again, *phylaxis,* protection], a form of passive anaphylaxis that results from the transfer of serum between two animals of different species.

heterologous insemination. See **artificial insemination.**

heterologous tumor [Gk, *heteros* + *logos,* relation], a neoplasm consisting of tissue different from that of its site. Compare **homologous tumor, organoid neoplasm.**

heterologous twins. See **dizygotic twins.**

heterologous vaccine, a vaccine that confers protective immunity against a pathogen that shares cross-reacting antigens with the microorganisms in the vaccine.

heterometropia /-mətrō′pē·ə/ [Gk, *heteros,* different, *metron,* measure, *ops,* eye], a generally mild visual disorder in which one eye refracts differently from the other, causing slightly different images to be perceived by the right and left eyes.

heteronymous /het′əron′iməs/ [Gk, *heteros,* different, *onyma,* name], **1.** having different names; the opposite of synonymous. **2.** pertaining to an optical phenomenon in which two images are produced by one object. **3.** abnormal.

heterophil /het′ərofil′/ [Gk, *heteros* + *philein,* to love], having affinity for something unusual or abnormal, as an antibody that recognizes an antigen other than the one it is expected to challenge. Also spelled **heterophile** /-fīl′/.

heterophil antibody test [Gk, *heteros* + *philein,* to love], a test for the presence of heterophil antibodies in the serum of patients suspected of having infectious mononucleosis, based on an agglutination reaction between heterophil antibodies in a person's serum and heterophil antigen, a normal component of sheep erythrocytes. This antibody eventually appears in the serum of more than 80% of the patients with mononucleosis caused by the Epstein-Barr virus; hence it is highly diagnostic of the disease. See also **Epstein-Barr virus.**

heterophile. See **heterophil.**

heterophilic leukocyte /-fil′ik/ [Gk, *heteros,* different, *philein,* to love, *leukos,* white, *kytos,* cell], a neutrophil of certain animal species that takes an acid stain.

Heterophyes /het′erofi′ēz/, a genus of minute trematodes found in the middle third of the small intestine of humans and certain other mammals. Various species are found in Egypt and Turkey, throughout Asia, and in Japan and the Philippines.

heteroplastic transplantation /-plas′tik/ [Gk, *heteros,* different, *plassein,* to mold; L, *transplantare*], the transfer of tissue from one animal to another of a different species. Compare **homoplastic transplantation.**

heteroploid /het′ərəploid′/ [Gk, *heteros* + *ploos,* times, *eidos,* form], **1.** *n,* an individual, organism, strain, or cell that has a variation in the number of chromosomes characteristic of somatic cells of the species. The change may involve entire sets of chromosomes or single chromosomes. **2.** *adj,* pertaining to such an individual, organism, strain, or cell. See also **aneuploid, euploid. —heteroploidy,** *n.*

heteroploidy /het′ərəploi′dē/, the state or condition of having an abnormal number of chromosomes, either more or less than that characteristic of the somatic cell of the species.

heteropolymer /-pol′imir/ [Gk, *heteros* + *polys,* many, *meros,* part], a compound formed from subunits that are not all the same, such as a protein composed of various amino acid subunits.

heterosexual /-sek′shəl/ [Gk, *heteros,* different; L, *sexus,* male or female], **1.** *n,* a person whose sexual desire or preference is for people of the opposite sex. **2.** *adj,* pertaining to sexual desire or preference for people of the opposite sex. See also **sexual orientation. —***heterosexuality, n.*

heterosexual panic, an acute attack of anxiety that results in the frantic pursuit of heterosexual activity in response to unconscious or latent homosexual impulses. Compare **homosexual panic.**

heterosis /het′ərō′sis/ [Gk, *heteros* + *osis,* condition], the superiority of first-generation hybrid plants and animals with respect to one or more traits when compared with either of the parent strains or with corresponding inbred strains. Also called **hybrid vigor.**

heterotaxy syndrome, a variable set of complex congenital anomalies of the GI and cardiovascular systems that results from heterotaxia of the abdominal and thoracic viscera.

heterotopic ossification /-top′ik/ [Gk, *heteros* + *topos,* place], a nonmalignant overgrowth of bone, frequently occurring after a fracture, that is sometimes confused with certain bone tumors when visualized on x-ray film. Also called **exuberant callus, myositis ossificans.**

heterotopic pain, pain that appears in the wrong part of the body, such as pain originating in the gallbladder that may be felt in the right shoulder. The phenomenon seems to be caused by projection of sensory neurons from different parts of the body into the same regions of the central nervous system. Also called **referred pain.**

heterotopic pregnancy, a pregnancy that is both intrauterine and extrauterine.

heterotopic transplantation [Gk, *heteros,* different, *topos,* place; L, *transplantare*], the transfer of tissue from one part of a body of a donor to another area of the body of a recipient.

heterotransplant /-trans′plant/ [Gk, *heteros,* different; L, *transplantare*], the transfer of tissue from one animal to another of a different species.

heterotypic /het′ərōtip′ik/ [Gk, *heteros* + *typos,* pattern], pertaining to or characteristic of a type differing from the usual or the normal, specifically regarding the first meiotic division of germ cells in gametogenesis as distinguished from the second meiotic division or a mitotic division. Also called *heterotypical*. Compare **homeotypic.**

heterotypic chromosomes, any unmatched pair of chromosomes, specifically the sex chromosomes.

heterotypic mitosis, the division of bivalent chromosomes, as occurs in the first meiotic division of germ cells in gametogenesis; a reduction division. Compare **homeotypic mitosis.**

heterozygosis /het′ərōzīgō′sis/ [Gk, *heteros* + *zygotos,* yoked, joined], **1.** the formation of a zygote by the union of two gametes that have dissimilar pairs of alleles. **2.** the production of hybrids through crossbreeding. **—heterozygotic,** *adj.*

heterozygote /-zī′gōt/ [Gk, *heteros,* different, *zygotos,* yoked], an organism whose somatic cells have two different allelomorphic genes on the same locus of each pair of chromosomes. It can produce two different types of gametes.

heterozygote detection, the use of amniocentesis and other techniques to identify potential inherited X-linked recessive disorders, such as Hunter's syndrome or Duchenne's muscular dystrophy.

heterozygotic. See **heterozygosis.**

heterozygous /het′ərəzī′gəs/ [Gk, *heteros* + *zygotos,* yoked], having two different alleles at corresponding loci on homologous chromosomes. An individual who is heterozygous for a trait has inherited an allele for that trait from one parent and an alternative allele from the other parent. An individual who is heterozygous for a genetic disease caused by a dominant allele, such as Huntington's disease, manifests the disorder. A person who is heterozygous for a hereditary disorder produced by a recessive allele, such as sickle cell anemia, is asymptomatic or exhibits reduced symptoms of the disease. The offspring of a heterozygous carrier of a genetic disorder have a 50% chance of inheriting the allele associated with the disorder if the other parent does not carry the allele. Compare **homozygous.**

heuristic /hyo͞oris′tik/ [Gk, *heuriskein,* to discover], **1.** serving to stimulate interest for further investigation. **2.** pertaining to a teaching method in which the student is encouraged to learn through independent research and investigation.

HEV, abbreviation for *hepatitis E virus.*

hex-, hexa-, prefix meaning "six": *hexabasic, hexavaccine, hexhydric.*

hexachlorophene /hek′səklôr′əfēn/, a topical bacteriostatic cleansing agent.

■ INDICATIONS: It is used as an antiseptic scrub and as a disinfectant to clean inanimate objects of gram-positive bacteria. It is not effective against gram-negative bacteria such as ***Pseudomonas aeruginosa*** or ***Escherichia coli.***

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. Systemic absorption can occur when it is used on burns, broken skin, mucous membranes, and infant skin, with hemotoxic effects. Hexachlorophene washing of disposable gloves prior to reusing them is not recommended; if reusing gloves is absolutely necessary, chlorhexidine 4%

liquid soap or povidone-iodine 7.5% liquid soap are far superior choices.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are skin rash and neurological abnormalities.

■ NOTE: The skin should be rinsed thoroughly to prevent systemic absorption.

hexacosanol. See **ceryl alcohol.**

hexadactyly /hek′sədak′təle/ [Gk, *hex,* six + *daktylos,* finger], the occurrence of six digits on the hand or foot.

hexadecanoic acid. See **palmitic acid.**

hexadecanol. See **cetyl alcohol.**

Hexadrol, a trademark for a glucocorticoid **(dexamethasone).**

hexamethylenamine. See **methenamine.**

hexamethylmelamine /-meth′ilmel′əmēn/. See **altretamine**.

hexanoic acid. See **caproic acid.**

hexaploid. See **polyploid.**

hexavalent /hek′sivā′lənt/, pertaining to a chemical with a valence of 6. Also called **sexivalent.**

hexenmilch. See **witch's milk.**

hexokinase /hek′səkī′nās/ [Gk, *hex,* six, *glykys,* sweet, *kinein,* to move, *ase,* enzyme], a transferase enzyme present in all tissue that catalyzes the transfer of a phosphate group from adenosine triphosphate to glucose 6-phosphate. It is also found in yeast.

hexosaminidase test, a blood test used to detect the presence of the enzyme hexosaminidase, which is present in Tay-Sachs disease and Sandhoff's disease, a variant of Tay-Sachs.

hexose /hek′sōs/ [Gk, *hex,* six, *glykys,* sweet], a monosaccharide that contains six carbon atoms in the molecule. Glucose, mannose, and fructose are the principal hexoses found in nature, as well as being the principal absorbable end products of carbohydrate digestion.

hexylcaine hydrochloride /hek′silkān/, a local anesthetic for use on intact mucous membranes of the respiratory, upper GI, and urinary tracts.

hexylresorcinol /hek′silrəsôr′sənol/, an antiseptic and anthelmintic.

Hf, symbol for the element **hafnium.**

HF, abbreviation for **hepatitis F.**

HFJV, abbreviation for **high-frequency jet ventilation.** See **high-frequency ventilation.**

HFO, abbreviation for **oscillation.**

HFV, abbreviation for **high-frequency ventilation.**

Hg, symbol for the element **mercury.**

HG, abbreviation for **hepatitis G.**

Hgb, abbreviation for **hemoglobin.**

HGE, abbreviation for **human granulocytic ehrlichiosis.** See **ehrlichiosis.**

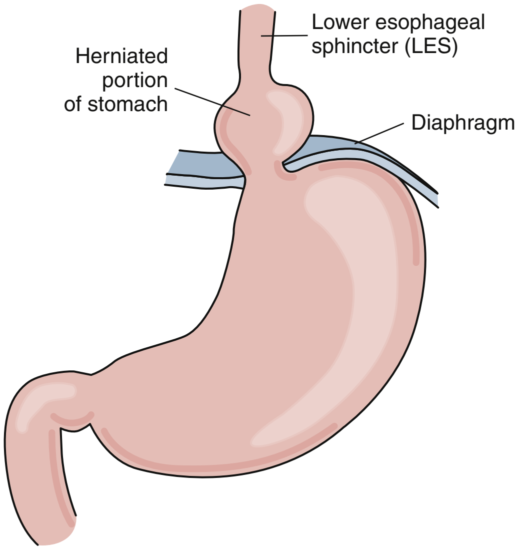
HGF, **1.** abbreviation for *human growth factor.* **2.** abbreviation for **hyperglycemic-glycogenolytic factor.** See **glucagon.**

HHCC, abbreviation for **Home Health Care Classification.**

HHCC system, a computerized classification system for home health care that assesses and classifies home health Medicare patients to predict their need for nursing and other home health care services and their outcomes of care.

HI, abbreviation for **hemagglutination inhibition.**

hiatal hernia, protrusion of a portion of the stomach upward through the diaphragm. The condition occurs in about 40% of the population, and most people display few, if any, symptoms. The major difficulty in symptomatic patients is gastroesophageal reflux, the backflow of the acid contents of the stomach into the esophagus. Diagnosis is made easily on x-ray films and may be an incidental finding of a chest radiogram. Surgical treatment is usually unnecessary, and efforts should be directed to alleviating the discomfort associated with reflux. See also **diaphragmatic hernia, gastroesophageal reflux, heartburn.**



Lower esophageal sphincter (LES)
Herniated portion of stomach
Diaphragm

Sliding hiatal hernia *(Monahan et al, 2007)*

hiatus /hī·ā′təs/ [L, *hiare,* to stand open], a usually normal opening in a membrane or other body structure. —*hiatal, adj.*

hiatus esophagus [L, *hiare,* to stand open; Gk, *oisophagos,* gullet], the opening in the diaphragm for the esophagus.

hibakusha /hē′bäko͞o′shä/ [Japanese], people who were exposed to the atomic bomb explosions in Hiroshima and Nagasaki.

Hib disease, an infection caused by *Haemophilus influenzae* type B (Hib), which mainly affects children in the first 5 years of life. It is a leading cause of bacterial meningitis, as well as childhood bacterial pneumonia, joint or bone infections, and throat inflammations. More than two thirds of the U.S. cases of Hib disease have been attributed to exposure in day-care centers. It is fatal in about 5% of infections. The infection can generally be prevented with a vaccine, given in infancy, usually at 2, 4, 6, and 12 to 18 months.

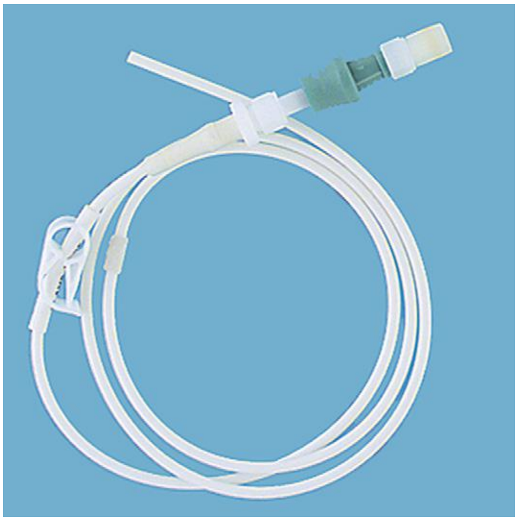
hibernation /hī′bərnā′shun/ [L, *hibernare,* to winter], a natural physiological state or process wherein a generalized slowdown in metabolic and body functions produces a somnolescent condition and in which body temperature is maintained at a lower level than normal. It is a survival mechanism used by some species of birds and mammals to cope with periods of low temperature and reduced food supply.

hibernoma /hī′bərnō′mə/ [L, *hibernus,* winter; Gk, *oma,* tumor], a benign tumor, usually on the hips or the back, composed of fat cells that are partly or entirely of fetal origin. Also called **fat cell lipoma, fetal lipoma.**

Hibiclens, a trademark for a topical antibiotic and cleanser for the skin and mucous membranes (chlorhexidine gluconate).

hiccup /hik′əp/, a characteristic sound that is produced by the involuntary contraction of the diaphragm, followed by rapid closure of the glottis. Hiccups have various causes, including indigestion, rapid eating, certain types of surgery, and epidemic encephalitis. They can also be caused by or associated with abdominal distension. Most episodes of hiccups do not persist longer than a few minutes, but recurrent and prolonged attacks sometimes occur. The condition is most often seen in men. Sedatives are used in extreme cases. Also spelled **hiccough.** Also called **singultus.**

Hickman catheter /hik′mən/ [R. O. Hickman, American surgeon, 20th century], a type of central venous catheter used for the long-term administration of substances via the venous system, such as antibiotics, total parenteral nutrition, or chemotherapeutic agents. It can be used for continuous or intermittent administration and may have either a single or a double lumen.



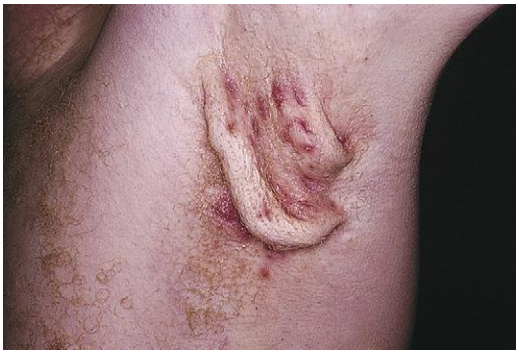
Hickman catheter *(Tighe, 2012)*

hickory stick fracture. See **greenstick fracture.**

HICPAC, abbreviation for **Hospital Infection Control Practices Advisory Committee.**

hidradenitis. See **hydradenitis.**

hidradenitis suppurativa /hī′dradənī′tis sup′yo͞orətē′və/ [Gk, *hydos,* water + *aden,* gland + *itis,* inflammation; L, *suppurare,* to form pus], a chronic suppurative and cicatricial disease of the apocrine gland–bearing areas, chiefly the axillae (especially in young women) and anogenital region (especially in men), caused by occlusion of the pores with secondary bacterial infection of apocrine sweat glands. It is characterized by the development of one or more tender red abscesses that enlarge and eventually break through the skin, yielding purulent or seropurulent drainage. Healing occurs with fibrosis, and recurrences lead to sinus tract formation and progressive scarring. Also called *apocrinitis, hidradenitis axillaris.*



Hidradenitis suppurativa *(Callen et al, 2000)*

hidro-, prefix meaning "sweat or sweat gland": *hidrocystoma, hidrosadenitis.*

hidrosis /hidrō′sis, hī-/ [Gk, *hidros,* sweat], sweat production and secretion. Also spelled **hydrosis.** Compare **anhidrosis, hyperhidrosis.** —*hidrotic, adj.*

hieralgia /hī′əral′jə/ [Gk, *hieron,* sacrum, *algos,* pain], a painful sacrum.

hiero-, hier-, prefix meaning "sacrum or something sacred": *hierolisthesis, hieromania, hierotherapy.*

high. See **rush.**

high-altitude pulmonary edema [ME, *heigh,* high + L, *altitudo* + Gk, *oidema,* swelling], a form of pulmonary edema that occurs in people who move rapidly to higher altitudes. Fluid accumulates in the lungs as atmospheric pressure decreases.

high blood pressure (HBP). See **hypertension.**

high-calorie diet, a diet that provides 1000 or more calories a day beyond what is ordinarily recommended. It may be prescribed for nursing mothers, patients with severe weight loss caused by illness, or people with abnormally high metabolic rates or energy requirements, such as certain athletes or outdoor workers.

high-copy number, a large number of repetitive copies of a gene, such as may be produced by cloning.

high-definition imaging (HDI), an ultrasound technique used in breast cancer diagnosis to determine without biopsy whether a lump is a solid tumor or a relatively harmless fluid-filled cyst. HDI also provides a clear picture of lumps, revealing such details as irregular colors and edges.

high-density lipoprotein (HDL) [ME, *heigh,* high; L, *densus,* thick; Gk, *lipos,* fat, *proteios,* first rank], a plasma protein made mainly in the liver and containing about 50% lipoprotein (apoprotein) along with cholesterol, triglycerides, and phospholipid. It is involved in transporting cholesterol and other lipids to the liver to be disposed. Higher levels of high-density lipoprotein are associated with decreased cardiac risk profiles. See also **low-density lipoprotein, very low-density lipoprotein.**

high-dose tolerance, the absence of an expected immunological response after repeated injections of large amounts of an antigen.

high enema [ME, *heigh* + Gk, *einienai,* to send in], an enema that is inserted into the colon through a long catheter.

high-energy phosphate compound, a chemical compound containing an easily hydrolyzed phosphoric anhydride group. The hydrolysis of this group liberates considerable energy, and coupling of this reaction to an endothermic reaction provides the energy necessary for the endothermic reaction to proceed. Adenosine triphosphate is the most powerful and ubiquitous of the high-energy phosphate compounds found in the body. All of these compounds liberate energy to fuel muscle contraction, active transport across cell membranes, and synthesis of many substances in the body.

highest intercostal vein [ME, *heigh* + L, *inter,* between, *costa,* rib, *vena,* vein], one of a pair of veins that drain the blood from the upper two or three intercostal spaces. The right vein descends and opens into the azygous vein. The left vein crosses the arch of the aorta and opens into the left brachiocephalic vein, usually receiving the left bronchial vein.

high-flow oxygen delivery system, a respiratory care apparatus that supplies inspired gases at a consistent preset oxygen concentration. It is generally not affected by changes in the ventilatory pattern. Also called **fixed-performance oxygen delivery system.**

high forceps, an obstetric procedure in which forceps are used to deliver a baby whose head is not engaged in the birth canal. It is no longer considered acceptable or meeting the standard of care. Compare **low forceps, mid forceps.** See also **forceps delivery, obstetric forceps.**

high-Fowler’s position [ME, *heigh,* high; George R. Fowler, American surgeon, 1848–1906], placement of the patient in a semisitting position by raising the head and trunk 90 degrees. The knees may or may not be flexed.

high-frequency hearing loss [ME, *heigh* + L, *frequens;* AS, *deaf*], a loss of ability to hear high-frequency sounds. It is most commonly associated with aging or noise exposure. Hearing loss may begin in early adulthood with a loss of hearing to frequencies in the range of 18 to 20 kHz. At about 60 years of age, loss of hearing may begin to affect lower frequencies, in the range of 4 to 8 kHz, thus interfering with the ability to understand speech. Hearing loss caused by noise exposure is often greatest at or near 4 kHz.

high-frequency jet ventilation, a type of high-frequency ventilation characterized by delivery of gas through a small catheter in the endotracheal tube.

high-frequency oscillation, a type of high-frequency ventilation characterized by the use of active expiration.

high-frequency percussive ventilation, a type of high-frequency ventilation characterized by delivery of pressure-limited breaths in short bursts of gas from a Venturi mask.

high-frequency positive pressure ventilation, a type of high-frequency ventilation characterized by low compressible volume circuit and tidal volume delivery of 3 to 4 mL per kg.

high-frequency ventilation (HFV), a technique for providing ventilatory support to patients at a rate of at least 60 breaths per minute with small tidal volumes. It may be used during intraoperative procedures such as laryngoscopy or bronchoscopy, as well as for ventilation in patients with a bronchopleural fistula or advanced respiratory distress syndrome, or in respiratory distress of the neonate. Kinds of HFV include high-frequency jet ventilation (HFJV) and high-frequency oscillation (HFO). HFJV uses a high-pressure gas source that can produce short, rapid jets of gas through a small-bore cannula into the airway above the carina at a rate of 100 to 400 per minute. HFO forces small impulses of gas into and out of the airway at a rate of 400 to 4000 per minute.

high-fructose corn syrup, a sweetener made by processing corn syrup to increase the level of fructose, usually to between 42% and 55% of the total sugar, with the balance being glucose. It is used extensively as a sweetener in processed foods and soft drinks, particularly soda and baked goods, but it is included also in many foods not normally thought of as sweet foods. See also **fructose.**

high labial arch, a labial arch wire adapted to lie gingivally to the anterior tooth crowns with auxiliary springs that extend downward in contact with the teeth to be moved.

highland moccasin. See **copperhead.**

high-level wellness, a concept of optimal health that emphasizes the integration of body, mind, and environment to maximize the function of an individual.

high lithotomy, a suprapubic approach for surgical removal of urinary bladder stones that are not easily removed by ultrasonic crushing. Also called **suprapubic lithotomy.**

highly active antiretroviral therapy (HAART), the aggressive use of extremely potent antiretroviral agents in the treatment of human immunodeficiency virus infection.

High-molecular-weight kininogen. See Fitzgerald Factor.

high-potassium diet, a diet that contains foods rich in potassium, including all leafy green vegetables, brussels sprouts, citrus fruits, bananas, dates, raisins, legumes, meats, and whole grains. It is indicated for any condition that causes loss of extracellular fluid such as acute diarrhea, congenital renal alkalosis, aldosteronism, hypokalemia, hypertension, and diabetic coma. It is also indicated for patients who are receiving some diuretics, such as thiazide and furosemide, or corticosteroid therapy.

high-pressure liquid chromatography, a method of chromatography for separating and quantitating mixtures of substances in a solution. The procedure uses a high-resolution column, pressure, and gradient elution systems for separation of solutes by absorption, partition, ion exchange, and size exclusion. Also called *high-performance liquid chromatography.*

high-protein diet, a diet that contains large amounts of protein, consisting largely of meats, fish, milk, legumes, and nuts. It may be indicated in protein depletion that results from any cause, as a preoperative preparation, or for patients with severe burns and sepsis. It may be contraindicated in liver failure or when kidney function is so impaired that added protein could result in azotemia and acidosis.

high-residue diet /-rez′idyo͞o/ [ME, *heigh* + L, *residuum,* remaining; Gk, *diaita,* way of living], a diet that contains a greater than usual proportion of substances that the digestive tract will not metabolize and absorb, such as soluble and insoluble dietary fiber.

high-resolution, the quality and accuracy of detail presented by a graphics system display, such as on a computer monitor screen or a computer printout. Generally, resolution quality increases as the number of pixels, or image-forming units in the display, increases.

high-risk infant, any neonate, regardless of birth weight, size, or gestational age, who has a greater than average chance of morbidity or mortality, especially within the first 28 days of life. Risk factors include preconceptual, prenatal, natal, or postnatal conditions or circumstances that interfere with the normal birth process or impede adjustment to extrauterine growth and development. See also **neonatal period, premature infant.**

high-risk pregnancy care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as identification and management of a high-risk pregnancy to promote healthy outcomes for mother and baby. See also **Nursing Interventions Classification.**

high-speed handpiece, a handheld dental cutting instrument that rotates at up to 450,000 rpm. Modern high-speed handpieces are powered by miniature turbines driven by compressed air or an electric motor.

high-vitamin diet, a dietary regimen that includes a variety of foods containing therapeutic amounts of all of the vitamins necessary for the metabolic processes of the body. It is often ordered in combination with other therapeutic diets that contain larger than usual amounts of protein or calories, especially in the treatment of severe or chronic infection, malnutrition, or vitamin deficiency.

hila. See **hilum.**

hilar /hī′lär/ [L, *hilum,* a trifle], pertaining to a hilum.

Hilgenreiner’s line, a line connecting the superior aspect of the triradiate cartilages of the acetabula, used in radiographic assessment of the hip joint.

Hill-Burton Act, a 1946 amendment to the U.S. Public Health Service Act authorizing grants to states for surveying their hospital and public health center needs and for planning and constructing additional facilities. Subsequent amendments authorized federal funding for as much as two thirds of the cost of construction projects and broadened the scope of the legislation to include diagnostic and treatment centers, long-term treatment centers, and nursing homes and to aid in modernization of existing hospitals. Also called **Hospital Survey and Construction Act.**

Hill-Burton programs, a cluster of programs created by U.S. legislation included in the National Health Planning and Resources Development Act of 1974. The programs allow federal monetary assistance for modernization of health facilities, construction of outpatient health centers, construction of inpatient facilities in underserved areas, and conversion of existing health care facilities for the provision of new health services.

hilum /hī′ləm/ *pl.* **hila** [L, *hilum,* a trifle], a depression or recess at that part of an organ where vessels and nerves enter and leave.

hilum of the lung, an area of the lung where the mediastinal pleura is continuous with the visceral pleura.

hindbrain /hīnd′brān/ [ME, *hind* + AS, *bragen*], the division in the brain of an embryo that eventually becomes the pons, the medulla oblongata, and the cerebellum.

hindgut /hīnd′gut/ [ME, *hind* + AS, *guttas*], the caudal portion of the embryonic alimentary canal. It is formed by the development of the tail fold and eventually gives rise to part of the small and large intestines, rectum, bladder, and urogenital ducts. Compare **foregut, midgut.** See also **cloaca.**

hind kidney. See **metanephros.**

hinge axis, a line that passes through the left and right mandibular condyles and coincides with the center of rotation of the mandible. Determining the hinge axis is essential in constructing dental prostheses and correcting occlusal interferences.

hinge axis-orbital plane, a reference plane for the diagnosis of various types of malocclusions and for the development of associated prostheses. It is usually determined by marking three points on a patient's face. Two of the points, one on each side of the face, are located on the hinge axis. The third point is located on the face at the level of the orbital rim just beneath the eye.

hinged knee, an appliance designed to protect and support the knee during activity. It consists of an elastic sleeve with medial and lateral steel or aluminum bars hinged at the axis of the knee joint. The hinged bars are stabilized with leather or self-adhesive (Velcro) straps.

hinged knee brace. See **kinematic face-bow.**

hinge joint [ME, *henge,* hinge; ME, *jointe,* a connection], a synovial joint providing a connection in which articular surfaces are closely molded together in a manner that permits extensive motion in one plane. The distal bone of a hinge joint seldom moves in the same plane as that of the axis of the proximal bone. The interphalangeal joints are hinge joints. Also called **ginglymus joint.** Compare **gliding joint, pivot joint.**

hip. See **coxa.**

HIPAA, abbreviation for **Health Insurance Portability and Accountability Act.**

hip bath. See **sitz bath.**

hipbone. See **innominate bone.**

hip joint. See **coxal articulation.**

hip-joint disease [AS, *hype* + L, *jungere,* to join; Gk, *dis,* not; Fr, *aise,* ease], any abnormal condition of the hip joint, such as **Legg-Calvé-Perthes disease** or congenital dislocation of the hip.

Hippel's disease [Eugen von Hippel, German ophthalmologist, 1867–1939], a familial disease, hereditary hemangioma confined mainly to the retina, first described by Hippel. Compare **von Hippel-Lindau disease.**

hippocampal /hip′ōkam′pəl/ [Gk, *hippokampos,* seahorse], pertaining to the hippocampus.

hippocampal commissure [Gk, *hippokampos,* seahorse; L, *commissura,* a joint], a thin triangular sheet of transverse fibers that connects the medial edges of the posterior pillars of the fornix in the brain.

hippocampal fissure, a fissure reaching from the posterior aspect of the corpus callosum to the tip of the temporal lobe.

hippocampal formation [Gk, *hippokampos,* seahorse; L, *formatio*], a part of the rhinencephalon, including the dentate gyrus, longitudinal striae, and hippocampus.

hippocampal gyrus [Gk, *hippokampos,* seahorse, *gyros,* turn], a convolution on the medial side of the temporal lobe of the cerebral cortex.

hippocampus /hip′ōkam′pəs/ *pl. hippocampi* [Gk, *hippokampos,* seahorse], a curved convoluted elevation of the floor of the inferior horn of the lateral ventricle of the brain. It is composed of gray substance covered by a layer of white fibers, the alveus, and functions as an important component of the limbic system and of memory processing. Its efferent projections form the fornix of the cerebrum. Also called **Ammon's horn, hippocampus major.**

hippocampus minor. See **calcar avis.**

Hippocrates /hipok′rətēz/, a Greek physician born about 460 BC on the island of Cos, a center for the worship of Aesculapius. Called the "Father of Medicine," Hippocrates introduced a scientific approach to healing by seeking physical causes of disease rather than magic or mythic relationships used by members of the Jsculapian cults of the time. He also compiled case records of illnesses, including results of treatments administered, and developed the art of ethical bedside care. See also **Hippocratic oath.**

Hippocrates' bandage. See **capeline bandage.**

hippocratic facies, a drawn, pinched, and pale appearance of the face, indicative of approaching death.

Hippocratic oath /hip′əkrat′ik/, an oath, attributed to Hippocrates, that serves as an ethical guide for the medical profession. It may be incorporated into the graduation ceremonies of medical colleges and reads as follows: I swear by Apollo the physician, by Æsculapius, Hygeia, and Panacea, and I take to witness all the gods, and all the goddesses, to keep according to my ability and my judgment the following Oath: To consider dear to me as my parents him who taught me this art; to live in common with him and if necessary to share my goods with him; to look upon his children as my own brothers, to teach them this art if they so desire without fee or written promise; to impart to my sons and the sons of the master who taught me and the disciples who have enrolled themselves and have agreed to the rules of the profession, but to these alone, the precepts and the instruction. I will prescribe regimen for the good of my patients according to my ability and my judgment and never do harm to anyone. To please no one will I prescribe a deadly drug, nor give advice which may cause his death. Nor will I give a woman a pessary to procure abortion. But I will preserve the purity of my life and my art. I will not cut for stone, even for patients in whom the disease is manifest; I will leave this operation to be performed by practitioners (specialists in this art). In every house where I come I will enter only for the good of my patients, keeping myself far from all intentional ill-doing and all seduction, and especially from the pleasures of love with women or with men, be they free or slaves. All that may come to my knowledge in the exercise of my profession or outside of my profession or in daily commerce with men, which ought not to be spread abroad, I will keep secret and will never reveal. If I keep this oath faithfully, may I enjoy my life and practice my art, respected by all men and in all times; but if I swerve from it or violate it, may the reverse be my lot. See also **Hippocrates.**

hippuric acid [Gk, *hippos,* horse, *ouron,* urine; L, *acidus,* sour], a detoxication product in the urine of some animals, used as a medication in the treatment of arthritic diseases.

hip replacement [AS, *hype*], substitution of an artificial ball and socket joint for the hip joint. Hip replacement is performed to relieve a chronically painful and stiff hip in advanced osteoarthritis, an improperly healed fracture, degenerative joint disease, or rheumatoid arthritis. Antibiotic therapy is begun before surgery, and the patient is taught to walk with crutches or a walker. During surgery the femoral head, neck, and part of the shaft are removed, and the contours of the socket are smoothed. A prosthesis of a durable, hard metal alloy or stainless steel is attached to the femur. A metal or a plastic acetabulum is implanted. The affected leg is kept abducted and in straight alignment with pillows; external rotation of the leg must be prevented. The nurse observes nerve function and circulation in the leg frequently during the first postoperative day. The most frequent complications are infection requiring removal of the new joint and dislocation. Ambulation begins gradually, with frequent short walks. Sitting for more than 1 hour is to be prevented, and hip flexion beyond 60 degrees may cause dislocation of the prosthesis. The patient continues an exercise program after discharge to maintain functional motion of the hip joint and to strengthen the abductor muscles. Weight-bearing may be modified according to the type of prosthesis implanted.

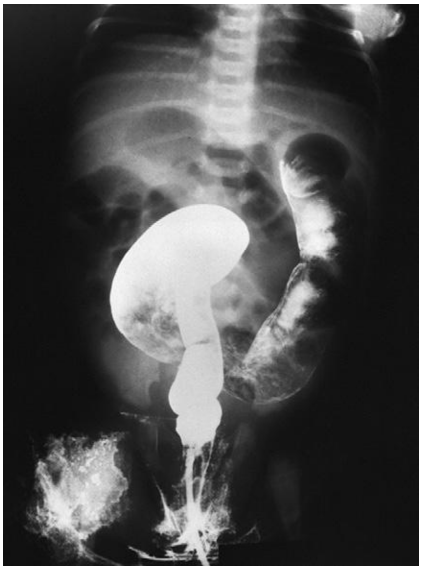
Hip replacements *(Courtesy Zimmer, Inc.)*

Hiprex, a trademark for a urinary antibacterial **(methenamine).**

Hirschberg's reflex /hursh′bərgz/, a diagnostic test for pyramidal tract disease. The test result is regarded as positive if inversion of the foot occurs when the sole is stroked at the base of the great toe.

Hirschfeld's method [Isador Hirschfeld, American dentist, 1881–1965], a tooth-brushing technique in which the bristles are vigorously rotated in very small circles against the gingivae and the axial surfaces of the teeth at a slight incisal or occlusal angle.

Hirschsprung's disease /hirsh′spro͝ongz/ [Harald Hirschsprung, Danish physician, 1830–1916], the congenital absence of autonomic ganglia in the smooth muscle wall of the distal part of the colon, which causes poor or absent peristalsis in the involved segment of colon, accumulation of feces, and dilation of the bowel (megacolon). Symptoms include intermittent vomiting, diarrhea, and constipation. The abdomen may become distended to several times its normal size. The condition is usually diagnosed in infancy, but it may not be recognized until much later in childhood, when anorexia, lack of urge to defecate, distention of the abdomen, and poor health occur. Diagnosis is confirmed by barium enema; biopsy of the affected tissue shows the absence of ganglia. Surgical repair in early childhood is usually successful. A temporary colostomy is performed, and the aganglionic portion of the bowel is resected. The colostomy is almost always reversed a few months later. Also called **aganglionic megacolon, congenital megacolon.**



Hirschsprung's disease: barium enema *(Kowalczyk and Mace, 2009/Courtesy American College of Radiology)*

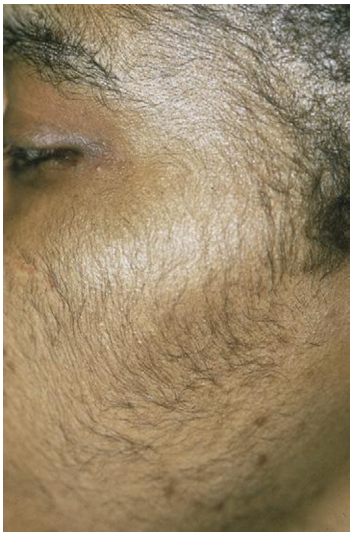
■ OBSERVATIONS: Manifestation patterns vary according to the length of the affected bowel. Neonates may be asymptomatic during the first few months of life. In a complete obstruction, signs include delayed passage of meconium, obstipation, massive abdominal distention, refusal to feed, and bilious vomiting. In a partial obstruction there are cycles of constipation and diarrhea with thin ribbon-like stools, intermittent vomiting, abdominal distention, and possible failure to thrive. If the condition goes undiagnosed until childhood, there are signs of anorexia, abdominal distention, lack of urge to defecate, and general poor health. Diagnosis is made through observation of clinical signs of obstruction and barium enema results that reveal narrowing of the colon distal to obstruction and enlargement of the colon proximal to the obstruction. Diagnosis is confirmed by a rectal suction biopsy that reveals no evidence of ganglion cells. Enterocolitis or toxic megacolon is the most serious complication and is marked by sudden onset fever, abdominal distention, and explosive bloody diarrhea. Enterocolitis causes death in about 20% of the cases.

■ INTERVENTIONS: The treatment is relief of the obstruction by one of several procedures, including a Soave endorectal pull through, a Duhamel procedure to create a neorectum, a Swenson's procedure to resect the aganglionic segment, a laparoscopic pull-through procedure, or a transanal endorectal coloanal anastomosis. A myectomy may be performed if only the anal segment is involved. A myectomy/myotomy may be indicated if the entire intestine is involved. A temporary ostomy is created to relieve obstruction and to promote healing after surgery. Antiinfectives are used to treat or prevent infection. Analgesics are used to control pain, and antiemetics are used for nausea and vomiting.

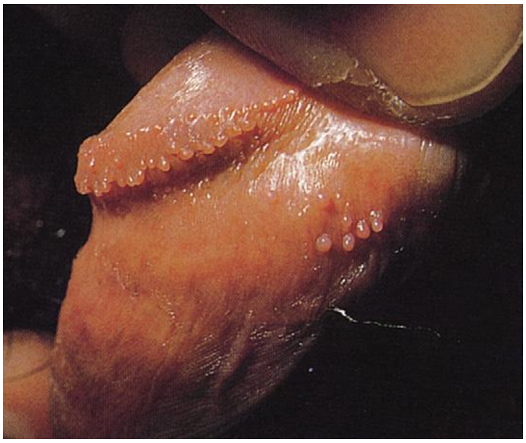
■ NURSING CONSIDERATIONS: Acute care focuses on routine preoperative and postoperative care, including saline enemas to prep the bowel for surgery, comfort measures, IV hydration, I and O, abdominal measurements, support and reassurance to child and family, colostomy care, and wound care. Instruction is needed for care and cleaning of the colostomy, and a home health care referral will help establish continuity of such care. Caregivers should be educated to expect continuing soiling incidents after surgery. Genetic counseling is needed for the parents.

hirsutism /hur′so͞otiz′əm/ [L, *hirsutus,* hairy], excessive body hair in a masculine distribution pattern as a result of heredity, hormonal dysfunction, porphyria, or medication. Treatment of the specific cause usually stops growth of more hair. Excess hair may be removed by laser, electrolysis, chemical depilation, shaving, or waxing. Fine facial hair may be most effectively minimized by bleaching. Topical eflornithine (Vaniqa) can retard hair growth, as can oral medications. Also called **hypertrichosis.** —*hirsute, adj., hirsuteness, n.*

hirsutoid papilloma of the penis /hur′so͞otoid/ [L, *hirsutus,* shaggy; Gk, *eidos,* form], a condition characterized by clusters of small white papules on the coronal edge of the glans penis. Also called **papillomatosis coronae penis, pearly penile papules.**



Hirsutism *(Hordinsky, Sawaya, and Scher, 2000)*



Hirsutoid papilloma of the penis *(Morse et al, 2003)*

His, abbreviation for **histidine.**

His bundle. See **bundle of His.**

His bundle electrogram (HBE) [Wilhelm His, Jr., German physician, 1863–1934], a direct recording of the electrical activity in the atrioventricular bundle (bundle of His).

His-Purkinje system /his′pərkin′jē/ [Wilhelm His, Jr.; Johannes E. Purkinje, Czechoslovakian physiologist, 1787–1869], the conduction system in the heart from the atrioventricular bundle (bundle of His) to the distal Purkinje fibers.

hist-. See **histo-.**

histaminase /histam′inās/, a soft tissue enzyme found in various body tissues. It catalyzes the decarboxylation of histamine and converts histamine into inactive imidazolacetic acid. Also called **diamine oxidase.**

histamine /his′təmēn, -min/ [Gk, *histos,* tissue; L, *amine,* ammonia], a compound, found in all cells, that is produced by the breakdown of histidine. It is released in allergic inflammatory reactions. Cellular receptors of histamine include the H_1 receptors, which are responsible for the dilation of blood vessels and the contraction of smooth muscle; the H_2 receptors, which are responsible for the stimulation of heart rate and gastric secretion; and H_3 receptors, which are believed to play a role in regulation of the release of histamine and other neurotransmitters from neurons. H_1 and H_2 receptors also mediate the contraction of vascular smooth muscle.

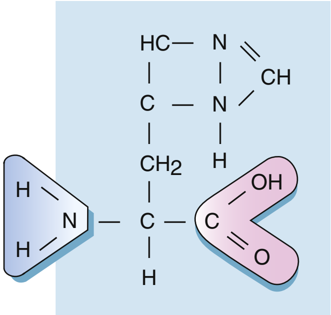
histamine blocking agent, a substance that interferes with stimulation of cells by histamine, which is a substance produced by nearby cells to cause, among other things, inflammation and acid release in the stomach.

histamine headache, a headache associated with the release of histamine from the body tissues and marked by symptoms of dilated carotid arteries, fluid accumulation under the eyes, tearing or lacrimation, and rhinorrhea (runny nose). Symptoms include sudden sharp pain on one side of the head, involving the facial area from the neck to the temple. Treatment includes the use of preparations of antihistamines and ergot that help constrict the arteries. Also called **cluster headache, Horton's histamine cephalalgia.** See also **cephalalgia.**

-histechia, suffix meaning a "tissue retaining a (specified) substance": *cholesterohistechia, glycohistechia, uratohistechia.*

histenzyme /histen′zīm/, a renal tissue enzyme that splits hippuric acid into glycine and benzoic acid.

histidine (His or H) /his′tidēn/ [Gk, *histos,* tissue], a basic amino acid found in many proteins and a precursor of histamine. It is an essential amino acid in infants. See also **amino acid, protein.**



Chemical structure of histidine

histidinemia /his′tidinē′mē·ə/, an inherited metabolic disorder caused by an enzyme defect involving L-histidine ammonia lyase and affecting the amino acid histidine. The condition leads to retardation and nervous system disorders. It is controlled by diet that limits the intake of histidine.

histio- [word element, Gr.], combining form meaning tissue.

histioblast /his′tē-/, a tissue-forming cell.

histiocyte. See **macrophage.**

histiocytic leukemia. See **monocytic leukemia.**

histiocytic malignant lymphoma /his′tē·ōsit′ik/ [Gk, *histos* + *kytos,* cell], a lymphoid neoplasm containing undifferentiated primitive cells or differentiated reticulum cells. Also called **reticulum cell sarcoma.**

histiocytic necrotizing lymphadenitis. See **Kikuchi's lymphadenitis.**

histiocytosis X /his′tē·ōsītō′sis/, obsolete,a cluster of conditions encompassing benign eosinophilic granuloma and several malignant lymphomatous diseases.

histiotypic growth /his′tē·ōtip′ik/ [Gk, *histos* + *typos,* mark], the uncontrolled proliferation of cells, as occurs in tissue cultures, bacterial cultures, and molds. Compare **organotypic growth.**

histo-, hist-, prefix meaning "tissue": *histoclastic, histohematin, histonectomy.*

histocompatibility /his′tōkəmpat′ibil′itē/ [Gk, *histos,* tissue; L, *compatibilis,* agreeing], a measure of the similarity of the antigens of a donor and a recipient of transplanted tissue.

histocompatibility antigen [Gk, *histos* + L, *compatibilis,* agreeable], one of a group of genetically determined antigens on the surface of many cells. They are the cause of most graft rejections that occur in organ transplantation. See also **histocompatibility locus, isoantigen.**

histocompatibility complex, a group of genes whose products determine the compatibility of tissues or organs transplanted from one individual to another of the same species or from one species to another. The histocompatibility complex of proteins is found on the plasma membrane cells and helps identify tissues as "self" or foreign. In humans the major histocompatibility complex contains 50 genes on the short arm of chromosome number 6. See also **HLA complex.**

histocompatibility gene [Gk, *histos,* tissue; L, *compatibilis* + *genein,* to produce], a gene of the HLA complex that determines an antigen that governs histocompatibility of the donor and recipient of transplanted tissue. See also **human leukocyte antigen.**

histocompatibility locus, one of a set of positions on a chromosome occupied by a complex of genes that govern several tissue antigens. Together the loci and the genes comprise the **HLA complex.**

histocyte /his′təsīt/ [Gk, *histion,* web, *kytos,* cell], a macrophage of connective tissue that plays a role in the body's immune system.

histogram /his′təgram′/ [Gk, *histos* + *gramma,* record], (in research) a graph showing the values of one or more variables plotted against time or against frequency of occurrence. A graph of a patient's temperature, pulse, and respiration is an example of a histogram.

histography /histog′rəfē/ [Gk, *histos* + *graphein,* to record], the process of describing or creating visualizations of tissues and cells. **—***histographer, n., histographic, adj., histographically, adv.*

histoincompatible /his′tō·in′kəmpat′əbəl/, pertaining to host and donor tissues that have different genotypes and are therefore likely to induce an immune response, leading to rejection of a tissue graft or organ transplant.

histological [Gk, *histos,* tissue, *logos,* science], pertaining to the study of the microscopic anatomical and physiological characteristics of tissues and the cells found therein. See also **histology.**

histological technician, an allied health professional who prepares tissue specimens of human and animal origin for a pathologist to examine for diagnostic, research, or teaching purposes. Histological technicians process sections of body tissue by fixation, dehydration, embedding, sectioning, decalcification, microincineration, mounting, and routine and special staining. Educational preparation is usually months for an associate degree. Also called **histotechnician.** See also **histotechnologist.**

histologist /histol′əjist/, a medical scientist who specializes in the study of the structure of organ tissues, including the composition of cells and their organization into various body tissues. See also **histology.**

histology /histol′əjē/ [Gk, *histos* + *logos,* science], **1.** the science dealing with the microscopic identification of cells and tissue. **2.** the structure of organ tissues, including the composition of cells and their organization into various body tissues. **—histologic, histological,** *adj.*

histolysis [Gk, *histos,* tissue, *lysis,* loosening], breakdown or dissolution of living organic tissue. **—histolytic,** *adj.*

histolytic /his′tōlit′ik/, pertaining to or causing the breakdown or dissolution of living organic tissue. See also **histolysis.**

histone /his′tōn/ [Gk, *histos,* tissue], any of a group of strongly basic, low–molecular weight proteins that are soluble in water and insoluble in dilute ammonia and combine with DNA to form nucleoproteins. They are found in the nucleus of eukaryotic cells, where they form a complex with DNA in the chromatin and function in regulating gene activity. See also **nucleosome.**

histopathology /his′tōpəthol′əjē/ [Gk, *histos,* tissue, *pathos,* disease, *logos,* science], the study of diseases involving the tissue cells.

histoplasma agglutinin /-plaz′mə/ [Gk, *histos* + *plasma,* a formation], a specific antibody that causes the clumping associated with fungal lung infections when it interacts with antigens.

Histoplasma capsulatum [Gk, *histos* + *plasma* + L, *capsula,* little box], a dimorphic fungal organism that is a single budding yeast at body temperature and a mold at room temperature. It is the causative organism in histoplasmosis, common in the Mississippi River Valley. The fungus, spread by airborne spores from soil contaminated with excreta from birds or infected bats, acts as a parasite on the cells of the reticuloendothelial system. See also **histoplasmosis.**

histoplasmin test /-plaz′min/, a skin test for diagnosis of an infection caused by *Histoplasma capsulatum* fungus.

histoplasmosis /his′tōplazmō′sis/ [Gk, *histos* + *plasma* + *osis,* condition], an infection caused by inhalation of spores of the fungus ***Histoplasma capsulatum.*** Most cases are asymptomatic. Individuals who experience symptoms are usually either immunocompromised or have been exposed to a high inoculum. **Primary histoplasmosis** is characterized by fever, malaise, cough, and lymphadenopathy. Spontaneous recovery is usual; small calcifications remain in the lungs and affected lymph glands. **Progressive histoplasmosis,** the sometimes fatal disseminated form of the infection, is characterized by ulcerating sores in the mouth and nose; enlargement of the spleen, liver, and lymph nodes; and severe and extensive infiltration of the lungs. The severe form is treated with amphotericin B, and less severe cases may be treated with ketoconazole. Infection confers immunity. A histoplasmin skin test may be performed to identify people who may safely work with contaminated soil. The disease is most common in the Mississippi and Ohio River Valleys. Also called **Darling's disease.**

history /his′tərē/ [L, *historia,* inquiry], **1.** a record of past events. **2.** a systematic account of the medical, emotional, and psychosocial occurrences in a patient's life and of factors in the family, ancestors, and environment that may have a bearing on the patient's condition.

history of present illness, an account obtained during the interview with the patient of the onset, duration, and character of the present illness, as well as of any acts or factors that aggravate or ameliorate the symptoms. The patient is asked what he or she considers to be the cause of the symptoms and whether a similar condition has occurred in the past. See also **health history.**

histotechnician. See **histological technician.**

histotechnologist, an allied health professional who prepares tissue specimens of human and animal origin for a pathologist to examine for diagnostic, research, or teaching purposes. Histotechnologists perform all functions of the histological technician as well as identifying tissue structures, cell components, and their staining characteristics and relating them to physiological functions; implementing and testing new techniques and procedures; making judgments concerning the results of quality control measures; instituting proper procedures to maintain accuracy; and sometimes supervising and teaching. A 4-year baccalaureate degree program is usually required. See also **histological technician.**

histotoxin /-tok′sin/ [Gk, *histos* + *toxikon,* poison], any substance that is poisonous to body tissues. Histotoxins are usually generated within the body rather than being introduced externally. An example is the tissue-destroying enzymes formed by bacteria such as ***Clostridium perfringens.***

histotroph, histotrophe, histotrophic nutrition. See **embryotroph.**

histrionic /his′trē·on′ik/ [L, *histrio,* actor], pertaining to exaggerated facial expressions, speech, or body movements, such as used on the stage.

histrionic paralysis [L, *histrio,* actor; Gk, *paralyein*], a condition, such as **Bell's palsy,** in which paralysis of facial muscles results in dramatic, excitable behavior.

histrionic personality [L, *histrio,* actor, *persona,* role played], a personality characterized by behavioral patterns and attitudes that are overreactive, emotionally unstable, overly dramatic, and self-centered, exhibited as a means of attracting attention, either consciously or unconsciously. Also called **hysteric personality.** See also **histrionic personality disorder.**

histrionic personality disorder, a disorder characterized by dramatic, reactive, and intensely exaggerated behavior, which is typically self-centered. It results in severe disturbance in interpersonal relationships that can lead to psychosomatic disorders, depression, alcoholism, and drug dependency. Symptoms include emotional excitability, such as irrational angry outbursts or tantrums; abnormal craving for activity and excitement; overreaction to minor events; manipulative threats and gestures; egocentricity; inconsiderateness; inconsistency; and continuous demand for reassurance generated by feelings of helplessness and dependency. A person with this disorder is perceived by others as vain, demanding, superficial, self-centered, and self-indulgent. The disorder is more prevalent in women than in men and is treated by various psychotherapies, depending on the individual and the severity of the condition. See also **narcissistic personality disorder.**

His-Werner disease [Wilhelm His, Jr., German physician, 1863–1934; Heinrich Werner, German physician, 1874–1947; Gk, *dis,* not; Fr, *aise,* ease]. See **trench fever.**

HIV, abbreviation for **human immunodeficiency virus.**

HIV-associated dementia (HAD), a usually rapidly progressive dementia that is the primary manifestation of encephalopathy caused by human immunodeficiency virus type I infection. It is marked by a variety of cognitive, motor, and behavioral abnormalities, including loss of retentive memory, inattentiveness, language disorders, apathy, incoordination, and ataxia. As the disease progresses, paraplegia, urinary and bowel incontinence, abulia, and mutism may occur. Survival after the onset of dementia is usually 3 to 6 months but is occasionally longer.

HIV-associated fever of unknown origin, a fever of at least 38.3° C occurring on several occasions over a period of 4 weeks of outpatient care or 3 days of hospitalization in a patient with human immunodeficiency virus infection, for which a cause cannot be determined after 3 days of investigation, including 2 days of incubation of cultures.

HIV-associated nephropathy, renal pathology in patients infected with the human immunodeficiency virus, similar to focal glomerular sclerosis, with proteinuria, enlarged kidneys, and dilated tubules containing proteinaceous casts. It may progress to end-stage renal disease within weeks. Formerly called **AIDS nephropathy.**

HIV-associated retinopathy, a usually asymptomatic microangiopathy affecting the retina, seen in human immunodeficiency virus infection. It is manifested by transient cotton-wool exudate and occasionally by hemorrhages, microaneurysms, and other lesions of the microvasculature. Also called **AIDS-associated retinopathy.**

hives. See **urticaria.**

Hivid, a trademark for an antiretroviral nucleoside analog **(zalcitabine).**

HIVNET, an international vaccine test network organized to conduct studies of prospective vaccines for human immunodeficiency virus (HIV) infection. It also supports behavioral and other studies of HIV infections.

HIV protease inhibitor /prō′tē·ās inhib′itər/ [*protein* + *-ase,* enzyme suffix; L, *inhibere,* to restrain,], any of a group of antiretroviral drugs active against the human immunodeficiency virus that prevent protease-mediated cleavage of viral polyproteins, causing production of immature viral particles that are noninfective. Examples include indinavir sulfate, nelfinavir mesylate, ritonavir, and saquinavir. See also **protease inhibitor.**

H^+,K^+-ATPase /ā·tē·pē′ās/, a membrane-bound enzyme occurring on the secretory surfaces of parietal cells that uses the energy derived from the hydrolysis of ATP to drive the exchange of ions across the cell membrane, secreting acid into the gastric lumen. Protons and chloride ions are pumped against gradients across the apical membranes of activated parietal cells into the gastric lumen in exchange for potassium ions. See also **adenosine triphosphatase.**

HLA, abbreviation for **human leukocyte antigen.**

HLA-A, abbreviation for *human leukocyte antigen A.* See **human leukocyte antigen.**

HLA-B, abbreviation for *human leukocyte antigen B.* See **human leukocyte antigen.**

HLA complex, antigens formed from genes on chromosome 6. HLA genes code for proteins that enable the immune system to differentiate tissues or proteins between "self" and "nonself." These loci are identified by numbers and letters, such as HLA-B27. Antigens are divided into three classes. Class I antigens (HLA-A, -B, and -C) occur on the surface of all nucleated cells and platelets and are important in tissue transplantation. If donor and recipient HLA antigens do not match, the nonself antigens are recognized and destroyed by killer T cells. Class II antigens occur only on immunocompetent cells and normally recognize foreign proteins. Class III antigens are nonhistocompatibility antigens, such as some complement components, that map in the HLA complex. Also called **histocompatibility complex, major histocompatibility complex.**

HLA-D, abbreviation for *human leukocyte antigen D*. See **human leukocyte antigen.**

HLH, abbreviation for *human luteinizing hormone*.

HLHS, abbreviation for **hypoplastic left heart syndrome.**

HMD, abbreviation for **hyaline membrane disease.** See **respiratory distress syndrome of the newborn.**

HME, abbreviation for **human monocytic ehrlichiosis.** See **ehrlichiosis.**

HMG-CoA reductase, a rate-controlling enzyme of cholesterol synthesis. Activity of the enzyme may be as much as 60 times higher than normal in patients with low-density lipoprotein receptor disorder.

HMG-CoA reductase inhibitor, any of a group of drugs that competitively inhibit the enzyme catalyzing the rate-limiting step in cholesterol biosynthesis and are used to lower plasma lipoprotein levels in the treatment of hyperlipoproteinemia. Also called **statin.**

HMO, abbreviation for **health maintenance organization.**

HMS Liquifilm, a trademark for an ophthalmic preparation containing a glucocorticoid **(medrysone).**

Ho, symbol for the element **holmium.**

H_2O, symbol for **water.**

hoarseness /hôrs′nəs/, an unnatural condition marked by a deep or rough, harsh, grating voice, indicating an inflammation of the throat and larynx.

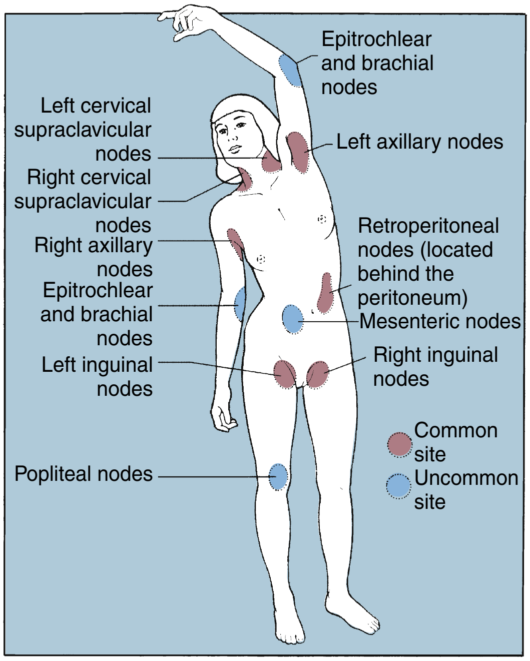
hod-, prefix meaning "pathway": *hodology, hodoneuromere*.

Hodgkin's disease, Hodgkin's lymphoma /hoj′kinz/ [Thomas Hodgkin, English physician, 1798–1866], a malignant disorder characterized by painless, progressive enlargement of lymphoid tissue, usually first evident in cervical lymph nodes; splenomegaly; and the presence of Reed-Sternberg cells, large binucleate CD20 (B cell marker)-positive lymphoid/histiocytic cells. Symptoms include anorexia, weight loss, generalized pruritus, low-grade fever, night sweats, anemia, and leukocytosis. The disease is diagnosed in about 7100 Americans annually and causes approximately 1700 deaths a year, affects twice as many males as females, and most often occurs in individuals 25 to 30 years of age and older than 50 years of age. The diagnosis is established by biopsy. The patient undergoes staging to determine the extent of the disease, including computed tomography of the chest and abdomen, complete blood count, biopsy of distant lymph nodes, liver function studies, and bilateral bone marrow biopsies. Radiotherapy, using a covering mantle to protect other organs, is the treatment of choice for early stages of the disease; combination chemotherapy is the treatment for advanced disease. Long-term remissions are achieved in more than half of the patients treated, and 60% to 90% of those with localized disease may be cured. There is a threefold increased risk of development of Hodgkin's disease in first-degree relatives, suggesting an unknown genetic mechanism.

Hodgson's disease /hoj′sənz/ [Joseph Hodgson, English physician, 1788–1869; Gk, *dis,* not; Fr, *aise,* ease], an aneurysmal dilation of the aorta.

Hoffmann's atrophy. See **Werdnig-Hoffmann disease.**

Hoffmann's reflex [Johann Hoffmann, German neurologist, 1857–1919], an abnormal reflex elicited by sudden forceful flicking of the nail of the index, middle, or ring finger, which causes flexion of the thumb and of the middle and distal phalanges of one of the other fingers. It is indicative of pyramidal tract disease above the level of the seventh or eighth cervical and first thoracic vertebrae. Also called *Hoffmann's sign*.



Epitrochlear and brachial nodes
Left cervical supraclavicular nodes
Left axillary nodes
Right cervical supraclavicular nodes
Retroperitoneal nodes (located behind the peritoneum)
Right axillary nodes
Epitrochlear and brachial nodes
Mesenteric nodes
Right inguinal nodes
Left inguinal nodes
Common site
Uncommon site
Popliteal nodes

Lymph node sites for Hodgkin's disease
(Huether and McCance, 2008)

hol-. See **holo-.**

holandric /holan′drik/ [Gk, *holos,* whole, *aner,* man], **1.** referring to genes located on the nonhomologous portion of the Y chromosome. **2.** pertaining to traits or conditions transmitted only through the paternal line. Compare **hologynic.**

holandric inheritance, the acquisition or expression of traits or conditions only through the paternal line, transmitted by genes located on the nonhomologous portion of the Y chromosome. Compare **hologynic inheritance.**

hold-relax, a technique of facilitating neuromuscular sensation and awareness, used in treating hypertonicity or motor dysfunction. It is often applied when there is muscle tightness on one side of a joint and when immobility is the result of pain.

holism /hō′lizəm/ [Gk, *holos,* whole], a philosophic concept in which an entity is seen as more than the sum of its parts. Holism is prominent in current approaches to psychology; biology; nursing; medicine; and other scientific, sociological, and educational fields of study and practice. Also spelled *wholism*.

holistic /hōlis′tik/ [Gk, *holos*], pertaining to the whole; considering all factors, as holistic medicine. Also spelled *wholistic*.

holistic counseling, an alternative form of psychotherapy that focuses on the whole person (mind, body, and spirit) and health. The goal is growth of the whole person.

holistic dentistry, dental practice that takes into account the effect of dental treatment and materials on the overall health of the individual.

holistic health /hōlis′tik/ [AS, *hal,* whole, *haelth*], a concept that concern for health requires a perception of the individual as an integrated system rather than one or more separate parts including physical, mental, spiritual, and emotional. Also spelled *wholistic health*.

holistic health care, a system of comprehensive or total patient care that considers the physical, emotional, social, economic, and spiritual needs of the person; his or her response to illness; and the effect of the illness on the ability to meet self-care needs. Holistic nursing is the modern nursing practice that expresses this philosophy of care. Also called **comprehensive care.**

holistic nurse, a nurse who focuses on healing the whole person as the goal of care. In practicing holistic nursing, the nurse implements interventions aimed at bio-psycho-social-spiritual-environmental healing.

Hollenback condenser. See **pneumatic condenser.**

Holliday-Segar formula, a method of estimating the daily caloric needs of the average hospital patient under conditions of bed rest, based on the body weight in kilograms of the patient. Beginning at 100 kcal/kg for an infant, the formula plots a curve to 1500 kcal plus 20 kcal/kg for each kilogram over 20 kg.

hollow /hol′ō/ [OE, *holh*], a depressed area or concavity.

hollow cathode lamp [ME, *holwe* + Gk, *kata,* down, *hodos,* way, *lampas*], a lamp consisting of a metal cathode and an inert gas. When an electric current is passed through the cathode, electrons in the metal are excited so as to emit a line spectrum of specific wavelengths related to the metal of the cathode.

holmium (Ho) /hōl′mē·əm/ [L, *Holmia,* Stockholm, Sweden], a rare earth metallic element. Its atomic number is 67; its atomic mass is 164.93.

holo-, hol-, prefix meaning “entire or the whole”: *holodiastolic, holomastigote, holotonia.*

holoacardius /hol′ō·ākär′dē·əs/ [Gk, *holos* + *kardia,* heart], a separate, grossly defective monozygotic twin fetus. It is usually a shapeless, nonformed mass in which the heart is absent and the circulation in utero is accomplished totally by the heart of the viable twin through a vascular shunt.

holoacardius acephalus, a grossly defective separate twin fetus that lacks a heart, a head, and most of the upper portion of the body.

holoacardius acormus, a grossly defective, separate twin fetus in which the trunk is malformed and little more than the head is recognizable.

holoacardius amorphus, a malformed separate twin fetus in which there are no recognizable or formed parts.

holoarthritis /-ärthrī′tis/, a form of arthritis that involves all or most of the joints.

holoblastic /hol′əblas′tik/ [Gk, *holos* + *blastos,* germ], pertaining to an ovum that contains little or no yolk and undergoes total cleavage. Compare **meroblastic.**

holocephalic /hō′lōsifal′ik/ [Gk, *holos* + *kephale,* head], pertaining to a malformed fetus in which several parts are deficient, although the head is complete.

holocrine /hol′əkrēn/ [Gk, *holos,* whole, *krienein,* to secrete], pertaining to the secretion of a gland or the gland itself as well as the accumulated gland secretions.

holocrine gland [Gk, *holos,* whole, *krienein,* to secrete], a gland whose discharge contains disintegrated or altered cells of the gland. Compare **apocrine gland, merocrine gland.**

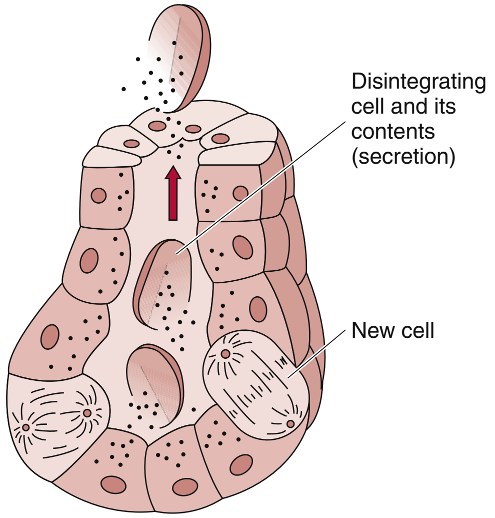
holodiastolic. See **pandiastolic.**

holoendemic /hol′ō·endem′ik/, pertaining to an intensely endemic disease area.

holoenzyme /hol′ō·en′zīm/ [Gk, *holos* + *en,* in, *zymos,* ferment], a complete enzyme-cofactor complex that gives rise to full catalytic activity.

holographic reconstruction /-graf′ik/, a method of producing three-dimensional images with diagnostic ultrasound equipment.

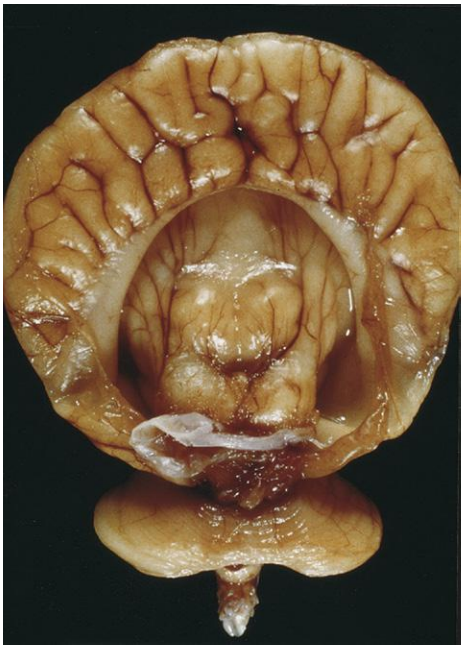
hologynic/hol′ōjin′ik/ [Gk,*holos*+*gyne*,female], **1.** referring to genes located on attached X chromosomes. **2.** pertaining to traits or conditions transmitted only through the maternal line. Compare **holandric.**



Holocrine gland *(Gartner and Hiatt, 2007)*

hologynic inheritance, the acquisition or expression of traits or conditions only through the maternal line, transmitted by genes located on attached X chromosomes. The phenomenon is not known to occur in humans. Compare *holandric inheritance.*

holoprosencephaly /hol′ōpros′ensef′əlē/ [Gk, *holos* + *pro,* before, *enkephalos,* brain], a congenital defect caused by the failure of the prosencephalon to divide into hemispheres during embryonic development. It is characterized by multiple midline facial defects, including cyclopia in severe cases. It can also be caused by an extra chromosome in the 13–15 or D group, manifested as one of many developmental defects. See also **trisomy 13.** —*holoprosencephalic, holoprosencephalous, adj.*



Holoprosencephaly: view of dorsal surface
(Kumar, Abbas, and Fausto, 2005)

holorachischisis. See **complete rachischisis.**

holosystolic. See **pansystolic.**

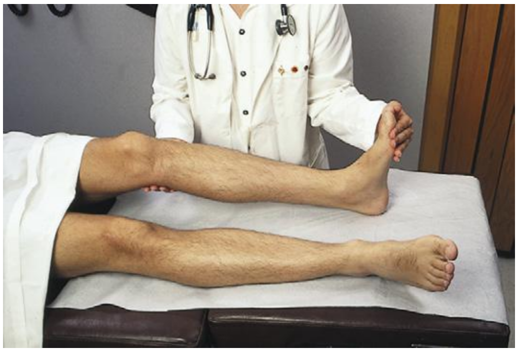
Holter monitor [Norman J. Holter, American biophysicist, 1914–1983; L, *monere,* to remind], a trademark for a device for making prolonged electrocardiograph recordings (usually 24 hours) on a portable tape recorder while the patient conducts normal daily activities. The patient also may keep an activity diary for the purpose of comparing daily events with electrocardiographic tracings. Also called **ambulatory electrocardiograph.**

Holthouse's hernia. See **inguinocrural hernia.**

Holt-Oram syndrome /hōlt or′əm/ [Mary Clayton Holt, British cardiologist, 20th century; Samuel Oram, English cardiologist, b. 1913], autosomal-dominant heart disease of varying severity, usually an atrial or ventricular septal defect associated with skeletal malformation (hypoplastic thumb and short forearm). Also called **heart-hand syndrome.**

Holtzman inkblot technique, a modification of the Rorschach test in which many more pictures of inkblots are used, the subject is permitted only one response to each design, and the scoring is predominantly objective rather than subjective.

Homans' sign [John Homans, American surgeon, 1877–1954; L, *signum,* mark], pain in the calf with dorsiflexion of the foot, indicating thrombophlebitis or thrombosis. It is not, however, a reliable indicator of either medical problem.



Assessing for Homans' sign

(Harkreader, Hogan, and Thobaben, 2007)

home assessment [AS, *ham,* village; L, *assidere,* to sit beside], an examination of the living area of a physically challenged person for the purposes of making recommendations about elimination of safety hazards and suggesting architectural or other modifications that would allow for independent functioning.

home care [AS, *ham,* village; L, *garrire,* to chatter], a health service provided in the patient's place of residence for the purpose of promoting, maintaining, or restoring health or minimizing the effects of illness and disability. Service may include such elements as medical, dental, and nursing care; speech and physical therapy; homemaking services of a home health aide; and provision of transportation. The nature and extent of care needed and the ability of the patient's family and friends to assume responsibility for that care are assessed. Nursing may be provided by a registered nurse, licensed practical nurse, or home health aide. Some hospitals have home care services that include regular visits by a nurse and a physician to patients in the home.

home health agency, an organization that provides health care in the home. Medicare certification for a home health agency in the United States requires provision of skilled nursing services and at least one additional therapeutic service.

Home Health Care Classification (HHCC), a system developed by Dr. Virginia Saba to assess and classify patients receiving home health care.

home health nurse, a registered nurse who visits patients in the home. The nurse works primarily in the area of secondary or tertiary care, providing hands-on care and educating the patient and family on care and prevention of future episodes.

homeless person, an individual who has no permanent home, haven, or domicile. Such individuals usually are indigent and depend on charity or public assistance for temporary lodging and medical care. An estimated 30% of homeless persons suffer from some type of mental disorder. See also **indigence.**

home maintenance assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as helping the patient/family to maintain the home as a clean, safe, and pleasant place to live. See also **Nursing Interventions Classification.**

home management activities, tasks that are necessary to obtain and maintain personal and household possessions.

homeo-, homoeo-, homoio-, prefix "sameness, similarity": *homeochrome, homeomorphus, homeothermal.*

homeodynamics /hō′mē·ədīnam′iks/ [Gk, *homoios,* similar, *dynamis,* force], the constantly changing interrelatedness of body components while an overall equilibrium is maintained.

homeomorphous /-môr′fəs/, similar in appearance but different in composition.

Homeopathic Pharmacopoeia of the United States, one of the three official drug compendia specified in the Federal Food, Drug, and Cosmetic Act. See also **compendium, *National Formulary.***

homeopathist /hō′mē·op′əthist/, a physician who practices homeopathy.

homeopathy /hō′mē·op′əthē/ [Gk, *homoios,* similar, *pathos,* disease], a system of therapeutics based on the theory that "like cures like." The theory was advanced in the late eighteenth century by Dr. Samuel Hahnemann, who believed that a large amount of a particular drug may cause symptoms of a disease whereas moderate dosage may reduce those symptoms; thus some disease symptoms may be treated by very small doses of medicine. In practice, homeopathists dilute drugs with milk sugar in ratios of 1 to 10 to achieve the smallest dose of a drug that seems necessary to control the symptoms in a patient and prescribe only one medication at a time. Compare **allopathy.** —*homeopathic, adj.*

homeostasis /hō′mē·əstā′sis/ [Gk, *homoios* + *stasis,* standing still], a relative constancy in the internal environment of the body, naturally maintained by adaptive responses that promote healthy survival. Various sensing, feedback, and control mechanisms function to effect this steady state. Some of the key control mechanisms are the reticular formation in the brainstem and the endocrine glands. Some of the functions controlled by homeostatic mechanisms are heartbeat, hematopoiesis, blood pressure, body temperature, electrolytic balance, respiration, and glandular secretion. —*homeostatic, adj.*

homeotherapy /-ther′əpē/, the treatment or prevention of disease by homeopathic methods.

homeotic mutation /hō′mē·ot′ik/, a mutation that causes tissues to alter their normal differentiation pattern, producing integrated structures but in unusual locations. For example, a homeotic mutation in the fruit fly, *Drosophila,* causes legs to develop where antennae normally form.

homeotypic /hō′mē·ōtip′ik/ [Gk, *homoios* + *typos*, mark], pertaining to or characteristic of the regular or usual type, specifically regarding the second meiotic division of germ cells in gametogenesis as distinguished from the first meiotic division. Also called *homeotypical*. Compare **heterotypic.**

homeotypic mitosis, the separation of sister chromatids, as occurs in the second meiotic division of germ cells in gametogenesis. Compare **heterotypic mitosis.**

Home's silver precipitation method, a technique for depositing silver in enamel and dentin by applying ammoniac silver nitrate solution and reducing with formalin or eugenol.

homicide /hom′isīd/ [L, *homo*, man, *caedere*, to kill], the death of one human being caused by another.

hominal physiology /hom′inəl/ [L, *hominis*, human; Gk, *physis*, nature, *logos*, science], the study of the specific physical and chemical processes involved in the normal functioning of humans; human physiology.

hominid /hom′inid/ [L, *homo*, man; Gk, *eidos*, form], pertaining to the primate family Hominidae, which includes humans.

homo-, **1.** prefix meaning "the same": *homocentric, homodont, homolysis*. **2.** prefix meaning "the addition of one CH_2 group to the main compound": *homochelidonine, homocystine, homoquinine*.

homoblastic /hō′mōblas′tik/ [Gk, *homos* + *blastos*, germ], developing from the same germ layer or from a single type of tissue. Compare **heteroblastic.**

homocarnosine /hō′mōkär′nōsēn/, a dipeptide consisting of gamma-aminobutyric acid and histidine. In humans it is found in the brain but not in other tissues.

homochronous inheritance /hōmok′rənəs/ [Gk, *homos* + *chronos*, time], the appearance of traits or conditions in offspring at the same age when they appeared in the parents.

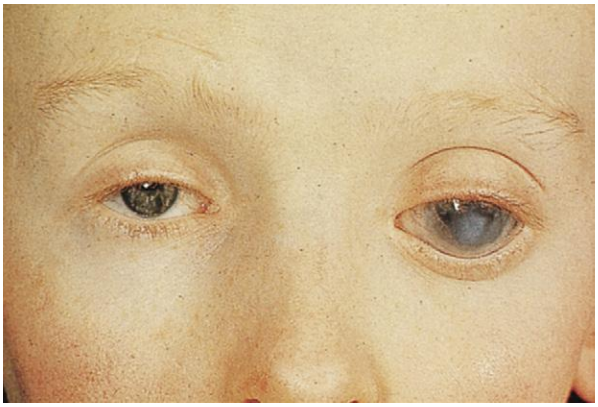
homocysteine /-sis′tēn/, an amino acid containing sulfur and a homolog of cysteine, produced in the demethylation of methionine. It is also an intermediate product in the biosynthesis of cysteine from L-methionine via L-cystathionine in the breakdown of proteins. High levels of homocysteine are associated with an increased risk of collagen cardiovascular disorders, particularly thromboembolic stroke. It is believed the amino acid may have a toxic effect on cells lining the blood vessels. Studies also indicate that low levels of homocysteine are found in people with high intake of B vitamins. See also **homocystine.**

homocysteine (HCY) test, a blood test used to detect levels of homocysteine, which, if increased, may act as an independent risk factor for ischemic heart disease, cerebrovascular disease, peripheral arterial disease, and venous thrombosis. This test should be considered for screening in individuals with progressive and unexplained atherosclerosis despite normal lipoproteins and in the absence of other risk factors and in those with an unusual family history of atherosclerosis.

homocystine /-sis′tin/, a disulfide analog of homocysteine produced by the oxidation of homocysteine. See also **homocysteine.**

homocystinemia /-sis′tinē′mē·ə/, an amino acid disorder that causes an excess of homocystine in the blood. See also **homocystinuria.**

homocystinuria /hō′mōsis′tino͝or′ē·ə/ [Gk, *homos* + (cystine); Gk, *ouron*, urine], a rare biochemical abnormality characterized by the abnormal presence of homocystine, an amino acid, in the blood and urine, which is caused by any of several enzyme deficiencies in the metabolic pathway of methionine to cystine. The disease is inherited as an autosomal-recessive trait. Its clinical signs are similar to those of Marfan's syndrome, including mental retardation, osteoporosis leading to skeletal abnormalities, dislocated lenses, and thromboembolism. Treatment may include a diet low in methionine and supplementation with large doses of vitamin B_6. Long-term results of treatment are not available. —*homocystinuric, adj.*



Homocystinuria: lens dislocation *(Newton, 1995)*

homoeo-. See **homeo-.**

homogametic /hō′mōgamet′ik/ [Gk, *homos* + *gamete*, spouse], pertaining to the sex that produces gametes of only one kind, in terms of their sex chromosomes. In human beings, the female is the homogametic sex.

homogenate /hōmoj′ənit/, a tissue that is or has been made homogenous, as by grinding cells into a creamy consistency for laboratory studies. A homogenate usually lacks cell structure. Also called **broken cell preparation.**

homogeneous /hō′mōjē′nē·əs/ [Gk, *homos* + *genos*, kind], **1.** consisting of similar elements or parts. **2.** having a uniform quality throughout. Also **homogenous.** Compare **heterogeneous.** —*homogeneity, adj.*

homogenesis /hō′mōjē′nē-əs/ [Gk, *homos* + *genesis*, origin], reproduction by the same process in succeeding generations so that offspring are similar to the parents. Also called **homogeny.** Compare **heterogenesis.**

homogenetic /-jenet′ik/, **1.** pertaining to homogenesis. **2.** See **homogenous,** def. 2.

homogenized /hōmoj′ənīzd/ [Gk, *homos*, same, *genein*, to produce], the state of having undergone homogenization; having a uniform texture or consistency throughout.

homogenized milk [Gk, *homos* + *genos*, kind], milk that has been mechanically treated to reduce and emulsify the fat globules so that the cream cannot separate.

homogenous /hōmoj′ənəs/ [Gk, *homos* + *genos*, kind], **1.** See **homogeneous. 2.** also **homogenetic.** having a likeness in form or structure as a result of a common ancestral origin. **3.** Compare **heterogenous.**

homogenous graft. See **allograft.**

homogentisic acid, a compound that is an intermediate product of the metabolism of tyrosine. It forms a melanin-like staining substance in the urine of people who have alkaptonuria.

homogeny /hōmoj′ənē/ [Gk, *homos* + *genos*, kind], **1.** See **homogenesis. 2.** a likeness in structure or form that results from a common ancestral origin. Compare **homoplasty.**

homograft. See **allograft.**

homoio-. See **homeo-.**

homoiothermal. See **warm-blooded.**

homoiothermic /hom′ē·əthur′mik/ [Gk, *homos,* same, *therme,* heat], pertaining to the ability of warm-blooded animals to maintain a relatively stable internal temperature regardless of the temperature of the environment. This ability is not fully developed in newborn humans.

homolateral /hō′mōlat′ərəl/, pertaining to the same side of the body.

homolateral limb synkinesis, a condition of hemiplegia in which there appears to be a mutual dependency between the affected upper and lower limbs. Efforts at flexion of an upper extremity cause flexion of the lower extremity.

homolog /hom′əlog/ [Gk, *homos,* same], **1.** any organ corresponding in function, origin, and structure to another organ, as the flippers of a seal correspond to human hands. **2.** (in chemistry) one of a series of compounds, each formed by an added common atom or atom combination. For example, CH_4, methane, is followed by C_2H_6, ethane, with the addition of a CH_2 group. Also spelled **homologue.** Compare **analog.** **—homologous,** *adj.*

homologous /hōmol′əgəs/ [Gk, *homos,* same, *logos,* relation], pertaining to corresponding attributes or similar in structure. Compare **analogous.** See also **homolog.**

homologous anaphylaxis [Gk, *homos,* same, *logos,* relation, *ana,* back, *phylaxis,* protection], a form of passive anaphylaxis resulting from the transfer of serum between animals of the same species.

homologous chromosomes [Gk, *homos,* same, *chroma* color, *soma* body], any two chromosomes in a diploid somatic cell that are identical in size, shape, and gene loci. In humans there are 22 pairs of homologous chromosomes and 1 pair of sex chromosomes, with 1 member of each pair derived from the mother and the other from the father.

homologous disease. See **graft-versus-host disease.**

homologous graft [Gk, *homos,* same, *logos,* relation, *graphein,* stylus], a tissue removed from a donor for transplantation to a recipient of the same species. Compare **autograft, isograft, xenograft.** Also called **homogenous graft.**

homologous insemination. See **artificial insemination—husband.**

homologous organs [Gk, *homos,* same, *logos,* relation, *organon,* instrument], body parts of different species (or sexes) that are structural equivalents, such as the arms of humans and the forelegs of dogs and cats.

homologous transplantation. See **homoplastic transplantation.**

homologous tumor, a neoplasm made up of cells resembling those of the tissue in which it is growing. Compare **heterologous tumor, organoid neoplasm.**

homologue. See **homolog.**

homonymous /hōmon′iməs/ [Gk, *homos,* same, *onyma,* name], having the same name or sound.

homonymous diplopia [Gk, *homos,* same, *onyma,* name, *diploos,* double, *opsis,* vision], a type of diplopia in which the image observed by the right eye is located to the right of the image observed by the left eye.

homonymous hemianopia [Gk, *homos* + *onyma,* name], blindness or defective vision in the right or left halves of the visual fields of both eyes.

homophobia /hō′mōfō′bē·ə/ [Gk, *homos,* same, *phobos,* fear], fear of or prejudice against homosexuals.

homoplastic. See **homoplasty.**

homoplastic transplantation [Gk, *homos,* same, *plassein,* to mold; L, *transplantare,* to transplant], the homologous transplantation of tissue from one human to another or from one animal to another of the same species. Also called **homologous transplantation.**

homoplasty /hō′məplas′tē/ [Gk, *homos* + *plassein,* to mold], having a likeness in form or structure acquired through similar environmental conditions or parallel evolution rather than resulting from common ancestral origin. Compare **homogeny.** **—***homoplastic, adj.*

homopolymer /hō′mōpol′imir/ [Gk, *homos* + *poly,* many, *meros,* part], a compound formed from subunits that are the same, such as a carbohydrate composed of a series of glucose units.

homosalate /hō′mōsal′āt/, a sunscreen effective against ultraviolet B rays, applied topically to the skin.

Homo sapiens /hō′mō sā′pē·əns, sä′pē·ens/ [L, *homo,* human, *sapere,* to know or taste], the scientific name of the human species.

homosexual /-sek′shəl/ [Gk, *homos* + L, *sexus,* sex, gender], **1.** *adj,* pertaining to or denoting the same sex. **2.** *n,* a person who is sexually attracted to members of the same sex. Compare **heterosexual.** See also **lesbian.**

homosexuality. See **sexual orientation.**

homosexual panic, an acute attack of anxiety based on unconscious conflicts concerning gender identity and a fear of being homosexual. Compare **heterosexual panic.**

homosexual sexual intercourse [Gk, *homos,* same; L, *sexus,* male or female, *intercursus,* interposition], sexual activity of members of the same sex ranging from feelings and fantasies to kissing and genital, oral, or anal contact.

homothermal. See **warm-blooded.**

homotopic pain /hō′mōtop′ik/, pain experienced at the point of injury.

homotype /hō′mōtīp/, any structure or body part, such as a hand or foot, that appears in reversed symmetry with a similar part.

homovanillic acid (HVA) /hō′mōvənil′ik/, an acid that is produced by the normal metabolism of dopamine and that may occur at an elevated level in urine in association with tumors of the adrenal gland. Its normal accumulation in a 24-hour collection urine sample is 15 mg.

homozygosis /hō′mōzīgō′sis/ [Gk, *homos* + *zygon,* yoke], **1.** the formation of a zygote by the union of two gametes that have one or more pairs of identical alleles. **2.** the production of purebred organisms or strains through in-breeding.

homozygote /hō′məzī′gōt/ [Gk, *homos,* same, *zygon,* yoke], an organism whose somatic cells have identical genes on the same locus on one of the chromosome pairs.

homozygous /hō′məzī′gəs/ [Gk, *homos* + *zygon,* yoke], having two identical alleles at corresponding loci on homologous chromosomes. An individual who is homozygous for a trait has inherited from each parent one allele for that trait. A person who is homozygous for a genetic disease caused by a pair of recessive alleles, such as sickle cell anemia, manifests the disorder. All of his or her offspring will inherit the allele for the disease. Compare **heterozygous.**

homunculus /hōmung′kyələs/ *pl. homunculi* [L, little man], **1.** a dwarf in whom all the body parts are proportionally developed and in which there is no deformity or abnormality. **2.** (in early embryological theories of development, primarily preformation) a minute and complete human being contained in each of the germ cells that after fertilization grows from the microscopic to normal size. **3.** a small anatomical model of the human form; a manikin, specifically, one believed to have been produced by an alchemist and placed into a flask. **4.** (in psychiatry) a little man created by the imagination who possesses magical powers.

hook grasp, a type of prehension in which an object is grasped with the fingers alone, without use of the thumb and palm.

hookworm [AS, *hok* + *wyrm*], *nontechnical*. a nematode of the genera *Ancylostoma, Necator,* and *Uncinaria*. Most hookworm infections in the western hemisphere are caused by the species ***Necator americanus.*** Infection occurs when the larvae invade exposed skin, mostly the feet. Individuals may be asymptomatic carriers.

hookworm disease [AS, *hok* + *wyrm* + Gk, *dis,* not; Fr, *aise,* ease], a roundworm infestation that may involve either of two important intestinal parasites of humans, *Ancylostoma duodenale* or ***Necator americanus.*** Both forms of the disease, **ancylostomiasis** and **necatoriasis,** are characterized by abdominal pain, in heavy infection, and iron deficiency anemia. The worm enters the human body as a larva by penetrating the skin, traveling to the lungs via the circulatory system, and ascending the respiratory tract to the pharynx, where it is swallowed. In the intestinal tract the hookworm attaches its mouth to the mucosa and subsists on the blood of the host. Hookworm is believed to infect 800 million people globally. It is treated with cryotherapy when still in the skin. Albendazole is effective against both the intestinal stages and skin infestation.

hope, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as optimism that is personally satisfying and life-supporting. See also **Nursing Outcomes Classification.**

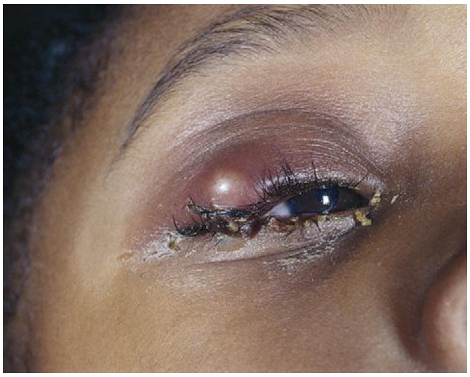
hope inspiration, a nursing intervention from the Nursing Interventions Classification (NIC) defined as enhancing the belief in one's capacity to initiate and sustain actions. See also **Nursing Interventions Classification.**

hops, a perennial herb cultivated throughout the world.

■ USES: It is used as a flavoring (e.g., beer), mild sedative, diuretic, and weak antibiotic. It is also used to improve appetite and to treat insomnia, hyperactivity, pain, fever, and jaundice. It may be effective against restlessness; there are insufficient reliable data on its efficacy for other indications.

■ CONTRAINDICATIONS: It should not be used in people who are hypersensitive to this product; who have breast, uterine, or cervical cancers; or who suffer from a depressive condition.

hordeolum /hôrdē′ələm/ [L, *hordeum,* barley], a furuncle of the margin of the eyelid originating in the sebaceous gland of an eyelash. Treatment includes hot compresses and antibiotic ophthalmic preparations; incision and drainage are occasionally required. Also called **sty.** Compare **chalazion.**



Hordeolum *(Roberts and Hedges, 2010)*

horizon /hôrī′zən/ [Gk, *horizein,* to encircle], a specific stage of human embryonic development determined by the appearance and ultimate formation of certain anatomical characteristics. The classification comprises 23 stages, each lasting 2 to 3 days, beginning with the fertilization of the ovum and ending 7 to 9 weeks later with the initiation of the fetal period of intrauterine life.

horizontal abdominal position /hôr′izon′təl/, prone position.

horizontal angulation [Gk, *horizein,* to encircle; L, *angularis,* angle], the angle within the occlusal plane, relative to a reference in the vertical or sagittal plane, at which the central x-ray beam is directed during radiography or dental imaging of oral structures. Compare **vertical angulation.**

horizontal fissure of the right lung, a cleft that marks the separation of the upper and middle lobes of the right lung.

horizontal overlap. See **overjet.**

horizontal plane [Gk, *horizein,* to encircle; L, *planum,* level ground], **1.** any plane of the erect body parallel to the horizon, dividing the body into upper and lower parts. **2.** a plane passing through a tooth at right angles to its long axis.

horizontal position, a position in which the patient lies on the back with the legs extended.

horizontal pursuit, a visual screening test in which the patient is asked to follow with both eyes a target moving in a horizontal plane while the examiner observes accuracy of alignment and supportive head movements.

horizontal resorption, a pattern of bone reduction in marginal periodontitis wherein the marginal crest of the alveolar bone between adjacent teeth remains level and the bases of the periodontal pockets are above the crest. Compare **vertical resorption.** See also **resorption.**

horizontal transmission, the spread of an infectious agent from one person or group to another, usually through contact with contaminated material, such as sputum or feces.

horizontal vertigo, a giddiness or feeling of instability experienced while lying down, frequently caused by a labyrinthine disorder.

horizontal violence, violence directed toward one's peers.

horm-, prefix meaning "an impulse, to urge or stimulate": *hormesis, hormonal, hormothyrin.*

hormic psychology /hôr′mic/ [Gk, *hormaien,* to begin action], (in psychology) the school that stresses the purposive, goal-oriented nature of human behavior. Also called *hormism.*

hormonal /hôr′mōnəl/ [Gk, *hormaein,* to set in motion], pertaining to or resembling hormones.

hormonal therapy. See **hormone therapy.**

hormone /hôr′mōn/ [Gk, *hormaein,* to set in motion], a complex chemical substance produced in one part or organ of the body that initiates or regulates the activity of an organ or a group of cells in another part. Hormones secreted by the endocrine glands are carried through the bloodstream to the target organ. Secretion of these hormones is regulated by other hormones, by neurotransmitters, and by a negative feedback system in which an excess of target organ activity or hormone signals a decreased need for the stimulating hormone. Other hormones are released by organs for local effect, most commonly in the digestive tract.

-hormone, **1.** suffix meaning a "chemical substance possessing a regulatory effect," classified by source: *necrohormone, phytohormone, zoohormone.* **2.** suffix meaning a "chemical substance possessing a regulatory effect," classified by activity affected: *cytohormone, neurohormone, parathormone.*

hormone replacement therapy^1, the administration of sex hormones following menopause or hysterectomy or in amenorrhea. There are a number of indications, including the induction of menses in amenorrhea. If used for postmenopausal symptoms, it should be given in the smallest effective dose for the shortest period of time. Following the completion of the Women's Health Initiative study, hormone replacement therapy is no longer used for the prevention of osteoporosis or coronary artery disease.

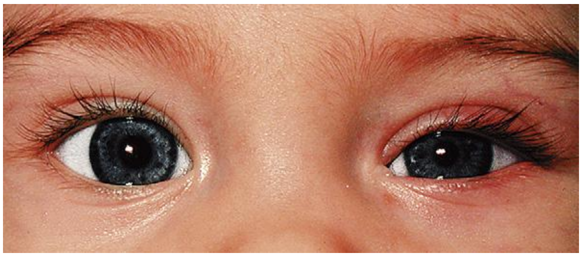
hormone replacement therapy[2], a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of safe and effective use of hormone replacement therapy. See also **Nursing Interventions Classification.**

hormone-sensitive lipase, an enzyme that catalyzes the release of fatty acids from adipose tissues.

hormone therapy, the treatment of diseases with hormones obtained from endocrine glands or substances that simulate hormonal effects. Also called **endocrine therapy, hormonal therapy.**

horn, a projection or protuberance on a body structure. Examples include the horn of the hyoid bone and the iliac horn.

Horner's syndrome [Johann F. Horner, Swiss ophthalmologist, 1831–1886], a neurological condition characterized by a constricted (miotic) pupil, ptosis, and facial anhidrosis, associated with a lesion in the spinal cord, with damage to a cervical nerve or any ascending part of the sympathetic outflow to the face/head. Signs are ipsilateral (same side) to the injury.



Horner's syndrome: ptosis of the right eyelid
(Taylor and Hoyt, 2005)

horny /hôr′nē/, having the nature or appearance of a projection. Also called **corneous, keratic.**

horny layer. See **stratum corneum.**

horripilation. See **pilomotor reflex.**

horse chestnut, a herbal product taken from a tree or shrub found worldwide. Its bark, flowers, leaves, and seeds may be harvested.

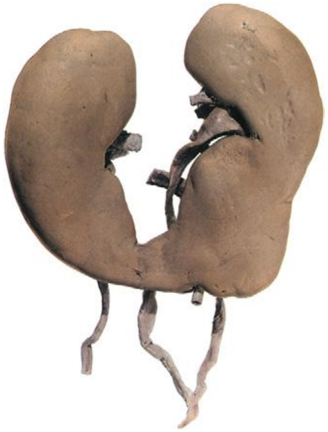
■ USES: It is used for fever, fluid retention, frostbite, hemorrhoids, inflammation, lower extremity swelling, phlebitis, varicose veins, and wounds. Horse chestnut seeds may have efficacy in the treatment of varicose veins and other forms of venous insufficiency. There is insufficient reliable information regarding efficacy of the bark, flower, or leaf products for other indications.

■ CONTRAINDICATIONS: It is contraindicated during pregnancy and lactation and in children until more research has been completed.

horse serum [AS, *hors* + L, *serum,* whey], immune serum prepared from the blood of a horse that has developed immunity to toxins. Because many people are sensitive to horse serum, a skin test for sensitivity is recommended before passive immunization with horse antibodies. Tetanus immune globulin prepared from human immune serum is preferred.

horseshoe fistula /hôrs′sho͞o/ [AS, *hors* + *scoh,* shoe], an abnormal semicircular passage in the perianal area with both openings on the surface of the skin.

horseshoe kidney, a relatively common congenital anomaly characterized by an isthmus of parenchymal tissue connecting the two kidneys at the lower poles. The condition may cause obstruction of the ureters, hydronephrosis, and abdominal pain. It is corrected by surgery to separate and reposition the kidneys.



Horseshoe kidneys: posterior view
(Moore, Persaud, and Shiota, 2000)

horsetail, a perennial herb known as a pteridophyte, found throughout the world.

■ USES: It is likely unsafe and should not be used for any purpose. It is used as a diuretic, a genitourinary astringent, and an antihemorrhagic. It is also used for Bell's palsy and for healing broken bones. There are no studies confirming its efficacy.

■ CONTRAINDICATIONS: People ignoring personal safety concerns should be aware that it should not be used during pregnancy and lactation or in children. It is also contraindicated in those with known hypersensitivity, edema, cardiac or renal disease, or nicotine sensitivity. It should not be used for prolonged periods of time.

Hortega cells. See **microglia.**

Horton's arteritis. See **temporal arteritis.**

Horton's headache. See **migrainous cranial neuralgia.**

Horton's histamine cephalalgia. See **histamine headache.**

hospice /hos′pis/ [L, *hospes,* host], a system of family-centered care designed to assist the terminally ill person to be comfortable and to maintain quality of life through the phases of dying. Hospice care is multidisciplinary and includes home visits, professional health care available on call, teaching and emotional support of the family, and physical care of the client. Some hospice programs provide care in a center, as well as in the home or in a nursing home. Hospice also offers bereavement counseling for the family. See also **emotional care of the dying patient, stages of dying.**

hospital /hos′pitəl/ [L, *hospitium,* guesthouse], a health care facility that provides inpatient beds, continuous nursing services, and an organized medical staff.

hospital-acquired infection. See **nosocomial infection.**

hospital clinic, an ambulatory care site owned by a hospital where persons who do not require hospitalization receive medical care. It may be primary care or subspecialty care.

Hospital Infection Control Practices Advisory Committee (HICPAC), a committee established in 1991 by the U.S. government with members appointed by the Secretary of Health and Human Services. It provides advice and guidance related to isolation practices and serves as an advisory committee to the Centers for Disease Control and Prevention for updating guidelines and policy statements related to control of nosocomial infection.

hospitalism /hos′pitəliz′əm/, the physical or mental effects of hospitalization or institutionalization on patients, especially infants and children in whom the condition is characterized by social regression, personality disorders, and stunted growth. See also **anaclitic depression.**

hospitalist /hos′pi·təl·ist/, a physician specializing in hospital inpatient care.

Hospital Survey and Construction Act. See **Hill-Burton Act.**

host /hōst/ [L, *hospes*], **1.** an organism in which another, usually parasitic, organism is nourished and harbored. A **definitive host** is one in which the adult parasite lives and reproduces. An **intermediate host** is one in which the parasite exists in its nonsexual, larval stage. A **reservoir host** is a primary animal host for organisms that are sometimes parasitic in humans and through which humans may become infected. **2.** the recipient of a transplanted organ or tissue. Compare **donor.**

host defense mechanisms, a group of body protective systems, including physical barriers and the immune response, that normally guard against infection.

hostility /hostil′itē/ [L, *hostilis,* hostile], an emotional state characterized by enmity toward others and a desire to harm those at whom the antagonism is directed. The hostility may be expressed passively and actively.

host modulating therapy, efforts to control periodontal disease by directly targeting the host response. An example is the use of drugs that do this, such as subgingival antimicrobial doses of doxycycline, NSAIDs, or bisphosphonates.

hot bath [AS, *hat* + *baeth*], a bath in which the temperature of the water is gradually raised to about 106° F (41.11° C).

hot compress [AS, *hat* + L, *comprimere,* to press together], a heated pad of damp, thickly folded cloth applied to an area to reduce pain or inflammation. See also **fomentation.**

hot flash, a transient sensation of warmth experienced by some women during or after menopause. Hot flashes result from autonomic vasomotor disturbances that accompany changes in the neurohormonal activity of the ovaries, hypothalamus, and pituitary. The exact causative mechanism is not known. All menopausal women do not experience hot flashes; among those who do, the frequency, duration, and intensity vary widely. Although physically harmless, the symptom may be extremely disturbing or, rarely, disabling. Hot flashes may be alleviated by cyclic or continuous administration of exogenous estrogen. Also called **hot flush.** See also **menopause.**

hot line, a means of contacting a trained counselor or specific agency for help with a particular problem, such as a rape hot line or a battered child hot line. The person needing help calls a telephone number and speaks to a counselor, who remains anonymous and who offers emotional support, specific recommendations for action, and referral to other medical, social, or community services. Such services are usually maintained by volunteers and are accessible 24 hours a day, 7 days a week.

hot spot, **1.** a site in a gene sequence at which mutations occur with an unusually high frequency. **2.** an area on a nuclear medicine image that represents an abnormally high absorption of radiation.

Hounsfield unit /hounz′fēld/ [Godfrey N. Hounsfield, 20th century English scientist], the numeric information contained in each pixel of a CT image. It is related to the composition and nature of the tissue imaged and is used to represent the density of tissue. Also called **CT number,** *Hounsfield number.*

hourglass uterus [Gk, *hora* + AS, *glaes*], a uterus in which a segment of circular muscle fibers contracts during labor, causing constriction ring dystocia. The condition is marked by lack of progress despite adequate labor contractions and recession rather than descent of the presenting part during a contraction.

housekeeping department, a unit of a hospital staff responsible for cleaning the hospital premises and furnishings, including controlling pathogenic organisms. See also **environmental services.**

housemaid's knee [AS, *hus* + *maeden* + *cneow,* knee], a chronic inflammation of the bursa in front of the kneecap, characterized by redness and swelling. It is caused by prolonged and repetitive pressure of the knee on a hard surface.

house organ, a publication designed for distribution to the employees or members of an institution or business. It may be prepared by a staff within the institution or business or by an outside agency.

house physician [AS, *hus* + Gk, *physikos,* natural], a physician on call and immediately available in a hospital or other health care facility.

house staff, the interns and residents who are employed at a hospital while receiving additional training after graduation from medical college.

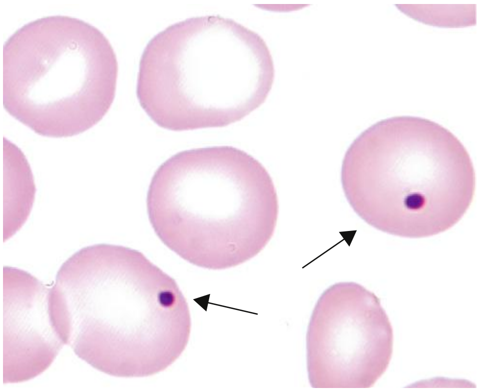
house surgeon, a surgeon on call and immediately available on the premises of a hospital.

housewives' eczema [AS, *hus* + *wif* + Gk, *ekzein,* to boil over], an informal term for contact dermatitis of the hands caused and exacerbated by their frequent immersion in water and by the use of soaps and detergents.

Houston's valves. See **transverse rectal folds.**

Hovius' plexus. See **Leber's plexus.**

Howell-Jolly bodies /hou′əl jol′ē/ [William H. Howell, American physiologist, 1860–1945; Justin M.J. Jolly, French histologist, 1870–1953], deep purple spherical erythrocyte nucleic acid inclusions observed on microscopic examination of stained blood films. They are most commonly seen in people who have hemolytic or megoblastic anemia, leukemia, thalassemia, or congenital absence of the spleen and in those who have had a splenectomy.



Howell-Jolly bodies *(Carr and Rodak, 2008)*

HPG, abbreviation for *human pituitary gonadotropin.*

HPL, abbreviation for **human placental lactogen.**

HPV, **1.** abbreviation for **human papillomavirus.** **2.** abbreviation for **human parvovirus.**

hr, abbreviation for *hour.*

H_1 receptor, a type of histamine receptor on vascular smooth muscle cells through which histamine mediates vasodilation. See also **histamine blocking agent.**

H_2 receptor, a type of histamine receptor on various kinds of cells through which histamine mediates bronchial constriction in asthma and GI constriction in diarrhea. See also **histamine blocking agent.**

H_1 receptor antagonist, any of a large number of agents that block the action of histamine by competitive binding to the H_1 receptor. Such agents also have sedative, anticholinergic, and antiemetic effects, the exact effect varying from drug to drug, and are used for the relief of allergic symptoms and as antiemetics, antivertigo agents, sedatives, and antidyskinetics in parkinsonism. This group is traditionally called the *antihistamines*.

H_2 receptor antagonist, an agent that blocks the action of histamine by competitive binding to the H_2 receptor. It is used to inhibit gastric secretion in the treatment of peptic ulcer.

HRF, **1.** abbreviation for *histamine-releasing factor.* **2.** abbreviation for *homologous restriction factor.*

HRIG, abbreviation for *human rabies immune globulin* vaccine.

HRSA, abbreviation for **Health Resources and Services Administration.**

hs, h.s., abbreviation for the Latin *hora somni,* at bedtime.

HSA, abbreviation for **health systems agency.**

HsP, abbreviation for **heat shock protein.**

HSV, abbreviation for *herpes simplex virus*. See **herpes genitalis, herpes simplex.**

HSV1, abbreviation for *herpes simplex virus type 1*. See **herpes simplex.**

ht, abbreviation for **height.**

HTLV, abbreviation for *human T-cell lymphotropic virus*. See **human T-cell lymphotrophic virus type I/II antibody test.**

HTLV-I, abbreviation for **human T-cell lymphotropic virus type I.**

HTLV-I–associated myelopathy. See **chronic progressive myelopathy.**

HTLV-II, abbreviation for **human T-cell lymphotropic virus type II.**

HTLV-III, abbreviation for **human T-cell lymphotropic virus type III.** See **human immunodeficiency virus.**

Hu antigen, a family of four RNA-binding proteins (HuD, HuC/ple21, Hel-N1, and Hel-N2) that are expressed in neurons and are believed to play an important role in the development and maintenance of the nervous system. They are also expressed in the cells of small cell lung carcinoma, sarcoma, and neuroblastoma, and antibodies to them are associated with neurological paraneoplastic syndromes.

Hubbard tank [Carl P. Hubbard, American engineer, b. 1857; Port, *tanqu*], a water tank in which patients can perform underwater exercise. The patient's trunk and extremities are submerged on a stretcher. The water provides buoyancy and heat for the benefit of weakened or painful muscles or joints with limited active range of motion. The tank also may be used for wound debridement. See also **whirlpool bath.**

huffing, forced expiration with an open glottis used to clear secretions from the airway when pain limits normal coughing.

HUGO /hyo͞o′gō/, abbreviation for **Human Genome Organization.**

Huhner test /ho͞o′nər/ [Max Huhner, American urologist, 1873–1947], a test for male fertility in which a semen sample aspirated from the vagina within an hour after coitus is examined for spermatozoal activity.

human /h(y)o͞o′mən/ [L, *humanus*], a member of the genus *Homo* and particularly of the species *H. sapiens*.

human bite [L, *humanus* + AS, *bitan*], a wound caused by the piercing of skin by human teeth. Bacteria are usually present, and serious infection often follows. The area is thoroughly washed with an antiseptic and rinsed well. The wound is examined frequently, and appropriate antibiotic therapy instituted, if necessary.

human chorionic gonadotropin. See **chorionic gonadotropin.**

human chorionic somatomammotropin (HCS), a hormone produced by the syncytiotrophoblast during pregnancy. It regulates carbohydrate and protein metabolism of the mother to ensure delivery to the fetus of glucose for energy and protein for fetal growth. HCS, an insulin antagonist, also may have a diabetogenic effect in the mother, who therefore may have an increased blood glucose level. Also called *chorionic growth hormone-prolactin, placental lactogen*.

human diploid cell rabies vaccine (HDCV), an inactivated rabies virus vaccine prepared from rabies virus grown in human diploid cell cultures. Active immunization with HDCV begins on the day of exposure, followed by four or five additional injections. Passive immunization with human rabies immune globulin may be given concurrently with HDCV.

human ecology, the study of the interrelationships between people and their environments, as well as among individuals within an environment.

human endogenous retroviruses (HERV), Retrovirus-like sequences found in the human genome, thought to constitute the remains of true retroviruses that were absorbed through evolution. At least one is thought to be linked to expression of tumor cells. They are also thought to be involved in autoimmune disorders such as multiple sclerosis.

Human Genome Organization (HUGO), an international group established in 1989 to coordinate activities concerned with the human genome project, including the distribution of funding and dissemination of information.

human granulocytic ehrlichiosis (HGE). See **ehrlichiosis.**

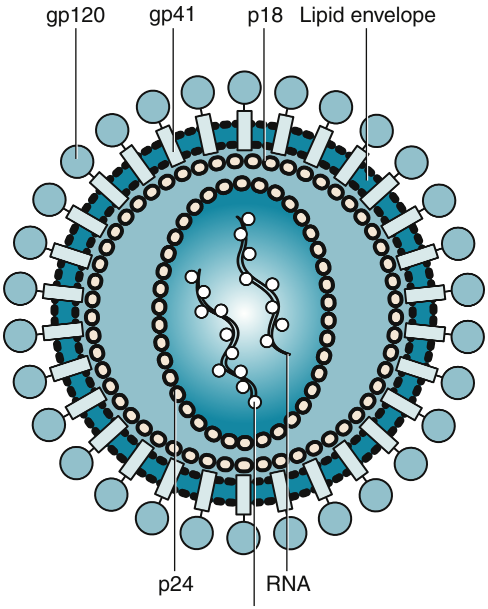
human growth hormone (synthetic). See **synthetic human growth hormone.**

human herpesvirus 6, a T-cell lymphotrophic virus belonging to the subfamily Betaherpesvirinae that has a high affinity for CD4 lymphocytes. It exists as two variants, A and B. Variant A is isolated mainly in immunocompromised individuals. Variant B causes roseola infantum. Most healthy adults carry the virus and are asymptomatic; infection results in lifelong persistence. See also **herpesvirus, roseola infantum.**

human herpesvirus 7, a virus belonging to the subfamily Betaherpesvirinae, closely related to human herpesvirus 6 but not known to be associated with any disease. See also **human herpesvirus 6.**

human herpesvirus 8, a virus in the family Herpesviridae that has been implicated as the causative agent of Kaposi's sarcoma, a rare form of cancer occasionally seen in AIDS patients, and primary effusion lymphoma. The predominant route of transmission is sexual activity. The virus may also be transmitted through blood contact in IV drug use. Treatment is currently experimental. Also called **Kaposi's sarcoma–associated herpesvirus.** See also **Kaposi's sarcoma, primary effusion lymphoma.**

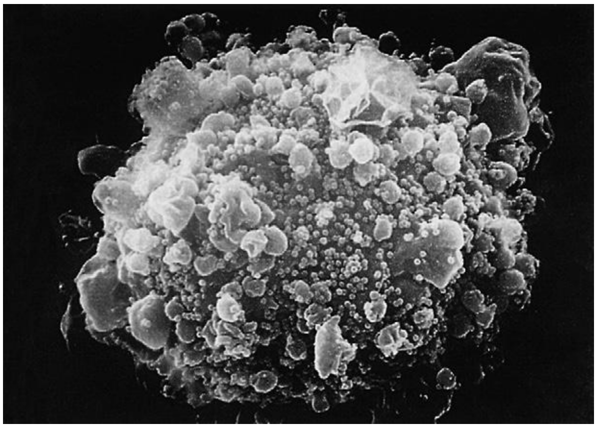
human immunodeficiency virus (HIV) /im′yo͞onō′difish′ənsē/ [L, *humanus* + *immunis*, free from, *de*, from, *facere*, to make, *virus*, poison], a retrovirus that causes acquired immunodeficiency syndrome (AIDS). Retroviruses produce the enzyme reverse transcriptase, which allows the viral RNA genome to be transcribed into DNA inside the host cell. HIV is transmitted through contact with an infected individual's blood, semen, breast milk, cervical secretions, cerebrospinal fluid, or synovial fluid. It infects CD4-positive helper T cells of the immune system and causes infection with an incubation period that averages 10 years. With the immune system destroyed, AIDS develops as opportunistic infections such as **candidiasis**, **Kaposi's sarcoma,** ***Pneumocystis pneumonia,*** and **tuberculosis** attack organ systems throughout the body. Aside from the initial antibody tests (enzyme-linked immunosorbent assay and Western blot) that establish the diagnosis for HIV infection, the most important laboratory test for monitoring the level of infection is the CD4 lymphocyte test, which determines the percentage of T lymphocytes that are CD4 positive. Patients with CD4 cell counts greater than 500/mm^3 are considered most likely to respond to treatment with alpha-interferon and/or zidovudine. A significant drop in the CD4 cell count is a signal for therapeutic intervention with antiretroviral therapy. Vaccines based on the HIV envelope glycoproteins gp120 and gp160, intended to boost the immune system of people already infected with HIV, are being investigated. Formerly called **human T-cell leukemia virus type III, human T-cell lymphotropic virus type III.** See also **acquired immunodeficiency syndrome.**



Structure of human immunodeficiency virus
(Mahon, Lehman, and Manuselis, 2011)

human insulin, a biosynthetic product manufactured from ***Escherichia coli*** by recombinant deoxyribonucleic acid technology. The advantage of human insulin is that it eliminates allergic reactions that occur with the use of animal insulins. See also **insulin,** def. 2.

human investigations committee, a group established in a hospital, school, or university to review research proposals involving human subjects to protect the rights of the people to be studied and to ensure that ethical principles are appropriately followed. Also called **human subjects review committee,** and in hospitals, the **institutional review board.**



Electron micrograph of HIV-infected cell
(Goering et al, 2008/Courtesy D. Hockley)

Signs and symptoms of HIV infection

- Chills and fever
- Night sweats
- Dry, productive cough
- Dyspnea
- Lethargy
- Confusion
- Stiff neck
- Seizures
- Headache
- Malaise
- Fatigue
- Oral lesions
- Skin rash
- Abdominal discomfort
- Diarrhea
- Weight loss
- Lymphadenopathy
- Progressive generalized edema

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St Louis, 2007, Mosby.

humanism /h(y)o͞o′məniz′əm/, a system of thought pertaining to the interests, needs, and welfare of human beings; the concept that human needs and values are of utmost importance.

humanistic existential therapy /hyo͞o′mənis′tik/, a kind of psychotherapy that promotes self-awareness and personal growth by stressing current reality and by analyzing and altering specific patterns of response to help a person realize his or her potential. This process may be facilitated in a group setting, where additional aspects of problems are revealed through interaction with others. Kinds of humanistic existential psychotherapy are **client-centered therapy, existential therapy,** and **Gestalt therapy.** Also called **existential humanistic psychotherapy.**

humanistic nursing model, a conceptual framework in which the nurse-patient relationship is analyzed as a human-to-human event rather than a nurse-to-patient interaction. The nurse makes therapeutic use of herself or himself, understanding the effects of nursing actions. Four phases are recognized in the development of the therapeutic relationship. The encounter phase is followed by the phase in which the identities of the nurse and patient emerge. The nurse empathizes and then sympathizes with the patient. The meaning of the patient's experience is important; hope and suffering are seen as central to that experience. Self-knowledge and self-awareness of the nurse are essential. Nursing intervention proceeds in five steps: observation of the need for intervention; validation of this observation; determination of the ability of the nurse to facilitate any necessary referral; formulation of a plan for meeting the need; and evaluation of the degree to which the need is met.

humanistic psychology, a branch of psychology that emphasizes a person's struggle to develop and maintain an integrated, harmonious personality as the primary motivational force in human behavior. See also **self-actualization.**

human leukocyte antigen (HLA), any one of four significant histocompatibility antigens governed by genes of the HLA complex, specific loci on chromosome 6, designated HLA-A, HLA-B, HLA-C, and HLA-D. Each locus has several genetically determined alleles; each of these is associated with certain diseases or conditions; for example, HLA-B27 is usually present in people who have ankylosing spondylitis. The HLA system is used to assess tissue compatibility. White blood cells are used for testing. Perfect tissue compatibility exists only between identical twins. See also **histocompatibility gene.**

human liver fluke. See **liver fluke.**

human lymphocyte antigen B27 (HLA-B27) test, a blood test done as part of paternity investigations, to indicate tissue compatibility with tissue transplantation, and to assist in the diagnosis of Reiter's syndrome and other conditions.

human metapneumovirus, a species that causes respiratory infection in humans that is clinically similar to but less severe than that caused by respiratory syncytial virus.

human monocytic ehrlichiosis. See **ehrlichiosis.**

human natural killer cell, a lymphocyte that is able to lyse tumor and virally infected cells as part of the body's natural defense against malignancy and invasion by pathogens.

human papillomavirus (HPV), a virus that is the cause of common warts of the hands and feet, as well as lesions of the mucous membranes of the oral, anal, and genital cavities. More than 50 types of HPV have been identified, some of which are associated with cancerous and precancerous conditions. The virus can be transmitted through sexual contact, and specific types of the virus are a precursor to cancer of the cervix. Transmission has taken place without the presence of warts, indicating that it may occur through body fluids, such as semen or cervical secretions. There is no specific cure for an HPV infection, but the virus often can be controlled by podophyllin or interferon and the warts can be removed by cryosurgery, laser treatment, or conventional surgery. A vaccine is available for young girls and women (9-26 years) that protects against four types of HPV.

human papillomavirus (HPV) test, a fluid analysis of a cervical mucus specimen, performed to identify genital HPV in women who have abnormal Pap smears.

human parvovirus (HPV), a small single-stranded deoxyribonucleic acid virion that has been associated with several diseases, including erythema infectiosum and aplastic crises of chronic hemolytic anemias. Parvoviruses of various types also infect wild and domestic animals and may replicate in susceptible cells without a helper virus. See also **helper virus, virion.**

human placental lactogen (HPL), a placental hormone that may be deficient in certain abnormalities of pregnancy. The normal concentrations of this hormone in serum after the fifth week of pregnancy are 0.5 μg/mL and increase to approximately 8 μg/mL at the time of delivery. Also called *chorionic somatomammotropin*.

human placental lactogen (HPL) test, a blood test to measure HPL, useful in monitoring placental function.

human prion diseases. See **transmissible spongiform encephalopathy.**

human rhinovirus 14, the common cold virus. It has a complex protein coat containing "sticky sites" that help attach the virus to cell receptors in the upper respiratory system. Because of the more than 100 strains of the virus that are known, devising a vaccine that would protect against all variations is difficult.

human subjects review committee. See **human investigations committee.**

human T-cell leukemia virus, human T-cell lymphotropic virus, former names for human T-lymphotropic virus.

human T-cell leukemia virus type I. See **human T-cell lymphotropic virus type I.**

human T-cell leukemia virus type II. See **human T-cell lymphotropic virus type II.**

human T-cell leukemia virus type III. See **human immunodeficiency virus.**

human T-cell lymphotropic virus type I (HTLV-I), a type C oncovirus of worldwide distribution but most common in Japan, Africa, and the Caribbean basin, having an affinity for helper/inducer T lymphocytes, that causes chronic infection and is associated with adult T-cell leukemia and lymphoma and tropical spastic paraparesis. Also called **human T-cell leukemia virus type I.**

human T-cell lymphotropic virus type II (HTLV-II), a type C oncovirus having extensive serological cross-reactivity with HTLV-I, isolated from an atypical T-cell variant of hairy cell leukemia and also from patients with other hematologic disorders. Also called **human T-cell leukemia virus type II.**

human T-cell lymphotropic virus type III (HTLV-III). See **human immunodeficiency virus.**

human T-cell lymphotrophic virus (HTLV) type I/II antibody test, a blood test to detect HTLV infection.

Humatin, a trademark for an amebicide **(paromomycin sulfate).**

Humatrope, a trademark for a brand of human synthetic growth hormone produced with recombinant deoxyribonucleic acid techniques. It is a polypeptide hormone with 191 amino acids in the same sequence as somatotropin, the human **growth hormone** produced by the pituitary gland.

humectant /hyo͞omek′tənt/, a substance that promotes retention of moisture.

humer-, prefix meaning "the humerus": *humeroradial, humeroulnar.*

humeral. See **humerus.**

humeral articulation. See **shoulder joint.**

humeral stem, in arthroplasty of the shoulder or elbow, the part of the prosthesis that inserts into the end of the trimmed and prepared humerus.

humerus /hyo͞o′mərəs/ *pl. humeri* [L, shoulder], the bone of the upper arm, from the elbow to the shoulder joint where it articulates with the scapula. It comprises a body, a head, and two condyles. The body is almost cylindric proximally and prismatic and flattened distally and has two borders and three surfaces. The nearly hemispheric head articulates with the glenoid cavity of the scapula and has a constriction called the surgical neck, frequently the seat of a fracture. The condyles at the distal end have several features that articulate with the radius and ulna. Also called **arm bone.** **—humeral,** *adj*.

humidification /hyo͞omid′ifikā′shən/ [L, *humidus,* moist, *facere,* to make], the process of increasing the relative humidity of the atmosphere around a patient through the use of aerosol generators or steam inhalers that exert an antitussive effect. Humidification acts by decreasing the viscosity of bronchial secretions, whereas added medications or sodium chloride may stimulate coughing by an irritant effect.

humidifier /hyo͞omid′ifī′ər/ [L, *humidus,* moist, *facere,* to make], a machine designed to adjust the amount of moisture in the atmosphere of a room or respiratory device.

humidifier lung, hypersensitivity pneumonitis caused by inhalation of air that has been passed through humidifiers, dehumidifiers, or air conditioners contaminated by any variety of fungi, amebas, or thermophilic bacteria.

humidity /hyo͞omid′itē/ [L, *humidus,* moist], the level of moisture in the atmosphere, which varies with the temperature. The percentage is usually represented in terms of **relative humidity,** with 100% the point of air saturation, or the level at which the air can absorb no additional water.

humor[1] /hyo͞o′mər/ [L, *humidus,* moist], any body fluid or semifluid substance such as blood or lymph. The term is often used in reference to the **aqueous humor** or the **vitreous humor** of the eye.

humor[2]**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating the patient to perceive, appreciate, and express what is funny, amusing, or ludicrous in order to establish relationships, relieve tension, release anger, facilitate learning, or cope with painful feelings. See also **Nursing Interventions Classification.**

humoral hypercalcemia of malignancy, hypercalcemia of malignancy caused by bone resorption mediated by circulating osteoclast-activating factors released from distant tumor cells.

humoral immunity /hyo͞o′mərəl/ [L, *humor,* liquid, *immunis,* freedom], a form of immunity mediated by circulating antibodies (immunoglobulins IgA, IgB, and IgM), which coat the antigens and target them for destruction by polymorphonuclear neutrophils. Circulating antibodies are produced by plasma cells of the reticuloendothelial system. The interaction of antibody with antigen also activates the complement system. Compare **cellular immunity.** See also **antigen-antibody reaction.**

humoral response, a hypersensitivity reaction mediated by B lymphocytes. Compare **cell-mediated immune response.** See also **humoral immunity.**

Humorsol, a trademark for an ophthalmic anticholinesterase agent **(demecarium bromide).**

humpback /hump′bak/ [Du, *homp,* thick slice; AS, *baec*]. See **kyphosis.**

Humulin, a trademark for a brand of human insulin of recombinant deoxyribonucleic acid origin.

hunger, a physical sensation usually associated with a craving or desire for food.

hunger contractions, strong contractions of the stomach usually associated with a desire for food.

hunger pain, epigastric cramps often associated with a desire for food.

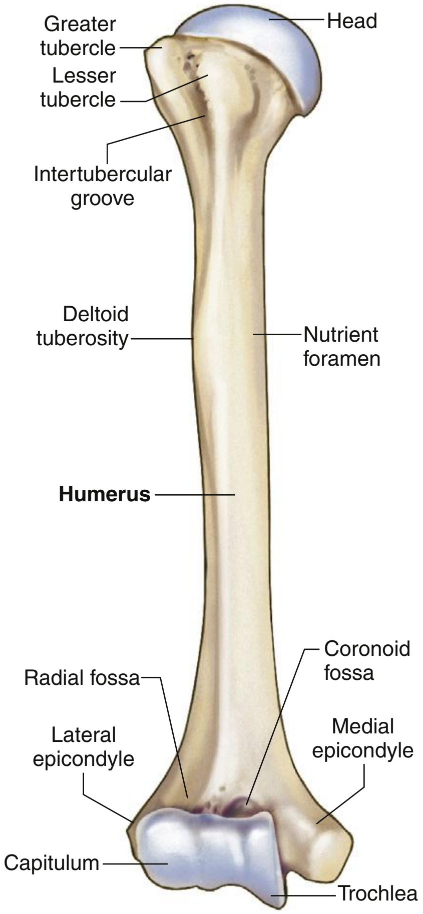
hung-up reflex, a deep tendon reflex in which, after a stimulus is given and the reflex action takes place, the limb slowly returns to its neutral position. This prolonged relaxation phase is characteristic of reflexes in persons with hypothyroidism. See also **deep tendon reflex.**

Hunner's ulcer [Guy LeRoy Hunner, American surgeon, 1868–1957], a deep hemorrhagic lesion in the bladder associated with interstitial cystitis.

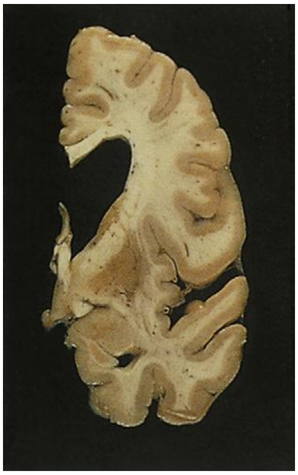
Hunter's canal. See **adductor canal.**

Hunter's syndrome [Charles Hunter, Canadian physician, 1873–1955; Gk, *syn,* together, *dromos,* course], a hereditary defect in mucopolysaccharide metabolism affecting only males, characterized by dwarfism, kyphosis, gargoylism, and mental retardation. It is transmitted as an X-linked recessive trait. Females who carry the gene can be identified by biochemical tests. Also called **MPS II, X-linked mucopolysaccharidosis.** See also **mucopolysaccharidosis.**

Huntington's disease [George S. Huntington, American physician, 1851–1916], a rare abnormal hereditary condition characterized by chronic progressive chorea and mental



Humerus *(Patton and Thibodeau, 2010)*



Huntington's disease: dilated lateral ventricle with caudate and lentiform atrophy *(Perkin, 2002)* deterioration that results in dementia. An individual afflicted with the condition usually shows the first signs in the fourth decade of life and dies within 15 years. It is transmitted as an autosomal trait and becomes progressively worse in severity as the trinucleotide repeats grow in successive generations. There is no known effective treatment, but symptoms can be relieved with medication.

Hunt's neuralgia. See **geniculate neuralgia.**

Hurler's syndrome [Gertrude Hurler, German physician, 1889–1965], a type of mucopolysaccharidosis, transmitted as an autosomal-recessive trait, that produces severe mental retardation. Symptoms appear within the first few months of life. Characteristic signs of the disease are enlargement of the liver and spleen, often with cardiovascular involvement. Facial characteristics include a low forehead and enlargement of the head, sometimes resulting from hydrocephalus. Corneal clouding is common, and the neck is short. Marked kyphosis is apparent at the dorsolumbar level, and the hands and the fingers are short and broad. Flexion contractures are common. The disease process usually results in death during childhood from cardiac complications or pulmonary disorders. Also called **gargoylism, lipochondrodystrophy, MPS I.** See also **mucopolysaccharidosis.**

Hurter and Driffield curve. See **characteristic curve.**

Hürthle cell adenoma /hirt′lə, ho͞orth′lē/ [Karl W. Hürthle, German histologist, 1860–1945], a benign tumor of the thyroid gland composed of large cells with granular eosinophilic cytoplasm (Hürthle cells). Compare **Hürthle cell carcinoma.**

Hürthle cell carcinoma [Karl W. Hürthle], a malignant neoplasm of the thyroid gland composed of Hürthle cells. These tumors, which occur more often in women than in men, are encapsulated, resemble adenomas, and are locally invasive. Compare **Hürthle cell adenoma.**

Hürthle cell tumor [Karl W. Hürthle], a neoplasm of the thyroid gland composed of large cells with granular eosinophilic cytoplasm (Hürthle cells) that may be benign (Hürthle cell adenoma) or malignant (Hürthle cell carcinoma).

husband-coached childbirth. See **Bradley method.**

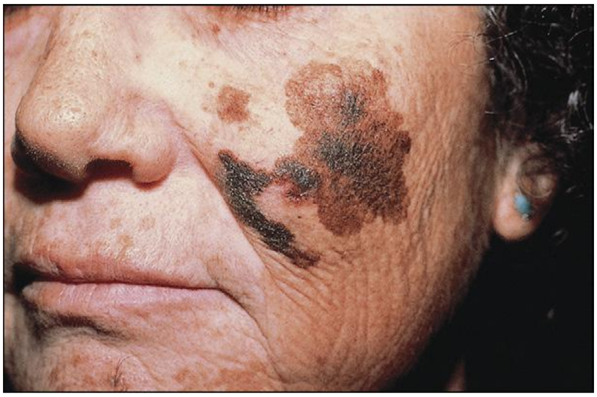
Husted, Gladys L. and James H., nursing theorists who developed the Symphonological Bioethical Theory and the Symphonological Model for Ethical Decision Making. Symphonology is the system of ethics inherent in the mutual commitments and obligations agreed upon by the health care professional and patient. Central to this implicit agreement are the needs of the patient. Bioethical standards include autonomy, beneficence, fidelity, freedom, objectivity, and self-assertion. The model is designed to provide nurses and other health care professionals with theoretical guidelines for ethical delivery of care.

Hutch diverticulum, herniation of bladder mucosa through a weak point in the wall near the ureterovesical junction, often caused by chronically high intravesical pressure.

Hutchinson-Gilford syndrome. See **progeria.**

Hutchinson's disease. See **angioma serpiginosum.**

Hutchinson's freckle [Jonathan Hutchinson, English surgeon, 1828–1913], a tan patch on the skin that grows slowly and becomes mottled, dark, thick, and nodular. The lesion is usually seen on one side of the face of an elderly person. Local excision is recommended because it often becomes malignant. Also called **lentigo maligna.** See also **melanoma.**



Hutchinson's freckle
(White and Cox, 2006/Courtesy Dr. Michael O. Murphy)

Hutchinson's teeth [Jonathan Hutchinson], a characteristic of congenital syphilis in which the adult secondary central and lateral incisors are peg-shaped or screwdriver-shaped, widely spaced, and notched at the end, with a central crescent-shaped deformity. Also called *Hutchinson's incisors*. See also **syphilis.**

Hutchinson's triad [Jonathan Hutchinson], the interstitial keratitis, notched teeth, and deafness characteristic of congenital syphilis. See also **syphilis.**

Hutchison-type neuroblastoma [Robert G. Hutchison, English pediatrician, 1871–1960; Gk, *typos*, mark], a neuroblastoma that has metastasized to the cranium.

HUTT, abbreviation for **heads-up tilt table test.**

HVA, abbreviation for **homovanillic acid.**

HV interval /in′tərvəl/, the conduction time of an impulse traveling through the His-Purkinje system. It is measured from the onset of the atrioventricular bundle potential to the onset of ventricular activation as recorded on an electrogram.

HVL, abbreviation for **half-value layer.**

hyal-. See **hyalo-.**

hyaline /hī′əlin/ [Gk, *hyalos*, glass], pertaining to substances that are clear or glasslike.

hyaline bodies [Gk, *hyalos* + AS, *bodig*], **1.** the residue of colloidal degeneration found in some cells. **2.** globules of neurosecretory material found in the posterior lobe of the pituitary. **3.** deposits of homogenous eosinophilic material found in renal tubular epithelium and representing excess protein molecules that cannot be metabolized or transported.

hyaline cartilage [Gk, *hyalos*, glass; L, *cartilago*], a type of connective tissue composed of specialized cells in a translucent, pearly blue matrix. Hyaline cartilage thinly covers the articulating ends of bones, connects the ribs to the sternum, and supports the nose, the trachea, and part of the larynx. It is covered by a membranous perichondrium, except where it coats the ends of bones, and tends to calcify in advanced age. Compare **elastic cartilage, white fibrocartilage.**

hyaline cast, a transparent cast composed of mucoprotein.

hyaline membrane [Gk, *hyalos*, glass; L, *membrana*], a fibrous covering of the alveolar membranes in infants, caused by a lack of pulmonary surfactant associated with prematurity and low-birth-weight delivery. See also **respiratory distress syndrome of the newborn.**

hyaline membrane disease. See **respiratory distress syndrome of the newborn.**

hyaline thrombus, a transparent mass of hemolyzed erythrocytes.

hyalinization /hī′əlin′īzā′shən/ [Gk, *hyalos,* glass], the development of glassy homogenous material within a cell.

hyalinuria /-ŏŏr′ē·ə/ [Gk, *hyalos,* glass, *ouron,* urine], the presence of hyaline casts of protein in acidic urine, indicative of renal disease.

hyalo-, hyal-, prefix meaning "resembling glass": *hyaloenchondroma, hyaloplasm, hyaloid.*

hyalohyphomycosis /hi′älohi′fomiko′sis/, a hyphomycosis caused by mycelial fungi with colorless walls, most of which are opportunistic. It usually occurs as a result of steroid therapy, indwelling catheters, immunosuppressive drugs, or cytotoxins.

hyaloid /hī′əloid/ [Gk, *hyalos,* glass, *eidos,* form], pertaining to or resembling hyaline.

hyaloid artery [Gk, *hyalos* + *eidos,* form], an embryonic blood vessel that branches to supply the vitreous body of the eye and develops part of the blood supply to the capsula vasculosa lentis. The hyaloid artery disappears from the fetus in the ninth month of pregnancy, leaving a vestigial remnant, the hyaloid canal, which persists in the adult as a narrow passage through the vitreous body from the optic disc to the posterior surface of the crystalline lens.

hyaloid membrane [Gk, *hyalos,* glass; L, *membrana*], a surface layer of the vitreous body of the eye, at the interface between the primary and secondary vitreous and at the boundaries of the hyaloid canal.

hyaloplasm /hī′əlōplaz′əm/ [Gk, *hyalos* + *plasma,* formation], the portion of the cytoplasm that is clear and more fluid than the granular and reticular part. Also called **cytohyaloplasm, cytolymph, enchylema, interfibrillar mass of Flemming, interfilar mass, paramitome.**

hyaluronate /hi′älŏŏronāt/, a salt, anion, or ester of hyaluronic acid. The sodium salt and a derivative of it are used as analgesics in the treatment of osteoarthritis of the knee, administered by intraarticular injection.

hyaluronate sodium, the sodium salt of hyaluronic acid; a preparation obtained from chicken combs used as an analgesic in the treatment of osteoarthritis of the knee, administered by intraarticular injection.

hyaluronate sodium derivative, a polymeric derivative of hyaluronate sodium, having the same actions and uses.

hyaluronic acid /hī′əlyŏŏron′ik/, a mucopolysaccharide formed by the polymerization of acetylglucosamine and glucuronic acid, which occurs in vitreous humor, synovial fluids, and various tissues. Known as the cement substance of tissues, it forms a gel in intercellular spaces.

hyaluronidase /hī′əlyŏŏron′ədās/, an enzyme that hydrolyzes hyaluronic acid, a component of the extracellular matrix.
■ INDICATIONS: It is prescribed to increase the absorption and dispersion of parenteral drugs that have extravasated (e.g., vesicant chemotherapeutics), for hypodermoclysis, and for improvement of resorption of radiopaque agents.
■ CONTRAINDICATIONS: Acute inflammation, infection, or known hypersensitivity to this drug prohibits its use.
■ ADVERSE EFFECT: The most serious adverse effect is hypersensitivity.

hybrid /hī′brid/ [L, *hybrida,* offspring], **1.** *n,* an offspring produced by mating organisms from different species, varieties, or genotypes. **2.** *adj,* pertaining to such an offspring.

hybrid computer, a computer that combines the characteristics of a digital computer and an analog computer by its capacity to accept input and provide output in either digital or analog form and to process information digitally. Compare **analog computer, digital computer.**

hybridization /hī′bridīzā′shən/, **1.** the process of producing hybrids by crossbreeding. **2.** the process of combining single-stranded nucleic acids from different sources to form stable, double-stranded molecules. The technique involves fragmentation and separation of the source nucleic acids by heating, followed by recombination through cooling. The resulting hybrids can be DNA-DNA, DNA-RNA, or RNA-RNA duplexes.

hybridoma /hī′bridō′mə/, a hybrid cell formed by the fusion of a myeloma cell and an antibody-producing cell. Hybridomas are used to produce monoclonal antibodies.

hybrid subtraction, a method for producing digitized radiographic images that requires at least four images. It uses both energy and temporal subtraction steps to mitigate patient motion artifacts.

hybrid vigor. See **heterosis.**

Hycodan, a trademark for a fixed-combination antitussive/decongestant medication containing hydrocodone, chlorpheniramine, phenylephrine, caffeine, and acetaminophen.

Hycomine, a trademark for a fixed-combination drug containing an adrenergic (phenylpropanolamine hydrochloride) and an antitussive **(hydrocodone bitartrate).**

hydantoin /hīdan′tō·in/, any one of a group of anticonvulsant medications, chemically and pharmacologically similar to the barbiturates, that acts to limit seizure activity and reduce the spreading of abnormal electrical excitation from the focus of the seizure. A primary hydantoin in the management of almost all forms of epilepsy is phenytoin, formerly known as diphenylhydantoin. Frequent determination of the blood concentration of hydantoin is necessary.

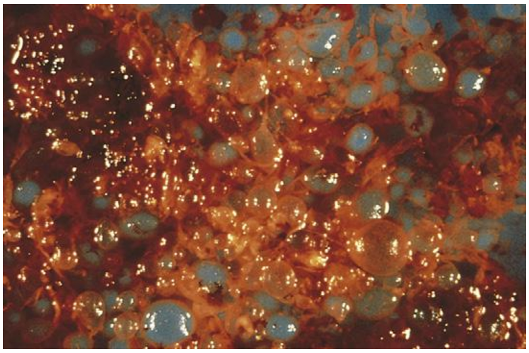
hydatid /hī′dətid/ [Gk, *hydatis,* water drop], a cyst or cystlike structure that usually is filled with fluid, especially the cyst formed around the developing scolex of the dog tapeworm *Echinococcus granulosus.* Humans and sheep can become hosts to the larval stage by ingesting the eggs. Hydatid cysts may be identified by palpation. They occur most commonly in the liver. An acute anaphylactoid allergic reaction may occur if the cyst ruptures. See also **hydatid cyst, hydatid mole, hydatidosis.** —*hydatic, adj.*

hydatid cyst, a cyst in the liver that contains larvae of the tapeworm *Echinococcus granulosus,* whose eggs are carried from the intestinal tract to the liver via the portal circulation. Patients are generally asymptomatic, except for hepatomegaly and a dull ache over the right upper quadrant of the abdomen. Radiological tests are used in diagnosis, and, because no medical treatment is available, surgical removal of the cyst is indicated. Compare **hydatid mole.**

hydatid disease. See **echinococcosis.**

hydatidiform /hī′dətid′ifôrm/ [Gk, *hydatis,* water drop; L, *forma*], having the appearance or form of a **hydatid.** Also spelled **hydatiform** /hīdat′ifôrm/.

hydatid mole, an intrauterine neoplastic mass of grapelike enlarged chorionic villi that occurs in approximately 1 in 1500 pregnancies in the United States and eight times more frequently in some Asian countries. Molar pregnancies are more common in older and younger women than in those between 20 and 40 years of age. The cause of the degenerative disorder is not known. It may be the result of a primary ovular defect, an intrauterine abnormality, or a nutritional deficiency. Characteristic signs are extreme nausea, uterine bleeding, anemia, hyperthyroidism, an unusually large uterus for the duration of pregnancy, absence of fetal heart sounds, edema, and high blood pressure. Diagnostic measures include ultrasonography, amniography, and measurement of chorionic gonadotropin level in the blood. In most cases the mole is discovered when abortion is threatened or in progress. Oxytocin may be used to stimulate evacuation of a mole that is not spontaneously aborted, and curettage is usually performed several days later to be certain that no molar tissue remains in the uterus. It is important that pregnancy be avoided for at least 1 year and that assays for chorionic gonadotropin be performed to monitor for the risk of development of gestational trophoblastic disease. Also called *hydatidiform mole,* **vesicular mole.** See also **trophoblastic cancer.**



Hydatid mole *(Kumar, Abbas, and Fausto, 2005)*

hydatidosis /hī′dətidō′sis/ [Gk, *hydatis* + *osis,* condition], infestation with the tapeworm *Echinococcus granulosus.* See also **hydatid cyst.**

hydatiform. See **hydatidiform.**

Hydeltrasol, a trademark for a glucocorticoid (prednisoLONE sodium phosphate).

Hydeltra TBA, a trademark for a glucocorticoid (prednisoLONE tebutate).

Hydergine, a trademark for a fixed-combination drug containing various ergoloid mesylates.

hydr-. See **hydro-.**

hydradenitis /hī′dradənī′tis/ [Gk, *hydor,* water, *aden,* gland, *itis,* inflammation], an infection or inflammation of the sweat glands. Also spelled **hidradenitis.**

hydrALAZINE hydrochloride /hīdral′əzēn/, a vasodilator used in hypertension.

■ INDICATION: It is prescribed in the treatment of moderate to severe hypertension, primary pulmonary hypertension, and hypertension of preeclampsia, and during the treatment of congestive heart failure.

■ CONTRAINDICATIONS: Coronary artery disease, mitral valvular rheumatic heart disease, or known sensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are angina pectoris, palpitations, tachycardia, hypotension, anorexia, tremors, blood dyscrasias, depression, nausea, peripheral neuritis, and a drug-induced lupuslike syndrome.

hydramnios /hīdram′nē·əs/ [Gk, *hydor* + *amnos,* lamb's caul], an abnormal condition of pregnancy characterized by an excess of amniotic fluid. It occurs in less than 1% of pregnancies and is diagnosed by palpation, ultrasound, or radiographic examination. It is associated with maternal disorders, including toxemia of pregnancy and diabetes mellitus, and some fetal disorders, including anomalies of the GI tract, respiratory tract, and cardiovascular system, which may interfere with normal exchange of amniotic fluid. Fetal hydrops and multiple gestation are also associated with the condition. The incidence of premature rupture of the membranes, premature labor, and perinatal mortality is increased. Periodic amniocentesis may be necessary. Also called *hydramnion,* **polyhydramnios.** Compare **oligohydramnios.**

hydranencephaly /hīdran′ənsef′əlē/, a neurological disorder in which the cerebral hemispheres are lacking although the cerebellum, brainstem, and other central nervous system tissues may be intact. The newborn with hydranencephaly may have normal neurological functions but does not develop, and computed tomographic scans indicate an absence of cerebral tissue. Treatment is supportive. See also **anencephaly.**

hydrargyrism. See **mercury poisoning.**

hydrate /hī′drāt/ [Gk, *hydor,* water], **1.** a combination of a substance with one or more water molecules. **2.** a molecular association of a substance with water.

hydration^1 /hīdrā′shən/ [Gk, *hydor,* water], a chemical process in which water is added to a substance. Hydration may or may not involve breaking bonds in the substance.

hydration^2**,** a nursing outcome from the Nursing Outcomes Classification (NOC) defined as adequate water in the intracellular and extracellular compartments of the body. See also **Nursing Outcomes Classification.**

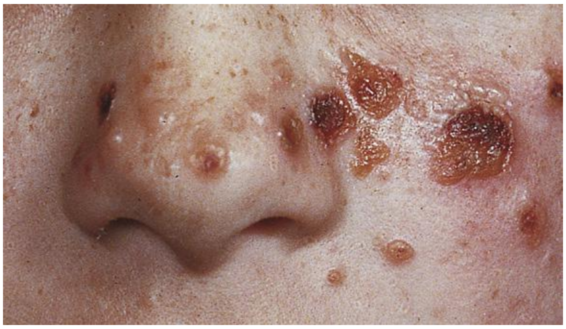
Hydrea, a trademark for an antineoplastic **(hydroxyurea).**

hydremic ascites /hīdrem′ik/ [Gk, *hydor* + *haima,* blood, *askos,* bag], an abnormal accumulation of fluid within the peritoneal cavity accompanied by hemodilution, as in protein calorie malnutrition. See also **ascites.**

-hydria, suffix meaning "level of fluid in the body": *histohydria, isohydria, oligohydria.*

hydro-, hydr-, prefix meaning "water or hydrogen": *hydroadipsia, hydrocele, hydropexis.*

hydroa /hīdrō′ə/ [Gk, *hydor* + *oon,* egg], an unusual vesicular and bullous skin condition of childhood that recurs each summer after exposure to sunlight, sometimes accompanied by itching lichenification and scars. It usually disappears soon after puberty. Treatment includes use of sunscreen and avoidance of exposure to sunlight.



Hydroa vacciniforme *(du Vivier, 2002)*

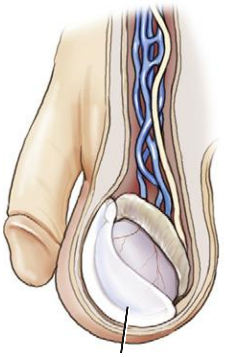
hydroalcoholic /hi′dro·al′kähol′ik/, pertaining to or containing both water and alcohol.

hydrobilirubin /hī′drōbil′iro͞o′bin/ [Gk, *hydor,* water; L, *bilis,* bile, *ruber,* red], a reddish-brown bile pigment produced by the reduction of bilirubin.

hydrocarbon /-kär′bən/ [Gk, *hydor* + L, *carbo,* charcoal], any of a large group of organic compounds whose molecules are composed of hydrogen and carbon, many of which are derived from petroleum. Brief incidental exposures to low concentrations of solvent vapors that contain carbon, such as gasoline, lighter fluids, aerosol sprays, and spot removers, may be relatively harmless, but exposures to concentrations of hydrocarbon vapors often found in the home and in manufacturing environments may be dangerous.

hydrocele /hī′drōsēl′/ [Gk, *hydor* + *kele,* hernia], an accumulation of fluid in any saclike cavity or duct, specifically in the tunica vaginalis testis or along the spermatic cord.

The condition is caused by inflammation of the epididymis or testis or by lymphatic or venous obstruction in the cord. Congenital hydrocele is caused by failure of the canal between the peritoneal cavity and the scrotum to close completely during prenatal development. In some newborns the defect may resolve spontaneously after neonatal obliteration of the communication. Treatment for persistent hydrocele is surgery. Aspiration is only a temporary measure and may induce secondary infection. See also **hydrocephalus, inguinal hernia.**



Hydrocele *(Leonard, 2009)*

hydrocephalic cry /-səfal′ik/, an involuntary loud nighttime cry of a child who has acquired hydrocephalus.

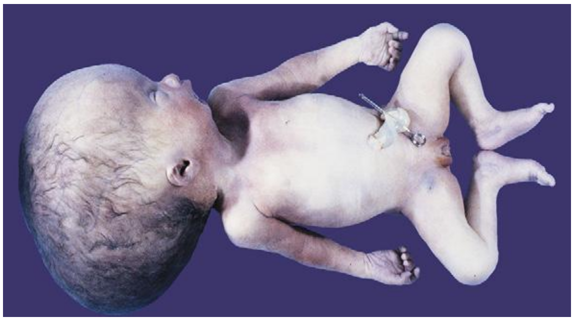
hydrocephalocele, a hernia consisting of a watery sac of brain tissue protruding through a fissure into the skull. Also spelled *hydrencephalocoele*.

hydrocephalus /-sef′ələs/ [Gk, *hydor* + *kephale,* head], a pathological condition characterized by an abnormal accumulation of cerebrospinal fluid, usually under increased pressure, within the cranial vault and subsequent dilation of the ventricles. Interference with the normal flow of cerebrospinal fluid may result from increased secretion of the fluid, obstruction within the ventricular system (noncommunicating or intraventricular hydrocephalus), or defective resorption from the cerebral subarachnoid space (communicating or extraventricular hydrocephalus). Hydrocephalus may be caused by developmental anomalies, infection, trauma, or brain tumors. Also called *hydrocephaly*. See also **macrocephaly.** —*hydrocephalic, adj., n.*

■ OBSERVATIONS: The condition may be congenital, with rapid onset of symptoms, or it may progress slowly so that neurological manifestations do not appear until early to late childhood or even early adulthood. In infants the head grows at an abnormal rate with separation of the sutures, bulging fontanels, and dilated scalp veins. The face becomes disproportionately small, and the eyes appear depressed within the sockets. Typical behavior includes irritability with lethargy and vomiting, opisthotonos, lower extremity spasticity, and failure to perform normal reflex actions. If the condition progresses, lower brainstem function is disrupted; the skull becomes enormous; the cortex is destroyed; and the infant displays somnolence, seizures, and cardiopulmonary obstruction and usually does not survive the neonatal period. At later onset, after the cranial sutures have fused and the skull has formed, symptoms are primarily neurological and include headache, edema of the optic disc, strabismus, and loss of muscular coordination. Hydrocephalus in infants is suspected when head growth is observed to be in excess of the normal rate. In all age groups, diagnosis is confirmed by such procedures as cerebrospinal fluid examination, computed tomography, air encephalography, arteriography, and echoencephalography.

■ INTERVENTIONS: Treatment consists almost exclusively of surgical intervention to correct the ventricular obstruction, reduce the production of cerebrospinal fluid, or shunt the excess fluid by ventricular bypass to the right atrium of the heart or to the peritoneal cavity. Surgically treated hydrocephalus with continued neurosurgical and medical management has a survival rate of approximately 80%, although prognosis depends largely on the cause of the condition. Hydrocephalus is frequently associated with myelomeningocele, in which case there is a less favorable prognosis.

■ NURSING CONSIDERATIONS: Primary care of the child with hydrocephalus consists of maintaining adequate nutrition, proper positioning and support to prevent extra strain on the neck, and assistance with diagnostic evaluation and procedures. After surgery, in addition to routine care and observation to prevent complications, especially infection, the nurse gives support to the parents and teaches them how to care for a child with a functioning shunt, specifically how to recognize signs that indicate shunt malfunction or infection and how to pump the shunt.



Fetus with pronounced hydrocephalus *(Carlson, 2009/ Courtesy M. Barr, Ann Arbor, Michigan.)*

hydrochloric acid (HCl) /-klôr′ik/ [Gk, *hydor* + *chloros,* green], an aqueous solution of hydrogen chloride or hydrogen ions and chloride ions. Hydrochloric acid is secreted in the stomach and is a major component of gastric juice.

hydrochlorothiazide /-klôr′ōthī′əzīd/, a thiazide diuretic.

■ INDICATIONS: It is prescribed in the treatment of mild to moderate hypertension and edema caused by congestive heart failure or protein loss by the kidney (nephritic syndrome).

■ CONTRAINDICATIONS: Anuria or known hypersensitivity to this drug, to other thiazide medication, or to sulfonamide derivatives prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypoglycemia, hyperglycemia, hyperuricemia, and hypersensitivity reactions.

hydrocholeretics /-kō′ləret′iks/ [Gk, *hydor* + *chloe,* bile, *eresis,* removal], drugs that stimulate the production of bile with a low specific gravity or with a minimal proportion of solid constituents.

Hydrocil Instant, a trademark for a laxative (psyllium hydrophilic mucilloid).

hydrocodone bitartrate /-kō′dōn/, an opioid antitussive and analgesic.

■ INDICATIONS: It is prescribed in the treatment of cough and moderate to severe pain.

■ CONTRAINDICATIONS: Drug dependence or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are drug dependence and respiratory and circulatory depression.

hydrocolloid, a gelatinous colloid in which water is the dispersion material. It is used in dentistry as an impression material.

hydrocortisone /-kôr′tisōn/, a topical corticosteroid.

■ INDICATION: It is prescribed for the topical treatment of skin inflammation.

■ CONTRAINDICATIONS: Viral and fungal diseases of the skin that occur where circulation is impaired or known hypersensitivity to steroids prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are various systemic side effects that may result from prolonged or excessive use. Local irritation of the skin may occur.

hydrocortisone enema, an aqueous solution of hydrocortisone administered rectally as an antiinflammatory in treatment of ulcerative colitis.

hydrocortisone, hydrocortisone acetate, hydrocortisone cyclopentylpropionate. See **cortisol.**

hydrocortisone probutate, an ester of hydrocortisone used topically for the relief of inflammation and pruritus in corticosteroid-responsive dermatoses.

hydrocortisone sodium succinate. See **cortisol.**

Hydrocortone, a trademark for a glucocorticoid (hydrocortisone acetate).

hydrocytosis /hi′drōsito′sis/. See **stomatocytosis.**

HydroDIURIL, a trademark for a diuretic **(hydrochlorothiazide).**

hydroencephalocele /hi′drō·ensef′älosēl′/. See **hydrocephalocele.**

hydroflumethiazide /-flo͞o′methī′əzīd/, a diuretic.

■ INDICATIONS: It is prescribed in the treatment of mild to moderate hypertension and edema caused by congestive heart failure or protein loss in the urine (nephrotic syndrome).

■ CONTRAINDICATIONS: Anuria or known hypersensitivity to this drug, to other thiazide medication, or to sulfonamide derivatives prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blood disorders, hypotension, hypokalemia, hyperglycemia, hyperuricemia, and hypersensitivity reactions.

hydrofluoric acid /hī′drōflo͝or′ik/, a term applied to aqueous solutions of hydrogen fluoride, an organic acid used in dilute solutions for cleaning and etching. It is extremely poisonous, as well as corrosive to the skin.

hydrogel, a gel in which water is the dispersion medium.

hydrogen (H) /hī′drəjən/ [Gk, *hydor* + *genein,* to produce], a gaseous monovalent element. Its atomic number is 1; its atomic mass is 1.008. It is the simplest and the lightest of the elements and is a colorless, odorless, highly flammable diatomic gas. It occurs in pure form only sparsely in the earth and the atmosphere but is plentiful in the sun and in many other stars. Hydrogen is a component of numerous compounds, many of them produced by the body. As a component of water, hydrogen is crucial in the metabolic interaction of acids, bases, and salts within the body and in the fluid balance necessary for the body to survive.

hydrogenase /hī′drōjənās′/ [Gk, *hydor,* water, *genein,* to produce, *ase,* suffix indicating an enzyme], an enzyme that catalyzes reduction of molecules by combining them with two atoms of hydrogen.

hydrogenation. See **reduction,** def. 1.

hydrogen bonding, the attractive force of compounds in which a hydrogen atom covalently linked to an electronegative element such as oxygen, nitrogen, or fluorine has a large degree of positive character relative to the electronegative atom, thereby causing the compound to possess a large dipole and to associate strongly with other like molecules.

hydrogen carbonate. See **bicarbonate.**

hydrogen cyanide (HCN), an extremely poisonous, colorless, toxic, volatile liquid or gas with the aroma of bitter almonds. It occurs naturally in almonds and in the stone pits of peaches, plums, and other fruits. Inhalation of the gas can cause death within a minute. When dissolved in water, it is called *hydrocyanic acid* or *prussic acid*.

hydrogen donor, a compound that gives up hydrogen (usually H^+, a proton) to another compound.

hydrogen ion $[H^+]$, a positively charged hydrogen atom or proton.

hydrogen ion $[H^+]$ concentration of blood, a measure of blood pH and its effect on the ability of the hemoglobin molecule to hold oxygen. See also **Bohr effect.**

hydrogen peroxide, a disinfectant and sterilizing agent without antiseptic properties because it is rapidly inactivated by enzymes in the skin. However, the frothing that occurs is beneficial since it loosens debris in wounds.

hydrogen sulfide poisoning, poisoning by excessive exposure to hydrogen sulfide gas, seen primarily in those who work with petroleum or petrochemicals. The gas is a potent inhibitor of cytochrome-*c* oxidase, and poisoning is characterized by metabolic acidosis and anoxia. Severe cases may result in coma with death from respiratory paralysis. Treatments include immediate inhalation of amyl nitrate, injections of sodium nitrate, inhalation of oxygen, administration of bronchodilators, and, in severe cases, hyperbaric oxygen therapy.

hydroglossa. See **ranula.**

hydrokinetics /-kinet′iks/ [Gk, *hydor,* water, *kinesis,* motion], the study of movement of fluids.

hydrolase /hī′drōlās/, an enzyme that cleaves ester bonds by the addition of water.

hydrolysis /hīdrol′isis/ [Gk, *hydor* + *lysis,* loosening], the chemical alteration or decomposition of a compound with water.

hydrolytic /-lit′ik/ [Gk, *hydor,* water, *lysis,* loosening], pertaining to or having the ability to produce hydrolysis.

hydrolyze /hī′drōlīz/ [Gk, *hydor,* water, *lysis,* loosening], **1.** to cause or bring about hydrolysis. **2.** to cause a substance to split into component parts by the addition of water.

hydrometer /hīdrom′ətər/ [Gk, *hydor* + *metron,* measure], a device that determines the specific gravity or density of a liquid by a comparison of its weight with that of an equal volume of water. A calibrated hollow glass device is placed in the liquid being examined, and the depth to which the device settles in the liquid is noted.

hydromorphone hydrochloride /-môr′fōn/, an opioid analgesic.

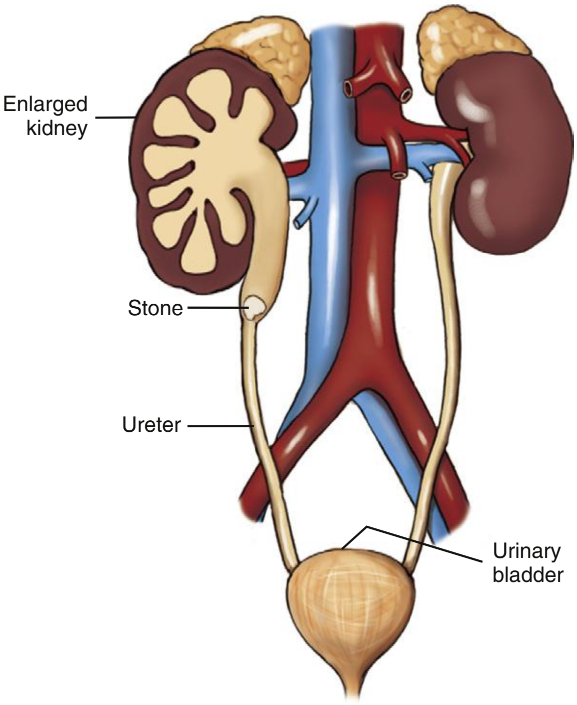
■ INDICATION: It is used to treat moderate to severe pain.

■ CONTRAINDICATIONS: It is used with caution in many conditions, including head injuries, asthma, impaired renal or hepatic function, or unstable cardiovascular status. Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are drowsiness, dizziness, nausea, constipation, respiratory and circulatory depression, and drug addiction.

hydromyelia /hī′drōmī·ē′lē·ə/ [Gk, *hydor,* water + *myelos,* marrow], a pathological condition characterized by dilation of the central canal of the spinal cord with increased fluid accumulation. Compare **syringomyelia.**

hydronephrosis /hī′drōnefrō′sis/ [Gk, *hydor* + *nephros,* kidney, *osis,* condition], distension of the pelvis and calyces of the kidney by urine that cannot flow past an obstruction in a ureter. Ureteral obstruction may be caused by a tumor, a calculus lodged in the ureter, inflammation of the prostate gland, or edema caused by a urinary tract infection. Symptoms include pain in the flank and, in some cases, hematuria, pyuria, and hyperpyrexia. IV pyelography, cytoscopy, or retrograde pyelography may be used in diagnosis. Surgical repair or removal of the obstruction may be necessary. Prolonged hydronephrosis causes atrophy and eventual loss of kidney function. Also called **ureterohydronephrosis.** See also **urinary calculus.** —*hydronephrotic, adj.*



Hydronephrosis *(Leonard, 2009)*

hydropenia /-pē′nē·ə/, **1.** the process of removing water from a living thing. **2.** the condition resulting from lack of water in the body tissues.

hydropericarditis, inflammation of the pericardium accompanied by excessive accumulation of serous fluid.

hydropericardium. See **pericardial effusion.**

hydroperitoneum /-per′itənē′əm/, an accumulation of fluid in the peritoneum.

hydrophilic /-fil′ik/ [Gk, *hydor* + *philein,* to love], pertaining to the property of attracting or associating preferentially with water molecules, a quality possessed by polar radicals or ions. Compare **hydrophobic.**

hydrophobia /-fō′bē·ə/ [Gk, *hydor* + *phobos,* fear], **1.** one of the later symptoms of a **rabies** infection. **2.** a morbid, extreme fear of water.

hydrophobiaphobia, a morbid fear of hydrophobia, with symptoms that may simulate those of rabies.

hydrophobic [Gk, *hydor* + *phobos,* fear], pertaining to the property of repelling or preferentially excluding water molecules, a quality possessed by nonpolar radicals or molecules that are more soluble in organic solvents than in water. Compare **hydrophilic.**

hydrophone /hī′drəfōn/, a small-diameter probe with a piezoelectric element, usually about 0.5 mm in diameter, at one end. When placed in an ultrasound beam, the hydrophone produces an electric signal.

hydrophthalmos, **1.** a type of glaucoma characterized by enlargement and distension of the fibrous coats of the eyeball. **2.** See **congenital glaucoma.**

hydropic /hīdrop′ik/ [Gk, *hydrops*], **1.** pertaining to the condition of dropsy. **2.** containing an excess of water or watery fluid.

Hydropres, a trademark for a fixed-combination drug containing a diuretic **(hydrochlorothiazide)** and an antihypertensive **(reserpine).**

hydrops /hī′drops/ [Gk, dropsy], an abnormal accumulation of clear watery or serous fluid in a body tissue or cavity, such as a joint, a graafian follicle, a fallopian tube, the abdomen, the middle ear, or the gallbladder. Hydrops in the entire body may occur in infants born with thalassemia or severe Rh sensitization. Formerly called **dropsy.**

hydrops fetalis, massive edema in the fetus or newborn, usually in association with severe erythroblastosis fetalis. Severe anemia and effusions of the pericardial, pleural, and peritoneal spaces also occur. The condition usually leads to death, even with immediate exchange transfusions after delivery. Also called **fetal hydrops.**

hydrops gravidarum [Gk, *hydor,* water; L, *gravidus,* pregnant], edema caused by pregnancy.

hydrops tubae profluens, blocking of the fallopian tube. See **intermittent hydrosalpinx.**

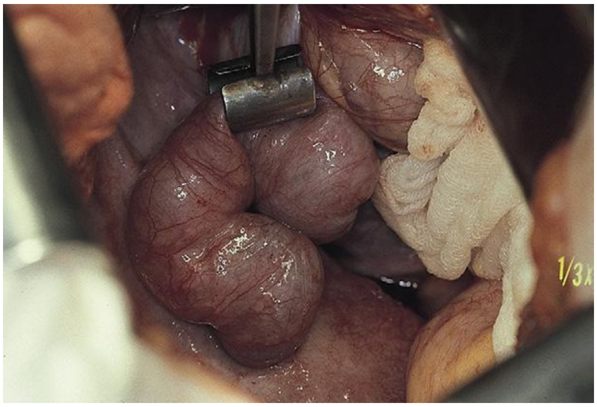
hydroquinone /hī′drōkwin′ōn/, a dermatological bleaching agent.

■ INDICATIONS: It is prescribed to reduce pigmentation of the skin in certain conditions in which an excess of melanin causes hyperpigmentation.

■ CONTRAINDICATIONS: Sunburn, prickly heat, other irritation of the skin, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are tingling, erythema, burning, and severe inflammation of the skin.

hydrosalpinx /hī′drōsal′pingks/ [Gk, *hydor* + *salpinx,* tube], an abnormal condition of the fallopian tube in which it is cystically enlarged and filled with clear fluid. It is the result of an infection that has previously occluded the tube at both ends. The purulent material produced by the infection undergoes liquefaction during resolution of the acute phase of the inflammatory process.



Hydrosalpinx *(Baggish and Karram, 2011)*

hydrosis [Gk, *hydor,* water, *osis,* condition], pertaining to the production of sweat. Also spelled **hidrosis.**

Hydro-Sphere Nebulizer, a trademark for a type of nebulizer in which a source gas enters a hollow sphere coated with a film of water. The gas exits through slits at the top of the sphere as an aerosol jet, carrying particles of fluid from the sphere's surface.

hydrostatic /-stat′ik/ [Gk, *hydor,* water, *statos,* standing], pertaining to fluids at rest or in equilibrium and the pressure they exert.

hydrostatic dosimetry, the weighing of a person under water to determine the ratio of lean tissue to body fat.

hydrostatic pressure, the pressure exerted by a liquid.

hydrostatics, the study of pressures in liquids at rest or in equilibrium.

hydrotherapy /-ther′əpē/ [Gk, *hydor* + *therapeia,* treatment], the use of water in the treatment of various disorders. Hydrotherapy may include continuous tub baths, wet sheet packs, or shower sprays.

hydrothorax /-thôr′aks/ [Gk, *hydor* + *thorax,* chest], a noninflammatory accumulation of serous fluid in one or both pleural cavities.

hydrotropism /-trō′pizəm/ [Gk, *hydor* + *trope,* turning], the tendency of a cell or organism to turn or move in a certain direction under the influence of a water stimulus.

hydrous /hī′drəs/ [Gk, *hydor,* water], pertaining to a substance or object that contains water or is moist.

hydrous wool fat. See **lanolin.**

hydroxide (OH-) /hīdrok′sīd/, an ion.

hydroxyamphetamine hydrobromide /hīdrok′sē·əmfet′əmēn/, an adrenergic agonist.

■ INDICATIONS: It is prescribed for short-term dilation of the pupil for ophthalmoscopy and as a diagnostic aid in Horner's syndrome.

■ CONTRAINDICATIONS: Narrow-angle glaucoma or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are increased intraocular pressure and photophobia.

hydroxyandrosterone /hīdrok′sē·andros′tərōn/ [Gk *hydor* + *andros,* male, *stereos,* solid], a sex hormone secreted by the testes and adrenal glands. Its normal accumulation in the urine of men after 24-hour collection is 0.1 to 8 mg; in women, 0 to 0.5 mg.

hydroxyapatite /hīdrok′sē·ap′ətīt/, an inorganic compound composed of calcium, phosphate, and hydroxide, found in the bones and teeth in a crystallized latticelike form that gives these structures rigidity.

hydroxybenzene. See **carbolic acid.**

hydroxychloroquine sulfate /-klôr′əkwīn/, a drug initially developed to treat malaria that also has efficacy against autoimmune diseases.

■ INDICATIONS: It is prescribed in the treatment of malaria and the suppression of acute paroxysmal attacks of the disease; in the treatment of extraintestinal, usually hepatic, amebiasis; and in conjunction with salicylate to reduce the symptoms of lupus erythematosus and rheumatoid arthritis.

■ CONTRAINDICATIONS: Concurrent use of other 4-aminoquinolones or of gold salts or a known hypersensitivity to this drug or to other 4-aminoquinolones prohibits its use. It is used with caution in cases of alcoholism, blood dyscrasia, severe neurological disorder, retinal or visual field damage, psoriasis, or porphyria. The drug is not usually recommended in pregnancy because it has been associated with damage to the central nervous system of the fetus.

■ ADVERSE EFFECTS: Among the many severe adverse effects are retinopathy, corneal opacity, polyneuritis, seizure, agranulocytosis, and hepatitis. The incidence and severity of these and many other adverse effects increase with the dosage and prolonged duration of treatment.

17-hydroxycorticosteroid /-kôr′tikos′təroid/, any steroid hydroxylated at carbon-17 secreted by adrenal glands and occasionally measured in the urine in a test for determining adrenal function and diagnosing hypoadrenalism or hyperadrenalism. The normal accumulation in the urine of men after 24-hour collection is 5.5 to 14.5 µg; in women, 4.9 to 12.9 µg; and in children, slightly less. The levels are normally two to four times higher in all cases after injection of 25 USP units of adrenocorticotropic hormone.

17-hydroxycorticosteroids test (17-OCHS), an obsolete 24-hour urine test formerly used to detect abnormal levels of 17-OCHS. Elevated levels are seen in hyperfunction of the adrenal gland (Cushing's syndrome) whereas low levels are seen in hypofunction (Addison's disease).

11-hydroxyetiocholanolone /hīdrok′sē·ē′tē·ōkolan′əlōn/, a sex hormone secreted by the testes and adrenal glands. The normal accumulation in the urine after 24-hour collection is 0.2 to 0.6 mg in men and 0.1 to 1 mg in women.

5-hydroxyindoleacetic acid (5-HIAA) /hīdrok′sē·in′dōlē·əset′ik/, an acid produced by serotonin metabolism, measured in the blood and urine to aid in the diagnosis of certain kinds of tumors. It commonly rises above normal levels in whole blood in association with asthma, diarrhea, rapid heartbeat, and other symptoms and is elevated in the urine of patients with carcinoid syndrome. Its normal concentration in whole blood is 0.05 to 0.20 g/mL; its normal accumulation in urine after 24-hour collection is 1 to 5 mg.

5-hydroxyindoleacetic acid test, a 24-hour urine test used to detect and follow the clinical course of patients with carcinoid tumors, which may grow in the appendix, intestine, lung, or any tissue derived from the neuroectoderm.

hydroxyl (OH) /hīdrok′sil/, a monovalent radical consisting of an oxygen atom and a hydrogen atom. The hydroxyl radical is an extremely reactive species capable of damaging DNA.

hydroxyproline /-prō′lēn/, an amino acid whose level in the urine is elevated in diseases of the bone and certain genetic disorders, such as Marfan's syndrome. Its normal accumulation in urine after a 24-hour collection is 10 to 75 mg.

hydroxypropyl cellulose /hīdrok′sēpro′pil sel′u-lōs/, a water-soluble derivative of cellulose, used as a pharmaceutic aid and also applied topically to the conjunctiva to protect and lubricate the cornea in the treatment of dry eye.

5-hydroxytryptamine (5-HT). See **serotonin.**

hydroxyurea /hīdrok′siyo͝orē′ə/, an antineoplastic.

■ INDICATIONS: It is prescribed in the treatment of a variety of neoplasms and other conditions involving the blood and by itself or as a radiosensitizer for the treatment of other cancers, including those involving the brain, head and neck, lungs, kidneys, ovaries, and prostate.

■ CONTRAINDICATIONS: Bone marrow depression or known hypersensitivity to this drug prohibits its use. It is not to be given to women who are or may become pregnant.

■ ADVERSE EFFECTS: The most serious adverse effect is bone marrow depression. GI disturbances and dermatitis also may occur.

hydrOXYzine hydrochloride /hīdrok′səzēn/, an antihistamine.

■ INDICATIONS: It is prescribed for the relief of anxiety, nervous tension, hyperkinesis, itching, and motion sickness.

■ CONTRAINDICATION: Known hypersensitivity to this drug is the only contraindication.

■ ADVERSE EFFECTS: No serious adverse effects have been observed. Decreased mental alertness sometimes occurs.

hygiene /hī′jēn/ [Gk, *Hygieia,* the goddess of health], **1.** the principles and science of the preservation of health and prevention of disease. **2.** sanitation.

hygienist /hī′jənist, hījē′nist/ [Gk, *Hygieia*], one who practices the principles and laws of **hygiene.**

hygro-, prefix for terms relating to moistness or moisture.

hygroma /hī·grō′mə/ *pl. hygromas, hygromata* [Gk, *hygros,* moist + *-oma,* tumor], a sac, cyst, or bursa distended with a fluid.

hygrometer /hīgrom′ətər/ [Gk, *hygros,* moist, *metron,* measure], an instrument that directly measures relative humidity of the atmosphere or the proportion of water in a specified gas or gas mixture, without extracting the moisture.

hygroscopic humidifier /-skop′ik/, a humidifying device attached to the tubing circuit of a mechanical ventilator or anesthesia gas machine to maintain a constant rate of humidity in the trachea.

Hygroton, a trademark for a diuretic **(chlorthalidone).**

Hylorel, a trademark for an antihypertensive **(guanadrel sulfate).**

hymen /hī′mən/ [Gk, membrane], a fold of mucous membrane, skin, and fibrous tissue that covers the introitus of the vagina. It may be absent; small; thin and pliant; or, rarely, tough and dense, completely occluding the introitus. When the hymen is disrupted, small rounded "tags" of tissue remain. See also **carunculae hymenales.**

hymenal /hī′mənəl/ [Gk, *hymen,* membrane], pertaining to the hymen.

hymenal tag, normal redundant hymenal tissue protruding from the floor of the vagina during the first weeks after birth. It eventually disappears without treatment.

hymenectomy /hī′mənek′təmē/ [Gk, *hymen,* membrane, *ektomē,* excision], the surgical excision of a membrane, particularly the hymen.

hymenolepiasis, heavy infestation by *Hymenolepis nana,* a rat tapeworm that may cause abdominal pain, bloody stools, and disorders of the nervous system, especially in children. Contaminated food spreads the disease, which is endemic in the United States. Quinacrine hydrochloride or hexylresorcinol is used to treat the infestation. Praziquantel is the drug of choice for treatment of this infection. Also called **rat tapeworm infection.**

Hymenolepis /hī′mənol′əpis/ [Gk, *hymen,* membrane + *lepis,* rind], a genus of tapeworms of the family Hymenolepididae, which parasitize birds and mammals, including humans. See also **hymenolepiasis.**

hymenotomy /hī′mənot′əmē/ [Gk, *hymen* + *temnein,* to cut], the surgical incision of the hymen.

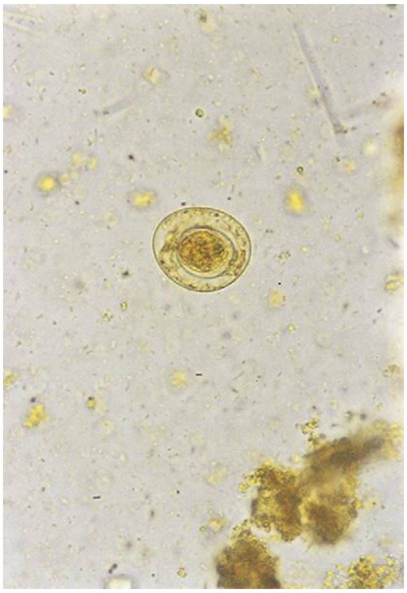
hyo-, prefix meaning "shaped like the letter *u* or pertaining to the hyoid bone": *hyobasioglossus, hyoglossus.*

hyoepiglottic ligament, a ligament that extends from the midline of the epiglottis anterosuperiorly to the body of the hyoid bone.

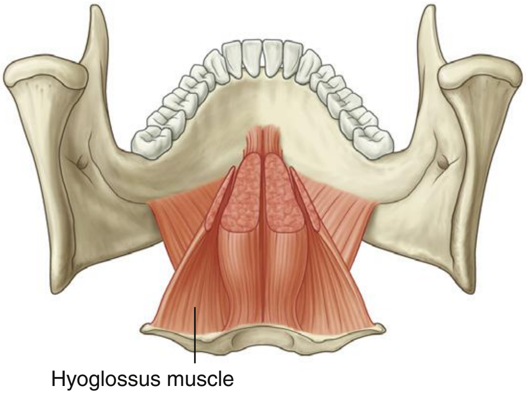
hyoglossal /hī′ō-glos′əl/ [Gk, *hyoeides,* upsilon, U-shaped *glossa,* tongue], pertaining to the tongue and the horseshoe-shaped hyoid bone at the base of the tongue immediately above the thyroid cartilage. Also **glossohyal.**

hyoglossal membrane, a widening of the lingual septum connecting the root of the tongue to the hyoid bone.

hyoglossus /-glos′əs/ [Gk, *hyoeides* + *glossa,* tongue], a depressor muscle of the tongue that arises from the hyoid bone.

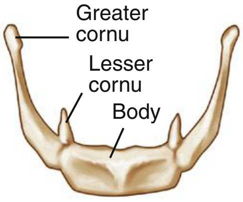


Hymenolepis nana egg *(Mahon, Lehman, and Manuselis, 2011)*



Hyoglossus muscle *(Drake, Vogl, and Mitchell, 2010)*

hyoid /hī′oid/ [Gk, *hyoeides,* upsilon, U-shaped], **1.** *n,* the hyoid bone. **2.** *adj,* pertaining to the hyoid bone.



Hyoid bone

hyoid arch [Gk, *hyoeides* + L, *arcus,* bow], the second pharyngeal or branchial arch. It is present in typical form in the embryo, but the skeletal elements develop into the stapes and styloid process of the temporal bone of the adult.

hyoid bone /hī′oid/ [Gk, *hyoeides,* upsilon, U-shaped; AS, *ban,* bone], a single U-shaped bone suspended from the styloid processes of the temporal bones. The body of the hyoid is square and flat; its ventral surface is convex and angled cranially. Two greater wings of the bone attach to the lateral thyroid ligaments, and the body of the bone attaches to various muscles, such as the hypoglossus and the sternohyoideus. The hyoid is palpable in the neck. Also called **lingual bone, os hyoideum.**

hyoscine. See **scopolamine.**

hyoscine hydrobromide. See **scopolamine.**

hyoscyamine /hī′əsī′əmēn/, an anticholinergic/antispasmodic.

■ INDICATIONS: It is prescribed in the treatment of hypermotility of the GI and lower urinary tracts and is used preoperatively to reduce secretions and block vagal inhibitory effects on the heart.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, obstruction of the genitourinary or GI tract, severe ulcerative colitis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, and hypersensitivity reactions.

hyp-. See **hypo-.**

hypalgesia /hī′paljē′zē·ə/ [Gk, *hypo*, below, *algesis*, pain], the perception of a painful stimulus to a degree that varies significantly from a normal perception of the same stimulus.

hypaxial muscles, muscles of the limbs and trunk.

hyper-, prefix meaning "excessive, above, or beyond": *hyperacidaminuria, hyperalkalinity, hyperechema*.

Hyperab, a trademark for a passive immunizing agent **(rabies immune globulin).**

hyperacidity /hī′pərəsid′itē/ [Gk, *hyper*, excess; L, *acidus*, sour], an excessive amount of acidity, as in the stomach. See also **hyperchlorhydria.**

hyperactive child syndrome. See **attention deficit hyperactivity disorder.**

hyperactivity /-aktiv′itē/ [Gk, *hyper* + L, *activus*, active], any abnormally increased motor activity or function involving either the entire organism or a particular organ, as the heart or thyroid. Compare **hypoactivity.** See also **attention deficit disorder.**

hyperactivity level, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of patterns of inattention or impulsivity in a child from 1 year through 17 years of age. See also **Nursing Outcomes Classification.**

hyperacuity /-akyo͞o′itē/ [Gk, *hyper*, *akouien*, to hear], excessive sensitivity to sounds.

hyperadenosis /-ad′ənō′sis/ [Gk, *hyper*, *aden*, gland, *osis*, condition], a condition characterized by enlarged glands.

hyperadrenalism. See **Cushing's disease.**

hyperadrenocorticism. See **Cushing's syndrome.**

hyperalbuminemia /-albyo͞o′minē′mē·ə/, an excessive amount of albumin in the blood.

hyperaldosteronism. See **aldosteronism.**

hyperalgia /-al′jə/, extreme sensitivity to pain. Also called **hyperalgesia.**

hyperalimentation /-al′iməntā′shən/ [Gk, *hyper* + L, *alimentum*, nourishment], **1.** overfeeding or the ingestion or administration of an amount of nutrients that exceeds the demands of the appetite. **2.** See **total parenteral nutrition.**

hyperalkalinity /-al′kəlin′itē/, a condition of excessive alkalinity.

hyperammonemia /hī′pəram′ōnē′mē·ə/ [Gk, *hyper* + (ammonia), *haima*, blood], abnormally high levels of ammonia in the blood. Ammonia is produced in the intestine, absorbed into the blood, and detoxified in the liver. It is also generated as a by-product of protein metabolism. An increased production of ammonia or a decreased ability to detoxify it increases the blood levels of ammonia. The disorder is controlled by low-protein diets, including essential amino acid mixtures. Untreated, the condition leads to hepatic encephalopathy, characterized by asterixis, vomiting, lethargy, coma, and death.

hyperammonuria /hī′peram′ōnu′re·ə/, increased excretion of ammonia in the urine, as with hyperammonemia. Also called *ammoniuria*.

hyperbaric chamber /-ber′ik/ [Gk, *hyper*, excess, *baros*, weight, *kamara*, arched roof], an airtight chamber containing an oxygen atmosphere under high pressure. A patient may be placed in the chamber for the treatment of certain infections, tumors, and cardiovascular diseases in which atmospheric oxygen pressures up to three times normal may have therapeutic value.

hyperbaric oxygen, oxygen under greater than atmospheric pressure.

hyperbaric oxygenation [Gk, *hyper* + *baros*, weight, *oxys*, sharp, *genein*, to produce], the administration of oxygen at greater than normal atmospheric pressure. The procedure is performed in specially designed chambers that permit the delivery of 100% oxygen at atmospheric pressure that is three times normal. The technique is used to overcome the natural limit of oxygen solubility in blood, which is about 0.3 mL of oxygen per 100 mL of blood. In hyperbaric oxygenation, dissolved oxygen can be increased to almost 6 mL per 100 mL and the PO_2 in blood may be nearly 2000 mm Hg at 3 atmospheres absolute. Hyperbaric oxygenation has been used to treat carbon monoxide poisoning, air embolism, smoke inhalation, acute cyanide poisoning, decompression sickness, wounds, clostridial myonecrosis, and certain cases of blood loss or anemia in which increased oxygen transport may compensate in part for hemoglobin deficiency. Factors limiting the usefulness of hyperbaric oxygenation include the hazards of fire and explosive decompression, pulmonary damage and neurological toxicity at high atmospheric pressures, cardiovascular debility of the patient, and the need to interrupt treatments repeatedly because exposures at maximum atmospheric pressures must be limited to 90 minutes. Also called *hyperbaric oxygen therapy*.

hyperbaric solution [Gk, *hyper*, excess, *baros*, weight], a type of spinal anesthetic that has a specific gravity greater than that of cerebrospinal fluid so that it will settle into the lowest parts of the spinal canal.

hyperbarism /-ber′izəm/, any disorder resulting from exposure to increased ambient pressure, usually caused by sudden exposure to or a significant increase in pressure. See also **barotrauma, decompression sickness.**

hyperbetalipoproteinemia /hī′pərbā′təlip′ōprō′tēnē′mē·ə/ [Gk, *hyper* + *beta*, second letter of Greek alphabet, *lipos*, fat, *proteios*, first rank, *haima*, blood], type II hyperlipoproteinemia, a genetic disorder of lipid metabolism characterized by abnormally high levels of serum cholesterol and the appearance of xanthomas on the tendons of the heels, knees, and fingers. There is a marked tendency to development of atherosclerosis and early myocardial infarction, especially among males. Treatment attempts to reduce blood cholesterol levels in the hope of lowering the risk of early death from heart disease. The patient is usually counseled to avoid most meats, eggs, milk products, and all saturated fats and is encouraged to eat fish, grains, fruits, vegetables, lean poultry, and unsaturated fats. Exercise may be recommended, and drugs may be prescribed in some cases. See also **cholesterolemia.**

hyperbilirubinemia /hī′pərbil′iro͞o′binē′mē·ə/ [Gk, *hyper* + L, *bilis*, bile, *ruber*, red; Gk, *haima*, blood], greater than normal amounts of the bile pigment bilirubin in the blood, often characterized by jaundice, anorexia, and malaise. Hyperbilirubinemia is most often associated with liver disease or biliary obstruction, but it also occurs when there is excessive destruction of red blood cells, as in hemolytic anemia. Treatment is specific to the underlying condition. When bilirubin levels are high, treatment includes phototherapy and hydration. Also spelled *hyperbilirubinaemia*. See also **jaundice.**

hyperbilirubinemia of the newborn, an excess of bilirubin in the blood of the neonate. It is usually caused by a deficiency of an enzyme that results from physiological immaturity or by increased hemolysis, especially that produced by blood group incompatibility, which, in severe cases, can lead to kernicterus. Also called **neonatal hyperbilirubinemia.** See also **breast milk jaundice, cholestasis, Crigler-Najjar syndrome, Dubin-Johnson syndrome, erythroblastosis fetalis, Gilbert's syndrome, kernicterus, phototherapy in the newborn, Rotor's syndrome.**

■ OBSERVATIONS: The elevation of serum bilirubin levels in the normal newborn is caused by the greater concentration of circulating erythrocytes and the infant's diminished ability to conjugate and excrete bilirubin because of a lack of the enzyme glucuronyl transferase, a reduced albumin concentration, and a lack of intestinal bacteria. Jaundice appears when blood levels of bilirubin exceed 5 mg/dL, usually not before 24 hours in full-term neonates. Clinically observable jaundice or serum bilirubin level exceeding 5 mg/dL within the first 24 hours of life is abnormal and indicates a pathological cause of hyperbilirubinemia. In erythroblastosis fetalis, jaundice is evident shortly after birth, and bilirubin levels rise rapidly. Severely affected infants also show hepatosplenomegaly and signs of anemia, which quickly worsen, causing a decrease in oxygen-carrying capacity that may lead to cardiac failure and shock. Early symptoms of kernicterus are lethargy, poor feeding, and vomiting, followed by severe neurological excitation or depression, including tremors, twitching, convulsion, opisthotonos, a high-pitched cry, hypotonia, diminished deep tendon reflexes, and absence of Moro and sucking reflexes. Brain damage generally does not occur at serum bilirubin levels below 20 mg/dl in an otherwise healthy term infant. Factors such as metabolic acidosis, lowered albumin levels, hypoxia, hypothermia, free fatty acids, and certain drugs, especially salicylates and sulfonamides, increase the risk at much lower levels. The mortality rate may reach 50%. Sequelae of kernicterus include mental retardation, minimal brain dysfunction, cerebral palsy, delayed or abnormal motor development, hearing loss, ataxia, athetosis, perceptual problems, and behavioral disorders.

■ INTERVENTIONS: Such preventive measures as frequent feedings during the first 6 to 12 hours of life to increase GI motility have little justification. Infants with mild jaundice require no treatment, only observation. Phototherapy is the usual treatment for severe or increasing hyperbilirubinemia. If hyperbilirubinemia is the result of increased hemolysis caused by blood group incompatibility, exchange transfusion may be done. It is usually indicated if laboratory analysis reveals a positive antiglobulin test result, a hemoglobin concentration of the cord blood below 12 g/dl, or a bilirubin level of 20 mg/dl or more in a full-term infant or 15 mg/dl or more in a premature infant. Phototherapy may be used in conjunction with exchange transfusion, except in cases of Rh incompatibility. If used immediately after the initial exchange transfusion, phototherapy may remove enough bilirubin from the tissues to make subsequent transfusions unnecessary. Clinical practice nomograms using major and minor risk factors are useful for predicting worsening hyperbilirubinemia and need for phototherapy or exchange transfusion.

■ NURSING CONSIDERATIONS: An initial concern is to identify high-risk infants in whom hyperbilirubinemia and kernicterus may develop. The nurse may monitor the serum bilirubin levels and observe for evidence of jaundice, anemia, central nervous system irritability, and such conditions as acidosis, hypoxia, and hypothermia. In erythroblastosis fetalis, exchange transfusion may be necessary. The amounts of blood infused and withdrawn, the vital signs, and any signs of exchange reactions are noted. Resuscitative equipment is kept available. Optimal body temperature is maintained: Hypothermia increases oxygen and glucose consumption, causing metabolic acidosis, and hyperthermia damages the donor's erythrocytes, causing an elevation in the amount of free potassium, which may lead to infant cardiac arrest. After the procedure a sterile dressing is applied to the catheter site.

hypercalcemia /hī′pərkalsē′mē·ə/ [Gk, *hyper* + L, *calx*, lime; Gk, *haima*, blood], greater than normal amounts of calcium in the blood, most often resulting from excessive bone resorption and release of calcium, as occurs in hyperparathyroidism, metastatic tumors of bone, Paget's disease, and osteoporosis. Clinically patients with hypercalcemia experience confusion, anorexia, abdominal pain, muscle pain, and weakness. Extremely high levels of blood calcium may result in coma, shock, kidney failure, and death. Hypercalciuria is also found in most patients with elevated blood calcium level. Prednisone, diuretics, isotonic saline solution, and other drugs may be used in treatment. Also spelled *hypercalcaemia*. *—hypercalcemic, adj.*

hypercalcemia of malignancy, an abnormal elevation of serum calcium associated with malignant tumors, resulting from osteolysis caused by bone metastases or by the action of circulating osteoclast-activating factors released from distant tumor cells (known as **humoral hypercalcemia of malignancy**).

hypercalcemic nephropathy /-kalsē′mik/ [Gk, *hyper*, L, *calx*, lime, *haima*, blood; Gk, *nephros*, kidney, *pathos*, disease], a progressive disorder of kidney function caused by an excessive level of calcium in the blood. The calcium causes cumulative functional and histological abnormalities that lead to a decreased glomerular filtration rate and kidney failure.

hypercalciuria /hī′pərkal′sēyo͞or′ē·ə/ [Gk, *hyper* + L, *calx*, lime; Gk, *ouron*, urine], the presence of abnormally great amounts of calcium in the urine, resulting from conditions such as sarcoid, hyperparathyroidism, or certain types of arthritis that are characterized by augmented bone resorption. Immobilized patients are often hypercalciuric. Some people absorb more calcium than is normal and therefore excrete greater than normal amounts into their urine. Concentrated amounts of calcium in the urinary tract may form kidney stones. Treatment is directed to correcting any underlying disease condition and limiting dietary intake of calcium. Also called *hypercalcinuria*. Compare **hypercalcemia.** *—hypercalciuric, adj.*

hypercapnia /hī′pərkap′nē·ə/ [Gk, *hyper* + *kapnos*, vapor], greater than normal amounts of carbon dioxide in the blood. Also called **hypercarbia.**

hypercapnic acidosis /-kap′nik/ [Gk, *hyper*, *kapnos*, vapor; L, *acidus*, sour, *osis*, condition], an excessive acidity in body fluids caused by an increase in carbon dioxide tension in the blood. The condition may be secondary to pulmonary insufficiency. As carbon dioxide accumulates in the blood, its acidity increases.

hypercarbia. See **hypercapnia.**

hypercarotenemia /hi"per-kar" cah te ne' me-ah/an excessive amount of carotene in the blood usually associated with a yellow discoloration of the skin.

hypercementosis, a non-neoplastic deposition of excessive cementum that is continuous with normal radicular cementum. Compare **concrescence.**

hyperchloremia /-klôrē′mē·ə/ [Gk, *hyper* + *chloros*, green, *haima*, blood], an excessive level of chloride in the blood that results in acidosis. Also spelled *hyperchloraemia*.

hyperchlorhydria /-klôrhid′rē·ə/ [Gk, *hyper* + *chloros* + *hydor*, water], the excessive secretion of hydrochloric acid by cells lining the stomach. Also called **chlorhydria.** See also **hyperacidity.**

hypercholesterolemia /-kōles′tərōlē′mē·ə/ [Gk, *hyper* + *chole,* bile, *stereos,* solid, *haima,* blood], a condition in which greater than normal amounts of cholesterol are present in the blood. High levels of cholesterol and other lipids may lead to the development of atherosclerosis. Hypercholesterolemia may be reduced or prevented by avoiding saturated fats, which are found in red meats, eggs, and dairy products, or by certain medications. Inherited hypercholesterolemia is caused by a defect in the low-density lipoprotein receptor or apolipoprotein B; in such cases diet is a less effective factor. Also spelled *hypercholesterolaemia*.

hypercholesterolemic xanthomatosis. See **low-density lipoprotein receptor disorder.**

hyperchromatic. See **hyperchromia.**

hyperchromia /-krō′mē·ə/ [Gk, *hyper, chroma,* color], an increase of hemoglobin in the erythrocytes.

hyperchylomicronemia /-kī′lōmī′krōnē′mē·ə/ [Gk, *hyper* + *chylos,* juice, *mikros,* small, *haima,* blood], type I hyperlipoproteinemia, a rare congenital deficiency of an enzyme essential to fat metabolism. Fat accumulates in the blood as **chylomicron.** The condition affects children and young adults, in whom xanthomas (fatty deposits) in the skin, hepatomegaly, and abdominal pain develop. Pancreatitis is the most significant complication. Strict limitation of dietary fat may allow the person to prevent discomfort and complications. Also called **familial lipoprotein lipase deficiency.**

hypercoagulability /-kō·ag′yələbil′itē/ [Gk, *hyper* + L, *coagulare,* to curdle, *habilis,* able], a tendency of the blood to coagulate more rapidly than is normal.

hyperdactyly. See **polydactyly.**

hyperdiploid. See **hyperploid.**

hyperdipsia, intense thirst of relatively brief duration.

hyperdynamic circulation, abnormally increased circulatory volume with low vascular resistance and often tachycardia, a condition sometimes accompanying septic shock, preeclampsia, and other conditions.

hyperdynamic syndrome /-dīnam′ik/ [Gk, *hyper* + *dynamis,* force], a cluster of symptoms that signals the onset of septic shock, often including a shaking chill, rapid rise in temperature, flushing of the skin, galloping pulse, and alternating rise and fall of the blood pressure. This is a medical emergency treated by keeping the patient warm, elevating the legs to assist venous return, administering IV fluids and antibiotics, and managing blood pressure. Nothing is given by mouth. The patient's head is turned to the side to prevent aspiration if there is vomiting. See also **septic shock.**

hyperemesis /hī′per·em′ə·sis/ [Gk, *hyper,* excess + *emesis,* vomit], excessive vomiting.

hyperemesis gravidarum /hī′pərem′isis/ [Gk, *hyper* + *emesis,* vomiting; L, *gravida,* pregnant], an abnormal condition of pregnancy characterized by protracted vomiting, weight loss, and fluid and electrolyte imbalance. If the condition is severe and intractable, brain damage, liver and kidney failure, and death may result. The cause of the condition is not known; an increase in levels of chorionic gonadotropins or other hormones, an immunological sensitivity to products of conception, or aggravation of preexisting emotional conflicts has been suggested, but a causal relationship has not been proved. It occurs in approximately 3 of every 1000 pregnancies. Its incidence has diminished in recent years.

■ OBSERVATIONS: Women are frightened of and uncomfortable and embarrassed about their illness. Dry mucous membranes are a sign of dehydration. Other signs include decreased skin elasticity, a rapid pulse, and falling blood pressure. The specific gravity of the urine rises, and the volume of urine excreted falls. The hematocrit is elevated because of hemoconcentration. Loss of electrolytes in vomitus leads to metabolic acidosis with hypokalemia, hypochloremia, and hyponatremia. Severe potassium deficit alters myocardial function; the electrocardiogram may show prolonged P-R and Q-T intervals and inverted T waves. In addition to weight loss, undernourishment causes fever, ketosis, and acetonuria. Severe vitamin B deficiency may result in encephalopathy manifested by confusion and eventually coma. Laboratory analyses of blood indicate increased concentrations of metabolic products normally cleared by the liver and kidneys. Forceful vomiting may cause retinal hemorrhages that impair vision and gastroesophageal tears that bleed, causing hematemesis or melena.

■ INTERVENTIONS: Effective therapy arrests vomiting and achieves rehydration, adequate nutrition, and emotional stabilization. Bed rest is instituted. Antiemetics safe for the fetus are administered. Fluids, electrolytes, nutrients, and vitamins are given parenterally if the woman is unable to retain fluids by mouth. The fetal heart rate is measured frequently. Psychiatric consultation and therapy are sometimes beneficial. Termination of pregnancy is curative but almost never required.

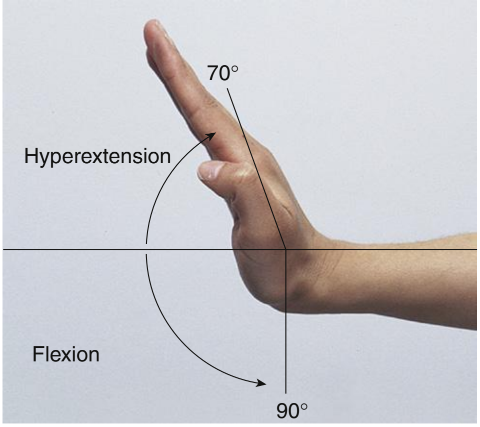
■ NURSING CONSIDERATIONS: Visitors are encouraged; isolation, formerly recommended, is not desirable. Sympathetic listening and supportive, nonjudgmental care are provided. The woman and her family are told often that the prognosis is excellent for both mother and baby. The woman is weighed regularly, and her weight is accurately recorded, for the best evidence of recovery is steady weight gain.

hyperemesis lactentium, a condition of excessive vomiting by nursing infants.

hyperemia /hī′pərē′mē·ə/ [Gk, *hyper* + *haima,* blood], an excess of blood in part of the body, caused by increased blood flow, as in the inflammatory response, local relaxation of arterioles, or obstruction of the outflow of blood from an area. Skin overlying a hyperemic area usually becomes reddened and warm. *—hyperemic, adj.*

hyperesthesia /-esthē′zhə/, an extreme sensitivity of one of the body's sense organs, such as pain or touch receptors in the skin.

hyperextension /-exten′shən/ [Gk, *hyper* + L, *extendere,* to stretch out], movement at a joint to a position beyond the joint's normal maximum extension.



Hyperextension of the wrist *(Wilson and Giddens, 2009)*

hyperextension bed, a bed used in pediatric orthopedics to maintain any correction achieved by suspension of a body part and to increase the range of motion of the hips after an operative muscle release procedure. The hyperextension bed may be purchased, or a regular hospital bed may be converted. Removal of the mattress from a hospital bed and the addition of three half mattresses allow sufficient height to permit alternating prone and supine positions and the concomitant alternating flexion and extension of the hips. The bilateral extremities of the patient, in casts, are suspended over the lower half of the bed with rings and traction apparatus. The position of the patient's hips is alternated at 2-hour intervals; abduction and adduction can be controlled by the position of the pulleys. Restraints are required to maintain the child in position so that the horizontal, gluteal folds are even with the bottom edge of the stacked mattresses. Also called **Schwartz bed.** Compare **CircOlectric bed, Foster bed, Stryker wedge frame.**

hyperflexia /-flek′shə/ [Gk, *hyper* + L, *flectere,* to bend], the forcible overflexion or bending of a limb.

hyperfunction /-fungk′shən/ [Gk, *hyper* + L, *functio,* performance], increased function of any organ or system.

hypergenesis /-jen′əsis/ [Gk, *hyper* + *genesis,* origin], excessive growth or overdevelopment. The condition may involve the entire body, as in gigantism, or any part, or it may result in the formation of extra parts, such as additional fingers or toes. *—hypergenetic, adj.*

hypergenetic teratism /-jənet′ik/ [Gk, *hyper* + *genesis* + *teras,* monster], a congenital anomaly in which there is excessive growth of a part, an organ, or the entire body, as in gigantism.

hypergenitalism /-jen′itəliz′əm/, the presence of abnormally large external genitalia. The condition is usually associated with precocious puberty.

hyperglobulinemia /-glob′yəlinē′mē·ə/ [Gk, *hyper,* L, *globulus,* small globe, *haima,* blood], an excess of globulin in the plasma.

hyperglycemia /hī′pərglīsē′mē·ə/ [Gk, *hyper* + *glykys,* sweet, *haima,* blood], a greater than normal amount of glucose in the blood. Most frequently associated with diabetes mellitus, the condition may occur in newborns, after the administration of glucocorticoid hormones, and with an excess infusion of IV solutions containing glucose, especially in poorly monitored long-term hyperalimentation. Also spelled *hyperglycaemia*. Also called *hyperglycosemia*. Compare **hypoglycemia.**

hyperglycemia management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preventing and treating above-normal blood glucose levels. See also **Nursing Interventions Classification.**

hyperglycemic-glycogenolytic factor. See **glucagon.**

hyperglycemic-hyperosmolar nonketotic syndrome /-glīsē′mik/ [Gk, *hyper* + *glykys* + *hyper* + *osmos,* impulse; L, *non,* not, (ketone); Gk, deep sleep], a diabetic syndrome caused by hyperosmolarity of extracellular fluid and resulting in severe osmotic diuresis causing dehydration. HHS is often a consequence of dehydration, stress, or diabetogenic medication given to an elderly person with undiagnosed or diagnosed type 2 diabetes. Also called **hyperglycemic-hyperosmolar syndrome (HHS).**

hyperglyceridemia /-glī′səridē′mē·ə/ [Gk, *hyper, glykys* + *haima,* blood], an excess of glycerides, particularly triglycerides, in the blood. It is caused by a congenital defect in the ability to metabolize the amino acid glycine.

hyperglycinemia, an increased concentration of glycine in the blood.

hyperglycogenolysis /-glī′kōjənol′isis/, excessive breaking down of glycogen to glucose in animal tissue.

hyperglycosuria /-glī′kōso͝or′ē·ə/, an excess of sugar in the urine.

hyperglysemia /-glī′kəsē′mē·ə/, an excess of sugar in the blood. See also **hyperglycemia.**

hypergonadism /-gō′nədiz′əm/ [Gk, *hyper, gone,* seed], excessive secretion of hormones from the ovaries or testes.

hyperhidrosis /hī′pərhīdrō′sis, -hidrō′sis/ [Gk, *hyper* + *hidros,* perspiration], excessive perspiration often caused by heat, hyperthyroidism, strong emotion, menopause, or infection. Symptomatic therapy usually includes topical antiperspirants and anticholinergics or Botox. Severe cases may be treated with surgery. Also called **hyperidrosis, polyhidrosis, polyidrosis.**

hyperhydration. See **overhydration.**

hyperidrosis. See **hyperhidrosis.**

hyperimmune /-imyo͞on′/ [Gk, *hyper* + L, *immunis,* freedom], having a greater-than-normal immunity because of an unusual abundance of antibodies.

hyperimmune globulin, any of various immune globulin preparations especially high in antibodies against certain specific diseases.

hyperimmune plasma, plasma containing high levels of antibodies.

hyperimmunoglobulinemia D, an abnormal elevation of immunoglobulin D in the serum.

hyperimmunoglobulinemia D syndrome (HIDS), a periodic fever inherited as an autosomal-recessive trait, caused by mutations in the gene for mevalonate kinase and having onset usually before 1 year of age. It is characterized by attacks of high fever preceded by chills, occurring at intervals of approximately 4 to 8 weeks and lasting 4 to 6 days, often accompanied by headache, arthritis and arthralgia, erythematous lesions, and hepatosplenomegaly. Serum IgD levels are continuously high. Also called **Dutch type periodic fever.**

hyperinsulinism /-in′səliniz′əm/ [Gk, *hyper* + L, *insula,* island], an excessive amount of insulin in the body. It may be caused by administration of an insulin dose greater than required or the presence of an insulin-secreting tumor in the islets of Langerhans or insulin reference. If there is hypoglycemia, symptoms include hunger, shakiness, and diaphoresis. See also **insulin shock.**

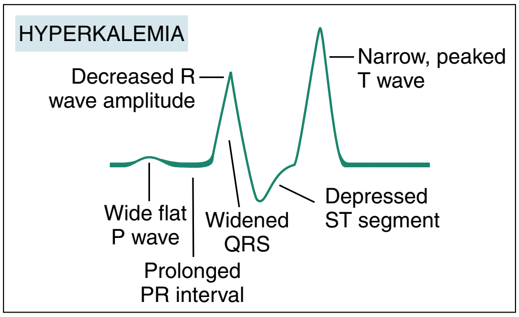
hyperirritability /-irit′əbil′itē/ [Gk, *hyper,* L, *irritare,* to tease], excessive excitability or sensitivity; exaggerated response to a stimulus.

hyperkalemia /hī′pərkəlē′mē·ə/ [Gk, *hyper* + L, *kalium,* potassium; Gk, *haima,* blood], greater than normal amounts of potassium in the blood. This condition is seen frequently in acute renal failure, massive trauma, major burns, and Addison's disease. Early signs are nausea, diarrhea, and muscle weakness. As potassium levels increase, marked cardiac changes are observed in the electrocardiogram. Treatment of severe hyperkalemia includes oral administration of Kayexalate (sodium polystyrene sulfonate) and IV administration of sodium bicarbonate, calcium salts, and dextrose. Hemodialysis is used if these measures fail. Also spelled *hyperkalaemia*.

hyperkalemic periodic paralysis. See **adynamia episodica hereditaria.**

hyperkeratinization /-ker′ətinīzā′shən/ [Gk, *hyper,* excessive, *keras,* horn], an abnormal horny thickening of the epithelium of the palms and soles.

hyperkeratosis /-ker′ətō′sis/ [Gk, *hyper* + *keras,* horn, *osis,* condition], overgrowth of the cornified epithelial layer of the skin. See also **callus, corn.** *—hyperkeratotic, adj.*



Hyperkalemia: ECG changes *(Huether and McCance, 2008)*

hyperketonemia /-kē′tōnē′mē·ə/, an abnormally high level of ketone bodies in the blood.

hyperketonuria /-kē′tōno͝or′ē·ə/, an abnormally high level of ketone bodies in the urine.

hyperkinesis. See **attention deficit disorder.**

hyperlactation /-laktā′shən/, a condition in which lactation continues beyond the usual period of breastfeeding. Also called *superlactation*.

hyperlipemia /-lipē′mē·ə/, cloudy or opaque plasma caused by fat particles called chylomicrons seen subsequent to a fat-laden meal caused by a lipoprotein lipase deficiency or a defect in the conversion of low-density lipoprotein to high-density lipoprotein.

hyperlipidemia /-lip′idē′mē·ə/ [Gk, *hyper* + *lipos,* fat, *haima,* blood], an excess of lipids, including glycolipids, lipoproteins, and phospholipids, in the plasma. Also spelled *hyperlipidaemia*. See also **antilipidemic.**

hyperlipidemia type I, a condition of elevated blood lipid levels characterized by an increase in both cholesterol and triglycerides and caused by the presence of chylomicrons. It is inherited as an autosomal-recessive trait and has a low risk of atherosclerosis. It results in recurrent bouts of acute pancreatitis. The symptoms begin in childhood. The accumulation of triglycerides is generally proportional to the amount of dietary fat. Treatment is primarily dietary. Both saturated and unsaturated fats are restricted to amounts that produce less than 500 mg/dL of blood, evaluated after an overnight fast. Also called **exogenous hypertriglyceridemia, familial hyperglyceridemia, fat-induced hyperlipidemia.**

hyperlipidemia type IIA, hyperlipidemia type IIB. See **low-density lipoprotein (LDL) receptor disorder.**

hyperlipidemia type III. See **broad beta disease.**

hyperlipidemia type IV, a relatively common form of hyperlipoproteinemia characterized by a slight elevation in cholesterol levels, a moderate elevation of triglyceride levels, and an elevation of the triglyceride carrier protein (very-low-density lipoprotein) level. It is sometimes familial and is associated with an increased risk for coronary atherosclerosis. The condition is controlled with weight reduction, a low-carbohydrate diet, drugs, niacin, and avoidance of alcohol. Also called **endogenous hypertriglyceridemia.**

hyperlipidemia type V, a condition of elevated blood lipid levels, characterized by slightly increased cholesterol level, greatly increased triglyceride level, elevation of the triglyceride carrier protein (very-low-density lipoprotein) level, and above-normal levels of chylomicrons. It is a genetically heterogeneous disorder that apparently does not increase the risk of atherosclerosis. Treatment includes weight control, a low-fat diet, drugs, niacin, and abstinence from alcohol. Also called **mixed hyperlipemia, mixed hypertriglyceridemia.**

hyperlipoproteinemia /hī′pərlip′ōprō′tēnē′mē·ə/ [Gk, *hyper* + *lipos,* fat, *proteios,* first rank, *haima,* blood], any of a large group of inherited and acquired disorders of lipoprotein metabolism characterized by greater than normal amounts of certain protein-bound lipids and other fatty substances in the blood and usually low levels of high-density lipoprotein cholesterol. Hyperlipoproteinemia causes atherosclerosis and pancreatitis. The treatment includes dietary control of fats and/or saturated fats and cholesterol. Diet may reduce specific lipoprotein levels in the blood. Medication and other treatment vary according to the specific metabolic defect, its cause, and its prognosis. Also called **dyslipidemia**. Formerly called **hyperlipidemia**.

hypermagnesemia /hī′pərmag′nisē′mē·ə/ [Gk *hyper* + *magnesia,* magnesium, *haima,* blood], a greater than normal amount of magnesium in the plasma, found in people with kidney failure and in those who use large doses of drugs containing magnesium, such as antacids. Toxic levels of magnesium cause cardiac arrhythmias and depression of deep tendon reflexes and respiration. Treatment often includes IV fluids, a diuretic, and hemodialysis.

hypermature cataract /-məcho͝or′/ [Gk, *hyper,* L, *maturare,* to make ripe; Gk, *katarrhaktes,* portcullis], an opaque lens that has lost water and has become soft and reduced in size.

hypermenorrhea. See **menorrhagia.**

hypermetabolic state /-met′əbol′ik/, an abnormally increased rate of metabolism, as in a high fever or hyperthyroidism.

hypermetabolism /-mətab′əliz′əm/, increased metabolism, usually accompanied by excessive body heat.

hypermetaplasia /-met′əplā′zhə/, an abnormal increase in the rate of transformation of one kind of tissue into another, as in the development of tumors.

hypermetria /hī′pərmē′trē·ə/ [Gk, *hyper* + *metron,* measure], an abnormal form of dysmetria characterized by a dysfunction of the power to control the range of muscular action and causing movements that overreach the intended goal of the affected individual. Compare **hypometria.**

hypermetropia, hypermetropy. See **hyperopia.**

hypermnesia /hī′pərm·nē′zhə/, an extraordinarily good state of memory.

hypermobility /-mōbil′itē/ [Gk, *hyper,* L, *mobilis,* movable], an abnormally wide range of movement of the joints. The condition is seen in children and may be associated with **Marfan's syndrome.**

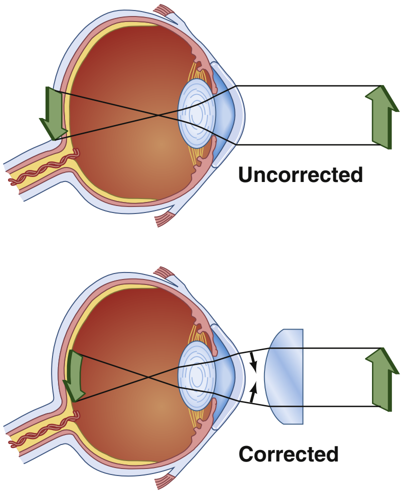
hypermorph /hī′pərmôrf′/ [Gk, *hyper* + *morphe,* form], **1.** a person whose arms and legs are disproportionately long in relation to the trunk, and whose sitting height is disproportionately short compared to the standing height. **2.** a mutant allele that has an increased effect on the expression of a trait. Compare **amorph, antimorph, hypomorph.**

hypermotility /-motil′itē/, an excessive movement of the involuntary muscles, particularly in the GI tract. Compare **hypomotility.**

hypernasality /hī′pərnāzal′itē/ [Gk, *hyper,* excess + *nasus,* nose], excessively nasal speech resonance, which may result in unintelligible speech. The cause is velopharyngeal dysfunction with emission of too much air through the nose. Also called **open rhinolalia.** See also **velopharyngeal insufficiency.**

hypernatremia /hī′pərnatrē′mē·ə/ [Gk, *hyper* + L, *natrium,* sodium], a greater than normal concentration of sodium in the blood, caused by excessive loss of water and electrolytes that results from polyuria, diarrhea, excessive sweating, or inadequate water intake. It may also be a result of a large intake of salt, either orally or intravenously. When water loss is caused by kidney dysfunction, urine is profuse and dilute. If water loss is not through the kidneys, such as in diarrhea and excessive sweating, the urine is scanty and highly concentrated. People with hypernatremia may become mentally confused, have seizures, and lapse into coma. The treatment is restoration of fluid and electrolyte balance by mouth or by IV infusion. Care must be taken to restore water balance slowly because further electrolyte imbalances may occur and complications from correcting sodium concentration may arise. Also spelled *hypernatraemia*. See also **diabetes insipidus.**

hyperopia (h) /-ō′pē·ə/ [Gk, *hyper* + *ops,* eye], farsightedness, or an inability of the eye to focus on nearby objects. It results from an error of refraction in which rays of light entering the eye are brought into focus behind the retina. Also called **farsightedness, hypermetropia, hypermetropy.** Compare **myopia.**



Hyperopia *(Patton and Thibodeau, 2010)*

hyperorchidism /-ôr′kidiz′əm/ [Gk, *hyper,* excessive, *orchis,* testis], excessive endocrine activity of the testes.

hyperornithinemia /-ôr′nithinē′mē·ə/, a metabolic disorder involving the amino acid ornithine, which tends to accumulate in the tissues, causing seizures and retardation. Treatment is a low-protein diet.

hyperosmia /-oz′mē·ə/, an abnormally increased sensitivity to odors. Compare **anosmia.**

hyperosmolarity /-oz′məler′itē/ [Gk, *hyper* + *osmos,* impulse], a state or condition of abnormally increased osmolarity. —*hyperosmolar, adj.*

hyperosmotic /-osmot′ik/, pertaining to a solution that has a higher solute concentration than another solution. Compare **hypoosmotic, isosmotic.**

hyperostosis. See **exostosis.**

hyperostosis frontalis interna, thickening of the inner table of the frontal bone, which may be associated with hirsutism and obesity. It most commonly affects women near menopause. It is thought to be a generalized disorder of bone metabolism and may cause neuropsychological sequelae. Also called **Morel's syndrome.**

hyperoxaluria /-ok′səlo͝or′ē·ə/, an excessive level of oxalic acid or oxalates, primarily calcium oxalate, in the urine. The cause is usually an inherited deficiency of an enzyme needed to metabolize oxalic acid, which is present in many fruits and vegetables, or a disorder of fat absorption in the small intestine. An excess of oxalates may lead to the formation of renal calculi and renal failure. Treatments include pyridoxine, forced fluids, and a low-oxalate diet.

hyperoxemia /-oksē′mē·ə/ [Gk, *hyper,* excess, *oxys,* sharp, *haima,* blood], increased oxygen content of the blood.

hyperoxia /-ok′sē·ə/, abnormally high oxygen tension in the blood.

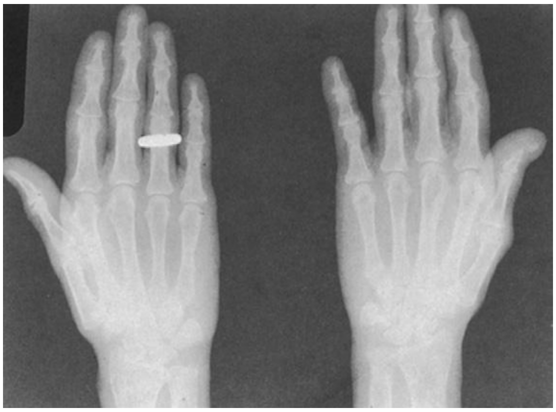
hyperoxygenation /-ok′sijənā′shən/ [Gk, *hyper* + *oxys,* sharp, *genein,* to produce], the use of high concentrations of inspired oxygen before and after endotracheal aspiration.

hyperparathyroidism /-per′əthī′roidiz′əm/ [Gk, *hyper* + *para,* beside, *thyreos,* shield, *eidos,* form], an abnormal endocrine condition characterized by hyperactivity of any of the four parathyroid glands with excessive secretion of parathyroid hormone (PTH), which causes increased resorption of calcium from the skeletal system and increased absorption of calcium by the kidneys and GI system. The condition may be primary, originating in one or more of the parathyroid glands and usually caused by an adenoma, or secondary, resulting from an abnormal hypocalcemia-producing condition in another part of the body, which causes a compensatory hyperactivity of the parathyroid glands.

■ OBSERVATIONS: Hypercalcemia in primary hyperparathyroidism results in dysfunction of many body systems. In the kidneys, tissue calcifies, calculi form, and renal failure may ensue. In addition, excess phosphorus is excreted, and excess 1,25 (OH)2 D (vitamin D) is synthesized. In the bones and joints, osteoporosis develops, causing pain and fragility; fractures, synovitis, and pseudogout often occur. In the GI tract, chronic, piercing epigastric pain may develop as a result of pancreatitis and increased gastrin production; anorexia and nausea may occur; and vomiting of blood may result if peptic ulceration occurs. In the neuromuscular system, generalized weakness and atrophy develop if the condition is not corrected, and changes in the central nervous system produce alteration of consciousness, coma, psychosis, abnormal behavior, and disturbances of personality. Secondary hyperparathyroidism may result in many of these signs of calcium imbalance and in various abnormalities of the long bones, such as rickets. The diagnosis of primary hyperparathyroidism is made by laboratory findings of increased levels of PTH and calcium in the blood and by the characteristic appearance of the bones on radiographic films. Calcium in the blood and urine and chloride and alkaline phosphatase in the blood are present in excessive amounts; phosphorus is present in the serum in less than normal amounts.

■ INTERVENTIONS: Primary parathyroidism that is the result of an adenoma of one of the glands is treated by excision of the tumor; other causes of primary disease may require excision of up to one half of the glandular tissue. In asymptomatic patients over 50, noninterventional observation may be indicated. Dietary intake of calcium may be limited, and adequate hydration must be maintained. Estrogens may be used in postmenopausal females. Bisphosphates may be administered in severe hypercalcemia to lower the serum calcium level. After surgery, calcium levels in the blood may drop rapidly to dangerously low levels if frequent laboratory evaluations are not made and supplemental calcium is not given as required. Secondary hyperparathyroidism is managed by treating the underlying cause of hypertrophy of the gland. Vitamin D is frequently given, and peritoneal dialysis may be necessary to remove excess calcium from the circulation.

■ NURSING CONSIDERATIONS: Frequent laboratory evaluations of blood levels of calcium, phosphorus, potassium, and magnesium are necessary throughout the course of treatment. Because fractures occur easily and are common, great care is taken to prevent trauma to the patient. IV hydration is usually performed to dilute the concentration of calcium, and the lungs are assessed regularly to detect pulmonary edema in its earliest stages. Tetany is a warning sign of severe hypoglycemia; calcium gluconate is kept available for immediate use after surgery. Walking and moving about cause pain but accelerate healing of the affected bones and are therefore encouraged.



Hyperparathyroidism: changes in bones *(Moll, 1997)*

hyperperistalsis /-per′istal′sis/ [Gk, *hyper,* excess, *peristellein,* to clasp], a state of excessive motility of the waves of alternate contractions and relaxations that propel contents forward through the digestive tract.

hyperphagia. See **polyphagia.**

hyperphenylalaninemia /hī′pərfen′ilal′əninē′mē·ə/ [Gk, *hyper* + (phenylalanine), *haima,* blood], an abnormally high concentration of phenylalanine in the blood. This symptom may be the result of one of several defects in the metabolic process of breaking down phenylalanine. See also **phenylketonuria.**

hyperphoria /hī′pərfôr′ē·ə/ [Gk, *hyper* + *pherein,* to bear], the tendency of an eye to deviate upward.

hyperphosphoremia /-fos′fərē′mē·ə/, an abnormally high level of phosphorus compounds in the blood.

hyperpigmentation /-pig′məntā′shən/ [Gk, *hyper* + L, *pigmentum,* paint], a darkening of the skin. Causes include heredity, drugs, exposure to the sun, trauma, and adrenal insufficiency. Compare **hypopigmentation.** See also **chloasma, melanocyte-stimulating hormone.**

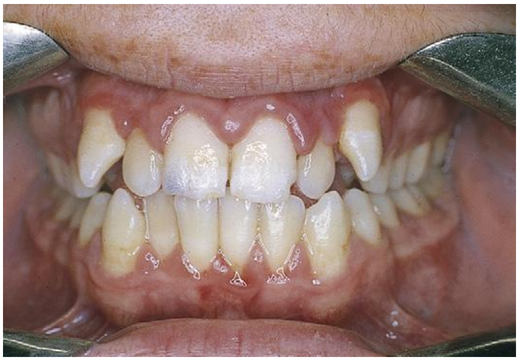
hyperpituitarism /-pityo͞o′itəriz′əm/ [Gk, *hyper,* excess; L, *pituita,* phlegm], overactivity of the anterior lobe of the pituitary gland, resulting in increased secretion of its hormones leading to such conditions as **acromegaly** and **Cushing's disease.** See also **gigantism.**

hyperplasia /hī′pərplā′zhə/ [Gk, *hyper* + *plassein,* to mold], an increase in the number of cells of a body part that results from an increased rate of cellular division. Types of hyperplasia include compensatory, hormonal, and pathological. Compare **aplasia, hypertrophy, hypoplasia.**

hyperplastic gingivitis [Gk, *hyper,* excess, *plassein,* to mold; L, *gingiva,* gum; Gk, *itis,* inflammation], inflammation and enlargement of the gums caused by an increase in the number of cells, usually because of bacterial plaque accumulation. Compare **hypertrophic gingivitis.**

hyperplastic obesity. See **obesity.**

hyperploid /hī′pərploid/ [Gk, *hyper* + *eidos,* form], **1.** *n,* an individual, organism, strain, or cell that has one or more chromosomes in excess of the haploid number or of an exact multiple of the haploid number characteristic of the species. The result is one or more unbalanced sets of chromosomes, which are referred to as **hyperdiploid, hypertetraploid, hypertriploid,** and so on, depending on the number of multiples of the haploid number they contain. **2.** *adj,* pertaining to such an individual, organism, strain, or cell. Compare **hypoploid.** See also **trisomy.** —**hyperploidy,** *adj.*



Hyperplastic gingivitis *(Regezi, Sciubba, and Pogrel, 2000)*

hyperploidy /hī′pərploi′dē/, any increase in chromosome number that involves individual chromosomes rather than entire sets, resulting in more than the normal haploid number characteristic of the species, as in Down syndrome. Compare **hypoploidy.**

hyperpnea /hī′pərpnē′ə/ [Gk, *hyper* + *pnoe,* blowing], an exaggerated deep, rapid, or labored respiration. It occurs normally with exercise and abnormally with aspirin overdose, pain, fever, hysteria, or any condition in which the supply of oxygen is inadequate, such as cardiac disease and respiratory disease. Also spelled **hyperpnoea.** Compare **dyspnea, hypopnea, orthopnea, tachypnea.** See also **respiration rate.** —*hyperpneic, hyperpnoic, adj.*

hyperpolarized helium /-pō′lərīzd/, a gas used in magnetic resonance imaging studies of respiratory disorders to produce images of the air spaces in the lungs.

hyperprolactinemia /-prōlak′tinē′mē·ə/ [Gk, *hyper* + L, *pro,* before, *lac,* milk; Gk, *haima,* blood], an excessive amount of prolactin in the blood, usually caused by a pituitary adenoma but sometimes caused by endocrine side effects related to certain antipsychotic medications. In women it is usually associated with galactorrhea and secondary amenorrhea; in men it may be a factor in gynecomastia, decreased libido, and impotence. Also spelled **hyperprolactinaemia.**

hyperprolinemia /hī′pərprō′linē′mē·ə/, an autosomal-recessive aminoacidopathy characterized by an excess of proline in the body fluids and occurring as two types, I and II, each of which is caused by deficiency in a different enzyme involved in proline metabolism. Type 1 is associated with renal disease and type 2 with mental retardation and convulsions.

hyperproteinemia /-prō′tēnē′mē·ə/ [Gk, *hyper,* excessive, *proteios,* first rank, *haima,* blood], an abnormally high concentration of protein in the blood.

hyperptyalism. See **ptyalism.**

hyperpyrexia /hī′pərpīrek′sē·ə/ [Gk, *hyper* + *pyressein,* to be feverish], an extremely elevated temperature that sometimes occurs in acute infectious diseases, especially in young children. Malignant hyperpyrexia, characterized by a rapid rise in temperature, tachycardia, tachypnea, sweating, rigidity, and blotchy cyanosis, occasionally occurs in patients undergoing general anesthesia. A high temperature may be reduced by sponging the body with tepid water, by giving a tepid tub bath, or by administering antipyretic medication, such as aspirin or acetaminophen. See also **fever.** —*hyperpyretic, adj.*

hyperreactivity /-rē′aktiv′itē/ [Gk, *hyper* + L, *re,* again, *activus,* active], an abnormal condition in which responses to stimuli are exaggerated. For example, asthma involves hyperreactive airways.

hyperreflection /-riflek′shən/, a compulsion to devote excessive attention to oneself.

hyperreflexia /-riflek′sē·ə/ [Gk, *hyper* + L, *reflectere,* to bend back], increased reflex reactions. See also **autonomic hyperreflexia.**

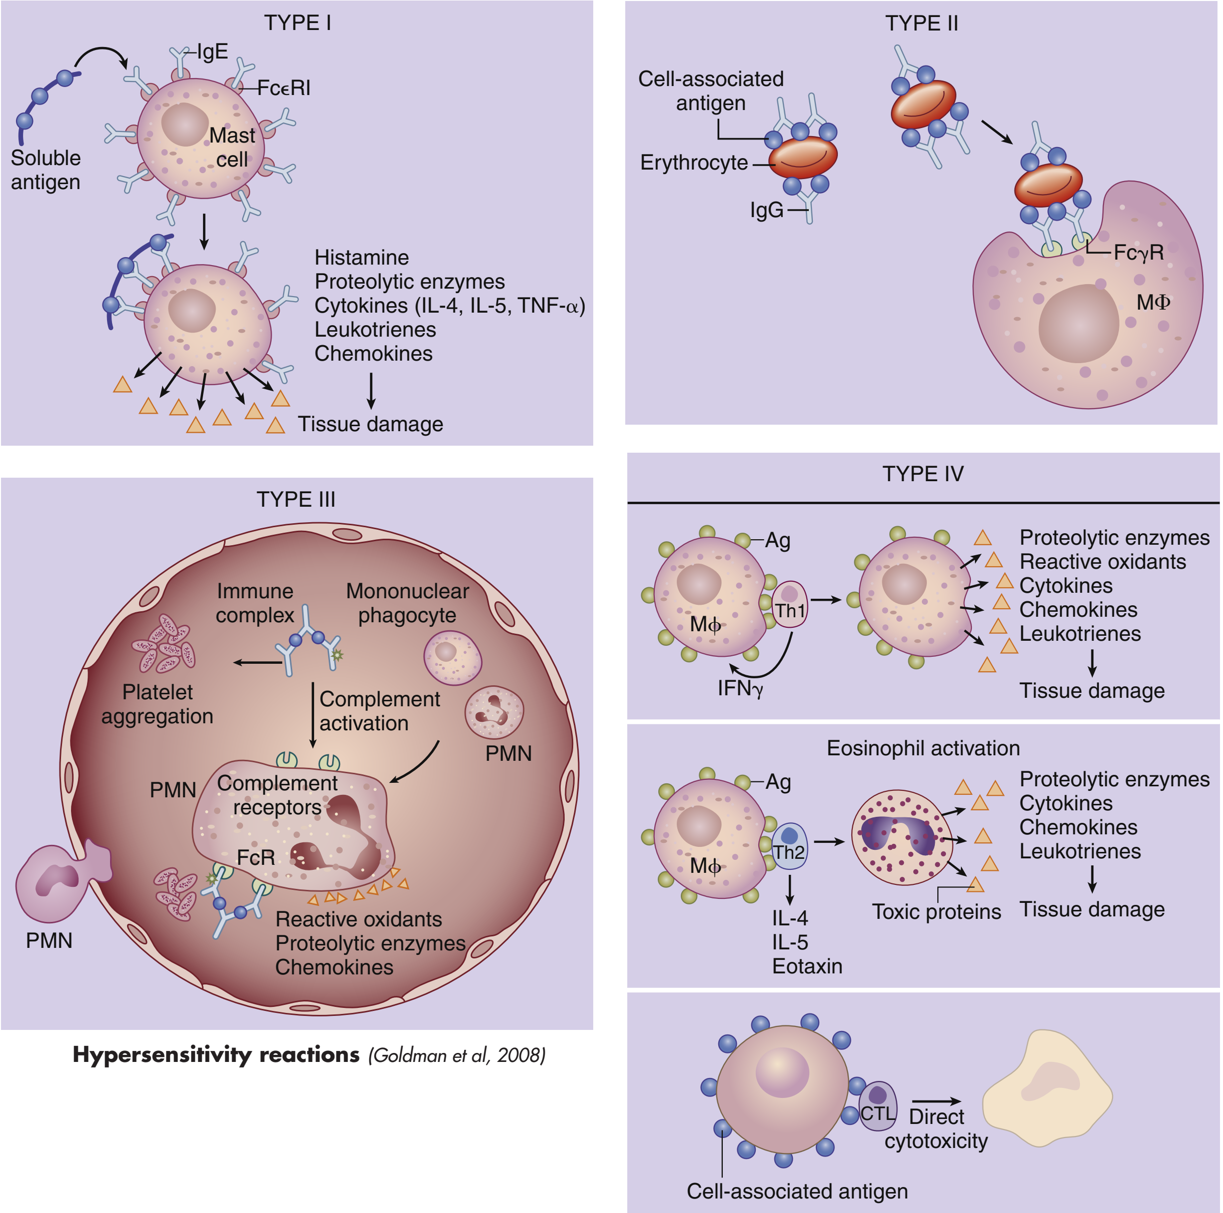
hypersalivation. See **sialorrhea.**

hypersensibility /-sen′səbil′itē/, excessive ability to perceive or feel, as excessive sensibility to pain.

hypersensitivity /-sen′sətiv′itē/ [Gk, *hyper* + L, *sentire,* to feel], an abnormal condition characterized by an exaggerated response of the immune system to an antigen. See also **allergy.** —*hypersensitive, adj.*

hypersensitivity pneumonitis, an inflammatory form of interstitial pneumonia that results from an immunological reaction in a hypersensitive person. The reaction may be provoked by a variety of inhaled organic dusts, often those containing fungal spores. The disease can be prevented by avoiding contact with the causative agents. Classification of the disease is based solely on the character of the immune response rather than on its clinical manifestations. A wide variety of symptoms may occur, including asthma, fever, chills, malaise, and muscle aches, which usually develop 4 to 6 hours after exposure. Laboratory examination of the blood commonly reveals leukocytosis. Recovery is usually spontaneous. In an acute attack, corticosteroids may be given to diminish the inflammatory response. Kinds of hypersensitivity pneumonitis include **bagassosis, cork worker's lung, farmer's lung, humidifier lung,** and **mushroom worker's lung.** Also called **extrinsic allergic alveolitis.** See also **Arthus reaction.**

hypersensitivity reaction, an inappropriate and excessive response of the immune system to a sensitizing antigen, called an allergen. Several factors determine the degree of the response: the person's genetic predisposition for an exaggerated response, the amount of allergen, the kind of allergen, its route of entrance into the body, the timing of the exposures to the allergen, and the site of the allergen–immune mediator reaction. Hypersensitivity reactions are classified



TYPE I
Soluble antigen
IgE
FcεRI
Mast cell
Histamine
Proteolytic enzymes
Cytokines (IL-4, IL-5, TNF-α)
Leukotrienes
Chemokines
Tissue damage
TYPE II
Cell-associated antigen
Erythrocyte
IgG
FcγR
MΦ
TYPE III
Immune complex
Mononuclear phagocyte
Platelet aggregation
Complement activation
PMN
PMN
Complement receptors
FcR
PMN
Reactive oxidants
Proteolytic enzymes
Chemokines
TYPE IV
Ag
Mϕ
Th1
IFNγ
Proteolytic enzymes
Reactive oxidants
Cytokines
Chemokines
Leukotrienes
Tissue damage
Eosinophil activation
Ag
Mϕ
Th2
IL-4
IL-5
Eotaxin
Toxic proteins
Proteolytic enzymes
Cytokines
Chemokines
Leukotrienes
Tissue damage
CTL
Direct cytotoxicity
Cell-associated antigen

Hypersensitivity reactions *(Goldman et al, 2008)* into four types according to the components of the immune system involved in their mediation. A type I or **immediate hypersensitivity** reaction occurs rapidly, within several minutes, on reexposure to an antigen, and is the result of interaction of immunoglobulin E and the antigen; anaphylaxis is a particularly severe type I hypersensitivity reaction. A type II or **cytotoxic hypersensitivity reaction** is one of tissue or cell damage resulting from antibody-antigen interactions on cell surfaces. A type III or immune complex–mediated hypersensitivity reaction is a local or general inflammatory response caused by formation of circulating antigen-antibody complexes and their disposition in tissues. A type IV hypersensitivity reaction (also called **cell-mediated** or **T-cell–mediated hypersensitivity reaction**) is one initiated by antigen-specific T lymphocytes. Unlike hypersensitivity reactions mediated by antibodies, this type takes one or more days to develop, and the hypersensitivity can be transferred by lymphocytes but not by serum. The term is often equated with delayed hypersensitivity reactions that are cytokine-mediated (as contrasted with direct cytolysis).

hypersensitization /-sen′sitīzā′shən/ [Gk, *hyper,* excess; L, *sentire,* to feel], a state of increased reactivity or sensitivity to a stimulus.

hypersomnia /hī′pərsom′nē·ə/ [Gk, *hyper* + L, *somnus,* sleep], **1.** sleep of excessive depth or abnormal duration, usually caused by psychological rather than physical factors and characterized by a state of confusion on awakening. **2.** extreme drowsiness, often associated with lethargy. **3.** a condition characterized by periods of deep, long sleep. Compare **narcolepsy.**

hyperspadias. See **epispadias.**

hypersplenism /hī′pərsplē′nizəm/ [Gk, *hyper* + *splen,* spleen], a syndrome consisting of splenomegaly and a deficiency of one or more types of blood cells. Causes may include portal hypertension, the lymphomas, the hemolytic anemias, malaria, tuberculosis, and various connective tissue and inflammatory diseases. Patients complain of abdominal pain of the left upper and middle quadrant. Patients often experience a sensation of fullness after small meals secondary to an enlarged pressing against the stomach. On physical examination the enlarged spleen is felt and abnormal bruits (vascular sounds) may be auscultated over the epigastric area. Treatment of the underlying disorder may relieve the syndrome and its secondary effects. Splenectomy is considered when hemolytic anemias or splenic enlargement is severe, in treatment failures, or if the danger of vascular accident is significant. See also **splenectomy.**

Hyperstat, a trademark for an emergency vasodilator **(diazoxide).**

hypersthenic /hī′pərsthen′ik/, **1.** pertaining to a condition of excessive strength or tonicity of the body or a body part. **2.** pertaining to a body type characterized by massive proportions.

hypersystole /-sis′təlē/, abnormal force or duration of ventricular contraction.

hypertaurodontism /hī′pərtô′rōdon′tizəm/ [Gk, *hyper,* excess; L, *taurus,* bull; Gk, *odous,* tooth], taurodontism in which the tooth roots do not branch. See also **mesotaurodontism, taurodontism.**

hypertelorism /hī′pərtel′əriz′əm/ [Gk, *hyper* + *tele,* far, *horizo,* separate], a developmental defect characterized by an abnormally wide space between two organs or parts. A kind of hypertelorism is **ocular hypertelorism.** Compare **hypotelorism.**

hypertelorism-hypospadias syndrome. See **Smith-Lemli-Opitz syndrome.**

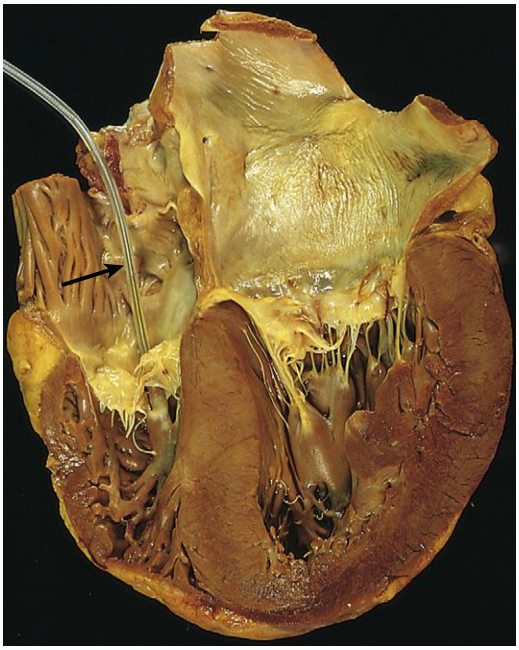
hypertension /-ten′shən/ [Gk, *hyper* + L, *tendere,* to stretch], a common disorder that is a known cardiovascular disease risk factor, characterized by elevated blood pressure over the normal values of 120/80 mm Hg in an adult over 18 years of age. This elevation in blood pressure can be divided into three classes of hypertension. Prehypertension describes blood pressure measurements of greater than 120 mm Hg systolic or 80 mm Hg diastolic and less than 130 mm Hg systolic or 90 mm Hg diastolic. Persons exhibiting prehypertension are encouraged to explore life-style modifications to lower blood pressure, but blood-pressure lowering agents are not generally prescribed without compelling indications. The second classification of hypertension is Stage 1 hypertension and is defined by a blood pressure of over 130 mm Hg systolic or 90 mm Hg diastolic but less than 160 mm Hg systolic or 100 mm Hg diastolic. Patients with Stage 1 hypertension are also encouraged to make life-style modifications, and initial drug therapy may include thiazide-type diuretics, ACE inhibitors, calcium channel blockers, beta blockers, and angiotensin-receptor blockers, or a combination of these. Stage 2 hypertension is defined by a blood pressure greater than 160 mm Hg systolic or 100 mm Hg diastolic. Persons with Stage 2 hypertension are encouraged to make life-style modifications. Two-drug combination therapies (of thiazide-type diuretics, ACE inhibitors, calcium channel blockers, beta blockers, and angiotensin-receptor blockers) are indicated for these patients. Essential hypertension, the most common kind, has no single identifiable cause, but risk for the disorder is increased by obesity, a high serum sodium level, hypercholesterolemia, and a family history of high blood pressure. Known causes of secondary hypertension include sleep apnea, chronic kidney disease, primary aldosteronism, renovascular disease, chronic steroid therapy, Cushing's syndrome, pheochromocytoma, coarctation of the aorta, and thyroid or parathyroid disease. The incidence of hypertension is higher in men than in women and is twice as great in African-Americans as in Caucasians. People with mild or moderate hypertension may be asymptomatic or may experience suboccipital headaches, especially on rising; tinnitus; lightheadedness; ready fatigability; and palpitations. With sustained hypertension, arterial walls become thickened, inelastic, and resistant to blood flow, and the left ventricle becomes distended and hypertrophied as a result of its efforts to maintain normal circulation against the increased resistance. Inadequate blood supply to the coronary arteries may cause angina or myocardial infarction. Left ventricular hypertrophy may lead to congestive heart failure. Malignant hypertension, characterized by a diastolic pressure higher than 120 mm Hg, severe headaches, blurred vision, and confusion, may result in fatal uremia, myocardial infarction, congestive heart failure, or a cerebrovascular accident. Patients with high blood pressure are advised to follow a low-sodium, low-saturated-fat diet; to control obesity by reducing caloric intake; to exercise; to avoid stress; and to have adequate rest. Also called **high blood pressure.** See also **blood pressure.**

Hypertension and Lipid Trial (HALT), a study to assess the efficacy and safety of alpha-adrenergic blockers in patients with hypertension.

hypertensive /-ten′siv/ [Gk, *hyper,* excessive; L, *tendere,* to stretch], pertaining to high blood pressure, its cause, or its effects.

hypertensive arteriosclerosis, a form of arteriosclerosis complicated by a buildup of the muscular and elastic tissues of the arterial walls caused by hypertension.

hypertensive crisis [Gk, *hyper* + L, *tendere,* to stretch; Gk, *krisi,* turning point], a sudden, severe increase in blood pressure to a level exceeding 200/120 mm Hg, occurring most frequently in individuals who have untreated hypertension or



Hypertrophy of the left ventricle in hypertension
(Kumar et al, 2010)

who have stopped taking prescribed antihypertensive medication. See also **malignant hypertension.**

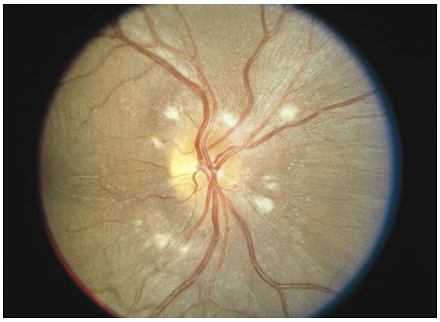
■ OBSERVATIONS: Characteristic signs include severe headache, vertigo, diplopia, tinnitus, photophobia, nosebleed, twitching of muscles, tachycardia or other cardiac arrhythmia, distended neck veins, narrowed pulse pressure, nausea, and vomiting. The patient may be confused, irritable, or stuporous, and the condition may lead to convulsions, coma, myocardial infarction, renal failure, cardiac arrest, or stroke.

■ INTERVENTIONS: Treatment consists of antihypertensive drugs and diuretics; anticonvulsants, sedatives, and antiemetics may be used if indicated. The patient is usually placed on a cardiac monitor in a bed with the head elevated and is maintained in a quiet environment. The diet is low in calories, and sodium and fluids may be restricted. As the patient's condition improves, progressive ambulation is permitted, but the patient is carefully observed for symptoms of orthostatic hypotension, such as pallor, diaphoresis, or faintness, which may be side effects of the antihypertensive drugs.

■ NURSING CONSIDERATIONS: The major concerns of the nurse are to observe and report any sign of hypotension. In preparation for discharge the nurse advises the patient to recognize symptoms of any dramatic increase or decrease in blood pressure, to adhere to the prescribed diet and medication, and to avoid fatigue, heavy lifting, use of tobacco products, and stressful situations.

hypertensive encephalopathy [Gk, *hyper* + L, *tendere,* to stretch; Gk, *enkephalos,* brain, *pathos,* disease], a set of symptoms, including headache, lethary, vision changes, convulsions, and coma secondary to end organ damage from critically elevated systolic or diastolic blood pressure.

hypertensive retinopathy [Gk, *hyper* + L, *tendere,* to stretch, *rete* + *net,* web; Gk, *pathos,* disease], a condition in which retinal changes occur in association with arterial hypertension. The changes may include blood vessel alterations, hemorrhages, exudates, papilledema, and retinal edema.



Hypertensive retinopathy
(Swartz, 2009/Courtesy Ben Serar, MA, CRA)

hypertetraploid. See **hyperploid.**

hyperthermia /hī′pərthur′mē·ə/ [Gk, *hyper* + *therme,* heat], **1.** a much higher than normal body temperature induced therapeutically or iatrogenically. **2.** *nontechnical.* malignant hyperthermia. **3.** the use of various heating methods, such as electromagnetic therapy, to produce temperature elevations of a few degrees in cells and tissues. It is believed to lead to an antitumor effect. Hyperthermia may be used in conjunction with radiotherapy or chemotherapy for cancer treatment.

hyperthyroidism /-thī′roidiz′əm/ [Gk, *hyper* + *thyreos,* shield, *eidos,* form], a condition characterized by hyperactivity of the thyroid gland. The gland is usually enlarged, secreting greater than normal amounts of thyroid hormones, and the metabolic processes of the body are accelerated. Nervousness, exophthalmos, tremor, constant hunger, weight loss, fatigue, heat intolerance, palpitations, and diarrhea may develop. Antithyroid drugs, such as propylthiouracil or methimazole, are usually prescribed. Radioactive iodine may be prescribed in certain cases. Surgical ablation of the gland is sometimes necessary. Untreated hyperthyroidism may lead to death from cardiac failure. See also **Graves' disease, thyroid storm.**

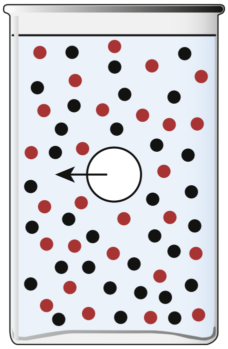
hypertonia /-tō′nē·ə/, **1.** abnormally increased muscle tone or strength. The condition is sometimes associated with genetic disorders, such as trisomy 18, and may be expressed in arm or leg deformities. **2.** a condition of excessive pressure, such as the intraocular pressure of glaucoma.

hypertonic /hī′pərton′ik/ [Gk, *hyper* + *tonos,* stretching], **1.** *adj,* pertaining to a solution that causes cells to shrink. **2.** *n,* a solution that increases the degree of osmotic pressure on a semipermeable membrane. Compare **hypotonic, isotonic.**

hypertonic bladder [Gk, *hyper,* excess, *tonos,* tone; AS, *blaedre*], a condition of excessive tension in the detrusor muscle of the bladder, often caused by an irritant such as a calculus or occurring after surgery.

hypertonic contracture, prolonged muscle contraction that results from continuous nerve stimulation in spastic paralysis. Anesthesia or sleep eliminates this condition. Also called **functional contracture.**

hypertonicity /-tənis′itē/ [Gk, *hyper,* excess, *tonos,* tone], **1.** excessive tone, tension, or activity. **2.** (in ophthalmology) increased intraocular pressure. **3.** excessive tension of the arteries or muscles. **4.** increase in osmotic pressure.



Hypertonic *(Lewis et al, 2010)*

hypertonic saline, a saline solution that contains 1% to 23.4% sodium chloride (compared with normal saline solution at 0.9%).

hypertonus /-tō′nəs/, an excessive level of skeletal muscle tension or activity. See also **clonus.**

hypertrichosis. See **hirsutism.**

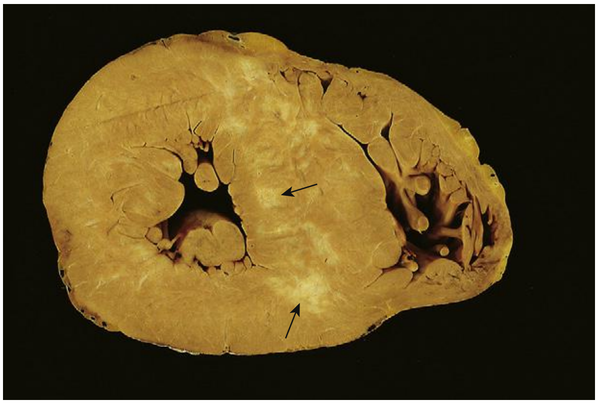
hypertriglyceridemia. See **hyperchylomicronemia.**

hypertriploid. See **hyperploid.**

hypertrophic /-trof′ik/ [Gk, *hyper,* excess, *trophe,* nourishment], pertaining to an increase in size, structure, or function.

hypertrophic angioma. See **hemangioendothelioma.**

hypertrophic cardiomyopathy, an abnormal condition characterized by gross hypertrophy of the interventricular septum and left ventricular free wall of the heart. Ventricular hypertrophy results in impaired diastolic filling and reduced cardiac output. Signs and symptoms, such as fatigue and syncope, are often associated with exercise when the demand for increased cardiac output cannot be met. This is commonly a genetic disease, with numerous genes implicated. Also called **hypertrophic obstructive cardiomyopathy.**



Hypertrophic cardiomyopathy
(Finkbeiner, Ursell, and Davis, 2009)

hypertrophic catarrh [Gk, *hyper* + *trophe,* nourishment, *kata,* down, *rhoia,* flow], a chronic condition characterized by inflammation and discharge from a mucous membrane, accompanied by the thickening of the mucosal and submucosal tissue. Compare **atrophic catarrh.** See also **catarrh.**

hypertrophic cicatrization. See **hypertrophic scarring.**

hypertrophic cirrhosis, a stage of cirrhosis characterized by an overgrowth of liver tissue.

hypertrophic gastritis, a premalignant condition characterized by inflammation of the gastric mucosa associated with gastric albumin wasting. Symptoms include epigastric pain, nausea, vomiting, weight loss, and abdominal distension. It is differentiated from other forms of gastritis by the presence of prominent rugae (folds), enlarged glands, excess mucus production, and nodules on the wall of the stomach. This condition often accompanies peptic ulcer, Zollinger-Ellison syndrome, or gastric hypersecretion.

hypertrophic gingivitis [Gk, *hyper,* excess; *trophe,* nourishment], inflammation and enlargement of the gums resulting from an increase in the size of cells, usually because of an underlying systemic disorder. Compare **gingivitis, hyperplastic gingivitis.**

hypertrophic obesity. See **obesity.**

hypertrophic obstructive cardiomyopathy. See **hypertrophic cardiomyopathy.**

hypertrophic pulmonary osteopathy. See **Marie's hypertrophy.**

hypertrophic scarring, excessive overgrowth of dense collagen tissue, often red, pink, or purple in appearance, at the site of a healed skin defect. It resembles a keloid but is usually temporary, most often regresses without treatment, and remains confined to the site of injury. Also called **hypertrophic cicatrization.**

hypertrophic subaortic stenosis, a form of hypertrophic cardiomyopathy, in which the left ventricle is hypertrophied (commonly with disproportionate involvement of the interventricular septum), and the cavity is small. It is marked by obstruction to left ventricular outflow. Also called *idiopathic hypertrophic subaortic stenosis, muscular subaortic stenosis.*

hypertrophy /hīpur′trəfē/ [Gk, *hyper* + *trophe,* nourishment], an increase in the size of an organ caused by an increase in the size of the cells rather than the number of cells. The cells of the heart and kidney are particularly prone to hypertrophy. Kinds of hypertrophy include **adaptive hypertrophy, compensatory hypertrophy, Marie's hypertrophy, physiological hypertrophy,** and **unilateral hypertrophy.** Also called **overgrowth.** Compare **atrophy, auxesis, hyperplasia. —hypertrophic,** *adj.*

hypertrophy of heart [Gk, *hyper,* excess, *trophe,* nourishment; AS, *heorte*], an increase in the size of the heart resulting from enlargement of the heart muscle, but without an increase in the capacity of the heart chambers. It is a compensatory mechanism in heart failure associated with increased afterload, such as that caused by hypertension or aortic stenosis.

hypertropia. See **anoopsia.**

hyperuricaemia, hyperuricemia. See **gout.**

hyperuricosuria /hi′peru′rĭkosu′re·ä or re·ə/, an excess of uric acid or urates in the urine. Also called **hyperuricuria**, **uricosuria.**

hyperuricuria. See **hyperuricosuria.**

hypervalinemia /hī′pərval′inē′mē·ə/, **1.** an autosomal-recessive aminoacidopathy, probably caused by a defect in an enzyme necessary for valine catabolism, characterized by elevated levels of valine in the plasma and urine and by failure to thrive. **2.** elevated levels of valine in the plasma. Hypervalinemia is often associated with maple sugar urine disease. Also called **valinemia.**

hyperventilation /-ven′tilā′shən/ [Gk, *hyper* + *ventilare,* to fan], pulmonary ventilation rate greater than that metabolically necessary for gas exchange, resulting from an increased respiration rate, an increased tidal volume, or both. Hyperventilation causes an excessive intake of oxygen and elimination of carbon dioxide and may cause hyperoxygenation. Hypocapnia and respiratory alkalosis then occur, leading to dizziness, faintness, numbness of the fingers and toes, possibly syncope, and psychomotor impairment. Causes of hyperventilation include asthma or early emphysema; increased metabolic rate caused by exercise, fever, hyperthyroidism, or infection; lesions of the central nervous system, as in cerebral thrombosis, encephalitis, head injuries, or meningitis; hypoxia or metabolic acidosis; use of hormones and drugs, such as epINEPHrine, progesterone, and salicylates; difficulties with mechanical respirators; and psychogenic factors, such as acute anxiety or pain. Compare **hypoventilation.** See also **respiratory center.**

hyperventilation tetany, a nervous disorder characterized by muscle twitches, cramps, or spasms caused by abnormally low blood levels of CO_2 from forced overbreathing. See also **tetany.**

hyperviscosity /-viskos′itē/ [Gk, *hyper,* excess; L, *viscosus,* sticky], extreme viscosity or thickness of fluid.

hyperviscosity syndrome, several syndromes associated with increased thickness and slowed flow rate of blood. One type, which results from serum hyperviscosity, is caused by is caused by increased proteins and is characterized by neurological and ocular disorders. Another type is polycythemia causing organ congestion, reduced capillary perfusion, and increased cardiac effort. A third group includes conditions in which the deformability of erythrocytes is impaired, such as sickle cell anemia.

hypervitaminosis /-vī′təminō′sis/, an abnormal condition resulting from excessive intake of toxic amounts (self-prescribed, usually from supplements) of one or more vitamins, especially over a long period. Serious effects may result from overdoses of fat-soluble vitamins A, D, E, or K, but adverse reactions are less likely with the water-soluble B and C vitamins, except when taken in megadoses. Compare **avitaminosis.** See also **megadose,** specific vitamins.

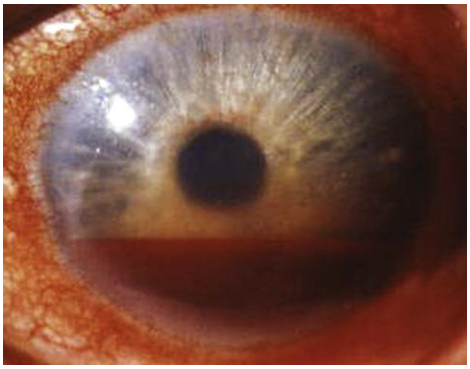
hypervolemia /-vōlē′mē·ə/ [Gk, *hyper* + L, *volumen,* paper roll; Gk, *haima,* blood], an increase in the amount of intravascular fluid, particularly in the volume of circulating blood or its components. See also **congestive heart failure.**

hypervolemia management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as reduction in extracellular and/or intracellular fluid volume and prevention of complications in a patient who is fluid overloaded. See also **Nursing Interventions Classification.**

hypesthesia /hī′pisthē′zhə/ [Gk, *hypo,* under, *aisthesis,* feeling], a decrease in sensation in response to stimulation of the sensory nerves or body organs or areas they innervate. Also called **hypoesthesia.** —*hypesthetic, adj.*

hypha /hī′fə/ *pl.* *hyphae* [Gk, *hyphe,* web], a threadlike structure in the mycelium in a fungus.

hyphema /hīfē′mə/ [Gk, *hypo,* under, *haima,* blood], a hemorrhage into the anterior chamber of the eye, usually caused by a blunt trauma. The patient is treated by an ophthalmologist, who evaluates the need for evacuation of the blood and the use of mydriatic or miotic medications or a carbonic anhydrase inhibitor. Glaucoma may result from recurrent bleeding. Also called *hyphaemia, hyphemia.*



Hyphema *(Palay and Krachmer, 2005)*

hyphomycosis /hi′fomiko′sis/, any infection caused by an imperfect fungus of the form-class Hyphomycetes. The group has been divided into hyalohyphomycosis and phaeohyphomycosis on the basis of the color of the mycelium and wall of the fungus. It is a disease of horses and mules, rarely of humans.

hypnagogic. See **hypnagogue.**

hypnagogic hallucination /hip′nəgoj′ik/ [Gk, *hypnos,* sleep, *agogos,* leading], a vivid image that occurs while falling asleep.

hypnagogue /hip′nəgog/ [Gk, *hypnos* + *agogos,* leading], an agent or substance that tends to induce sleep or the feeling of dreamy sleepiness, as occurs before falling asleep. See also **hypnotic.** **—hypnagogic,** *adj.*

hypno-, prefix meaning "sleep": *hypnagogic, hypnalgia.*

hypnoanalysis /hip′nə·anal′isis/ [Gk, *hypnos* + *analyein,* to loosen], the use of hypnosis as an adjunct to other techniques in psychoanalysis.

hypnogenic zone /hip′nəjen′ik/, a specific area on the body that, when stimulated with pressure, can cause a person to enter a hypnotic state.

hypnopomic hallucination, an image perceived while awakening from sleep.

hypnosis^1 /hipnō′sis/ [Gk, *hypnos,* sleep], a passive, trancelike state that resembles normal sleep during which perception and memory are altered, resulting in increased responsiveness to suggestion. The condition is usually induced by the monotonous repetition of words and gestures while the subject is completely relaxed.

hypnosis^2**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient to achieve a state of attentive, focused concentration with suspension of some peripheral awareness to create changes in sensation, thoughts, or behavior. See also **Nursing Interventions Classification.**

hypnotherapy /hip′nəther′əpē/ [Gk, *hypnos* + *therapeia,* treatment], the induction of a specific altered state (trance) for memory retrieval, relaxation, or suggestion. Hypnotherapy is often used to alter habits (e.g., smoking, obesity), treat biological mechanisms such as hypertension or cardiac arrhythmias, deal with the symptoms of a disease, alter an individual's reaction to disease, and affect an illness and its course through the body.

hypnotic /hipnot′ik/ [Gk, *hypnos,* sleep], one of a class of drugs often used as sedatives. See also **hypnagogue.**

-hypnotic, suffix meaning "sleep or hypnosis": *anhypnotic, autohypnotic, posthypnotic.*

hypnotic sleep /hipnot′ik/ [Gk, *hypnos,* sleep; ME, *slep*], sleep induced through the administration of hypnotic medicines.

hypnotic suggestion [Gk, *hypnos,* sleep; L, *suggerere,* to suggest], a suggestion implanted in the mind of a person under hypnosis.

hypnotic trance, an artificially induced sleeplike state, as in hypnosis.

hypnotism /hip′nətiz′əm/ [Gk, *hypnos,* sleep], the study or practice of inducing hypnosis.

hypnotist /hip′nətist/, one who practices hypnotism.

hypnotize /hip′nətīz/, **1.** to put into a state of hypnosis. **2.** to fascinate, entrance, or control through personal charm.

hypo-, hyp-, prefix meaning "under, below, beneath, deficient," or, in chemistry, "lacking oxygen": *hypochlorite, hypodermic, hypodontia.*

hypoacidity /hī′pō·əsid′itē/, a deficiency of acid.

hypoactivity /-aktiv′itē/ [Gk, *hypo,* under; L, *activus,* active], any abnormally diminished activity of the body or its organs, such as decreased cardiac output, thyroid secretion, or peristalsis. Compare **hyperactivity.**

hypoacusis /-əko͞o′sis/ [Gk, *hypo,* under, *akouein,* to hear], a reduced sensitivity to sounds.

hypoadrenalism. See **Addison's disease.**

hypoalbuminemia /-albo͞o′minē′mē·ə/, a condition of abnormally low levels of albumin in the blood. It may occur in celiac disease, tropical sprue, malnutrition, and some forms of liver or kidney impairment. Also spelled *hypoalbuminaemia*.

hypoalimentation /-al′iməntā′shən/ [Gk, *hypo* + L, *alimentum,* nourishment], a condition of insufficient or inadequate nourishment.

hypoallergenic /-al′ərjen′ik/ [Gk, *hypo,* under, *allos,* other, *ergein,* to work], having a lowered potential for producing an allergic reaction.

hypobarism /-ber′izəm/, air pressure that is significantly less than the sea level normal of 760 mm Hg. See also **barotrauma, decompression sickness.**

hypobetalipoproteinemia /hī′pōbā′təlip′ōprō′tēnē′mē·ə/ [Gk, *hypo* + *beta,* second letter of Greek alphabet, *lipos,* fat, *proteios,* first rank, *haima,* blood], an inherited disorder in which there are less than normal amounts of beta-lipoprotein in the serum. Blood lipids and cholesterol are present at less than the expected levels regardless of dietary intake of fats. There are no clinical signs, and treatment is unnecessary. Compare **hyperbetalipoproteinemia.**

hypoblast /hī′pōblăst/ [Gk, *blastos,* germ], the lower layer of the bilaminar embryonic disk in a human embryo, present during the second week, that gives rise to the endoderm.

hypocalcemia /hī′pōkalsē′mē·ə/ [Gk, *hypo* + L, *calx,* lime; Gk, *haima,* blood], a deficiency of calcium in the serum that may be caused by hypoparathyroidism, vitamin D deficiency, kidney failure, acute pancreatitis, or inadequate amounts of plasma magnesium and protein. Normal serum calcium levels range from 8.5 to 10.5 mg/dl. Mild hypocalcemia is asymptomatic. Severe hypocalcemia is characterized by cardiac arrhythmias and tetany with hyperparesthesia of the hands, feet, lips, and tongue. The underlying disorder is diagnosed and treated, and calcium is given by mouth or IV infusion. Hypocalcemia is also seen in dysmature newborns, in infants born of mothers with diabetes, or in normal babies of normal mothers delivered after a long or stressful labor and delivery. The condition is signaled by vomiting, twitching of extremities, poor muscle tone, high-pitched crying, and difficulty in breathing. Also spelled *hypocalcaemia*. See also **Chvostek's sign, tetany.** —*hypocalcemic, adj.*

hypocalcemic tetany /-kalsē′mik/ [Gk, *hypo,* under, L, *calx,* calcium, *haima,* blood, *tetanos,* convulsive tension], a disease caused by an abnormally low level of calcium in the blood. It is characterized by hyperexcitability of the neuromuscular system and results in carpopedal spasms. A common cause is a deficiency of parathyroid hormone secretion.

hypocalciuria /-kal′siuo͝or′ē·ə/ [Gk, *hypo,* under; L, *calx,* lime; Gk, *ouron,* urine], a diminished level of calcium in the urine.

hypocapnia /-kap′nē·ə/, an abnormally low arterial carbon dioxide level. Also called *hypocarbia*.

hypochloremia /-klôrē′mē·ə/ [Gk, *hypo* + *chloros,* green, *haima,* blood], a decrease in the chloride level in the blood serum below 95 mEq/L. The condition may result from prolonged gastric suctioning. Also spelled *hypochloraemia*.

hypochloremic alkalosis /-klôrē′mik/, a metabolic disorder resulting from an increase in blood bicarbonate level secondary to loss of chloride from the body.

hypochlorhydria /-klôrhid′rē·ə/ [Gk, *hypo* + *chloros,* green, *hydor,* water], a deficiency of hydrochloric acid in gastric secretions.

hypochlorite poisoning /-klôr′īt/, toxic effects of ingestion of or skin contact with household or commercial bleaches or similar chlorinated products. Symptoms include pain and inflammation of the mouth and digestive tract, vomiting, and breathing difficulty. Skin contact may produce blisters.

hypochlorous acid /-klôr′əs/ [Gk, *hypo* + *chloros,* green; L, *acidus,* sour], a compound, HOC1, that is stable only in the form of a dilute aqueous solution formed by dissolving chlorine gas in water to yield a greenish-yellow solution. An unstable compound that decomposes to hydrochloric acid and oxygen, it is used as a bleaching agent and disinfectant.

hypocholesteremia /-kəles′tərē′mē·ə/, an abnormally low level of cholesterol in the blood. Also called *hypocholesterolemia*.

hypochondria. See **hypochondriasis.**

hypochondriac /-kon′drē·ak/ [Gk, *hypo,* under, *chondros,* cartilage], **1.** *adj,* pertaining to the regions of the upper abdomen beneath the lower ribs and lateral to the epigastric region. See also **hypochondriac region. 2.** *n,* a person who is so preoccupied with matters of ill health that the state of mind itself becomes a disability. —*hypochondriacal, adj.*

hypochondriac region [Gk, *hypo* + *chondros,* cartilage; L, *regio,* direction], the part of the abdomen in the upper zone on both sides of the epigastric region and beneath the cartilages of the lower ribs. Also called **hypochondrium.** See also **abdominal regions.**

hypochondriasis /hī′pōkəndrī′əsis/ [Gk, *hypo* + *chondros,* cartilage, *osis,* condition], a chronic abnormal concern about the health of the body. It is characterized by extreme anxiety, depression, and an unrealistic interpretation of real or imagined physical symptoms as indications of a serious illness or disease despite rational medical evidence that no disorder is present. The condition is caused by some unresolved intrapsychic conflict and may involve a specific organ, such as the heart, lungs, or eyes, or several body systems at various times or simultaneously. In severe cases the distorted body-mind relationship is so strong that actual symptoms and disease may develop. Treatment usually consists of psychotherapy to uncover the underlying emotional conflict. Also called **hypochondria.**

hypochondrium. See **hypochondriac region.**

hypochondroplasia /-kon′drōplā′zhə/, an inherited form of dwarfism that resembles a mild form of achondroplasia. It is relatively uncommon and is transmitted as an autosomal-dominant trait.

hypochromic /hī′pōkrō′mik/ [Gk, *hypo* + *chroma,* color], pale staining red blood cells with broadened central zone of pallor; most often associated with hypochromic, microcytic anemia, thalassemia, and anemia of chronic inflammation. Compare **normochromic.** See also **hypochromic anemia, red cell indexes.**

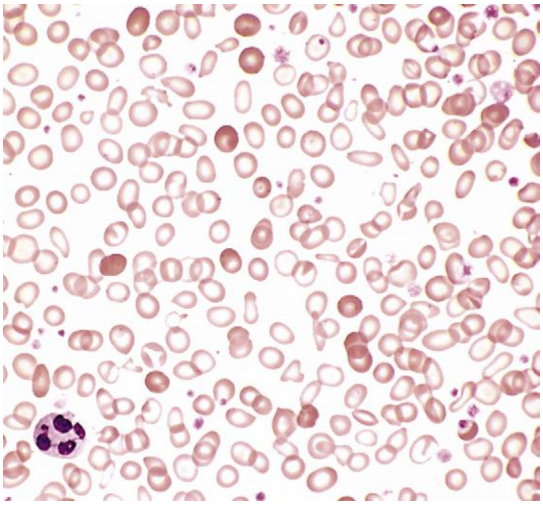
hypochromic anemia, 1. a group of anemias characterized by a decreased concentration of hemoglobin in the red blood cells. **2.** a decrease in hemoglobin characterized by hypochromic, microcytic red blood cells such as iron deficiency anemia, thalassemia and anemia of chronic inflammation. See also **anemia, red cell indexes.**

hypocitraturia /hī′pōsĭtratu′re·ə/, excretion of urine containing an abnormally small amount of citrate, an important cause of the formation of oxalate urinary calculi.

hypocycloidal motion /-sī′kloidəl/, a complex circular movement of the x-ray tube and film during the acquisition of CT images. It is used to blur structures outside the focal plane and eliminate ghost images.

hypocythemia, deficiency in the number of red blood cells. Also called **erythropenia.**

hypocytic leukemia. See **aleukemic leukemia.**



Hypochromic microcytic anemia
(Kumar et al, 2007/Courtesy Dr. Robert W. McKenna, Department of Pathology, University of Texas Southwestern Medical School)

hypodermatoclysis. See **hypodermoclysis.**

hypodermic /-durmik/ [Gk, *hypo* + *derma,* skin], pertaining to the area below the skin, such as in a hypodermic injection.

hypodermic implantation [Gk, *hypo,* under, *derma,* skin; L, *implantare,* to set into], the introduction of a solid medicine under the skin, usually on the chest or abdominal wall, to ensure local action or slow absorption.

hypodermic needle, a short, thin hollow needle that attaches to a syringe for injecting a drug or medication under the skin or into vessels and for withdrawing a fluid, such as blood, for examination.

Hypodermic needle *(Potter et al, 2011)*

hypodermic syringe [Gk, *hypo,* under, *derma,* skin, *syrigx,* tube], an instrument designed to direct fluid under the skin through a fine hollow needle.

hypodermic tablet, a compressed or molded dosage form of a medication that can be dissolved for IV administration.

hypodermoclysis /hī′pōdərmok′lisis/ [Gk, *hypo* + *derma,* skin, *klysis,* flushing out], the injection of an isotonic or hypotonic solution into subcutaneous tissue to supply a continuous and large amount of fluid, electrolytes, and nutrients. The procedure is used to replace the loss or inadequate intake of water and salt during illness or surgery or after shock or hemorrhage. It is performed only when a patient is unable to take fluids intravenously, orally, or rectally. The rate of absorption into the circulatory system is increased with the addition to the solution of the enzyme hyaluronidase. The most common sites of administration are the anterior thighs, the abdominal wall along the crest of the ilium, below the breasts in women, and directly over the scapula in children; sites should be changed when multiple infusions are given. The patient is placed in a comfortable position because the procedure takes a long time. The nurse observes for signs of circulatory collapse, respiratory difficulty, and edema at the site of injection. Also called **hypodermatoclysis, interstitial infusion, subcutaneous infusion.**

hypodiploid. See **hypoploid.**

hypodipsia /-dip′sē·ə/, a condition in which homeostasis is threatened by an abnormally low fluid intake. It is often related to dysfunction of the thirst osmoreceptor in the anterior hypothalamus.

hypodontia /hī′pōdon′shə/, [Gk, *hypo,* under + *odous,* tooth] See **partial anodontia.**

hypoesthesia. See **hypesthesia.**

hypofertility. See **subfertility.**

hypofibrinogenemia /-fī′brinōjənē′mē·ə/ [Gk, *hypo* + L, *fibra,* fiber; Gk, *genein,* to produce, *haima,* blood], plasma fibrinogen deficiency. It may be inherited or acquired, as in disseminated intravascular coagulation or liver disease. Also spelled *hypofibrinogenaemia*.

hypofunction /-fungk′shən/ [Gk, *hypo,* under; L, *functio,* performance], a diminished or inadequate level of activity of an organ system or its parts.

hypogammaglobulinemia /-gam′əglō′byəlinē′mē·ə/ [Gk, *hypo* + *gamma,* third letter in Greek alphabet; L, *globus,* small sphere; Gk, *haima,* blood], lower than normal concentration of plasma gamma globulin, usually the result of increased protein catabolism or loss of protein via the urine. It is associated with a decreased resistance to infection. Also spelled *hypogammaglobulinaemia*. Compare **agammaglobulinemia.**

hypogastric /-gas′trik/ [Gk, *hypo,* under, *gaster,* stomach], pertaining to the hypogastrium, the lower abdominal region below the umbilical region and between the right and left iliac regions.

hypogastric artery. See **internal iliac artery.**

hypogastric pain, pain in the lower abdomen.

hypogastric plexus, a complex of nerve fibers in the pelvic area near the termination of the aorta and the beginning of the common iliac artery.

hypogastric region, hypogastrium. See **pubic region.**

hypogenitalism /-jen′itəliz′əm/ [Gk, *hypo* + L, *genitalis,* fruitful], a condition of retarded sexual development caused by a defect in male or female hormonal production in the testis or ovary.

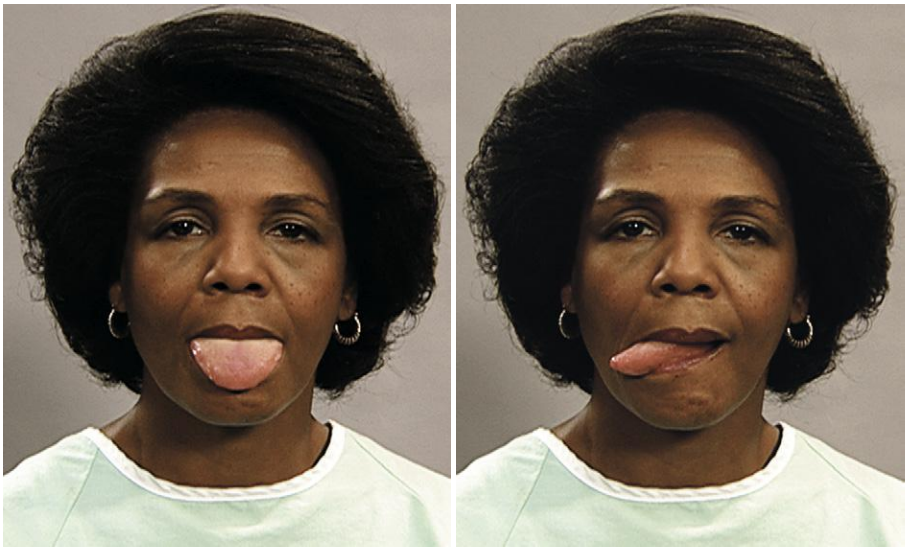
hypogeusia /-go͞o′zē·ə/, reduced taste, often a consequence of Parkinson's or Alzheimer's disease, as well as a side effect of multiple medications.

hypoglossal /-glos′əl/ [Gk, *hypo,* under, *glossa,* tongue], pertaining to nerves or other structures under the tongue.

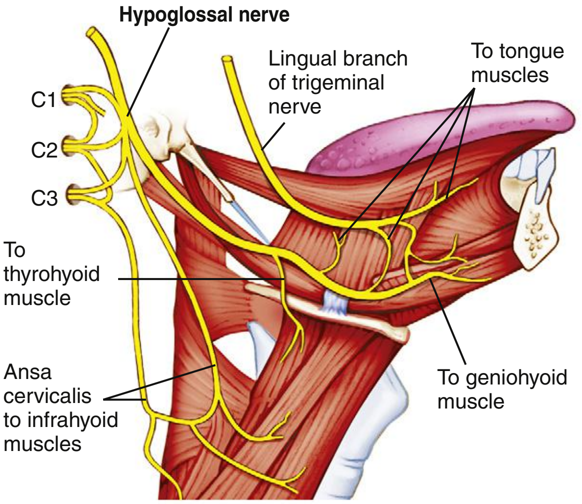
hypoglossal nerve [Gk, *hypo* + *glossa,* tongue], either of a pair of cranial nerves essential for swallowing and for moving the tongue. Each nerve has four major branches, communicates with the vagus nerve, and arises from nucleus XII in the brain. Also called **nervus hypoglossus, twelfth cranial nerve.**

hypoglossus /-glos′əs/, **1.** a muscle that retracts and pulls down the side of the tongue. **2.** the hypoglossal nerve.

hypoglycemia /hī′pōglīsē′mē·ə/ [Gk, *hypo* + *glykys,* sweet, *haima,* blood], a low level of glucose in the blood. It may be caused by administration of too much insulin, excessive secretion of insulin by the islet cells of the pancreas, or dietary deficiency. The condition may cause weakness, headache, hunger, visual disturbances, ataxia, anxiety, personality changes, and, if untreated, delirium, coma, and death. The treatment is the administration of glucose by mouth if the patient is conscious or IV glucose supplementation if the person is unconscious or uncooperative. Glycogen or complex carbohydrates may also be given. Also spelled *hypoglycaemia*. Also called **glycopenia.** Compare **diabetic coma.**



Hypoglossal nerve assessment *(Seidel et al, 2011)*



Hypoglossal nerve

hypoglycemia management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preventing and treating low blood glucose levels. See also **Nursing Interventions Classification.**

hypoglycemic /-glīsē′mik/ [Gk, *hypo,* under, *glykys,* sweet, *haima,* blood], pertaining to or resembling a state of low blood glucose level. Also spelled *hypoglycaemic.*

hypoglycemic agent, any of various synthetic drugs that lower the blood glucose level and are used to treat type 2 diabetes mellitus. They may stimulate synthesis of insulin by pancreatic beta cells, inhibit glucose production, facilitate transport of glucose to muscle cells, and sometimes increase the number of receptor sites where insulin can be bound and can initiate the process of breaking down glucose. Most are sulfonylureas, including acetoHEXAMIDE, chlorproPAMIDE, glipiZIDE, TOLAZamide, and TOLBUTamide. Patients should be advised that these drugs are not a cure for diabetes but only a means of controlling it and that it is important to continue to comply with dietary and exercise prescriptions.

hypoglycemic coma [Gk, *hypo,* under, *glykys,* sweet, *koma,* deep sleep], a loss of consciousness that results from abnormally low blood glucose levels.

hypoglycogenolysis /-glī′kōjənol′isis/, a metabolic disorder in which deficient or defective splitting of glycogen molecules results in decreased formation of glucose.

hypogonadism /-gō′nədiz′əm/, a deficiency in the secretory activity of the ovary or testis. The condition may be primary or caused by a gonadal dysfunction involving the Leydig's cells in the male, or it may be secondary to a hypothalamus or pituitary disorder. Secondary hypogonadism is sometimes further differentiated into pituitary hypogonadism and hypothalamic hypogonadism.

hypohidrotic ectodermal dysplasia. See **anhidrotic ectodermal dysplasia.**

hypoinsulinism /-in′səliniz′əm/ [Gk, *hypo,* under; L, *insula,* island (of Langerhans)], a deficiency of insulin secretion by cells of the pancreas, with associated signs and symptoms of diabetes.

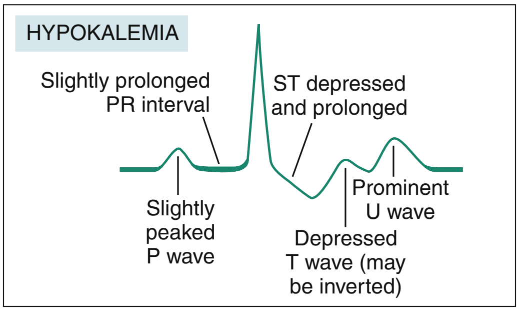
hypokalemia /hī′pōkəlē′mē·ə/ [Gk, *hypo* + L, *kalium,* potassium; Gk, *haima,* blood], a condition in which an inadequate amount of potassium, the major intracellular cation, is found in the circulating bloodstream. Hypokalemia is characterized by abnormal electrocardiographic findings, weakness, confusion, mental depression, and flaccid paralysis. The cause may be starvation, treatment of diabetic acidosis, adrenal tumor, or diuretic therapy. Mild hypokalemia may resolve itself when the underlying disorder is corrected. Severe hypokalemia may be treated by the administration of potassium chloride, orally or parenterally, and by a diet high in potassium. Also spelled *hypokalaemia.* Also called **kaliopenia.** Compare **hyperkalemia.** See also **electrolyte balance.** —*hypokalemic, adj.*

hypokalemic alkalosis /-kalē′mik/, a pathological condition resulting from the accumulation of base or the loss of acid from the body, associated with a low level of serum potassium. The retention of alkali or the loss of acid occurs primarily in extracellular fluid, but the pH of intracellular fluid may also be subnormal. See also **hypokalemia.**

Signs and symptoms of hypoglycemia

Adrenergic symptoms	Neuroglycopenic symptoms
Pallor	Headache
Diaphoresis	Mental confusion
Tachycardia	Circumoral paresthesia
Piloerection	Fatigue
Palpitations	Incoherent speech
Nervousness	Coma
Irritability	Diplopia
Sensation of coldness	Emotional lability
Weakness	Convulsions
Trembling	
Hunger	

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St Louis, 2007, Mosby.



HYPOKALEMIA
Slightly prolonged PR interval
ST depressed and prolonged
Prominent U wave
Slightly peaked P wave
Depressed T wave (may be inverted)

Hypokalemia: ECG changes *(Huether and McCance, 2008)*

hypokalemic nephropathy, nephropathy with hypokalemia, interstitial nephritis, swelling and vacuolization of proximal renal tubules, and progressive renal failure, resulting from long-term conditions, such as oncotic overloading of the kidney filtration mechanisms by sugars.

hypokalemic periodic paralysis [Gk, *hypo,* under; L, *kalium,* potassium; Gk, *peri,* near, *hodos,* way, *paralyein,* to be palsied], a state of recurring attacks of muscular weakness associated with low blood levels of potassium.

hypokinesia. See **hypomotility.**

hypokinetic /-kinet′ik/ [Gk, *hypo,* under, *kinesis,* movement], pertaining to diminished power of movement or motor function, which may or may not be accompanied by a mild form of paralysis.

hypolipoproteinemia /hī′pōlip′ōprō′tēnē′mē·ə/ [Gk, *hypo* + *lipos,* fat, *proteios,* first rank, *haima,* blood], a group of defects of lipoprotein metabolism that cause varying complexes of signs. Primary, or hereditary, hypolipoproteinemia factors include abnormal transport of triglycerides in the blood, low levels of high-density lipoproteins, and abnormal fat deposits in the body, especially in the kidneys and the liver. In some of the syndromes ocular, cardiovascular intestinal, and neurological effects are also present. The condition also may be secondary to anemia, malabsorption syndromes, or malnutrition. Kinds of hypolipoproteinemia are **abetalipoproteinemia,** *familial hypocalphalipoproteinemia,* **hypobetalipoproteinemia, lecithin-cholesterol acetyltransferase deficiency,** and **Tangier disease.** Also called *hypolipidemia.*

hypomagnesemia /hī′pōmag′nisē′mē·ə/, an abnormally low concentration of magnesium in the blood plasma, which causes nausea, vomiting, muscle weakness, tremors, tetany, and lethargy. Tachycardia and arrhythmia may also occur. Mild hypomagnesemia is usually the result of inadequate absorption of magnesium in the kidney or intestine, although it is also seen after prolonged parenteral feeding and during lactation. A more severe form is associated with malabsorption syndrome, protein malnutrition, and parathyroid disease. Magnesium salts to correct the deficiency may be given orally or intravenously.

hypomania /-mā′nē·ə/ [Gk, *hypo* + *mania,* madness], a mild degree of mania characterized by optimism; excitability; energetic, productive behavior; marked hyperactivity and talkativeness; heightened sexual interest; quick anger and irritability; and a decreased need for sleep. It may be observed before a full-blown manic episode. **—***hypomaniac, n., hypomanic, adj.*

hypomelanosis of Ito. See **incontinentia pigmenti achromians.**

hypometria /hī′pōmē′trē·ə/ [Gk, *hypo* + *metron,* measure], an abnormal form of dysmetria characterized by a dysfunction of the power to control the range of muscular action, resulting in movements that fall short of the intended goals of the affected individual. Compare **hypermetria.**

hypomobility /-mōbil′itē/, a decrease in the normal movement of a joint or body part, as may result from an articular surface dysfunction or from disease or injury that affects a bone, muscle, or joint.

hypomorph /hī′pōmôrf/ [Gk, *hypo* + *morphe,* form], **1.** a person whose arms and legs are disproportionately short in relation to the trunk and whose sitting height is disproportionately tall compared to the standing height. **2.** a mutant allele that has a reduced effect on the expression of a trait but does not cause abnormal development. Also called **leaky gene.** Compare **amorph, antimorph, hypermorph.**

hypomotility /-mōtil′itē/ [Gk, *hypo,* under; L, *motare,* to move frequently], a state of diminished motility or loss of power to move about. Also called **hypokinesia.**

hyponasality /hī′pōnāzal′itē/ [Gk, *hypo,* under + *nasus,* nose], a speech characteristic caused by insufficient resonance of air in the nasal cavity, so that speakers sound as if they have a cold. Consonant sounds /m/, /n/, and /ng/ are affected. Also called **denasality.**

hyponatremia /hī′pōnatrē′mē·ə/ [Gk, *hypo* + L, *natrium,* sodium; Gk, *haima,* blood], a lower-than-normal concentration of sodium in the blood, caused by inadequate excretion of water or by excessive water in the circulating bloodstream. In a severe case the person may experience water intoxication, with confusion and lethargy, leading to muscle excitability, convulsions, and coma. Fluid and electrolyte balance may be restored by IV infusion of a balanced solution or a fluid-restricted diet. Also spelled *hyponatraemia.*

hyponychial /hi′ponik′e·al/. See **subungual.**

hypoosmolality [Gk, *hypo* + *osmos,* impulse], a state or condition of abnormally reduced osmolality. The normal serum concentration (millimoles per liter) is 0.43–0.50 times the serum osmolality (milliosmoles per kilogram). A decrease in this ratio is caused by an increase in other osmolutes such as glucose or ketone bodies in diabetes mellitus, urea in uremia, or salicylate in salicylic poisoning. See also **osmolality.**

hypoosmotic /hī′pō·ozmot′ik/, pertaining to a solution that has a lower solute concentration than another solution. Compare **hyperosmotic, isosmotic.**

hypoosmotic swelling, swelling of sperm in a hypoosmotic solution because of shifts in free water.

hypoparathyroidism /-per′əthī′roidiz′əm/ [Gk, *hypo* + *para,* beside, *thyreos,* shield, *eidos,* form], a condition of insufficient secretion of the parathyroid glands. It can be caused by primary parathyroid dysfunction or by elevated serum calcium level.

hypoperistalsis /-per′istal′sis/ [Gk, *hypo,* under, *peristellein,* to clasp], a state of abnormally slow motility of waves of alternate contraction and relaxation that impel contents forward through the digestive tract.

hypopharyngeal /-fərin′jē·əl/ [Gk, *hypo* + *pharynx,* throat], **1.** pertaining to the hypopharynx. **2.** situated below the pharynx.

hypopharyngeal eminence. See **copula.**

hypopharynx /-fer′ingks/, the inferior portion of the pharynx, between the epiglottis and the larynx. It corresponds to the height of the epiglottis and is a critical dividing point in separating solids and fluids from air entering the region.

hypophonia /-fō′nē·ə/ [Gk, *hypo,* under, *phone,* voice], a weak or whispered voice.

hypophoria /-fôr′ē·ə/, a type of strabismus in which the patient may not show signs of ocular muscle imbalance until the affected eye is covered, resulting in a downward deviation. Otherwise the central nervous system may attempt to compensate for the defect through a fusion of the images received from both of the eyes.

hypophosphatasia /hī′pōfos′fətā′zhə/ [Gk, *hypo* + *phosphoros,* lightbearing], congenital absence of alkaline phosphatase, an enzyme essential to the calcification of bone tissue. Complications include vomiting, growth retardation, and often death in infancy. Children who survive have numerous skeletal abnormalities and suffer from dwarfism. There is no known treatment.

hypophosphatemic rickets /hī′pōfos′fətē′mik/, a rare familial disorder characterized by impaired resorption of phosphate in the kidneys and poor absorption of calcium in the small intestine, which result in osteomalacia, retarded growth, skeletal deformities, and pain. Treatment includes replacement of phosphate and vitamin D, to be taken by mouth.

hypophyseal /-fizē′əl, -fiz′ē·əl/ [Gk, *hypo,* under, *phyein,* to grow], pertaining to the hypophysis (pituitary body).

hypophyseal cachexia. See **panhypopituitarism.**

hypophyseal dwarf. See **pituitary dwarf.**

hypophyseal hormones, pituitary hormones that are associated with body growth and exercise effects, such as luteinizing hormone, which stimulates testosterone production and muscular hypertrophy; growth hormone; and antidiuretic hormone.

hypophyseal portal system, a set of vessels (arteries and capillaries) that carry blood and regulatory hormones from the hypothalamus to the adenohypophysis, where the target cells of the releasing hormones are located.

hypophysectomy /hīpof′əsek′təmē/ [Gk, *hypo* + *phyein,* to grow, *ektomē,* excision], surgical removal of the pituitary gland. It may be performed to slow the growth and spread of endocrine-dependent malignant tumors or to excise a pituitary tumor. The gland is removed only if other treatment, such as x-ray therapy, radioactive implants, or cryosurgery, fails to destroy all pituitary tissue. With general anesthesia, the gland is completely removed. Postoperative nursing care is as for a craniotomy. Levels of hormones, including thyroid-stimulating hormone, adrenocorticotropic hormone, and antidiuretic hormone, are monitored, and replacement therapy is begun as needed. Urinary output is measured every 2 hours for several days to monitor for diabetes insipidus, and an amount in excess of 300 mL in any 2-hour period is reported. The patient is closely monitored for early signs of thyroid crisis, Addisonian crisis, electrolyte imbalance, hemorrhage, hypothermia, and meningitis. —*hypophysectomize, v.*

hypophyseoprivic /-fiz′ē·ōpriv′ik/ [L, *privus,* deprived], pertaining to a deficiency of hormone secretions by the pituitary gland (hypophysis). The condition may be caused by functional inactivity or surgical removal of the gland.

hypophysial fossa, the deep central area of the sella turcica that contains the pituitary gland.

hypophysis /hīpof′isis/ [Gk, *hypo,* under, *phyein,* to grow], the pituitary body (gland). The anterior lobe is sometimes identified as the **adenohypophysis** and the posterior lobe as the **neurohypophysis.**

hypophysis cerebri. See **pituitary gland.**

hypopigmentation /-pig′məntā′shən/ [Gk, *hypo* + L, *pigmentum,* paint], unusual lack of skin color, but not complete lack of pigment as seen in albinism. Compare **hyperpigmentation.**

hypopituitarism /-pityo͞o′iteriz′əm/ [Gk, *hypo* + L, *pituita,* phlegm], an abnormal condition caused by diminished activity of the pituitary gland resulting in decreased secretion of its hormones. Symptoms vary depending on which hormones are affected. The manifestations depend on the hormone(s) and target tissues involved. Serum levels of pituitary hormones are lower than normal.

hypoplasia /hī′pōplā′zhə/ [Gk, *hypo* + *plassein,* to mold], underdevelopment of an organ or a tissue, usually resulting from the presence of a smaller-than-normal number of cells. Kinds of hypoplasia are **cartilage-hair hypoplasia** and **enamel hypoplasia.** Also called **hypoplasty.** Compare **aplasia, hyperplasia.** See also **oligomeganephronia, osteogenesis imperfecta. —hypoplastic,** *adj.*

hypoplasia of the mesenchyme. See **osteogenesis imperfecta.**

hypoplastic. See **hypoplasia.**

hypoplastic anemia /-plas′tik/, anemias characterized by inadequately functioning bone marrow. Compare **aplastic anemia, polycythemia.**

hypoplastic dwarf. See **primordial dwarf.**

hypoplastic left heart syndrome (HLHS), any of a group of congenital anomalies consisting of hypoplasia or atresia of the left ventricle and of the aortic or mitral valve or both and hypoplasia of the ascending aorta. It is characterized by respiratory distress and extreme cyanosis, with cardiac failure and death in early infancy.

hypoplasty. See **hypoplasia.**

hypoploid /hī′pəploid/ [Gk, *hypo* + *eidos,* form], **1.** *n,* an individual, organism, strain, or cell that has fewer than the haploid number or than an exact multiple of the haploid number of chromosomes characteristic of the species. The result is one or more unbalanced sets of chromosomes, which are referred to as **hypodiploid, hypotriploid, hypotetraploid,** and so on, depending on the number of multiples of the haploid chromosomes they contain. **2.** *adj,* pertaining to such an individual, organism, strain, or cell. Also called **hypoploidic.** Compare **hyperploid.** See also **monosomy. —hypoploidy,** *n.*

hypoploidy /hī′pōploi′dē/, any decrease in chromosome number that involves individual chromosomes rather than entire sets, so that fewer than the normal haploid number of chromosomes characteristic of the species are present, as in Turner's syndrome. Compare **hyperploidy.**

hypopnea /hīpop′nē·ə, hī′pōnē′ə/ [Gk, *hypo* + *pnoe,* breath], abnormally shallow and slow respiration. In well-conditioned athletes it may be appropriate and is often accompanied by a slow pulse. Otherwise, it is apparent when pleuritic pain limits excursion and is characteristic of damage to the brainstem. Accompanied by a rapid, weak pulse, it is a grave sign. See also **respiration rate.**

hypopotassemia /-pot′əsē′mē·ə/ [Gk, *hypo* + D, *potasch,* potash; Gk, *haima,* blood], a deficiency of potassium in the blood. See also **hypokalemia.**

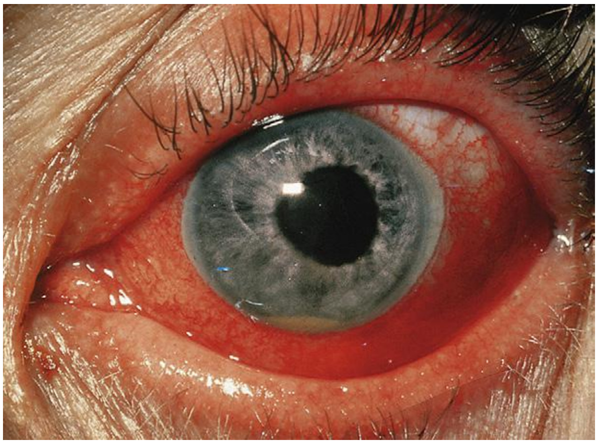
hypoproliferative anemias /-prolif′ərətiv′/, a group of anemias caused by inadequate production of erythrocytes. The condition is associated with protein deficiencies, renal disease, and myxedema.

hypoproteinemia /hī′pōprō′tēnē′mē·ə/ [Gk, *hypo* + *proteios,* first rank, *haima,* blood], abnormally decreased plasma protein, accompanied by edema, nausea, vomiting, diarrhea, and abdominal pain. It may be caused by renal failure and burns. Also spelled *hypoproteinaemia.* Also called **intestinal lymphangiectasia.**

hypoprothrombinemia /hī′pōprōthrom′binē′mē·ə/ [Gk, *hypo* + L, *pro,* before; Gk, *thrombos,* lump, *haima,* blood], abnormally reduced plasma prothrombin, characterized by bleeding, poor clot formation, and prolonged prothrombin and partial thromboplastin times. It is usually caused by inadequate synthesis of prothrombin in the liver, vitamin K deficiency, or most often by anticoagulant therapy. Also spelled *hypoprothrombinaemia.* See also **blood clotting.**

hypoptyalism. See **hyposalivation.**

hypopyon /hīpō′pē·on/ [Gk, *hypo* + *pyon,* pus], the presence of leukocytes and an accumulation of pus in the anterior chamber of an eye, which appears as a whitish or gray fluid between the cornea and the iris. It may occur as a complication of a penetrating wound to the eye, conjunctivitis, herpetic keratitis, or corneal ulcer.



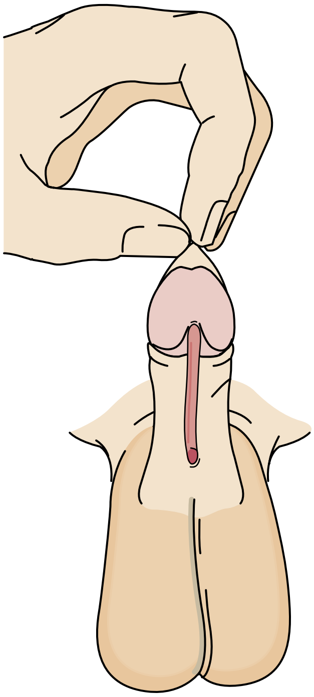
Hypopyon *(Spalton, Hitchings, and Hunter, 2005)*

hyporeflexia /-riflek′sē·ə/ [Gk, *hypo* + L, *reflectere,* to bend back], decreased reflex reactions.

hyposalivation /-sal′ivā′shən/ [Gk, *hypo* + L, *saliva,* spittle], a decreased flow of saliva associated with dehydration; radiation therapy of the salivary gland regions; anxiety; menopause; the use of drugs such as atropine, glycopyrrolate, and antihistamines; vitamin deficiency; inflammation or infection of the salivary glands; or various syndromes, such as Plummer-Vinson syndrome. Also called **asialorrhea.** See also **xerostomia.**

hyposensitization, a form of immunotherapy that can either reduce or eliminate hypersensitivity. See also **immunotherapy.**

hypospadias /hī′pōspā′dē·əs/ [Gk, *hypo,* under + *spadōn,* a rent], a developmental anomaly in the male in which the urethra opens on the ventral aspect of the penis or on the perineum.



Hypospadias *(Monahan et al, 2007)*

hypospermatogenesis /hi′pōsper′mätojen′ĕsis/, abnormally decreased production of spermatozoa. See also **aspermatogenesis.**

hypostatic /-stat′ik/ [Gk, *hypo* + *stasis,* standing still], pertaining to an accumulation of deposits of substances or congestion in a body area that results from a lack of activity.

hypostatic lung collapse [Gk, *hypo,* under, *stasis,* standing still; AS, *lungen* + L, *collabi,* to fall together], a disorder in which fluids or suspended solids pool or settle in a part of the lung, resulting in congestion.

hypostatic pneumonia, a type of pneumonia associated with elderly or debilitated people who remain in the same position for long periods. Fluids tend to settle in one area of the lungs, increasing the susceptibility to infection.

hyposthenic /hī′pōsthen′ik/, **1.** pertaining to a lack of strength or muscle tone. **2.** describing a body type characterized by a slender build.

hypotelorism /hī′pōtel′əriz′əm/ [Gk, *hypo* + *tele,* far, *horizo,* separate], a developmental defect characterized by an abnormally decreased distance between two organs or parts. A kind of hypotelorism is **ocular hypotelorism.** Compare **hypertelorism.**

hypotension /-ten′shən/ [Gk, *hypo* + L, *tendere,* to stretch], an abnormal condition in which the blood pressure is not adequate for normal perfusion and oxygenation of the tissues. An expanded intravascular space, hypovolemia, or diminished cardiac output may be the cause.

hypotensive /-ten′siv/ [Gk, *hypo,* under; L, *tendere,* to stretch], pertaining to abnormally low blood pressure.

hypotensive anesthesia, hypotensive technique. See **deliberate hypotension.**

hypotetraploid. See **hypoploid.**

hypothalamic. See **hypothalamus.**

hypothalamic amenorrhea /-thalam′ik/ [Gk, *hypo* + *thalamos,* chamber], cessation of menses caused by disorders that inhibit the hypothalamus from initiating the cycle of neurohormonal interactions of the brain, pituitary, and ovary necessary for ovulation and subsequent menstruation. Examples of causes are stress, anxiety, and acute weight loss. See also **amenorrhea.**

hypothalamic hormones, a group of hormones secreted by the hypothalamus, including vasopressin, oxytocin, and releasing and inhibitory hormones that act on the anterior pituitary.

hypothalamic obesity [Gk, *hypo,* under, *thalamos,* chamber; L, *obesitas,* fatness], obesity caused by damage or a functional disturbance involving the hypothalamus.

hypothalamic-pituitary-adrenal axis, the combined system of neuroendocrine units that in a negative feedback network regulate the adrenal gland's hormonal activities.

hypothalamus /hī′pōthal′əməs/ [Gk, *hypo* + *thalamos,* chamber], a portion of the diencephalon of the brain, forming the floor and part of the lateral wall of the third ventricle. It activates, controls, and integrates the peripheral autonomic nervous system, endocrine processes, and many somatic functions, such as body temperature, sleep, and appetite. Compare **epithalamus, metathalamus, subthalamus, thalamus. —hypothalamic,** *adj.*

hypothenar eminence /hīpoth′ənär, hī′pōthē′när/ [Gk, *hypo* + *thenar,* palm], a fleshy pad on the ulnar side of the palm of the hand.

hypothermal /-thur′məl/ [Gk, *hypo,* under, *therme,* heat], **1.** pertaining to a condition in which the body temperature is significantly below normal as a result of external exposure to cold or has been reduced markedly for surgical or therapeutic purposes. **2.** pertaining to temperatures that are tepid to slightly warm.

hypothermia /hī′pōthur′mē·ə/ [Gk *hypo*+ *therme,* heat], **1.** an abnormal and dangerous condition in which the oral temperature is below 95° F (35° C) or the rectal temperature is below 96° F (35.5° C), usually caused by prolonged exposure to cold or damp conditions. Symptoms include drowsiness, lack of coordination, confusion, and uncontrolled shivering. Respiration is shallow and slow, and the heart rate is faint and slow. The person may appear to be dead. People who are very old or very young, people who have cardiovascular problems, and people who are hungry, tired, or under the influence of alcohol are most susceptible to hypothermia. Hospitalization is necessary for evaluating and treating any metabolic abnormalities that may result from hypothermia. Hypothermic patients in cardiac arrest should be rewarmed to 32° C (92° F) before resuscitation efforts are abandoned. **2.** the deliberate and controlled reduction of body temperature with cooling mattresses or ice as preparation for some surgical procedures.

hypothermia blanket, a covering or pad used to lower the body temperature to decrease metabolism and oxygen consumption during a surgical procedure.

hypothermia induction, a nursing intervention from the Nursing Interventions Classification (NIC) defined as attaining and maintaining core body temperature below 35° C and monitoring for side effects and/or prevention of complications. See also **Nursing Interventions Classification.**

hypothermia therapy, the reduction of a patient's body temperature to counteract prolonged high fever caused by an infectious or neurological disease or, less frequently, as an adjunct to anesthesia in heart or brain surgery.

■ METHOD: Hypothermia may be produced by placing crushed ice around the patient, by immersing the body in ice water, by autotransfusing blood after it is circulated through coils submerged in a refrigerant, or most commonly by applying cooling blankets or vinyl pads containing coils through which cold water and alcohol are circulated by a pump. The cooling unit is placed in an open area. Any kinks or twists in the tubing are removed, and the blanket is checked for leaks. The patient is wrapped in bath blankets, and then covered with the cooling blanket. The patient's temperature, registered by means of a probe inserted into the rectum, is read and recorded before hypothermia is initiated, every 5 minutes until the desired reduction is achieved, and then every 15 minutes. The blood pressure, pulse, respirations, and neurological status are checked every 5 to 10 minutes until the temperature is stabilized, then every 30 minutes for 2 hours, every 4 hours for the next 24 hours, and subsequently as required. Every 1 to 2 hours the patient is assisted in turning, coughing, and deep breathing. At similar intervals the chest is auscultated for breath sounds, and oral, nose, and skin care are administered; the skin is lubricated with oil or lotion before and during the procedure. An indwelling catheter is connected to a closed gravity drainage system, as ordered, and fluid intake and output are measured; if less than 30 mL of urine per hour is excreted, the physician is notified. If the patient's oral temperature is less than 90° F (32.2° C), the gag reflex is tested before any oral fluids or foods are administered. Nasooral suction is performed as indicated, body alignment is maintained, and passive or active range-of-motion exercises are performed every 4 hours. Because shivering increases body heat, medication for its prevention, such as chlorpromazine hydrochloride, may be ordered. The patient is observed for medication reactions, decrease in blood pressure, bradycardia, arrhythmias, bradypnea, respiratory failure, unequal pupils, increase in intracranial pressure, changes in consciousness, intestinal ileus, and frostbite. Any changes in skin color or signs of edema and induration are reported to the physician immediately. At the termination of therapy, the cooling blanket is replaced by regular blankets, and the patient usually warms at his or her own rate. As the patient's temperature approaches normal, the warming blankets are removed, but the temperature probe remains in place until the body temperature is stable.

■ INTERVENTIONS: The technician administers hypothermia, carefully monitoring the patient's vital signs and any evidence of complications.

■ OUTCOME CRITERIA: Hypothermia therapy used in the treatment of high fever associated with generalized severe infections reduces body heat by decreasing metabolism and inhibits the multiplication of the causative pathogenic organisms. Patients with a high temperature caused by a neurological disease may be maintained in a state of mild hypothermia (87° F to 95° F or 30.6° C to 35° C) for as long as 5 days. The procedure is successful if the fever is broken and complications do not occur.

hypothermia treatment, a nursing intervention from the Nursing Interventions Classification (NIC) defined as rewarming and surveillance of a patient whose core body temperature is below 35° C. See also **Nursing Interventions Classification.**

hypothesis /hīpoth′isis/ [Gk, groundwork], (in research) a statement derived from a theory that predicts the relationship among variables representing concepts, constructs, or events. Kinds of hypotheses include **causal hypothesis, null hypothesis,** and **predictive hypothesis.**

hypothyroid /-thī′roid/ [Gk, *hypo,* under, *thyreos,* shield, *eidos,* form], pertaining to or resembling thyroid deficiency.

hypothyroid dwarf. See **cretin dwarf.**

hypothyroidism /-thī′roidiz′əm/ [Gk, *hypo* + *thyreos,* shield, *eidos,* form], a condition characterized by decreased activity of the thyroid gland. It may be caused by surgical removal of all or part of the gland, overdosage with antithyroid medication, decreased effect of thyroid-releasing hormone secreted by the hypothalamus, decreased secretion of thyroid-stimulating hormone by the pituitary gland, atrophy of the thyroid gland itself, or peripheral resistance to thyroid hormone. See also **Hashimoto's disease, myxedema.**

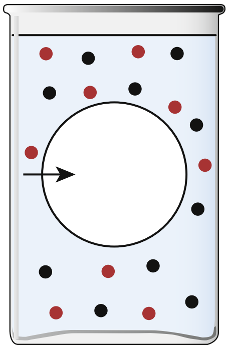
■ OBSERVATIONS: Manifestations include weight gain; cold, pale, dry, rough hands and feet; reduced attention span with memory impairment, slowed speech, and loss of initiative; swelling in extremities and around the eyes, eyelids, and face; menstrual irregularities; muscle aches and weakness; joint aches and stiffness; clumsiness; hyperstiff reflexes; decreased pulse; decreased blood pressure; agitation; depression; and paranoia. Hypothyroidism is diagnosed through lab testing. Serum and serum-free triiodothyronine and thyroxine (T_3, T_4) are decreased. Serum thyroid-stimulating hormone (TSH) is increased in primary hypothyroidism and decreased or normal in secondary hypothyroidism. Serum lipids and cholesterol levels are increased. Myxedema coma is a life-threatening complication of hypothyroidism that necessitates immediate treatment. It is preceded by gradual or sudden onset of mental sluggishness, drowsiness, and lethargy. Other complications include ischemic heart disease, congestive heart failure, pleural and pericardial effusion, deafness, psychosis, and anemia.

■ INTERVENTIONS: The primary treatment for hypothyroidism is oral replacement of the thyroid hormone, with lifelong monitoring of TSH level at least annually. Triiodothyronine may be added to the replacement therapy regimen in patients who continue to have mood or memory problems.

■ NURSING CONSIDERATIONS: Nursing care centers around education and includes instruction about signs and symptoms of hypothyroidism and hyperthyroidism, drug effects and side effects, and the need for thyroid hormone replacement therapy and monitoring for life. Nurses also play a role in early detection by advising patients to undergo thyroid screening every 2 to 3 years.

hypotonia /-tō′nē·ə/ [Gk, *hypo,* under, *tonos,* stretching], a condition of diminished tone or tension that may involve any body structure.

hypotonic /hī′pōton′ik/ [Gk, *hypo,* under, *tonos,* stretching], **1.** *adj,* pertaining to a lower or lessened tone or tension in any body structure, as in paralysis. **2.** *n,* a solution having a lower concentration of solute than another solution, hence exerting less osmotic pressure than that solution. **3.** *adj,* pertaining to a solution that causes cells to swell. Compare **hypertonic, isotonic.**



Hypotonic *(Lewis et al, 2010)*

hypotonic saline [Gk, *hypo,* under, *tonos,* tone; L, *sal,* salt], a saline solution that is less than isotonic in strength.

hypotriploid. See **hypoploid.**

hypoventilation /-ven′tilā′shən/ [Gk, *hypo* + L, *ventilare,* to fan], an abnormal condition of the respiratory system that occurs when the volume of air that enters the alveoli and takes part in gas exchange is not adequate for the body's metabolic needs. It is characterized by cyanosis, polycythemia, increased $PaCO_2$, and generalized decreased respiratory function. Hypoventilation may be caused by an uneven distribution of inspired air (as in bronchitis), obesity, neuromuscular or skeletal disease affecting the thorax, decreased response of the respiratory center to carbon dioxide, or a reduced amount of functional lung tissue, as in atelectasis, emphysema, and pleural effusion. The results of hypoventilation are hypoxia, hypercapnia, pulmonary hypertension with cor pulmonale, and respiratory acidosis. Treatment includes weight reduction in cases of obesity, artificial respiration, and possibly tracheostomy. Compare **hyperventilation.** See also **respiratory center.**

hypovitaminosis. See **avitaminosis.**

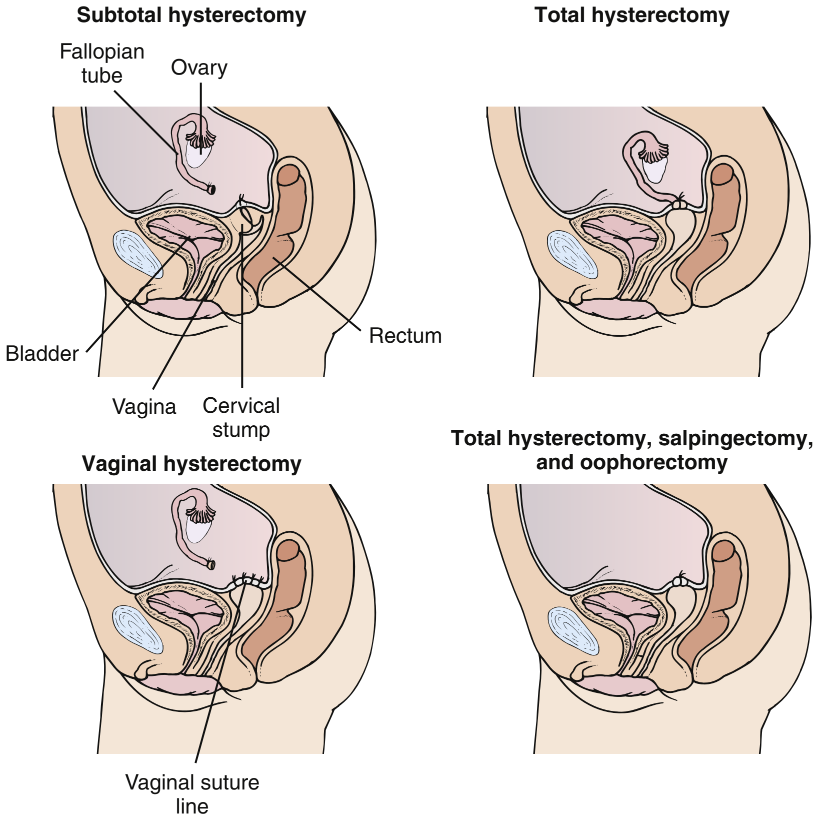
hypovolemia /-vōlē′mē·ə/ [Gk, *hypo* + L, *volumen,* whirl; Gk, *haima,* blood], an abnormally low circulating blood volume. Also spelled **hypovolaemia.** **—***hypovolemic, adj.*

hypovolemia management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as expansion of intravascular fluid volume in a patient who is volume depleted. See also **Nursing Interventions Classification.**

hypovolemic shock /-vōlē·mik/, a state of physical collapse and prostration caused by massive blood loss, about one fifth or more of total blood volume. The common signs include low blood pressure, thready pulse, clammy skin, tachycardia, rapid breathing, and reduced urinary output. The associated blood losses may stem from GI bleeding, internal or external hemorrhage, or excessive reduction of intravascular plasma volume and body fluids. Disorders that may cause hypovolemic shock are dehydration from excessive perspiration, severe diarrhea, protracted vomiting, intestinal obstruction, peritonitis, acute pancreatitis, and severe burns, which deplete body fluids. Associated effects may include metabolic acidosis with the accumulation of lactic acid, irreversible cerebral and renal damage, and disseminated intravascular coagulation. Treatment of hypovolemic shock focuses on prompt replacement of blood and fluid volumes, identification of bleeding sites, and control of bleeding. Without fast, aggressive treatment, further collapse that can cause death ensues. Compare **cardiogenic shock.** See also **electric shock, shock.**

hypoxemia /hī′poksē′mē·ə/ [Gk, *hypo* + *oxys,* sharp, *genein,* to produce, *haima,* blood], an abnormal deficiency in the concentration of oxygen in arterial blood. Symptoms of acute hypoxemia are cyanosis, restlessness, stupor, coma, Cheyne-Stokes respiration, apnea, increased blood pressure, tachycardia, and an initial increase in cardiac output that later falls, producing hypotension and ventricular fibrillation or asystole. Chronic hypoxemia stimulates red blood cell production by the bone marrow, leading to secondary polycythemia. Hypoxemia caused by decreased alveolar oxygen tension or underventilation improves with oxygen therapy. Hypoxemia resulting from shunting of blood from the right side of the heart to the left side without exchange of gases in the lungs is treated with bronchial hygiene and positive end-expiratory pressure. Also spelled *hypoxaemia*. Compare **hypoxia.** See also **anoxia, asphyxia.**

hypoxia /hīpok′sē·ə/ [Gk, *hypo* + *oxys,* sharp, *genein,* to produce], inadequate oxygen tension at the cellular level, characterized by tachycardia, hypertension, peripheral vasoconstriction, dizziness, and mental confusion. Mild hypoxia stimulates peripheral chemoreceptors to increase heart and



Hysterectomy *(Lewis et al, 2011)*

respiration rates. The central mechanisms that regulate breathing fail in severe hypoxia, leading to irregular respiration, Cheyne-Stokes respiration, apnea, and respiratory and cardiac failure. Increased sensitivity to the depressant effect of opiates on the respiratory system is common in chronic hypoxia, causing severe depression of respiration or apnea from relatively small doses. If the availability of oxygen is inadequate for aerobic cellular metabolism, energy is provided by less efficient anaerobic pathways that produce metabolites other than carbon dioxide and water. The tissues most sensitive to hypoxia are the brain, heart, pulmonary vessels, and liver. Treatment may include cardiotonic and respiratory stimulant drugs, oxygen therapy, mechanical ventilation, and frequent analysis of blood gases. Compare **hypoxemia.** See also **acute hypoxia, anoxia, chemoreceptor, chronic hypoxia, hyperventilation, respiratory center.** —*hypoxic, adj.*

hypoxic drive /-hīpok′sik/, stimulation of respiration by low PaO_2, mediated through the carotid and aortic bodies.

hypsi-, prefix meaning "high": *hypsicephalia, hypsiconchous, hypsistaphylie.*

hypsibrachycephaly /hips′ibrakisef′əlē/ [Gk, *hypsi*, high, *brachys*, short, *kephale*, head], the condition of having a skull that is high with a broad forehead. See also **brachycephaly, oxycephaly.** —*hypsibrachycephalic, adj., n.*

hypsicephaly. See **oxycephaly.**

hypso-, prefix meaning "height": *hypsonosus, hypsophobia, hypsotherapy.*

hyster-. See **hystero-.**

hysteralgia. See **metralgia.**

hysterectomy /his′tərek′təmē/ [Gk, *hystera*, womb, *ektomē*, excision], surgical removal of the uterus, performed to remove fibroid tumors of the uterus or to treat chronic pelvic inflammatory disease, severe recurrent endometrial hyperplasia, uterine hemorrhage, and precancerous and cancerous conditions of the uterus. Types of hysterectomy include **total hysterectomy,** in which the uterus and cervix are removed, and **radical hysterectomy,** in which ovaries, oviducts, lymph nodes, and lymph channels are removed with the uterus and cervix. Menstruation ceases after either type is performed. A vaginal irrigation may be given preoperatively. During surgery the uterus is excised and removed, either through the abdominal wall or through the vagina. In some cases it may be removed laparoscopically. One or both ovaries and oviducts may be removed at the same time. After surgery the nurse frequently observes the abdominal dressing and vaginal pad for bleeding. The lower half of the bed is kept flat, and the patient is advised to avoid sharply flexing the thighs or knees, because thrombophlebitis of the blood vessels of the pelvis and upper thigh is a frequent complication. Leg exercises, as well as use of sequential compression devices to prevent deep vein thrombosis, are encouraged. Low back pain or scanty urine may indicate a ligated ureter. A kind of hysterectomy is **cesarean hysterectomy.** Compare **hysterosalpingo-oophorectomy.** —*hysterectomize, v.*

hysteresis /his′tərē′sis/ [Gk, *hysterein*, to be late], **1.** a lagging or retardation of one of two associated phenomena or a failure to act in unison. **2.** the influence of the previous condition or treatment of the body on its subsequent response to a given force, as in the elastic property of a lung. At any given lung volume the elastic recoil pressure within the airways during expiration is less than that which exists at the same lung volume during inspiration.

hysteria /histir′ē·ə/ [Gk, *hystera,* womb], a general state of tension or excitement in a person or a group, characterized by unmanageable fear and temporary loss of control over the emotions.

hysteric /hister′ik/ [Gk, *hystera,* womb], pertaining to or resembling hysteria. Also called *hysterical.*

hysteric amaurosis [Gk, *hystera* + *amauroein,* to darken], monocular or, more rarely, binocular blindness that follows an emotional shock. It may last for hours, days, or months.

hysteric aphonia. See **conversion dysphonia.**

hysteric ataxia [Gk, *hystera,* womb, *ataxia,* without order], a loss of control over voluntary movements in walking or standing, although the involved muscles function normally when the person is lying or sitting. See also **astasia-abasia.**

hysteric blindness. See **psychic blindness.**

hysteric chorea [Gk, *hystera,* womb, *choreia,* dance], a condition in which an individual has choreiform movements, although the actions are psychogenic rather than the result of true chorea.

hysteric convulsion, a violent involuntary contraction and relaxation of the skeletal muscles marked by spasmodic muscular contractions with no organic cause.

hysteric dyspepsia, difficulty in digestion caused by emotional disturbances.

hysteric lethargy [Gk, *hystera* + *lethargia,* drowsiness], a sleep induced by hypnosis. See also **hypnosis, lethargy.**

hysteric paralysis [Gk, *hystera,* womb, *paralyein,* to be palsied], a loss of movement or muscular weakness that are psychogenic rather than the result of an identifiable organic defect.

hysteric personality. See **histrionic personality.**

hysteric syncope, a temporary loss of consciousness or a fainting spell caused by emotional agitation.

hysteric tremor [Gk, *hystera,* womb; L, *tremere,* to tremble], **1.** a fine rhythmic shaking in one extremity or of a generalized nature that may be an expression of fear, anxiety, or hysteria. **2.** a coarse, irregular shaking that increases with voluntary movements. **3.** a shaking that is transient and is caused by exposure to drugs or toxic substances rather than an organic disorder.

hysteric vertigo, a giddiness or loss of stability, often with a sensation of rotation, with no organic cause.

hystero-, hyster-, prefix meaning "uterus": *hysterocarcinoma, hysterocleisis, hysterolith.*

hysterodynia. See **metralgia.**

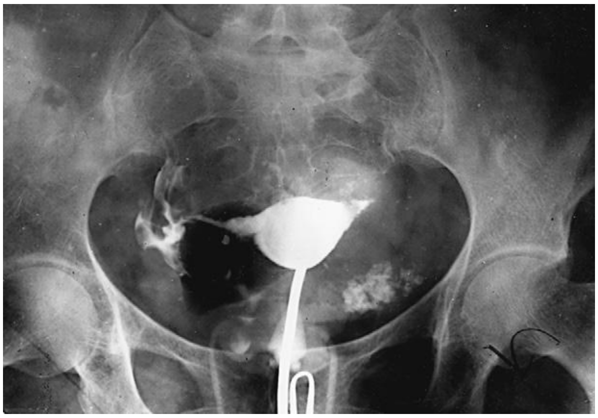
hysterogram /his′tərōgram′/ [Gk, *hystera* + *gramma,* record], a radiographic image of a uterus made after the injection of a contrast medium into the uterine cavity. See also **hysterosalpingogram.**

hysterography /his′tərog′rəfē/ [Gk, *hystera,* womb, *graphein,* to record], the use of x-ray film and other instruments to make a medical assessment of the condition of the uterus.

hysterolaparotomy /his′tərōlap′ərot′əmē/ [Gk, *hystera* + *lapara,* loin, *temnein,* to cut], abdominal hysterectomy or hysterotomy.

hystero-oophorectomy /-ō′əfərek′təmē/ [Gk, *hystera,* womb, *oophoron,* ovary, *ektomē,* excision], the surgical removal of the uterus and both ovaries.

hysterosalpingogram /his′tərō′salping′gōgram′/ [Gk, *hystera* + *salpinx,* tube, *gramma,* record], an x-ray film of the uterus and the fallopian tubes using gas or a radiopaque substance introduced through the cervix to allow visualization of the cavity of the uterus and the passageway of the tubes. A blockage of a structure is demonstrated on the film because the radiopaque substance cannot pass to the more distal structures and escape from the ends of the tubes into the peritoneal cavity. Serial hysterosalpingography is useful in the diagnosis of the cause of infertility.



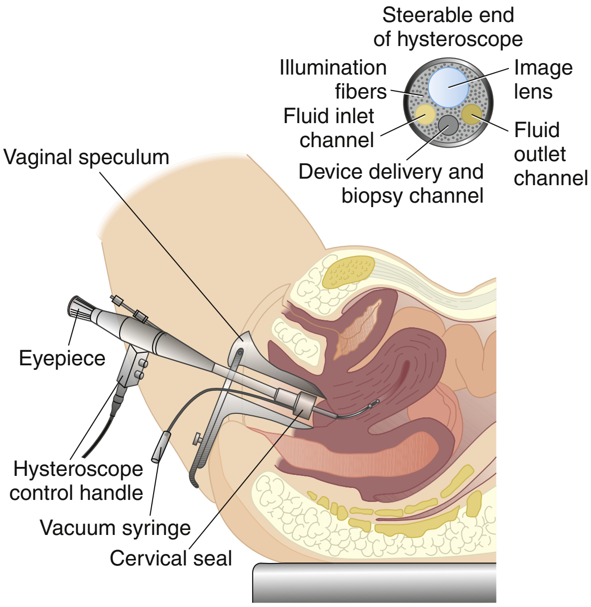
Hysterosalpingogram showing submucous fibroid
(Frank, Long, and Smith, 2012)

hysterosalpingography /his′tərōsal′ping·gog′rəfē/, a method of producing radiographic images of the uterus and fallopian tubes as part of the diagnosis of abnormalities in the reproductive tract of a nonpregnant woman. The technique outlines the size, shape, and position of the organs, including any tumors, fistulas, or polyps. It also reveals any obstructions in the fallopian tubes.

hysterosalpingo-oophorectomy /-salping′gō·ō′əfərek′təmē/ [Gk, *hystera* + *salpinx,* tube, *oophoron,* ovary, *ektomē,* excision], surgical removal of one or both ovaries and oviducts along with the uterus, performed commonly to treat malignant neoplastic disease of the reproductive tract and chronic endometriosis. Removal of the ovaries and oviducts is routinely done with a hysterectomy on menopausal or postmenopausal women. To prevent the severe symptoms of sudden menopause in premenopausal women, a portion of one ovary is left, unless a malignancy is present. If both ovaries are removed and no malignancy is present, estrogen replacement therapy is often begun immediately. Elastic stockings or bandages may be applied to the legs to prevent circulatory stasis because thrombophlebitis of the blood vessels of the pelvis or thigh is a frequent complication. The lower half of the bed is kept flat, and the patient is instructed not to flex the thighs or knees. Low back pain or scanty urine may indicate a ligated ureter. Compare **hysterectomy.**

hysteroscope /his′tərōskōp′/ [Gk, *hystera,* womb + *skopein,* to look to view], an endoscope used in direct visual examination of the canal of the uterine cervix and the cavity of the uterus.

hysteroscopy /his′təros′kepē/ [Gk, *hystera* + *skopein,* to look], direct visual inspection of the cervical canal and uterine cavity through a hysteroscope. Hysteroscopy is performed to examine the endometrium, to secure a specimen for biopsy, to remove an intrauterine device, or to excise cervical polyps. The endoscope is passed through the vagina and into the uterus, and the surrounding tissues are examined. The procedure is contraindicated in pregnancy, acute pelvic inflammatory disease, chronic upper genital tract infection, recent uterine perforation, and known or suspected cervical malignancy. **—hysteroscope,** *n., hysteroscopic, adj.*



Steerable end of hysteroscope
Illumination fibers
Image lens
Fluid inlet channel
Fluid outlet channel
Device delivery and biopsy channel
Vaginal speculum
Eyepiece
Hysteroscope control handle
Vacuum syringe
Cervical seal

Hysteroscopy *(Black and Hawks, 2009)*

hysterotome /his′tərotōm′/ [Gk, *hystera*, womb, *temnein*, to cut], a surgical knife used for certain procedures involving the uterus.

hysterotomy /his′tərot′əmē/ [Gk, *hystera* + *temnein*, to cut], surgical incision of the uterus, performed as a method of abortion in a pregnancy beyond the first trimester of gestation when a saline injection abortion was incomplete or a tubal sterilization is to be done with the abortion. During surgery the lower segment of the uterus is incised, and the products of conception are withdrawn. Postoperative care includes close observation for excessive vaginal bleeding.

hysterovaginoenterocele /-vaj′inō·en′tərōsēl′/ [Gk, *hystera*, womb; L, *vagina*, sheath; Gk, *enteron*, bowel, *kele*, hernia], a hernia involving the uterus, vagina, and intestines. Prolapse of the pelvic organs may be caused by pregnancy or an inherent weakness of the supporting structures. It is also common after menopause. Treatment may include surgical repair or the use of a pessary.

Hytone, a trademark for a glucocorticoid (**hydrocortisone**).

Hz, abbreviation for **hertz.**

HZV, abbreviation for **herpes zoster virus.** See **chickenpox.**

I

I, **1.** symbol for *inspired gas*. **2.** symbol for the element **iodine.**

-i, **1.** plural-forming suffix used in native and later scientific Latin words: *bacilli, bronchi, plumbi*. **2.** plural-forming suffix used in scientific terms derived through Latin from Greek: *encephali, pylori, tympani*.

^{131}I, symbol for *radioactive iodine, isotopic (atomic) mass 131*.

^{132}I, symbol for *radioactive iodine, isotopic (atomic) mass 132*.

-ia, suffix meaning a "specified condition of a disease or process": *athrombia, phrenoblabia, pontobulbia*.

IABC, abbreviation for *intraaortic balloon counterpulsation*. See **intraaortic balloon pump.**

IABP, abbreviation for **intraaortic balloon pump.**

IADL, abbreviation for **instrumental activities of daily living.**

IADR, abbreviation for **International Association for Dental Research.**

IAH, abbreviation for **idiopathic diffuse alveolar hemorrhage.**

I and O, abbreviation for *intake and output*.

-iasis, suffix meaning "the formation or presence of an abnormal condition or disease": *dicrocoeliasis, elephantiasis*.

-iatria. See **-iatry.**

-iatric, -iatrical, suffix meaning "relating to medicine, physicians, or medical treatment": *neuropsychiatric, orthopsychiatric, pithiatric*.

-iatrist, -iatrician, suffix meaning "one who treats or a physician": *hydriatrist, pediatrician, podiatrist*.

iatro-, prefix meaning "physician or treatment": *iatrogenic, iatrophysics, iatrotechnics*.

iatrogenic /ī′atrōjen′ik, yat-/ [Gk, *iatros*, physician, *genein*, to produce], caused by treatment or diagnostic procedures. An iatrogenic disorder is a condition that is caused by medical personnel or procedures or that develops through exposure to the environment of a health care facility. See also **nosocomial. —iatrogenesis, iatrogeny,** *n*.

iatrogenic diabetes mellitus, a form of diabetes that develops as an adverse effect of treatment for a different medical problem. Patients who are administered high doses of corticosteroids often develop iatrogenic diabetes mellitus. Also called **secondary diabetes.**

iatrogenic pneumothorax, a condition in which air or gas is present in the pleural cavity as a result of mechanical ventilation, tracheostomy tube placement, or other therapeutic intervention.

iatrogeny. See **iatrogenic.**

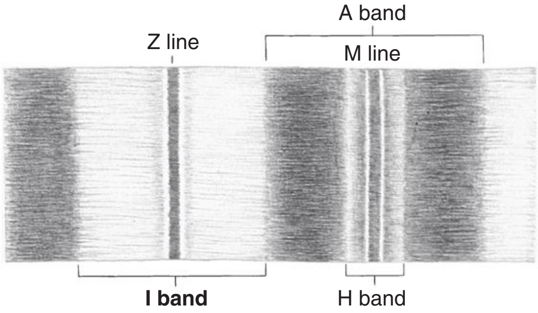
iatrology, the science of medicine.

iatropic /ī′atrop′ik/ [Gk, *iatros*, physician, *trepein*, to turn], describing a need to see a physician.

iatropic stimulus, the symptoms that induce a patient to seek professional health care. See also **chief complaint.**

-iatry, -iatria, suffix meaning a "(specified) type of medical treatment, the medical profession, or physicians": *andriatry, pediatry, pithiatry*.

I band [ME, *band*, flat strip], an isotropic band within a striated muscle fiber that appears dark in polarized light but light when stained. See also **sarcomere.** Compare **A band.**



I band *(Thompson et al, 2002)*

ibandronate, a bone-resorption inhibitor and electrolyte modifier.

■ INDICATION: This drug is used to prevent and treat osteoporosis.

■ CONTRAINDICATIONS: Achalasia, esophageal stricture, hypocalcemia, intrarterial administration, renal failure, vitamin D deficiency, and known hypersensitivity to bisphosphonates prohibit the use of this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include fever, insomnia, dizziness, headache, hypertension, ocular pain or inflammation, ureitis, constipation, nausea, vomiting, diarrhea, dyspepsia, rash, injection site reaction, bone pain, and myalgia. Common side effects include hypomagnesemia, hypophosphatemia, and hypocalcemia.

IBC, abbreviation for **iron-binding capacity.**

IBD, abbreviation for **inflammatory bowel disease.** See **ulcerative colitis.**

-ible. See **-able.**

ibritumomab tiuxetan, a monoclonal antibody radioimmunotherapy used as part of a regimen for non-Hodgkin's lymphoma.

IBS, abbreviation for **irritable bowel syndrome.**

ibuprofen /ī′byo͞o′prōfin/, a COX-1 over-the-counter nonsteroidal antiinflammatory agent.

■ INDICATIONS: It is used for the treatment of fever, headaches, and pain from rheumatoid arthritis and osteoarthritis, muscle aches, and menstrual cramps.

■ CONTRAINDICATIONS: Renal dysfunction, disorders of the GI tract, or known hypersensitivity to this drug, to other nonsteroidal antiinflammatory drugs, or to aspirin prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, gastric or duodenal ulceration, dizziness, skin rash, and tinnitus.

ibutilide /ĭbu′tĭlīd/, a cardiac depressant used in treatment of atrial arrhythmias, administered by IV infusion as the fumarate salt.

ibutilide fumarate, a drug used to treat heart arrhythmias.

■ INDICATIONS: It is prescribed in an effort to convert atrial fibrillation and atrial flutter of recent onset to normal sinus rhythm.

■ CONTRAINDICATIONS: If it does not result in conversion after an initial 10-minute infusion, a second 10-minute infusion may be given, but not sooner than 10 minutes after the first dose has been completed.

■ ADVERSE EFFECTS: The side effects most often reported include life-threatening arrhythmias, including ventricular tachycardia.

IBW, abbreviation for **ideal body weight.**

IC, **1.** abbreviation for **inspiratory capacity. 2.** abbreviation for **interstitial cystitis.**

-ic, -ac, suffix meaning "pertaining to, similar to": *allelic, cadaveric, hypochondriac*.

ICA, abbreviation for **islet cell antibody.**

-icam, suffix for antiinflammatory agents of the isoxicam group.

ICD, abbreviation for **implantable cardioverter-defibrillator.**

ICD, abbreviation for ***International Classification of Diseases.***

ice burn, partial-thickness thermal necrosis of the skin caused by prolonged therapy entailing applications of ice.

Iceland disease /īs′land/, a group of symptoms associated with effects of a viral infection of the nervous system, including muscular pain and weakness, depression, and sensory changes. It mainly affects young adults, women more than men. Its exact cause is unknown. Also called **benign myalgic encephalomyelitis, chronic fatigue syndrome, Royal free disease.**

Iceland moss, *Cetraria islandica,* a lichen native to Iceland.

I cell disease, a form of lysosomal disease characterized by progressive mental deterioration, heart disease, and respiratory failure in the first 10 years of life. A number of lysosomal enzymes are lacking, and fibroblasts display numerous coarse inclusions. Also called **inclusion cell disease, mucolipidosis II.**

ice pack [ME, *is* + *pakke*], a container of crushed ice placed on the body to reduce tissue temperature, relieve pain, soothe inflamed tissue, or control bleeding.

ICF, **1.** abbreviation for **intermediate care facility. 2.** abbreviation for **intracellular fluid.**

ICF/MR, abbreviation for *intermediate care facility for the mentally retarded*. See **intermediate care facility.**

ICH, abbreviation for **intracerebral hemorrhage.**

ichor /ī′kôr/, a thin, watery fluid discharged from a sore.

ichthyo-, prefix meaning "fish": *ichthyocolla, ichthyophagy, ichthyotoxic*.

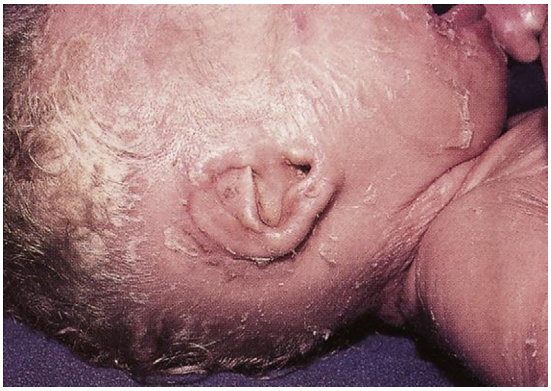
ichthyoid /ik′thē·oid/ [Gk, *ichthys,* fish, *eidos,* form], pertaining to objects or structures that are fish-shaped or fishlike.

ichthyosis /ik′thē·ō′sis/ [Gk, *ichthys,* fish, *osis,* condition], any of several inherited dermatological conditions in which the skin is dry and hyperkeratotic, resembling fish scales. It usually appears at or shortly after birth and may be part of one of several rare syndromes. Some types respond temporarily to urea or lactic acid emollients. A rare, acquired variety accompanying a lymphoma or multiple myeloma occurs in adults. Also called **fish skin disease, xeroderma.** **—ichthyotic,** *adj.*

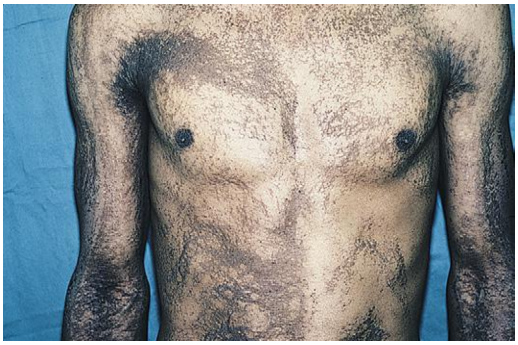
ichthyosis congenita, ichthyosis fetalis. See **lamellar exfoliation.**

ichthyosis fetus. See **harlequin fetus.**

ichthyosis hystrix [Gk, *ichthys,* fish + *-osis,* condition + *hystrix,* porcupine], a localized form of epidermolytic hyperkeratosis having the appearance of linear epidermal nevi. See also **epidermolytic hyperkeratosis.**

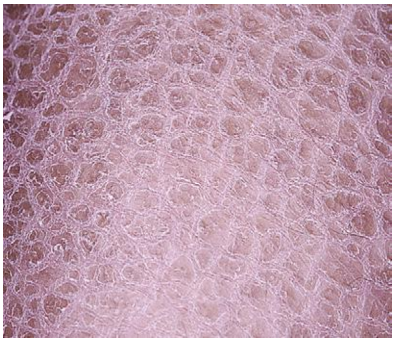


Lamellar ichthyosis *(Weston, Lane, and Morrelli, 2007)*



Ichthyosis hystrix *(Callen et al, 2000)*

ichthyosis vulgaris [Gk, *ichthys* + *osis* + L, *vulgaris,* common], a hereditary skin disorder characterized by large, dry, dark scales that cover the face, neck, scalp, ears, back, and extensor surfaces but not the flexor surfaces of the body. The condition is transmitted as an autosomal-dominant trait; it appears several months to 1 year after birth. Management consists of topical application of emollients and use of keratolytic agents to facilitate removal of the scales. Also called *ichthyosis simplex*. See also **sex-linked ichthyosis.**



Ichthyosis vulgaris

(Callen et al, 2000/Courtesy Dr. Donald Hazelrigg)

ichthyotic. See **ichthyosis.**

-ician, suffix meaning a "specialist in a field": *clinician, pediatrician, technician*.

ICN, abbreviation for **International Council of Nurses.**

icon /ī′kən/, an image on the screen of a computer terminal representing a specific command or point for data entry.

ICP, abbreviation for **intracranial pressure.**

-ics, suffix meaning the "systematic formulation of a body of knowledge": *bionomics, osmics, psychics*.

ICSH, abbreviation for **interstitial cell-stimulating hormone.** See **luteinizing hormone.**

ICSI, abbreviation for **intracytoplasmic sperm injection.**

ictal /ik′təl/ [Gk, *ikteros,* jaundice], pertaining to a sudden acute onset, as convulsions of an epileptic seizure.

-ictal, suffix meaning "to be caused by a sudden attack or stroke": *postictal*.

icter-, prefix meaning "jaundice": *icterohepatitis*.

icteric /ikter′ik/ [Gk, *ikteros,* jaundice], pertaining to or resembling jaundice.

icterogenic /ik′tərōjen′ik/, causing jaundice.

icterus. See **jaundice.**

icterus gravis neonatorum /ik′tərəs/ [Gk, *ikteros,* jaundice; L, *gravis,* weight, *neonatus,* newborn], a hemolytic jaundice of the newborn caused by incompatibility between the mother's serum and the infant's red corpuscles.

icterus neonatorum, a jaundiced condition in a newborn.

ictus /ik′təs/ *pl.* **ictuses, ictus** [L, stroke], **1.** a seizure. **2.** a cerebrovascular accident. **—ictal, ictic,** *adj.*

ICU, abbreviation for **intensive care unit.**

id [L, it], **1.** (in freudian psychoanalysis) the part of the psyche, functioning in the unconscious, that is the source of instinctive energy, impulses, and drives. It is based on the pleasure principle and has strong tendencies toward self-preservation. Compare **ego, superego. 2.** the true unconscious.

ID, abbreviation for **infectious disease.**

-id, **1.** suffix meaning "structure or body": *plasmid, protoconid, talonid, trigonid*. **2.** suffix meaning "a member of a group": *tuberculid*.

idarubicin, an antibiotic and antineoplastic.

■ INDICATIONS: This drug is used in combination with other antineoplastics for acute myelocytic leukemia in adults.

■ CONTRAINDICATIONS: Pregnancy, hypersensitivity, lactation, and myelosuppression prohibit the use of this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include hypertension, extrasystoles, ventricular tachycardia, bundle branch block, atrioventricular block, palpitations, supraventricular extrasystoles, syncope, and nausea. Common side effects include headache, hypotension, and bradycardia. Life-threatening side effects include sinus arrest, congestive heart failure, and arrhythmias.

IDDM, abbreviation for **insulin-dependent diabetes mellitus.** See **type 1 diabetes mellitus.**

-ide, suffix meaning "a compound of": *chloride, monoxide, sulfide*.

idea [Gk, form], any thought, concept, intention, or impression that exists in the mind as a result of awareness, understanding, or other mental activity.

ideal body weight (IBW), the weight statistically determined on actuarial tables to be associated with the lowest mortality for an average individual, adjusting for some combination of height, age, frame size, and gender. Which factors should be included and how it should be determined remain controversial.

ideal gas law /īdē′əl/ [Gk, *idea,* form, *chaos,* gas; AS, *lagu,* law], the rule that $PV = nRT$, with the product of pressure (P) and volume (V) equal to the product of the number of moles of gas (n), absolute temperature (T), and a gas constant (R).

idealized image /īdē′əlīzd/, a concept of a person characterized by a sense of perfection and admiration that results in unrealistically high and unattainable goals.

idea of influence, an idea held less firmly than a delusion, often seen in paranoid disorders, that external forces or persons are controlling one's thoughts, actions, and feelings.

idea of persecution, an idea held less firmly than a delusion, often seen in paranoid disorders, that one is being threatened, discriminated against, or mistreated by other persons or external forces.

idea of reference, a delusion that the statements, events, or actions of others, usually interpreted as deprecatory, refer to oneself. It is often seen in paranoid disorders. Also called **delusion of reference, referential idea.**

ideational apraxia /ī′dē·ā′shənəl/ [Gk, *idea,* form, *a* + *prassein,* not to do], a condition in which the conceptual process is lost, often because of a lesion in the parietal lobe. The individual is unable to formulate a plan of movement and does not know the proper use of an object because of a lack of perception of its purpose. There is no loss of motor movement or strength, but the reason for the movement is confused. Also called **sensory apraxia.** See also **apraxia.**

idée fixe. See **fixed idea.**

identical twins. See **monozygotic twins.**

identification /īden′tifikā′shən/ [L, *idem,* the same, *facere,* to make], an unconscious defense mechanism by which a person patterns his or her personality on that of another person, assuming the person's qualities, characteristics, and actions. The process is a normal function of personality development and learning, specifically of the superego, and it contributes to the acquisition of interests and ideals. Identification first occurs in early childhood when 3- to 5-year-olds identify with parental same-sex figures. It resurges in adolescence as a major task of identifying with peers.

identity[1] /īden′titē/, a component of self-concept characterized by one's persisting consciousness of being oneself, separate and distinct from others. **Identity diffusion,** or identity confusion, is a lack of clarity and consistency in one's perception of the self, which produces a high degree of anxiety.

identity[2]**,** a nursing outcome from the Nursing Outcomes Classification (NOC) defined as: distinguishes between self and nonself and characterizes one's essence. See also **Nursing Outcomes Classification.**

identity crisis [L, *idem,* the same; Gk, *krisis,* turning point], a period of confusion concerning an individual's sense of self and role in society, which occurs most frequently in the transition from one stage of life to the next. It is often expressed by isolation, negativism, extremism, and rebelliousness.

identity diffusion. See **identity.**

identity disorder of childhood, a mental disturbance of childhood in which the person is abnormally uncertain and concerned about long-term goals such as career choice or sexual preference to the point that the concerns interfere with educational and social functions. See also **identity crisis.**

ideo-, prefix meaning "idea": *ideogram*.

ideokinetic apraxia. See **ideomotor apraxia.**

ideology /ī′de·ol′əjē/ [Gk, *idea*], a scheme of ideas or systematic organization of ideas associated with doctrine and philosophy.

ideomotor apraxia /īdē′əmō′tor/ [Gk, *idea* + L, *motare,* to move about; Gk *a* + *prassein,* not to do], the inability to translate an idea into motion, resulting from some interference with the transmission of the appropriate impulses from the brain to the motor centers. There is no loss of the ability to perform an action automatically, such as tying the shoelaces, but the action cannot be performed on request. The condition is often caused by diffuse cortical disease. Also called **ideokinetic apraxia,** *limb-kinetic apraxia,* **transcortical apraxia.** See also **apraxia.**

ideophobia /-fō′bē·ə/ [Gk, *idea* + *phobos,* fear], an anxiety disorder characterized by the irrational fear or distrust of ideas or reason. See also **phobia.**

idio-, prefix meaning "private, distinctive, peculiar": *idiopathic*.

idiocrasy. See **idiosyncrasy.**

idiogram /id′ē·əgram′/, a diagram or graphic representation of a karyotype, showing the number, relative sizes, and morphological characteristics of the chromosomes of a species, individual, or cell.

idiojunctional rhythm /-jungk′shənəl/ [Gk, *idios,* own; L, *jungere,* to join; Gk, *rhythmos*], a heart rhythm emanating from the junction of the atrioventricular (AV) node and the AV bundle but without retrograde conduction to the atria.

idiomere. See **chromomere.**

idiopathic /-path′ik/ [Gk, *idios* + *pathos,* disease], without a known cause.

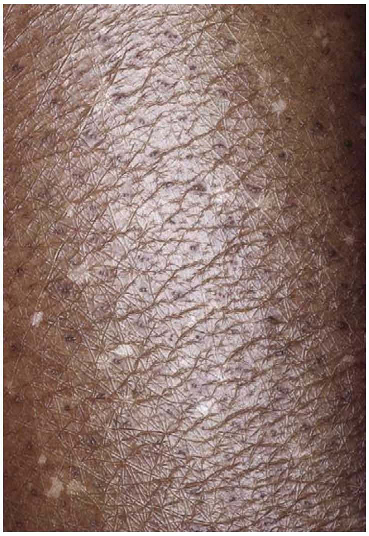
idiopathic diffuse alveolar hemorrhage (IAH), bleeding into the alveoli of the lungs caused by any of a number of disorders, including Goodpasture's syndrome, Wegener's granulomatosis, and collagen vascular disease.

idiopathic disease, a disease that develops without an apparent or known cause, although it may have a recognizable pattern of signs and symptoms and may be curable.

idiopathic edema, edema of unknown cause, usually affecting women, occurring intermittently over a period of years, and usually worse during the premenstrual phase. It is associated with increased aldosterone secretion.

idiopathic gangrene [Gk, *idios,* own, *pathos,* disease, *gaggraina*], a gangrenous condition of unknown cause.

idiopathic guttate hypomelanosis /hī′pōmel′ənō′sis/, one of many drop-shaped hypopigmented macules of unknown origin. It is fairly common, occurring in approximately half of all normal adults.



Idiopathic guttate hypomelanosis *(Goldman et al, 2012)*

idiopathic hemosiderosis, the accumulation of iron-containing deposits in cells of the lungs as a result of bleeding in the lungs.

idiopathic hypercalciuria, elevated urine calcium of unknown cause, often with formation of renal calculi. Some patients have increased turnover of bone calcium, whereas others may have a genetic predisposition to this condition.

idiopathic hypoventilation, a disorder of unknown cause associated with deficient ventilation of the alveoli of the lungs.

idiopathic midline destructive disease (IMDD), a disorder of unknown cause characterized by ulceration and necrosis of the midline facial tissues and obstruction of the upper airways. IMDD develops without systemic involvement.

idiopathic multiple pigmented hemorrhagic sarcoma. See **Kaposi's sarcoma.**

idiopathic necrotizing crescentic glomerulonephritis, an autoimmune disorder that causes intracapsular hemorrhage and cellular crescent formation in the renal glomerulus. See also **glomerulonephritis.**

idiopathic nephrotic syndrome [Gk, *idios,* own, *pathos,* disease, *nephros,* kidney], a kidney disease of unknown origin characterized by hematuria, albuminuria, edema, and hypertension resulting from damaged glomerular capillaries.

idiopathic neuralgia [Gk, *idios,* own, *pathos,* disease, *neuron,* nerve, *algos,* pain], a form of neuralgia that occurs without any identifiable structural nerve lesion.

idiopathic pericarditis [Gk, *idios,* own, *pathos,* disease, *peri,* near, *kardia,* heart, *itis,* inflammation], inflammation of the pericardium of unknown cause.

idiopathic postpartum renal failure, kidney failure that begins 1 day to several weeks after a delivery that follows an uneventful gestation. Symptoms include oliguria or anuria, which progresses to azotemia, with complications of hemolytic anemia or coagulopathy. Treatment is supportive but aimed primarily at reducing blood pressure.

idiopathic pulmonary fibrosis [Gk, *idios,* own, *pathos,* disease; L, *pulmoneous,* the lungs, *fibra,* fiber], a disorder of unknown cause characterized by fibrosis of the lungs. It may follow an earlier inflammation or disease, such as tuberculosis or pneumoconiosis.

idiopathic pulmonary hemorrhage, bleeding in the lungs without a known cause. It may be a cause of secondary spontaneous pneumothorax.

idiopathic reactive hypoglycemia, a condition of diminished blood glucose level that occurs after the ingestion of carbohydrates and has no known cause. It may be related to increased insulin sensitivity or decreased counterregulatory hormone secretion or action. It is controversial as to whether this is a real disease.

idiopathic respiratory distress syndrome. See **respiratory distress syndrome of the newborn.**

idiopathic scoliosis, an abnormal condition characterized by a lateral curvature of the spine. It is the most common type of scoliosis, evident in 70% of all patients with scoliosis and up to 80% of those with structural scoliosis. It may occur at any age, but three types are commonly associated with certain age groups. The infantile type affects 1- to 3-year-olds. The juvenile type affects 3- to 10-year-olds. The adolescent type affects preadolescents and adolescents. The main factors in diagnosing idiopathic scoliosis are the degree, balance, and rotational component of the curvature. The rotational component may contribute to rib cage deformities and impingement on the pulmonary and cardiac systems.

■ OBSERVATIONS: The most common type is the adolescent type. Early diagnosis is difficult because the associated curvature is often hidden by clothing. Preadolescent screening is encouraged in schools. The signs commonly associated with scoliosis include unlevel shoulders, a prominent scapula, a prominent breast, a prominent flank area, an unlevel or prominent hip, poor posture, and an obvious curvature. During diagnosis it is necessary to view the patient from the front and from the back and while the patient is bending. Other signs that may be associated with idiopathic scoliosis are occasional transient pain and fatigue and decreased pulmonary function. Radiographic films of the spine in the bending position are important in ascertaining the flexibility of the curvature and the potential for spontaneous correction. Neurological deficits are commonly associated with severe curvature and vary according to the extent to which the curvature has impinged on the spinal cord. Some signs of such impingement are reflex, sensation, and motor alterations of the lower extremities.

■ INTERVENTIONS: Nonsurgical intervention commonly uses observation, an exercise program, and a Milwaukee brace. Observation consists of frequent physical examinations and radiographic monitoring of the progress of the curvature. Exercise programs are designed to promote the maximum correction possible, as indicated by the degree of flexibility shown in the initial radiographic examination. Observation and the exercise program are used with patients who have a curvature less than 15 to 20 degrees. Greater degrees of curvature usually require the use of a Milwaukee brace in addition to observation and an exercise program. The brace, which is usually worn 23 hours a day, is used to control the progress of the curvature. The exercise program is implemented when the adolescent is out of the brace, and additional exercises are performed while in the brace. Surgical intervention may be required if the curvature has progressed to 40 degrees or more at the time of diagnosis or if a slightly lesser degree of curvature exists with a high degree of rotational component or imbalance. Approximately 5% to 10% of patients with idiopathic scoliosis require surgical intervention, which involves fusing of the involved vertebrae to prevent progress of the deformity. Preoperative traction such as Cotrel traction and halo-femoral traction may also be used to encourage gradual tissue alterations and to decrease postoperative complications. The patient may be placed in Cotrel traction for a period of 5 to 10 days before surgery. The patient may be placed in halo-femoral traction 1 to 3 weeks before surgery. Some physicians apply a preoperative cast to patients to achieve immobilization and adjustment, especially if surgery must be postponed for a considerable period after diagnosis. Common surgical intervention techniques for this condition are the Harrington rod instrumentation technique and the Dwyer cable instrumentation technique; the former is more common. Initial postoperative immobilization is achieved with a posterior plaster shell, a Milwaukee brace, or a windowed cast. A Stryker frame, Foster frame, or CircOlectric bed may also be used. Additional postoperative immobilization by means of cast therapy is often required for 8 to 12 months or until the bony union of the fused area is absolutely ensured. The usual type of cast in this application is a Risser localizer cast, applied with a degree of traction. The Risser turnbuckle cast may also be used when instrumentation has not been used. A Milwaukee brace or a plastic body jacket may be used when less immobilization is desired.

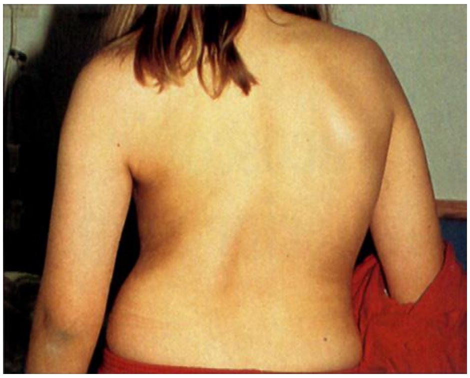
idiopathic steatorrhea [Gk, *idios,* own, *pathos,* disease, *stear,* fat, *rhoia,* flow], excess fat in the stool, particularly as in celiac disease in adults.

idiopathic tetanus [Gk, *idios,* own, *pathos,* disease, *tetanos,* convulsive tension], **1.** a tetanus infection of unknown cause. **2.** a tetanus infection occurring without a wound.

idiopathic ventricular tachycardia, an accelerated heart rhythm (greater than 100 beats/min) that originates in a focus within a ventricle but is of unknown cause.

idiopathy /id′ē·op′əthē/, any primary disease that arises without an apparent cause. **—idiopathic,** *adj.*

idiosyncrasy /-sin′krəsē/ [Gk, *idios* + *synkrasis,* mixing together], **1.** a physical or behavioral characteristic or manner that is unique to an individual or to a group. **2.** an individual's unique hypersensitivity to a particular drug, food, or other substance. Also called **idiocrasy** /id′ē·ok′rəsē/. See also **allergy.**



Idiopathic scoliosis: scapular asymmetry
(Nymberg and Crawford, 1996)

idiosyncratic /-sinkrat′ik/ [Gk, *idios,* own, *synkrasis,* mixing together], pertaining to personal peculiarities or mannerisms.

idiosyncratic drug effect [Gk, *idios,* own, *sygkrasis,* mixing together; Fr, *drogue*], an uncommon response to a drug because of a genetic predisposition. It usually manifests as an abnormally short or abnormally large or long response to the drug, but it is possible for the response to be qualitatively different.

idiotope /id′ē·ətōp′/, an antigenic determinant on a variable region of an immunoglobulin molecule.

idiotrophic /-trof′ik/, describing an organism capable of choosing its own food.

idiot savant /idē·ō′ savänt′/, an individual with mental retardation who is nonetheless capable of performing certain unusual mental feats, primarily those involving music, puzzle solving, or manipulation of numbers.

idiotype /id′ē·ətīp′/ [Gk, *idios* + *typos,* mark], the portion of an immunoglobulin molecule that confers the molecule's unique character, most often including its antigen-binding site.

idioventricular /-ventrik′yələr/ [Gk, *idios* + L, *ventriculus,* little belly], originating in a ventricle.

idioventricular rhythm [Gk, *idios,* own; L, *ventriculus,* little belly; Gk, *rhythmos*], an independent cardiac rhythm caused by a repeated discharge of impulses at a rate of less than 100 beats/min from a focus within a ventricle.

-idium, noun-forming suffix: *coracidium, parorchidium, thrombidium.*

IDL, abbreviation for **intermediate-density lipoprotein.**

IDM, abbreviation for *infant of a diabetic mother.*

idoxuridine /ī′doksyŏŏr′ədēn/, an ophthalmic antiviral.

■ INDICATION: It is prescribed for the treatment of herpes simplex keratitis.

■ CONTRAINDICATIONS: Deep ulceration of the cornea or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are visual disturbances and eye discomfort.

id reaction, the autosensitization resulting from any inflammatory condition that causes pruritus and vesicular lesions. These secondary lesions are caused by circulating antigens and are usually distant from the primary infection.

IDSA, abbreviation for the *Infectious Disease Society of America.*

idursulfase, a rarely used enzyme replacement.

■ INDICATIONS: This drug is used to treat mucopolysaccharidosis II.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or other systemic antifungal or azoles, fungal meningitis, and onchomycosis or dermatomycosis in cardiac function prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include insomnia, fever, rigors, weakness, anxiety, hypertension, hypotension, tachycardia, anemia, cramps, abdominal pain, flatulence, gynecomastia, impotence, decreased libido, malaise, hypokalemia, and tinnitus. Life-threatening side effects include GI bleeding, hepatotoxicity, toxic epidermal necrolysis, and rhabdomyolysis. Common side effects include headache, dizziness, nausea, vomiting, anorexia, diarrhea, pruritus, rash, edema, and fatigue.

I:E ratio, the ratio of the duration of inspiration to the duration of expiration. A range of 1:1.5 to 1:2 for an adult is considered acceptable for mechanical ventilation. Ratios of 1:1 or higher may cause hemodynamic complications, whereas ratios lower than 1:2 indicate lower mean airway pressure and fewer associated hazards.

-ifene, suffix for antiestrogen products of the clomiphene and tamoxifen groups.

-iform, suffix meaning "in the form of": *amebiform, bulbiform, nucleiform.*

ifosfamide, an antineoplastic alkylating agent.

■ INDICATIONS: This drug is used to treat testicular cancer, soft tissue sarcoma, Ewing's sarcoma, non-Hodgkin's lymphoma, lung sarcoma, and pancreatic sarcoma.

■ CONTRAINDICATIONS: Pregnancy, bone marrow suppression, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include facial paresthesia, fever, malaise, somnolence, confusion, depression, hallucinations, dizziness, disorientation, cranial nerve dysfunction, nausea, vomiting, anorexia, stomatitis, constipation, diarrhea, dysuria, urinary frequency, dermatitis, alopecia, and pain at the injection site. Life-threatening side effects include seizures, coma, hepatoxicity, hematuria, nephrotoxicity, hemorrhagic cystitis, thrombocytopenia, leukopenia, and anemia.

Ig, abbreviation for **immunoglobulin.**

IgA, abbreviation for **immunoglobulin A.**

IgA deficiency, a selective lack of immunoglobulin A (IgA). The most common type of immunoglobulin deficiency, it occurs in about 1 in 400 individuals. IgA is a major antibody in the saliva and in the mucous membranes of the intestines and the bronchi. It protects against bacterial and viral infections. IgA deficiency is inheritied as an autosomal-dominant or autosomal-recessive trait and is associated with autoimmune abnormalities. It is common in patients with rheumatoid arthritis and in those with systemic lupus erythematosus. Many individuals with this deficiency have normal numbers of peripheral blood lymphocytes with IgA receptors and normal amounts of other immunoglobulins. Normality accompanied by IgA deficiency suggests that the B lymphocytes of the patient may not secrete IgA. In some patients with this deficiency, T cells seem to depress the synthesis of IgA.

■ OBSERVATIONS: Common symptoms are respiratory allergies associated with chronic sinopulmonary infection; GI diseases, such as celiac disease and regional enteritis; autoimmune diseases, such as rheumatoid arthritis, systemic lupus erythematosus, and chronic hepatitis; and malignant tumors, such as squamous cell carcinoma of the lungs, reticulum cell sarcoma, and thymoma. However, symptoms of IgA deficiency are often lacking in patients whose immune system may compensate for low IgA levels with extra amounts of IgM. The age of onset varies. Some children with IgA deficiency may begin to synthesize IgA spontaneously when a recurrent infection wanes and their condition improves. Diagnoses of IgA-deficient patients depend on the results of tests that commonly show normal IgE and IgM levels while IgA levels are below 5 mg/dL in serum. The cell-mediated immune response and circulating B cell levels often appear normal, although tests may indicate autoantibodies and antibodies against IgG, IgM, and cow's milk. T cell interferon production may be decreased in some patients with IgA deficiency, increasing the chances of infection.

■ INTERVENTIONS: There is no known cure for selective IgA deficiency. Treatment usually involves efforts to control associated diseases, such as respiratory and GI infections.

■ NURSING CONSIDERATIONS: The patient with IgA deficiency should not receive gamma globulin because associated sensitization may cause anaphylaxis during administration of blood products. If the patient requires a blood transfusion, the risk of any harmful reaction can be reduced by using washed red blood cells. Using the crossmatched blood of an IgA-deficient donor in such a transfusion is considered safer because it completely eliminates the risk of an adverse reaction. IgA deficiency is a lifelong condition, and patients with this disorder are commonly instructed to identify its symptoms and to seek treatment promptly when the symptoms appear.

IgD, abbreviation for **immunoglobulin D.**

IgE, abbreviation for **immunoglobulin E.**

IGF, abbreviation for **insulin-like growth factor.**

IgG, abbreviation for **immunoglobulin G.**

IgM, abbreviation for **immunoglobulin M.**

ignipeditis /ig′nēpedī′tis/ [L, *ignis,* fire, *pes,* foot], a burning pain in the soles of the feet caused by peripheral neuropathy.

IGT, abbreviation for **impaired glucose tolerance.**

I.H., an abbreviation for **infectious hepatitis.**

Ikwa fever. See **trench fever.**

IL-1, abbreviation for **interleukin-1.**

IL-2, abbreviation for **interleukin-2.**

IL-3, abbreviation for **interleukin-3.**

IL-4, abbreviation for **interleukin-4.**

IL-5, abbreviation for **interleukin-5.**

IL-6, abbreviation for **interleukin-6.**

IL-7, abbreviation for **interleukin-7.**

IL-8, abbreviation for **interleukin-8.**

IL-9, abbreviation for **interleukin-9.**

IL-10, abbreviation for **interleukin-10.**

IL-11, abbreviation for **interleukin-11.**

IL-12, abbreviation for **interleukin-12.**

IL-13, abbreviation for **interleukin-13.**

IL-14, abbreviation for **interleukin-14.**

IL-15, abbreviation for **interleukin-15.**

ILD, abbreviation for **interstitial lung disease.**

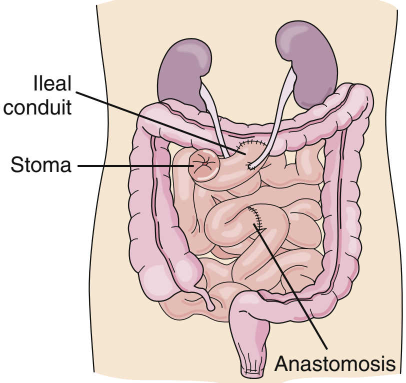
Ile, abbreviation for **isoleucine.**

ilea, ileac, ileal. See **ileum.**

ileal atresia, atresia of the ileum, the most common type of intestinal atresia.

ileal bypass /il′ē·əl/ [L, *ileum,* intestine; AS, *bi,* near; Fr, *passer*], a surgical procedure for treating obesity by anastomosis of the upper portion of the small intestine to a more distal segment of the small intestine, thereby bypassing much of the length of the ileum that normally absorbs nutrients. See also **intestinal bypass.**

ileal conduit [Fr, *conduire,* to guide], a method of urinary diversion using intestinal tissue. The ureters are implanted in a section of dissected ileum. This section is sutured closed on one end; the other end is drawn through the abdominal wall (right lower quadrant) to create a stoma. The patient wears a pouch to collect the urine.



Ileal conduit *(Monahan et al, 2007)*

ileal diverticulum. See **Meckel's diverticulum.**

ileal intussusception, intussusception involving two segments of the ileum.

ileal neobladder, a neobladder made from a section of ileum. Also called **continent ileal reservoir.**

ileal valve. See **ileocecal valve.**

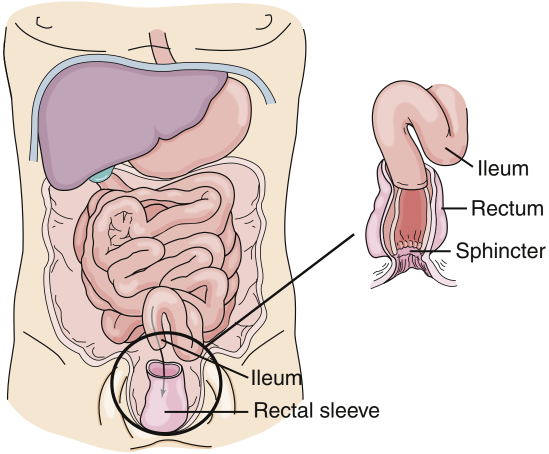
ileectomy /il′ē·ek′təmē/, surgical removal of the ileum.

ileitis /il′ē·ī′tis/ [L, *ileum*, intestine; Gk, *itis*], inflammation of the ileum. See also **Crohn's disease.**

ileo-, prefix meaning "the ileum": *ileocecum, ileorectostomy, ileotomy.*

ileoanal /il′ē·ō·ā′nal/, pertaining to or connecting the ileum and the anus.

ileoanal anastomosis /il′ē·ō·ā′nəl/, a surgical procedure in which the colon and rectum are removed but the anus and anal sphincter are left intact. An anastomosis is formed between the lower end of the small intestine and the anus. The operation is an alternative to proctocolectomy for the treatment of ulcerative colitis.



Ileoanal anastomosis *(Monahan et al, 2007)*

ileoanal reservoir, a pouch for the collection of feces, created surgically in a two-stage operation. The first stage involves removal of the rectal mucosa, an abdominal colectomy, and construction of a fecal reservoir from loops of ileum. A temporary ileostomy is created at this time to allow the ileoanal reservoir to heal. Several months later the patient returns for closure of the ileostomy so that discharge of feces through the anus is possible.

ileocecal /il′ē·ōsē′kəl/ [L, *ileum*, intestine, *caecus*, blind], pertaining to both the ileum and the cecum and the region where they are joined. Also spelled *ileocaecal.*

ileocecal fold, two flaps surrounding the opening of the ileum into the large intestine where the cecum and ascending colon join together. The flaps project into the lumen of the large intestine and come together at their end, forming ridges. Musculature from the ileum continues into each flap, forming a sphincter. Possible functions of the ileocecal fold include preventing reflux from the cecum to the ileum and regulating the passage of contents from the ileum to the cecum.

ileocecal incompetence. See **incompetence.**

ileocecal insufficiency. See **insufficiency.**

ileocecal intussusception, intussusception at the ileocecal junction, with the cecum being drawn back into the ileum.

ileocecal lip of ileal orifice, the inferior of the two lips forming the ileal orifice.

ileocecal orifice, ostium ileale.

ileocecal syndrome. See **appendicitis.**

ileocecal valve [L, *ileum*, intestine, *caecus*, blind, *valvarum*, folding door], the sphincter muscle between the ileum of the small intestine and the cecum of the large intestine. It consists of two flaps that project into the lumen of the large intestine, immediately above the vermiform appendix, preventing food from reentering the small intestine.

ileocecocystoplasty /il′e·ose′kosis′toplas′te/, augmentation cystoplasty using an isolated segment of the ileum and cecum for the graft.

ileocecostomy. See **cecoileostomy.**

ileocolic intussusception, intussusception at the ileocecal junction, with the distal ileum being drawn forward into the colon.

ileocolic lip of ileal orifice, the superior of the two lips forming the ileal orifice.

ileocolic node /il′ē·ōkol′ik/ [L, *ileum* + Gk, *kolon*, colon; L, *nodus*, knot], a node in one of three groups of superior mesenteric lymph glands, forming a chain of approximately 15 nodes around the ileocolic (mesenteric) artery. They tend to form in two main groups, one near the duodenum, the other on the lower part of the ileocolic artery. The chain breaks into several groups where the artery divides into its terminal branches. The ileocolic nodes receive materials from the jejunum, ileum, cecum, vermiform appendix, ascending colon, and transverse colon. Their efferent vessels pass to the preaortic nodes. Compare **mesenteric node, mesocolic node.**

ileocolitis /-kōlī′tis/, an inflammation of the ileum and colon.

ileocystoplasty /-sis′təplas′tē/ [L, *ileum* + Gk, *kystis*, bag, *plassein*, to mold], a surgical procedure in which the bladder is reconstructed by using a segment of the ileum for the bladder wall.

ileocystostomy /-sistos′təmē/ [L, *ileum* + intestine; Gk, *kystis*, bag, *stoma*, mouth], a surgical procedure to form a passage to direct urine through the abdominal wall by using a segment of small intestine as a tube from the bladder.

ileopectineal eminence. See **iliopubic eminence.**

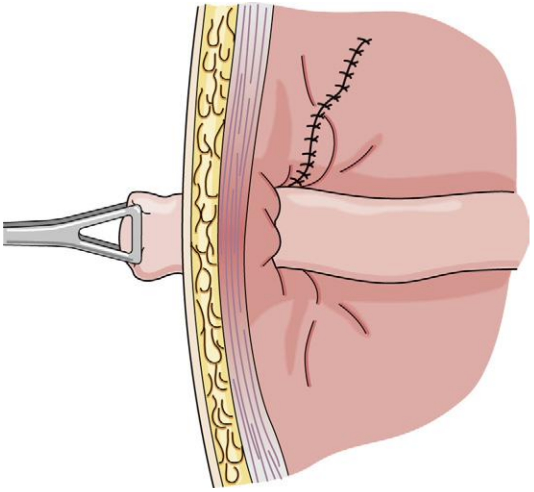
ileorectal /-rek′təl/, pertaining to the ileum and rectum.

ileosigmoid knotting, a severe type of volvulus consisting of twisting together of the ileum and the sigmoid colon.

ileosigmoidostomy /-sig′moidos′təmē/, surgical formation of a passageway between the ileum and the sigmoid colon.

ileostomate /il′ē·os′təmāt/, a person who has undergone an ileostomy.

ileostomy /il′ē·os′təmē/ [L, *ileum* + Gk, *stoma*, mouth, *temnein*, to cut], surgical formation of an opening of the ileum onto the surface of the abdomen, through which fecal matter is emptied. The operation is performed in advanced or recurrent ulcerative colitis, Crohn's disease, or cancer of the large bowel. A low-residue diet is given before surgery and is reduced to fluids 24 hours before surgery to decrease intestinal residue. Intestinal antibiotics are given to decrease the bacterial count. A nasogastric or intestinal tube is passed. The diseased portion of the large bowel is removed in a permanent ileostomy. Occasionally, the distal and proximal segments of bowel may be reconnected after ulcerated areas have healed. A loop of the proximal ileum is then drawn out onto the abdomen and sutured in place, and a stoma is formed. A pouch may be made with part of the terminal ileum, in which the open end is woven through the rectus muscles to form a valve and then opens onto the abdomen. After surgery the patient wears a disposable bag to collect the semiliquid fecal matter, which begins to drain once peristalsis is restored and the nasogastric tube is removed. Because the secretions contain digestive enzymes that can ulcerate the skin around the stoma, the nurse ensures that nothing leaks from the bag. The nurse instructs the patient in how to apply and care for the stoma and the ileostomy bag. If a pouch is present, it is drained three or four times a day through a small irrigating catheter through the valve. Compare **colostomy.** See also **enterostomy, ostomy irrigation, stoma.**



Ileostomy construction *(Monahan et al, 2007)*

ileum /il′ē·əm/ *pl.* **ilea** [L, intestine], the lower-third distal portion of the small intestine, extending from the jejunum to the cecum. Internally it has a few small circular folds and numerous clusters of lymphatic tissues. It ends in the right iliac fossa, opening into the medial side of the large intestine. See also **ileocecal valve. —ileac, ileal,** *adj.*

ileus /il′ē·əs/ [L; Gk, *eilein,* to pack close together], an obstruction of the intestines, such as an adynamic ileus caused by immobility of the bowel or a mechanical ileus in which the intestine is blocked by mechanical means. See also **paralytic ileus.**

ilia. See **ilium.**

-iliac, suffix meaning "the ilium": *occipitoiliac, subiliac, vertebroiliac.*

iliac circumflex node /il′ē·ak/ [L, *ilium* + flank; *circum,* around, *flectere,* to bend, *nodus,* knot], a node in one of the seven clusters of parietal lymph nodes of the abdomen. This node is one of a group found along the course of the deep iliac circumflex vessels. Compare **common iliac node, external iliac node, internal iliac node.** See also **lymph, lymphatic system, lymph node.**

iliac crest [L, *ilia,* intestines; ME, *creste*], the upper elevated margins of the ilium.

iliac fascia, the portion of the endoabdominal fascia that is attached with the iliacus to the crest of the ilium and passes under the inguinal ligament into the thigh.

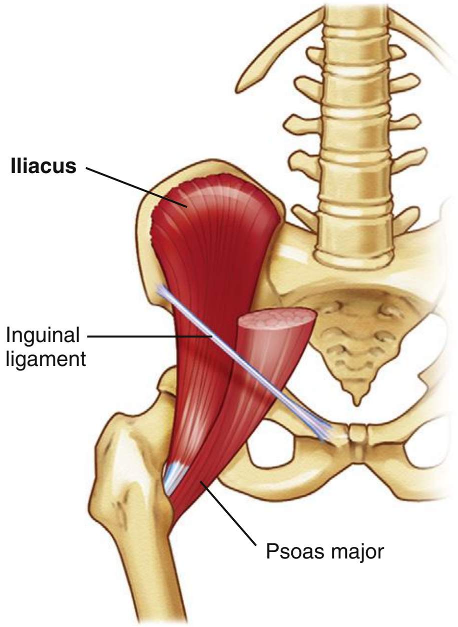
iliac horns, accessory bony spurs on the posterior of the ilium, one of the symptoms of nail-patella syndrome.

iliac part of iliopsoas fascia, the part of the fascia that invests the iliac muscle.

iliac region. See **inguinal region.**

iliac tuberosity, a rough elevation of the posterior iliac crest to which the posterior sacroiliac ligaments are attached. It is also a point of origin of the erector spinae and multifidus muscles.

iliacus /ilī′əkəs/ [L, *ilium,* flank], a flat triangular muscle that covers the inner curved surface of the iliac fossa. It arises from the inner aspect of the superior iliac crest, from the anterior and the iliolumbar ligaments, and from the sacrum. It joins the psoas major to form the iliopsoas at the inguinal ligament. The iliacus is innervated by branches of the femoral nerve that contain fibers from the second and third lumbar nerves. It acts to flex and laterally rotate the thigh. Compare **psoas major, psoas minor.**



Iliacus muscle

ilio-, prefix meaning "ilium or flank": *iliocostal, iliolumbar, iliometer.*

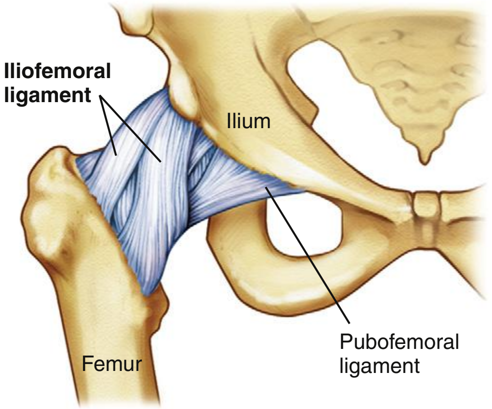
iliocostalis, the most laterally placed column of erector spinae muscles, including the iliocostalis lumborum, iliocostalis thoracis, and iliocostalis cervicis.

iliofemoral /il′ē·ōfem′ərəl/, pertaining to the ilium and femur.

iliofemoral ligament [L, *ilium* + *femur,* thigh, *ligamentum*], a triangular band of connective tissue attached by its apex to the anterior inferior spine of the ilium and acetabular margin and by its base to the intertrochanteric line of the femur.

iliofemoral thrombosis, an abnormal vascular condition in which a clot develops in the iliofemoral circulation.

iliohypogastric nerve, a nerve with branches that innervate the posterolateral gluteal skin and the skin in the pubic region, as well as the abdominal musculature.



Iliofemoral ligament

ilioinguinal /il′ē·ō·ing′gwinəl/ [L, *ilium* + *inguen,* groin], pertaining to the hip and inguinal regions.

ilioinguinal nerve, a nerve that provides cutaneous innervation to the upper medial thigh, the root of the penis and the anterior surface of the scrotum in men, or the mons pubis and labia majora in women. Through its course, it also supplies branches to the abdominal musculature.

iliolumbar artery, a branch of the posterior trunk of the internal iliac artery that supplies muscle and bone.

iliolumbar ligament /-lum′bər/ [L, *ilium* + *lumbus,* loin, *ligare,* to bind], one of a pair of ligaments forming part of the connection between the vertebral column and the pelvis. Each iliolumbar ligament attaches to a transverse process of the fifth lumbar vertebra and laterally to the ilium and inferiorly passes to the base of the sacrum, where it blends with the sacroiliac ligament.

iliopectineal eminence. See **iliopubic eminence.**

iliopectineal line /-pek′tənəl/ [L, *ilium* + *pectus,* breast, *linea*], a bony ridge on the inner surface of the ilium and pubic bones that divides the true and false pelves. Also called **brim of true pelvic cavity, inlet.**

iliopectineal tubercle. See **iliopubic eminence.**

iliopsoas /il′ē·ōsō′əs/ [L, *ilium* + Gk, *psoa,* loin muscle], one of the pair of muscle complexes that flex, adduct, and laterally rotate the thigh and the lumbar vertebral column, consisting of the psoas major and the iliacus. The psoas minor is often absent.

iliopsoas abscess [L, *ilium*], a collection of pus in the iliopsoas muscle, possibly tuberculous in origin, that spreads from the thoracic or lumbar spine to the upper leg muscles, usually caused by staphylococcus infection.

iliopubic eminence, a diffuse enlargement just anterior to the acetabulum, marking the junction of the ilium with the superior ramus of the pubis. Also called **iliopectineal eminence, iliopectineal tubercle.**

iliorenal bypass, a technique of renal revascularization involving insertion of a saphenous vein graft between an iliac artery and a renal artery to serve as a passage around an occluded segment of renal artery.

iliotibial tract /-tib′ē·əl/ [L, *ilium,* flank, *tibia,* shinbone], a band of connective tissue that extends from the iliac crest to the knee and links the gluteus maximus to the tibia.

ilium /il′ē·əm/ *pl.* **ilia** [L, flank], the uppermost of the three bones that make up the innominate bone (hip bone). The ilium forms the superior part of the acetabulum and provides attachment for several muscles, including the obturator internus, the gluteals, the iliacus, and the sartorius. Compare **ischium, pubis. —iliac,** *adj.*

illegal abortion, an abortion performed contrary to the laws regulating abortion. Illegal abortions are often associated with life-threatening complications. See also **septic abortion.**

illegitimate /il′ejit′imit/ [L, *in,* not, *lex,* law], **1.** not authorized by law. **2.** abnormal.

illicit /ilis′it/ [L, *in,* not, *lex,* law], pertaining to an act that is unlawful or otherwise not permitted.

illiterate /ilit′ərit/, unable to read and write.

illness [ME, unhealthy condition], an abnormal process in which aspects of the social, physical, emotional, or intellectual condition and function of a person are diminished or impaired compared with that person's previous condition.

illness behavior, the manner in which individuals monitor the structure and functions of their own bodies, interpret symptoms, take remedial action, and make use of health care facilities.

illness experience, the process of being ill. A commonly used model is Suchman's stages of illness, comprising five stages: stage I, experiencing a symptom; stage II, assuming a sick role; stage III, making contact for health care; stage IV, being dependent (a patient); and stage V, recovering or being rehabilitated. Each stage is characterized by certain decisions, behaviors, and end points. During stage I, in which a symptom is experienced, the person decides that something is wrong and seeks a remedy. Stage I ends with the person's accepting the reality of the symptom, no longer delaying any action toward help or denying the symptom (flight into health). During stage II the person decides that the illness is real and that care is necessary. Advice, guidance, and validation are sought. This stage gives the person permission to act sick and to be excused temporarily from usual obligations. The outcome of this stage is acceptance of the role—or denial of its necessity. In stage III, professional advice is sought. Authoritative declarations identify and validate the illness and legitimize the sick role. The person usually asks for help and negotiates for treatment. Denial may still occur, and the patient may "shop" further for medical care or may accept the illness, the medical authority, and the plan for treatment. In stage IV, professional treatment is performed and accepted by the person, who is now perceived as a patient. At any time during this stage the dependent patient may experience ambivalent feelings and may decide to reject the treatment, the caregiver, and the illness. More often care is accepted with ambivalence. The patient has a particular need to be informed and to be given emotional support during this stage. During stage V the patient relinquishes the sick role. The usual tasks and roles are reassumed to the greatest degree possible. Some people do not willingly give up the sick role, becoming in their own eyes chronically ill, or they may, for secondary gain, malinger, acting sick. Most people accept recovery and work toward rehabilitation.

illness prevention, **1.** a system of health education programs and activities directed at protecting patients from real or potential health threats, minimizing risk factors, and promoting healthy behavior. **2.** actions taken by individuals to prevent illness in themselves and/or their families.

illumination /ilo͞o′minā′shən/ [L, *illuminare,* to make light], the lighting up of a part of the body or of an object under a microscope for the purpose of examination. **—illuminate,** *v.*

illumination assessment, evaluation of the quality of lighting in the workplace.

illusion /ilo͞o′zhən/ [L, *illudere,* to mock], a false interpretation of an external sensory stimulus, usually visual or auditory, such as a mirage in the desert or voices on the wind. Compare **delusion, hallucination.**

Ilosone, a trademark for an antibacterial (erythromycin estolate).

im-, prefix in chemistry indicating the bivalent group NH: *imadyl, imide, imperialine*.

IM, abbreviation for **intramuscular.**

image /im′ij/ [L, *imago,* likeness], **1.** a representation or visual reproduction of the likeness of someone or something, such as a painting, photograph, or sculpture. **2.** an optic representation of an object, such as that produced by refraction or reflection. **3.** a person or thing that closely resembles another; semblance. **4.** a mental picture, representation, idea, or concept of an objective reality. **5.** (in psychology) a mental representation of something previously perceived and subsequently modified by other experiences, resulting from intrapsychic or extrapsychic stimuli, or both.

image acquisition time, the time required to acquire the data used in producing a magnetic resonance image. It does not include the time involved in constructing the image from the data. In comparing sequential plane imaging and volume imaging techniques, the equivalent image acquisition time per slice must be considered, as well as the actual image acquisition time.

image compression, reduction of the space required to store or time required to transfer a digital image.

image detector, any recording medium used in radiology, such as film or a cathode ray tube.

image foreshortening, a type of shape distortion in which a radiographic image appears shorter and wider than the actual structure it represents. It results from misalignment of the x-ray tube relative to the patient, of the patient relative to the film, or of the tube relative to the film.

image format, the manner in which a digital image is stored, such as on a computer disk, magnetic tape, or film.

image intensifier, an electronic device used to produce a fluoroscopic image with a low-radiation exposure. A beam of x-rays passing through the patient is converted into a pattern of electrons in a vacuum tube. The electrons are accelerated and concentrated onto a small fluorescent screen, where they present a bright image, which is generally displayed on a video monitor.

image matrix, an arrangement of columns or rows of cells, or pixels, forming a digital image.

image receptor (IR), a device that changes the x-ray beam into a visible image. An image receptor may be a radiographic film and cassette, a phosphorescent screen (used in fluoroscopy or computed radiography), or a special detector placed in a table or upright bucky diaphragm (used in direct digital radiography).

imagery /im′ijrē/ [L, *imago*], (in psychiatry) the formation of mental concepts, figures, or ideas; any product of the imagination. An imagery technique is applied therapeutically to decrease anxiety. See also **guided imagery.**

imagination /imaj′inā′shən/ [L, *imaginare,* picture to oneself], **1.** the ability to form, or the act or process of forming, mental images or conscious concepts of things that are not immediately available to the senses. **2.** (in psychology) the ability to reproduce images or ideas stored in the memory by the stimulation or suggestion of associated ideas or to regroup former ideas and concepts to form new images and ideas concerned with a particular goal or problem. See also **fantasy.**

imaging /im′ijing/ [L, *imago*], the formation of a mental picture or representation of someone or something using the imagination. See also **fantasy.**

imago /imā′gō/ [L, likeness], (in analytic psychology) an unconscious, usually idealized mental image of a significant individual, such as one's mother, in a person's early formative years. See also **identification.**

imatinib /imă′tĭnib′/, an inhibitor acting specifically on an abnormal enzyme form that is created by the Philadelphia chromosome abnormality and present in chronic myeloid leukemia. It is administered orally as the mesylate salt in the treatment of chronic myeloid leukemia during blast crisis, accelerated phase, or chronic phase after failure of interferon-alpha therapy.

imbalance /imbal′əns/ [L, *im,* not, *bilanx,* having two scales], **1.** a lack of balance between opposing muscle groups, such as in the imbalance of extraocular muscles leading to strabismus. **2.** an abnormal balance of fluid and electrolytes in the body tissues. **3.** the unequal distribution of subjects in a population group, such as the only girl in a large family of boys. **4.** a lack of balance in a person with mental abilities that are remarkable in one area but deficient in others, as in an idiot savant.

imbedded tooth. See **embedded tooth.**

imbricate /im′brikāt/ [L, *imbrex,* roofing tile], to build a surface with overlapping layers of material. Surgeons may imbricate with layers of tissue when closing a wound or other opening in a body part. **—imbrication,** *n.*

IMDD, abbreviation for **idiopathic midline destructive disease.**

Imferon, a trademark for an injectable hematinic **(iron dextran).**

imide-, imido-, prefix indicating the presence in a chemical compound of the bivalent group NH: *imidogen*.

imiglucerase, an analog of a human enzyme produced by recombinant deoxyribonucleic acid technology.

■ INDICATIONS: It is prescribed as enzyme replacement therapy for patients with type I Gaucher disease.

■ CONTRAINDICATIONS: There are no known contraindications to the use of imiglucerase by injection.

■ ADVERSE EFFECTS: The side effects most often reported include headache, nausea, abdominal discomfort, dizziness, and rash.

imino-, prefix indicating the presence of the bivalent group NH attached to a nonacid radical: *iminourea*.

iminoglycinuria /im′inōglī′sino͝or′ē·ə/, a benign familial condition characterized by the abnormal urinary excretion of the imino acids glycine, proline, and hydroxyproline.

imipenem-cilastatin sodium /im′ipē′nəm sil′əstat′in/, a broad-spectrum parenteral antibiotic.

■ INDICATIONS: It is prescribed for the treatment of infections caused by susceptible organisms in the lower respiratory or urinary tracts, skin, abdomen, reproductive organs, bones, or joints. It is also used in the treatment of endocarditis and septicemia.

■ CONTRAINDICATIONS: It is not recommended for children. Caution should be used in administering it to patients with pseudomembranous colitis, hypersensitivity reactions, or a history of seizures.

■ ADVERSE EFFECTS: The most common adverse effects are phlebitis, thrombophlebitis, nausea, vomiting, diarrhea, rash, fever, and central nervous system symptoms.

imipramine hydrochloride /imip′rəmēn/, a tricyclic antidepressant.

■ INDICATION: It is prescribed in the treatment of mental depression.

■ CONTRAINDICATIONS: Concomitant administration of monoamine oxidase inhibitors, recent myocardial infarction, cardiovascular disease or seizure disorder, or known hypersensitivity to this drug or to other tricyclic medication prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are sedation, GI disturbances, and cardiovascular and neurological reactions. It should not be withdrawn abruptly. This drug interacts with many other drugs.

imiquimod /im′ĭkwim′od/, a biological response modifier used topically in the treatment of venereal warts of the external genitalia and perianal region.

immature baby /iməcho͝or′/ [L, *im,* not, *maturus,* ripe], a term sometimes applied to an infant who weighs less than 1134 g (2.5 lb) and who is significantly underdeveloped at birth.

immature cataract [L, *im* + *maturus,* ripe; Gk, *katarrhaktes*], a cataract at an early stage of development when the lens, partially opaque, absorbs fluid and increases by swelling. Only part of the lens is opaque.

immature erythrocyte [L, *im* + *maturus,* ripe; Gk, *erythros,* red, *kytos,* cell], A nucleated precursor red blood cell in the erythrocyte series: pronormoblast, basophilic normoblast, polychromatophilic normoblast, or orthochromic normoblast. The orthochromic normoblast appears on peripheral blood films of newborns, in uncompensated hemolytic anemia, and in hematologic neoplasms.

immediate auscultation /imē′dē·it/ [L, *im* + *medius,* middle, *auscultare,* to listen], a method of examining a patient by placing an ear or stethoscope on the skin directly over the body part being studied.

immediate automatism, a state in which a person acts spontaneously and automatically and later has no recollection of the behavior.

immediate denture [L, *im* + *medius* + *dens,* tooth], a removable artificial denture that is placed in the mouth immediately after the surgical removal of all remaining teeth at the same appointment as the tooth extractions to maintain normal appearance, act as a compression and protective dressing, and allow the ability to chew food. It may be a complete or a partial denture.

immediate hypersensitivity, an allergic reaction that occurs within minutes after exposure to an allergen and is mediated by antibodies. Compare **delayed hypersensitivity.**

immediate hypersensitivity reaction. See **hypersensitivity reaction.**

immediate percussion. See **percussion.**

immediate postoperative fit (IPOF) prosthesis, a temporary or preparatory prosthesis, such as a pylon.

immediate posttraumatic automatism, a posttraumatic state in which a person acts spontaneously and automatically and later has no recollection of the behavior.

immersion /imur′zhən/ [L, *im* + *mergere,* to dip], the placing of a body or an object into water or other liquid so that it is completely covered by the liquid. **—immerse,** *v.*

immersion foot, an abnormal condition of the feet characterized by damage to the muscles, nerves, skin, and blood vessels, caused by prolonged exposure to dampness or by prolonged immersion in cold water. See also **frostbite, trench foot.**

Immerslund-Gräsbeck syndrome, a familial form of megaloblastic anemia and cobalamin deficiency characterized by selective intestinal malabsorption of vitamin B_{12}, uninfluenced by intrinsic factor. About 90% of the cases are associated with a mild, nonspecific form of proteinuria.

imminent abortion. See **inevitable abortion.**

immiscible /imis′əbəl/ [L, *im* + *miscere,* to mix], not capable of being mixed, such as oil and water. Compare **miscible.**

immobility consequences: physiological, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of compromise in physiological functioning due to impaired physical mobility. See also **Nursing Outcomes Classification.**

immobility consequences: psychocognitive, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of compromise in psychocognitive functioning due to impaired physical mobility. See also **Nursing Outcomes Classification.**

immobilization /imō′bəlīzā′shən/, **1.** fixation of a body part so that it cannot move during surgery or after setting of a fracture. **2.** prolonged inactivity of an individual, as with bed rest for neurological injury such as coma, paraplesia, or quadraplesia. **—immobile,** *adj.*

immobilization test, a procedure for identifying antibodies to motile microorganisms by measuring the ability of the antibodies to restrict the motility of the microorganisms.

immotile cilia syndrome /imō′til/ [L, *im, motilis,* movable, *cilia,* eyelashes; Gk, *syn,* together, *dromos,* course], a condition in which cilia, the hairlike processes of epithelial cells, fail to function normally. As a result, the patient has difficulty in filtering dust and other airborne debris from the respiratory system. See also **Kartagener's syndrome.**

immune /imyo͞on′/ [L, *immunis,* free from], having resistance to infection by a certain pathogen.

immune body. See **antibody.**

immune cytolysis, cell destruction mediated by a specific antibody, which activates the complement system, resulting in rupture of the cell membrane.

immune deviation, modification of an immune response to an antigen caused by a previous exposure to the same antigen.

immune elimination, **1.** a method for determining antibody response by measuring the rate of removal of labeled antigens from the circulation. **2.** an accelerated removal of antigens as a result of their binding to antibodies.

immune exclusion, the prevention of an antigen from entering the body by a specific immune response.

immune gamma globulin, passive immunizing agent obtained from pooled human plasma. Also called *immune globulin.* See also **immunoglobulin G.**

■ INDICATIONS: It is prescribed for immediate short-lived protection against measles, poliomyelitis, chickenpox, serum hepatitis after transfusion, hepatitis A, and other disease-causing organisms to which the person has been recently exposed or may be exposed and as replacement therapy for patients with agammaglobulinemia or hypogammaglobulinemia.

■ CONTRAINDICATION: Known hypersensitivity to gamma globulins prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are pain and inflammation at the site of injection, allergic reactions, and headache.

immune hemolysis, the destruction of red blood cells caused by the formation of specific antigen-antibody complexes in the presence of complement.

immune human globulin, a sterile solution of globulins derived from adult human blood that is used as a passive immunizing agent.

immune human serum globulin. See **immunoglobulin.**

immune hypersensitivity response, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of inappropriate immune responses. See also **Nursing Outcomes Classification.**

immune neutropenia, neutrophil destruction caused by antibodies specific for neutrophil antigenic determinants, as often occurs in autoimmune diseases.

immune protein [L, *immunis,* free from; Gk, *proteios,* first rank], a protein, such as an antibody or antitoxin, that contributes to the immunity of a host.

immune reaction. See **immune response.**

immune recognition, the activation of a T or B cell by an antigen.

immune response, a defense function of the body that protects the body against invading pathogens, foreign tissues, and malignancies. It consists of the humoral immune response and the **cell-mediated immune response.** In the humoral immune response, B lymphocytes produce antibodies that react with specific antigens. The antigen-antibody reactions activate the complement cascade, which causes the lysis of cells bearing those antigens. The humoral response may begin immediately on invasion by an antigen or up to 48 hours later. In the cell-mediated immune response, T lymphocytes mobilize tissue macrophages in the presence of foreign antigens. Also called **immune reaction.** See also **humoral immunity, immune system.**

immune serum. See **antiserum.**

immune serum globulin (ISG). See **immunoglobulin.**

immune status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as natural and acquired appropriately targeted resistance to internal and external antigens. See also **Nursing Outcomes Classification.**

immune surveillance. See **immunological surveillance.**

immune system, a system of tissues, organs, and cells that protects the body against pathogenic organisms and other foreign bodies. The principal components of the immune system include the bone marrow, the thymus, and the lymphoid tissues. The system also uses peripheral organs, such as the lymph nodes, the spleen, and the lymphatic vessels. The immune system protects the body initially by creating local barriers and inflammation. The local barriers provide chemical and mechanical defenses through the skin, the mucous membranes, and the conjunctiva. Inflammation draws polymorphonuclear leukocytes and neutrophils to the site of injury, where these phagocytes engulf the invading pathogens. If these first-line defenses fail or are inadequate to protect the body, the humoral immune response and the cell-mediated immune response are activated. See also **immune response.**

immune thrombocytopenic purpura /-sī′təpē′nik/ [Gk, *thrombos* + *kytos,* cell, *penia,* poverty; L, *purpura,* purple], mucocutaneous bleeding of thrombocytopenia, caused by a platelet membrane-specific autoantibody that shortens the platelet lifespan. It is diagnosed by exclusion of drug effects, inflammatory disorder, thrombotic thrombocytopenic purpura, DIC, or hematologic disorder. It affects middle-aged adults and is more prevalent in women than in men. Acute immune thrombocytopenic purpura is a side effect of viral infection in children 2 to 6 years of age, and although the thrombocytopenia is profound, the disorder resolves spontaneously within a few weeks. Also known as *autoimmune thrombocytopenic purpura,* once called *idiopathic thrombocytopenic purpura*. Compare **disseminated intravascular coagulation.** See also **hemophilia, hemorrhagic diathesis, thrombasthenia.**

■ OBSERVATIONS: Common manifestations include petechiae and ecchymoses on the skin, particularly the lower extremities; easy bruising; bleeding from the nose and gums; melena in stools; hematemesis; heavy menses and breakthrough bleeding; and hematuria. Jaundice, fever, and decreased levels of consciousness may be seen in thrombotic thrombocytopenic purpura. Diagnosis focuses on obtaining a history of bleeding symptoms and on ruling out other causes of thrombocytopenia, such as medications, ethanol abuse, HIV, or hematologic disorder. Lab findings include decreased platelet count. Bleeding time is prolonged, but coagulation time is normal. Capillary fragility is increased. Bone marrow aspiration shows an abundance of megakaryocytes. In thrombotic thrombocytopenic purpura there is severe anemia, elevated BUN, elevated creatinine, elevated reticulocytes, elevated LDH, decreased haptoglobin, and fragmented RBCs on peripheral smear. Platelet size and morphological appearance may be abnormal in thrombotic thrombocytopenic purpura. Complications include hemorrhage into organs, such as the brain, gastrointestinal tract, or heart, which can be fatal without treatment.

■ INTERVENTIONS: Medications that may be causing or contributing to the thrombocytopenia are discontinued. Treatment is determined by platelet count and bleeding status. Corticosteroids are used to enhance platelet production and promote capillary integrity. Immunosuppressants are used if the disease does not respond to steroids. Platelet transfusions are used in cases of severe bleeding in idiopathic thrombocytopenic purpura. Plasma exchange or plasmapheresis is the treatment of choice in thrombotic thrombocytopenic purpura. VinCRIStine may be used in thrombotic thrombocytopenic purpura cases that are refractory to plasmapheresis. Splenectomy may be considered for severe unresponsive thrombocytopenia. Immune globulin is given to prepare severely thrombocytic individuals for surgery. Platelet counts and bleeding episodes are monitored closely. Stool softeners are administered to prevent constipation.

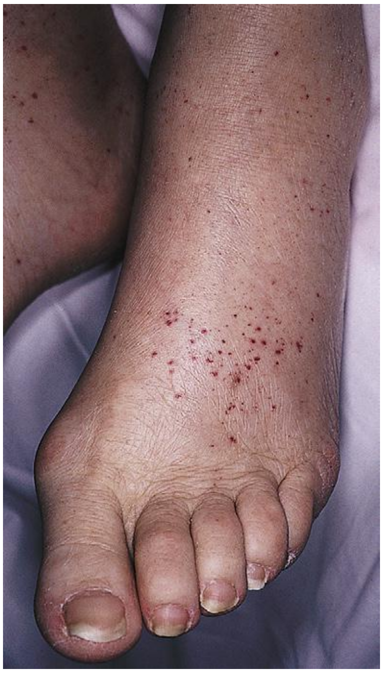
■ NURSING CONSIDERATIONS: Nursing goals are aimed at eliminating gross or occult bleeding, maintaining vascular integrity, decreasing risk for injury, and reducing

Comparison of humoral immunity and cell-mediated immunity

Characteristics	*Humoral immunity*	*Cell-mediated immunity*
Cells involved	B lymphocytes	T lymphocytes, macrophages
Products	Antibodies	Sensitized T cells, cytokines
Memory cells	Present	Present
Protection	Bacteria Viruses (extracellular) Respiratory and gastrointestinal pathogens	Fungus Viruses (intracellular) Chronic infectious agents Tumor cells
Examples	Anaphylactic shock Atopic diseases Transfusion reaction Bacterial infections	Tuberculosis Fungal infections Contact dermatitis Graft rejection Destruction of cancer cells

From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems*, ed 8, St Louis, 2011, Mosby.

complications. Safety precautions are instituted to prevent bruising (e.g., mouth swabs and soft bristle toothbrush for oral care; electric razor for shaving; insertion of IV access device for blood draws; padding bed rails and hard surfaces). Emesis, sputum, stool, urine, and other secretions for occult blood and pad counts during menstruation are frequently assessed and tested. Active bleeding is controlled with ice packs, gentle pressure, or packing. Rest and activity should be carefully balanced to conserve energy. Education is necessary about trauma prevention and safety precautions; avoidance of contact sports; avoidance of the Valsalva maneuver; the necessity for gentle coughing, sneezing, and nose blowing; and the necessity for increased fluid intake and balanced periods of rest and exercise. Instruction is given in infection precautions for those taking immunosuppressants. Education includes instruction to avoid anticoagulant over-the-counter medications, such as aspirin/aspirin products and other NSAIDs.



Immune thrombocytopenic purpura *(Callen et al, 2000)*

immune thrombocytopenic purpura (ITP), abnormally low platelet count associated with mucocutaneous bleeding. Acute ITP is a disease of children that may follow a viral infection, lasts a few weeks to a few months, and usually has no residual effects. Chronic ITP appears in adolescents and adults, especially women of childbearing age, with insidious onset, and is usually lifelong. Autoantibodies to platelets are found in patients with ITP. The condition may be transmitted to the fetus if the mother is affected. Treatment includes corticosteroids, therapeutic plasmapheresis, and splenectomy. See also **thrombocytopenia,** *thrombocytopenic purpura*.

immunity /imyo͞o′nitē/ [L, *immunis,* free from], **1.** (in civil law) exemption from a duty or an obligation generally required by law, as an exemption from taxation or from penalty for wrongdoing or protection against liability. **2.** the quality of being insusceptible to or unaffected by a particular disease or condition. Kinds of immunity are **acquired immunity, active immunity,** and **passive immunity. —immune,** *adj*.

immunization /im′yənīzā′shən/ [L, *immunis,* free], **1.** a process that increases an organism's reaction to an antigen, thereby improving the organism's ability to resist or overcome infection. See also **vaccination. 2.** a technique used to induce an immune response to a specific disease in humans by exposing the individual to an antigen in order to raise antibodies to that antigen.

immunization behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to obtain immunization to prevent a communicable disease. See also **Nursing Outcomes Classification.**

immunization/vaccination management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring immunization status, facilitating access to immunizations, and providing immunizations to prevent communicable disease. See also **Nursing Interventions Classification.**

immunoablative /im′mu-no·ab′lätiv/, immunosuppressant with removal and destruction of a cell population, such as in the ablative step preceding bone marrow transplantation.

immunoabsorbent /im′yənō′absôr′bənt/, a gel or other inert substance used to absorb antibodies from a solution or to purify them.

immunoabsorption /im′yənō′absôrp′shən/, **1.** removal of a specific group of antibodies by antigens. **2.** removal of antigen by interaction with specific antibodies.

immunoadsorbent /im′yənō′adsôr′bənt/, an insoluble preparation of antigens or antibodies used to bind homologous antibodies or antigens and remove them from a mixture of substances.

immunoassay /im′yənō·as′ā/ [L, *immunis* + Fr, *essayer,* to try], a commonly employed assay in which a solid-phase target antigen is designed to bind with an antibody in vitro to reveal its presence. When a conjugated antihuman immunoglobulin is added, it binds the antibody of interest. The conjugate, usually an enzyme, then reacts with its substrate to generate color or fluorescence that is proportional to antibody concentrations. See also **enzyme-linked immunosorbent assay (ELISA), radioimmunoassay, sandwich technique.**

immunoaugmentative therapy, an alternative cancer treatment that proposes that cancer cells can be arrested by the use of four different blood proteins. This approach is also proposed to restore the immune system and can be used as an adjunctive therapy.

immunobead /im′yənōbēd′/, a tiny, inert plastic sphere coated with antigens or antibody, used for immunoassays, such as the isolation of B cells from T cells.

immunobead assay, an assay for any of various types of antibodies or antigens, using immunobeads coated with a corresponding antigen or antibody that aggregates or agglutinates in the presence of the one in question.

immunoblastic lymphoma /-blas′tik/, a proliferation of immunoblasts involving the lymph nodes.

immunoblotting /-blot′ing/, a method for identifying antigens. The antigens are allowed to adhere to cellulose sheets and are identified by staining with labeled antibodies. The method is also used to detect monoclonal proteins. See also **Western blot test.**

immunochemistry, the study of the chemical properties of antigens and antibodies, complement, and T cell receptors.

immunochemotherapy /-kem′ōther′əpē/, a combination of biotherapy and chemotherapy. See also **chemotherapy, immunotherapy.**

immunocompetence /-kom′pətəns/, the ability of an immune system to mobilize and deploy its antibodies and other responses to stimulation by an antigen. Immunocompetence may be weakened in older individuals as a result of age-related attenuation in T cell function. It may also be diminished by viruses, radiation, and chemotherapeutic drugs. **—immunocompetent,** *adj.*

immunocomplex, a multimolecular complex formed when an antibody binds to a specific antigen. The complex is capable of activating complements and is a factor in diseases such as arthritis, vasculitis, serum sickness, and glomerulonephritis.

immunocomplex assay, a laboratory assessment of the amounts of components in multimolecular antigen-antibody complexes. The assay is used in various diagnostic tests for collagen-vascular disorders, glomerulonephritis, vasculitis, hepatitis, and neoplastic diseases.

immunocomplex hypersensitivity [L, *immunis,* free from; *complexus,* embrace; Gk, *hyper,* excess; L, *sentire,* to feel], a complement-dependent, immediate-acting humoral hypersensitivity to certain soluble antigens. It occurs when antibodies (immunoglobulin G or M) bind to circulating antigens, forming immune complexes. These complexes are deposited in tissues, such as blood vessels and renal glomeruli. Augmented by complement activation, they induce injury or dysfunctional responses in those tissues. Immune complex hypersensitivity is a dynamic, ever-changing process. Also called *type III hypersensitivity.* Compare **anaphylactic hypersensitivity, cell-mediated immune response, cytotoxic anaphylaxis.**

immunocomplex-mediated hypersensitivity reaction, type III hypersensitivity reaction. See also **hypersensitivity reaction.**

immunocompromised /-kom′prəmīzd′/ [L, *immunis,* free from, *compromittere,* to promise mutually], pertaining to an immune response that has been weakened by a disease or an immunosuppressive agent.

immunocompromised host, an individual whose immune response is weakened as a result of an immunodeficiency disorder or exposure to immunosuppressive drugs or irradiation.

immunodeficiency. See **dysgammaglobulinemia.**

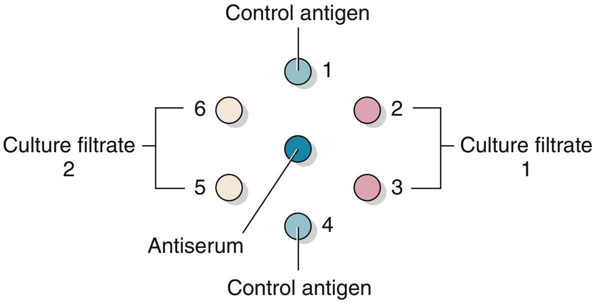
immunodeficiency disease /-difish′ənsē/, any of a group of diseases caused by a defect in the immune system and generally characterized by susceptibility to infections and chronic diseases. Such diseases are sometimes classified as B cell (antibody) deficiencies, T cell (cellular) deficiencies, combined T and B cell deficiencies, defects of cell movement, and defects of microbicidal activity. See also **severe combined immunodeficiency disease.**

immunodeficient /-difish′ənt/ [L, *immunis* + *de,* from, *facere,* to make], pertaining to an abnormal condition of the immune system in which cellular or humoral immunity is inadequate and resistance to infection is decreased. Kinds of immunodeficient conditions include **hypogammaglobulinemia** and **lymphoid aplasia.**

immunodiagnosis. See **serological diagnosis.**

immunodiagnostic /-dī′əgnos′tik/ [L, *immunis* + Gk, *dia,* through, *gnosis* knowledge], pertaining to or characterizing a diagnosis based on an antigen-antibody reaction. In many cases a tumor releases a discrete antigenic substance into the blood. Detection of a particular antigen can provide an immunodiagnostic sign of the presence of the tumor associated with that antigen.

immunodiffusion /-difyo͞o′zhən/ [L, *immunis* + *diffundere,* to spread], a technique for the identification and quantification of any of the immunoglobulins. It is based on the presence of a visible precipitate that results from an antigen-antibody combination under certain circumstances. **Gel diffusion** is a technique that involves evaluation of the precipitin reaction in a clear gel, seen when an antigen placed in a hole in the agarose diffuses evenly into the medium. An obvious ring forms where the antigen meets the antibody. **Electroimmunodiffusion** is a gel diffusion to which an electrical field is applied, accelerating the reaction. **Double gel diffusion** is a technique that permits identification of antibodies in mixed specimens. In an agar plate antigen is placed in one well, antibody in another. Antigen and antibody diffuse out of their wells. In mixed antigen specimens each antigen-antibody combination forms a separate line; observation of the location, shape, and thickness of a line permits identification and quantification of the antibody.



Immunodiffusion *(Mahon, Lehman, and Manuselis, 2011)*

immunoelectroadsorption /im′yənō′ilek′trō·adsôrp′shən/, an antibody assay technique in which antigens are adsorbed onto a metal-coated glass slide with an electric current. Serum containing antibodies is then applied to the slide.

immunoelectrodiffusion. See **immunodiffusion.**

immunoelectron microscopy /im′yənō′ilek′tron/, electron microscopy of specimens labeled with antibodies that have been conjugated with gold. The gold makes the antibody labels electron-dense.

immunoelectrophoresis /-ilek′trōfôrē′sis/ [L, *immunis* + Gk, *elektron,* amber, *pherein,* to bear], a technique that combines electrophoresis and immunodiffusion to separate and allow identification of complex proteins. The proteins in the test serum are spread out in agar and separated by electrophoresis. Wells or troughs are then cut into the agar, and parts of antibody are placed in the troughs and allowed to diffuse toward the separated proteins. A visible precipitin will form in a series of arcs in the agar when an antigen-antibody reaction occurs. The shape and location of each arc are specific for known proteins. Unusual arcs are representative of abnormal or unknown protein. Although the density of the precipitation corresponds to the concentration of protein in each electrophoretic band, immunoelectrophoresis does not accurately quantify the amount of protein in the test serum. **—immunoelectrophoretic,** *adj.*

immunoenhancement /im′yənō′enhans′mənt/, the augmentation of immune responsiveness by immunization or other means.

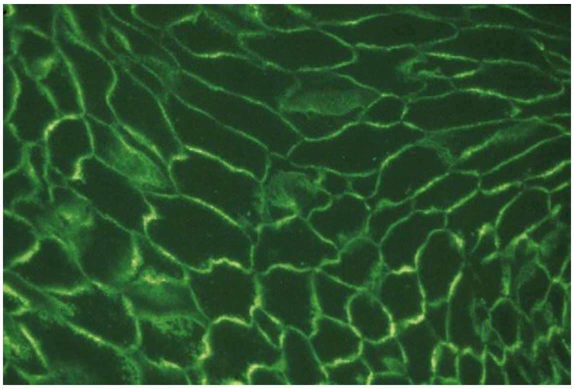
immunoferritin /-fer′itin/, an antibody labeled with ferritin used to identify specific antigens in electron microscopy.

immunoferritin technique, a method of labeling antibody molecules with ferritin, an electron-dense material. The ferritin renders the sites of antibody attachment visible in electron microscopy.

immunofixation /-fiksā′shən/, a process by which antigens in a protein mixture are separated on an electrophoretic gel and identified by the application of labeled antibodies.

immunofixation electrophoresis, a blood or urine test used to detect monoclonal gammopathies.

immunofluorescence /-flo͝ores′əns/ [L, *immunis* + *fluere,* to flow], a technique used for the rapid identification of an antigen by exposing it to known antibodies tagged with the fluorescent dye fluorescein and observing the characteristic antigen-antibody reaction of precipitation. As the fluorescent antibody reacts with its specific antigen, the precipitate appears luminous in the ultraviolet light projected by a fluorescent microscope. Many of the most common infectious organisms can be identified by this technique. Among them are *Candida albicans, Haemophilus influenzae, Neisseria gonorrhoeae, Shigella, Staphylococcus aureus,* and several viruses, including rabies virus and many enteroviruses. See also **fluorescent antibody test, fluorescent microscopy. —immunofluorescent,** *adj.*



Immunofluorescence
(Regezi, Sciubba, and Jordan, 2008/Courtesy Dr. Troy E. Daniels)

immunofluorescence test. See **fluorescent antibody test.**

immunofluorescent. See **immunofluorescence.**

immunofluorescent microscopy. See **fluorescent microscopy, immunofluorescence.**

immunogen /imyo͞o′nəjən/ [L, *immunis* + Gk, *genein,* to produce], any agent or substance capable of provoking an immune response or producing immunity. **—immunogenic,** *adj.*

immunogenetics /-jənet′iks/, a branch of medicine concerned with the role of genetics in tissue transplantation and immunological; response.

immunogenicity. See **antigenicity.**

immunoglobulin (Ig) /-glob′yəlin/ [L, *immunis* + *globus,* small sphere], any of five structurally distinct classes of proteins that function as antibodies in the serum and external secretions of the body. In response to specific antigens, immunoglobulins are formed in the bone marrow, spleen, and all lymphoid tissues except the thymus. Classes of immunoglobulins are **IgA, IgD, IgE, IgG,** and **IgM.** Also called **immune serum globulin.** See also **antibody, antigen, immunity.**

immunoglobulin A (IgA), one of the most prevalent of the five classes of antibodies produced by the body. It is found in all secretions of the body and is the major antibody in the tears, saliva, and mucous membranes lining the intestines and bronchi. IgA combines with a protein in the mucosa and defends body surfaces by seeking out foreign microorganisms and triggering an antigen-antibody reaction. The normal concentration of IgA in serum is 50 to 250 mg/dL. Compare **immunoglobulin D, immunoglobulin E, immunoglobulin G, immunoglobulin M.** See also **IgA deficiency.**

immunoglobulin D (IgD), one of the five classes of antibodies produced by the body. It is found in small amounts in serum tissue. Although its precise function is not known, IgD increases in quantity during allergic reactions to milk, insulin, penicillin, and various toxins. The normal concentration of IgD in serum is 0.5 to 3 mg/dL. Compare **immunoglobulin A, immunoglobulin E, immunoglobulin G, immunoglobulin M.**

immunoglobulin E (IgE), one of the five classes of antibodies produced by the body. It is concentrated in the lungs, skin, and mucous membranes. It provides the primary defense against environmental antigens and is believed to be responsive to immunoglobulin A. IgE reacts with certain antigens to trigger the release of chemical mediators that cause anaphylactic hypersensitivity reactions characterized by wheal and flare. The normal concentration of IgE in serum is 0.01 to 0.04 mg/dL. Compare **immunoglobulin A, immunoglobulin D, immunoglobulin G, immunoglobulin M.**

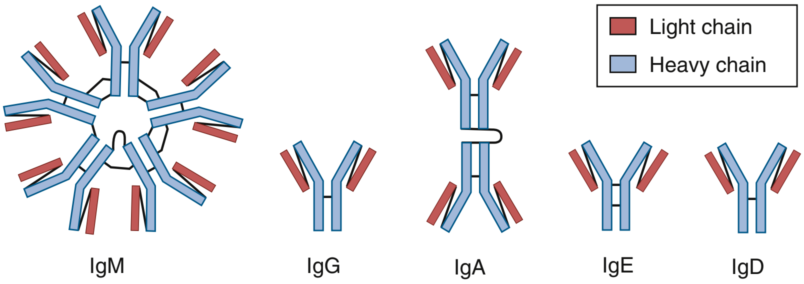
immunoglobulin electrophoresis, a blood test done to detect and identify the various immunoglobulins (antibodies), such as IgG, IgA, IgM, IgE, and IgD. Serum immunoelectrophoresis is used to detect and monitor the course of diseases.

immunoglobulin G (IgG), one of the five classes of antibodies produced by the body. It is synthesized in response to invasions by bacteria, fungi, and viruses. IgG crosses the placenta and protects the fetus against red cell antigens and white cell antigens. The normal concentration of IgG in serum is 800 to 1600 mg/dL. Compare **immunoglobulin A, immunoglobulin D, immunoglobulin E, immunoglobulin M.**

immunoglobulin M (IgM), one of the five classes of antibodies produced by the body and the largest in molecular structure. It is found in circulating fluids and is the first immunoglobulin produced when the body is challenged by antigens. IgM triggers the increased production of immunoglobulin G and the complement fixation required for effective immune response. It is the dominant antibody in ABO blood group incompatibilities. The normal concentration of IgM in serum is 40 to 120 mg/dL. Compare **immunoglobulin A, immunoglobulin D, immunoglobulin E, immunoglobulin G.**

immunohematology /-hem′ətol′əjē/ [L, *immunis* + Gk, *haima,* blood, *logos,* science], the study of antigen-antibody reactions and their effects on blood.

immunoincompetence /im′yənō′inkom′pətəns/, the inability to develop an immune reaction. See also **immunocompromised host. —immunoincompetent,** *adj.*



Immunoglobulins *(Patton and Thibodeau, 2010)*

Properties of immunoglobulin classes

Property	*Immunoglobulin class*				
	IgG	*IgM*	*IgA*	*IgE*	*IgD*
Physiochemical Principal site found	Internal body fluids	Serum	Serum and exocrine secretions	Tissue bound	Bound to lymphocyte surface
Fixed complement	Yes	Yes	No	No	No
Crosses placenta	Yes	No	No	No	No
Principal functions	Agglutination, detoxification, virus neutralization; enhancement of phagocytosis	Agglutination, cytolysis; enhancement of phagocytosis	Protection of mucosal surfaces	Mediation of immediate type of hypersensitivity	Control of lymphocytic activation and suppression

immunoincompetent /im′yənō′inkom′pətənt/, pertaining to the inability to develop an immune response to the challenge of antigens.

immunologically competent cell, a cell of the lymphoid series that can react with antigen to produce antibody or to become active in cell-mediated immunity or delayed hypersensitivity reactions.

immunological barrier /-loj′ik/, an apparent protection against an immune response afforded by certain areas of the body, as demonstrated by the prolonged survival of foreign grafts in those areas. The barrier may be related to the nature of lymphatic drainage in those areas.

immunological disease [L, *immunis,* free from; Gk, *logos,* science; L, *dis* + Fr, *aise,* ease], any condition caused by an abnormal immune system.

immunological granuloma, a small, organized, compact collection of mononuclear phagocytes that develops within 2 or 3 weeks after the introduction of a foreign material, provoking an inflammatory response. Such materials include sea urchin toxin, chemicals used in making tattoos, and antigens associated with leprosy, tuberculosis, and cat-scratch fever.

immunological infertility, any of several types of female factor infertility believed to be caused by presence of antibodies that interfere with functioning of the sperm, such as antisperm antibody.

immunological model of aging, an idea that a decline in the function of T cells and B cells causes normal cells to be unrecognized as such, thereby triggering immune reactions against an individual's own tissues.

immunological pregnancy test, a method of detecting pregnancy through an increase in the concentration of human chorionic gonadotropin (HCG) in the plasma or urine, as determined by the reaction of HCG with a specific antiserum.

immunological surveillance [L, *immunis,* free from; Gk, *logos,* science; Fr, *surveiller,* to watch over], the constant monitoring by the immune system of microorganisms, foreign tissue, and diseases caused by altered cells, especially cancer cells. Also called **immune surveillance, immunosurveillance.**

immunological test [L, *immunis* + *testum,* crucible], a test based on the principles of antigen-antibody reactions.

immunologist /im′yənol′əjist/, a specialist in immunology.

immunology /im′yənol′əjē/ [L, *immunis* + Gk, *logos,* science], the study of the reaction of tissues of the immune system of the body to antigenic stimulation.

immunomodulator /-mod′yəlā′tər/ [L, *immunis* + *modulus,* little measure], a substance that alters the immune response by augmenting or reducing the ability of the immune system to produce antibodies or sensitized cells that recognize and react with the antigen that initiated their production. Immunomodulators include corticosteroids, cytotoxic agents, thymosin, and immunoglobulins. Some immunomodulators are naturally present in the body, and certain of these are available in pharmacological preparations. **—immunomodulation,** *n.*

immunopathology /-pəthol′əjē/, **1.** the study of disease processes that have an immunological cause. **2.** injury induced by antibodies or other products of an immune response.

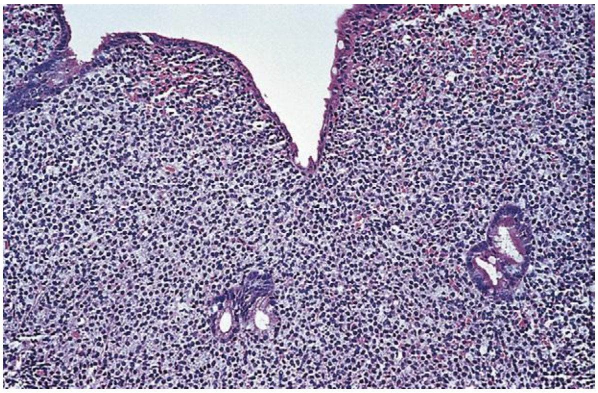
immunophenotypic analysis /-fē′nōtip′ik/, a method for dividing lymphomas and leukemias into clonal subgroups on the basis of differences in cell surfaces and cytoplasmic antigens. The antigenic differences are detected with monoclonal antibodies and flow cytometry.

immunopotency /-pō′tənsē/ [L, *immunis* + *potentia,* power], the ability of an antigen to elicit an immune response.

immunoprecipitation /-prisip′itā′shən/, a procedure used to isolate target molecules with which antibodies react. Precipitation results when insoluble antigen-antibody complexes are formed by the reaction between soluble antigens and antibodies.

immunoproliferative disorder, a condition characterized by the continuous proliferation of a subset of immune cells, such as lymphocytes or plasma cells, that is associated with autoimmune and immunoglobulin disorders.

immunoproliferative small intestine disease (IPSID), a disorder characterized by small, diffuse lesions composed of cells that have features of plasma cells, histiocytes, and



Immunoproliferative small intestine disease
(Fletcher, 2007)

atypical lymphocytes. The disease mainly affects the duodenum and proximal jejunum. Patients experience diarrhea, weight loss, abdominal pain, and clubbing of the fingers and toes. Also called **alpha chain disease, Mediterranean lymphoma.**

immunoprophylaxis /-prō′filak′sis/, the introduction of active immunization through vaccines or passive immunization through antisera.

immunoradiometric assay /-rā′dē·ōmet′rik/, a method for measuring certain plasma proteins by using radiolabeled antibodies.

immunoreactant, a substance that participates in an immune response; an antigen or antibody. **—immunoreactive,** *adj.*

immunoregulation /-reg′yəlā′shən/, control of the immune response, as by manipulation of pathways involving suppressor and contrasuppressor T cells.

immunoregulatory hormones /-reg′yələtôr′ē/, chemical substances secreted by endocrine glands and lymphocytes that influence activities of the immune system.

immunosecretory disorders, a group of disorders characterized by monoclonal proliferation of immunoglobulin-producing cells that resemble lymphocytes or plasma cells. The group includes primary amyloidosis, cryoglobulinemia, heavy chain disease, benign monoclonal gammopathy, multiple myeloma, and plasma cell dyscrasias.

immunoselection /-silek′shən/ [L, *immunis* + *seligere,* to select], the survival of certain cells as a result of their lack of surface antigens that would otherwise make them vulnerable to attack and destruction by antibodies. See also **erythroblastosis fetalis, Rh factor.**

immunosorbent /-sôr′bənt/, a substance containing attached antigens used to remove homologous antibodies from a solution. See also **enzyme-linked immunosorbent assay.**

immunostimulant /-stim′yələnt/, an agent, such as bacille Calmette-Guérin vaccine, that induces an immune response at the site of injection, a response that sometimes can be beneficial in the treatment of cancer and other disease.

immunosuppression /-səpresh′ən/ [L, *immunis* + *supprimere,* to press down], **1.** the administration of agents that significantly interfere with the ability of the immune system to respond to antigenic stimulation by inhibiting cellular and humoral immunity. Corticosteroids; cytotoxic drugs, including antimetabolites and alkylating agents; antilymphocytic antibodies; and irradiation may produce immunosuppression. Immunosuppression may be deliberate, such as in preparation for bone marrow or other transplantation to prevent rejection by the host of the donor tissue, or incidental, such as often results from chemotherapy for the treatment of cancer. **2.** an abnormal condition of the immune system characterized by markedly inhibited ability to respond to antigenic stimuli. **—immunosuppressed,** *adj.*

immunosuppressive /-səpres′iv/, **1.** *adj,* pertaining to a substance or procedure that lessens or prevents an immune response. **2.** *n,* an immunosuppressive agent. The immunosuppressive drugs used most frequently to prevent allograft rejection are the interleukin 2 production inhibitors cycloSPORINE and tacrolimus, the cytotoxic purine antimetabolite azathioprine, the alkylating agent cyclophosphamide, and the adrenocorticosteroid predniSONE. Methotrexate, cytarabine, dactinomycin, and thioguanine are also potent immunosuppressive drugs. Monoclonal antibodies against the T cell receptor (muromonab-CD3) and interleukin 2 receptors (basiliximab and daclizumab) are also administered for immunosuppression. The use of some of these agents is being explored for the treatment of autoimmune diseases such as rheumatoid arthritis and systemic lupus erythematosus.

immunosurveillance. See **immunological, surveillance.**

immunotherapy /-ther′əpē/ [L, *immunis* + Gk, *therapeia,* treatment], the application of immunological knowledge and techniques to prevent and treat disease. Examples include the administration of increasing doses of allergens in the treatment of allergies, the use of immunostimulants and immunosuppressants, the transfer of immunocompetent cells and tissues from one person to another, and the use of interferon for its antiviral and antitumor properties. **—immunotherapeutic,** *adj.*

immunotoxin (IT) /-tok′sin/, a toxin that is attached to a monoclonal antibody and used to destroy a specific type of target cell. An example is the plant toxin ricin, which inhibits protein synthesis in tumor cells that are recognized by the antibodies to which ricin is attached.

Imodium, a trademark for an antidiarrheal **(loperamide hydrochloride).**

Imovax, a trademark for a rabies virus vaccine (rabies human diploid cell vaccine).

impacted /impak′tid/ [L, *impingere,* to drive against], tightly or firmly wedged in a limited amount of space. **—impact,** *v.,* **impaction,** *n.*

impacted cerumen, accumulated cerumen forming a solid mass that adheres to the wall of the external auditory canal.

impacted fracture, a bone break in which the adjacent fragmented ends of the fractured bone are wedged together.

impacted tooth, a tooth so positioned against another tooth, bone, or soft tissue that its complete and normal eruption is impossible or unlikely. An impacted third molar tooth may be further described according to its position, such as buccoangular, distoangular, or vertical. Compare **embedded tooth.**

impaction /impak′shən/ [L, impactic, a pressing together], **1.** an obstacle or malposition that prevents a tooth from erupting. **2.** the presence of a large or hard fecal mass in the rectum or colon.

impact printer /im′pakt/, a mechanical printer that imprints computer characters on paper by striking it as a typewriter does, usually through an inked ribbon. Compare **nonimpact printer.** See also **dot-matrix printer.**

impaired glucose tolerance (IGT) /imperd′/ [L, *impejorare,* to make worse; Gk, *glykys,* sweet; L, *tolerare,* to endure], a condition in which fasting plasma glucose levels are higher than normal but lower than those diagnostic of diabetes mellitus. In some patients this represents a stage in the natural history of diabetes, but in some people IGT either does not progress or ends, and glucose tolerance reverts to normal. Also called impaired **prediabetes.** See also **diabetes mellitus.**

impairment [L, *impejorare,* to make worse], any disorder in structure or function resulting from anatomical, physiological, or psychological abnormalities that interfere with normal activities.

impedance /impē′dəns/ [L, *impedire,* to entangle], a form of electric resistance observed in an alternating current that is analogous to the classic electric resistance that occurs in a direct current circuit. It is expressed as a ratio of voltage applied to a circuit to the current it produces, as an alternating current oscillates ahead of or behind the voltage.

impedance audiometry. See **audiometry.**

impedance plethysmography, a technique for detecting blood vessel occlusion that determines volumetric changes in the limb by measuring changes in its girth as indicated by changes in the electric impedance of mercury-containing polymeric silicone (Silastic) tubes in a pressure cuff. The method is based on the principle that any circumferential rate of change in a limb segment is directly proportional to the volumetric rate of change, which in turn reflects occlusion of venous and arterial blood flow. However, the technique does not accurately indicate the presence or absence of partially obstructing thrombi in major vessels.

imperative conception /imper′ətiv/ [L, *imperare,* to command], a thought or impression that appears spontaneously in the mind and cannot be eliminated, such as an obsession.

imperative idea. See **compulsive idea.**

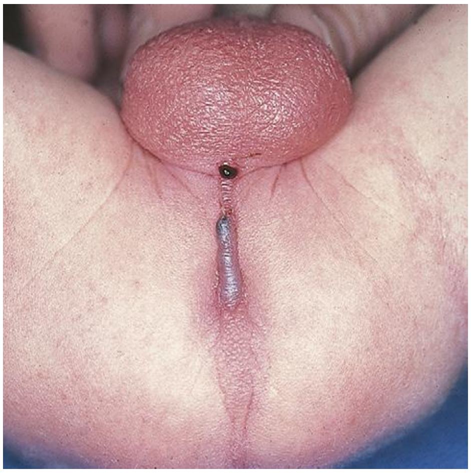
imperforate /impur′fərit/ [L, *im,* not, *perforare,* to pierce], lacking a normal opening in a body organ or passageway. An infant may be born with an imperforate anus. Compare **perforate.**

imperforate anus, any of several congenital developmental malformations of the anorectal portion of the GI tract.

■ OBSERVATIONS: The most common form is **anal agenesis**, in which the rectal pouch ends blindly above the surface of the perineum. An anal fistula is present in 80% to 90% of cases. Other forms include **anal stenosis**, in which the anal aperture is small, and **anal membrane atresia**, in which the anal membrane covers the aperture, creating an obstruction.

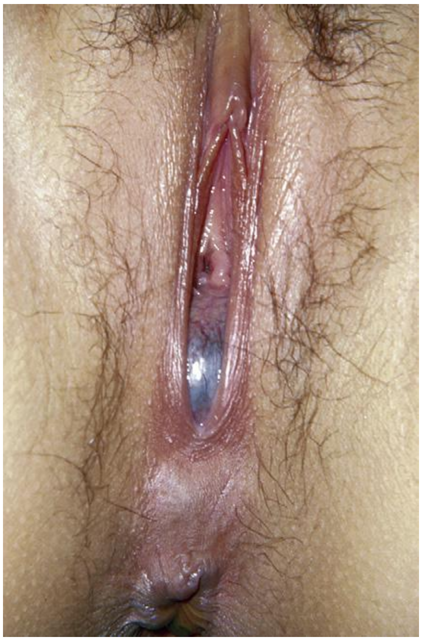
■ INTERVENTIONS: The defect is usually discovered at birth; inspection reveals absence of the anus or the presence of a thin translucent membrane covering it. Digital and endoscopic examination allows identification of the anatomical character of the malformation. Radiographic examination is performed to outline the rectal pouch. A radiopaque marker is placed at the usual site of the anus, and the infant is held upside down. Air moving through the intestines into the distal portion of the bowel or the rectum is visible on the x-ray film. Anal stenosis is treated with daily digital dilation begun in the hospital and continued at home by the parents. An imperforate anal membrane is excised, and digital dilation is performed daily as the skin heals. Surgical reconstruction is performed to treat anal agenesis in infants in whom the pouch is below the puborectalis of the levator ani; an anus is created surgically by an anoplasty. Anal atresia in which the pouch at the end of the bowel is high above the perineum may require a colostomy.

■ NURSING CONSIDERATIONS: Often it is the nurse who identifies the anal malformation during the routine newborn assessment. A newborn who does not pass any stool in the first 24 hours requires further evaluation for the possibility of the defect. The passage of meconium from the vagina or urinary meatus clearly indicates the presence of anal fistula and usually occurs in association with an imperforate anus. Postoperative care in the newborn treated surgically for any of these conditions requires scrupulous attention to the perineal area.



Imperforate anus *(Zitelli and Davis, 2007)*

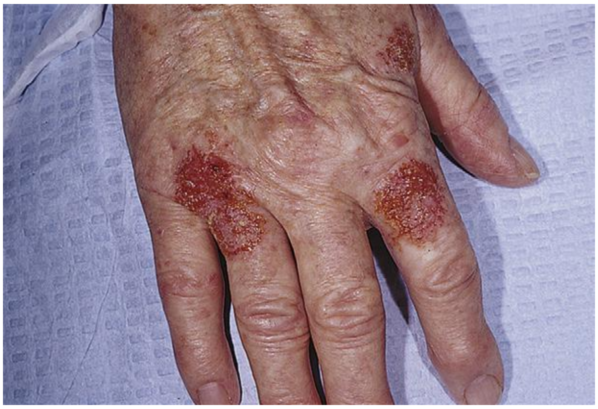
imperforate hymen [L, *im* + *perforare,* to pierce; Gk, *hymen,* membrane], a hymen that completely encloses the external orifice of the vagina.



Imperforate hymen
(Falcone and Hurd, 2007)

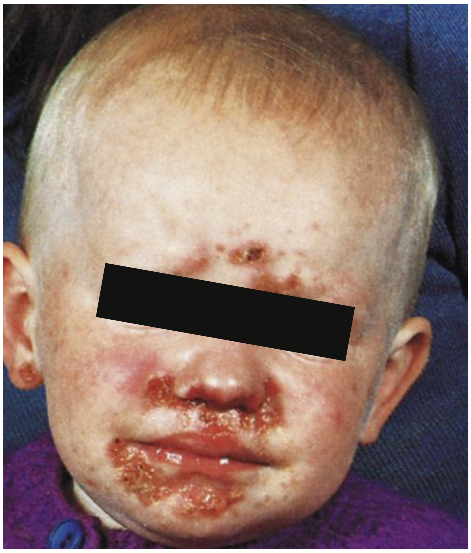
impermeable /impur′mē·əbəl/ [L, *im,* not, *permeare,* to pass through], (of a tissue, membrane, or film) preventing the passage of a substance through it. Also *impervious* /impur′vē·əs/. Compare **permeable**.

impetigo /im′pətī′gō/ [L, *impetus,* attack], a streptococcal, staphylococcal, or combined infection of the skin beginning as focal erythema and progressing to pruritic vesicles, erosions, and honey-colored crusts. Lesions usually form on the face and spread locally. The disorder is highly contagious through contact with the discharge from the lesions. Acute glomerulonephritis is an occasional complication. Treatment includes thorough cleansing with antibacterial soap and water, compresses of Burow's solution, and topical or oral antibiotics. Treatment of the sores, use of individual washcloths and linens, and scrupulous handwashing help prevent spread of the infection. **—impetiginous** /im′petij′inəs/, *adj*.



Impetigo *(Callen et al, 2000)*

impetigo contagiosa [L, *impetus,* attack; *contingere,* to touch], an acute contagious superficial infection of the skin. It is characterized by vesicles that rupture, leaving a purulent exudate that dries into golden crusts.



[redacted]

Impetigo contagiosa *(du Vivier, 2002)*

impetigo herpetiformis [L, *impetus,* attack; Gk, *herpein,* to creep; L, *forma*], a rare skin disorder that mainly affects pregnant women, beginning as an eruption in the genitofemoral area and spreading to other areas. The eruptions are usually irregular or circular groups of pustules that tend to coalesce.

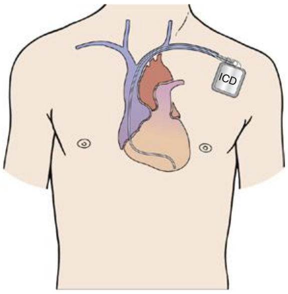
impingement injection test /impinj′mənt/, an appraisal of shoulder injury in which the injection of 10 mL of lidocaine into the subacromial space reduces the painful arc of abduction by more than 50%.

impingement sign, a painful arc produced by forceful abduction of the internally rotated arm against the acromion in evaluation of a shoulder injury.

impingement syndrome, a progressive condition of shoulder pain and dysfunction, usually caused by repetitive placement of the arm in overhead positions. The disorder is a common sports injury, particularly among persons who participate in baseball, tennis, swimming, and volleyball.

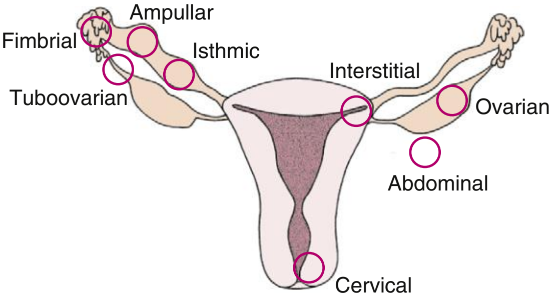
implant /im′plant, implant′/ [L, *implantare,* to set into], **1.** (in radiotherapy) an encapsulated radioactive substance embedded in tissue for therapy. Seeds containing iodine-125 may be implanted permanently in prostate and chest tumors, and seeds of iridium-192 in ribbons or wire may be embedded temporarily in head and neck cancers. Sealed sources of cesium-137 or radium-226 may be implanted in the body cavity temporarily in the treatment of gynecological malignancies; strontium-90 in sealed sources may be embedded for a brief period (usually less than 2 minutes) in the treatment of eye tumors; needles containing radium-226 may be used as temporary interstitial implants. Patients with radioactive implants are isolated from other patients whenever possible. **2.** (in surgery) material inserted or grafted into an organ or structure of the body. The implant may be of tissue, such as in a blood vessel graft, or of an artificial substance, such as in a hip prosthesis, a cardiac pacemaker, or a container of radioactive material.

implantable cardioverter-defibrillator (ICD), a surgically implanted electric device that automatically terminates lethal ventricular arrhythmias by delivering low-energy shocks to the heart, restoring proper rhythm when the heart begins beating rapidly or erratically. About the size of an audiotape cassette, the device can be implanted without thoracotomy in many cases. It is attached to the abdomen or chest wall with a wire link to the heart.



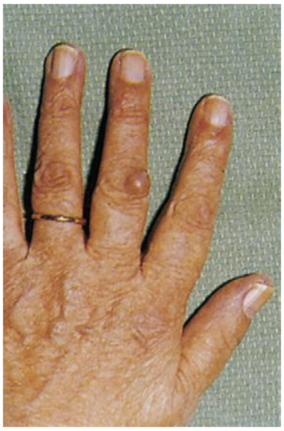
Implantable cardioverter-defibrillator *(Lewis et al, 2011)*

implantation, (in embryology) the process involving the attachment, penetration, and embedding of the blastocyst in the lining of the uterine wall during the early stages of prenatal development. It may be artificial or natural. Kinds of implantation include **eccentric implantation, interstitial implantation,** and **superficial implantation.** Also called **nidation.**



Sites of ectopic pregnancy implantation
(Lowdermilk et al, 2012)

implantation dermoid cyst, a tumor derived from embryonal tissues, caused by an injury that forces part of the ectoderm into the body.

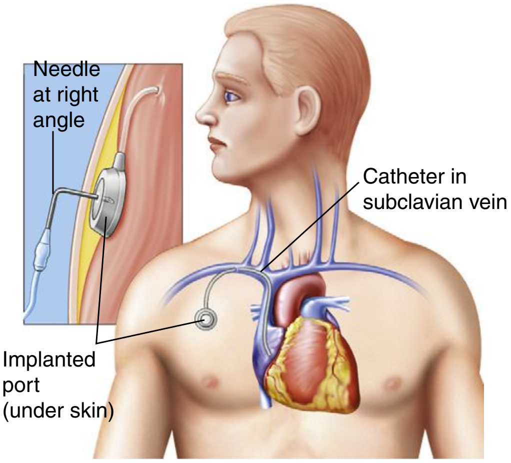


Implantation dermoid cyst *(Moll, 1997)*

implantation endometriosis [L, *implantare,* to set into; Gk, *endon,* within, *metra,* womb, *osis,* condition], ectopic endometrial tissue prevalent throughout the peritoneal cavity. Also called **peritoneal endometriosis.**

implant denture, a complete or partial denture that includes a subperiosteally or intraperiosteally implanted framework in contact with alveolar bone. The denture attaches to one or more posts that project from the framework through the connective tissues and mucous membranes. A variety of designs are available. This type of solution to the loss of natural teeth requires a strong commitment by the patient to practice effective oral hygiene measures.

implanted infusion port, a self-sealing silicone septum encased in a metal or plastic case with an attached silicone catheter that is threaded intravenously. It is implanted subcutaneously and used for long-term venous access for infusion of medications, parenteral nutrition, or IV solutions.



Implanted infusion port
(Harkreader, Hogan, and Thobaben, 2007)

implanted suture [L, *implantare,* to set into, *sutura*], a suture formed by inserting pins on opposite sides of a wound and drawing the edges of the wound together by winding thread tightly around the pins.

implant restoration, a single- or multiple-tooth implant crown or bridge that replaces a missing tooth or teeth.

implementation /im′pləməntā′shən/ [L, *implere,* to fill], a deliberate action performed to achieve a goal, such as carrying out a plan in caring for a patient. It is the fourth step, or phase, of the nursing process.

implementation mechanism, the means by which innovations are transferred from the planners to the units of service.

implementing /im′pləmen′ting/ [L, *implere,* to fill], (in five-step nursing process) a category of nursing behavior in which the actions necessary for accomplishing the health care plan are initiated and completed. Implementing includes performing or assisting in the performance of the patient's activities of daily living, if necessary; counseling and teaching the patient or the patient's family; giving care to achieve patient comfort and therapeutic goals and to optimize the patient's achievement of health goals; supervising and evaluating the work of staff members; and recording and exchanging information relevant to the patient's continued health care. The nurse helps the patient and the patient's family recognize and manage the emotional and psychological stress attendant on the patient's condition and facilitates the relationships of the patient, patient's family, staff, and other significant people. Correct principles, procedures, and techniques of health care are taught, and the patient is informed about the current status of his or her health. If necessary, the patient or the patient's family is referred to a health or social resource in the community. Care is given to achieve therapeutic goals, including acting to compensate for adverse reactions; using preventive and precautionary measures and correct technique in administering care; preparing the patient for surgery, delivery, or other procedure; and initiating lifesaving measures in emergencies. Care is given to the patient in a manner and to a degree that best promotes the patient's attainment of the goals by providing an environment that is conducive to attaining them, by adjusting the care given according to the patient's needs, by stimulating and motivating the patient to achieve independence, by encouraging the patient to comply with and accept the regimen of care, and by compensating for the staff reactions to factors that influence the relationship with the patient and the therapy planned. Implementing follows planning and precedes evaluating in the five-step nursing process. See also **analyzing, assessing, evaluating, nursing process, planning.**

implied consent /implīd′/ [L, *implicare,* to involve, *consentire,* to feel], the granting of permission for health care without a formal agreement between the patient and health care provider. An example is an appointment made with a physician by a patient with a physical complaint; it is implied that by making the appointment the patient gives consent to the physician to make a diagnosis and offer treatment. Compare **informed consent.**

implosion /implō′zhən/ [L, *im* + *plaudere,* to strike], **1.** a bursting inward. **2.** a psychiatric treatment for people disabled by phobias and anxiety in which the person is desensitized to anxiety-producing stimuli by repeated intense exposure in imagination or reality, until the stimuli are no longer stressful. Also called **flooding. —implode,** *v.*

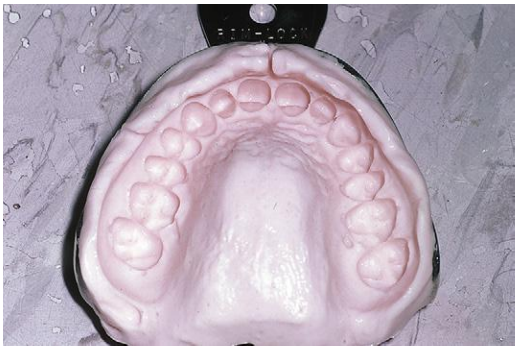
implosive therapy. See **flooding,** def. 2.

impotence /im′pətəns/ [L, *im,* not, *potentia,* power], **1.** weakness. **2.** inability of the adult male to achieve or sustain a penile erection or, less commonly, to ejaculate after achieving an erection. Several forms are recognized. Functional impotence has a psychological basis. Organic impotence includes vasculogenic, neurogenic, endocrinic, and anatomical factors. Anatomical impotence results from physically defective genitalia. Atonic impotence involves disturbed neuromuscular function. Poor health, old or advancing age, drugs, smoking, trauma, and fatigue can induce impotence. Also called **erectile dysfunction,** *impotency.* **—impotent,** *adj.*

impregnate /impreg′nāt/ [L, *impregnare,* to make pregnant], **1.** to inseminate and make pregnant; to fertilize. **2.** to saturate or mix with another substance. **—impregnable,** *adj.,* **impregnation,** *n.*

impression /impresh′ən/ [L, *imprimere,* to press into], **1.** (in dentistry and prosthetic medicine) a mold of a part of the mouth or other part of the body from which a dental restoration or prosthesis may be constructed. **2.** (in the medical record) the examiner's diagnosis or assessment of a problem, disease, or condition. **3.** a strong sensation or effect on the mind, intellect, or feelings. **4.** a slight indentation or depression, as one produced on the surface of one organ by pressure exerted by another. **5.** use of an elastomeric material to physically record a prepared tooth impression. Artificial dental stone (gypsum) is poured into the impression, making an exact replica of the tooth/mouth for the construction of a prosthesis. See also **indirect restorative method.**

impression material [L, *imprimere,* to press into, *materia,* stuff], any substance used for making impressions of teeth and oral structures to produce dental restorations.



Dental impression *(Bird and Robinson, 2012)*

impression tray, a rounded, contoured tray used to hold the substance utilized in dental care to create a mold for the teeth.

imprinted gene, a gene whose expression has been affected by genomic imprinting so that only a single allele functions, the other being turned off by epigenetic mechanisms during embryonic development.

imprinting [Fr, *empreindre,* to impress], (in ethology) a special type of learning that occurs at critical points during the early stages of development in animals. It involves behavioral patterning and social attachment, is characterized by rapid acquisition and irreversibility, and is usually species-specific, although animals exposed to members of a different species during this short period may become attached to and identify with that particular species instead of their own. The degree to which imprinting occurs in human development has not been determined. See also **bonding.**

imprisonment /impriz′ənment/ [Fr, *emprisonner,* to confine], (in law) the act of confining, detaining, or arresting a person or in any way restraining personal liberty and preventing free exercise of movement. See also **false imprisonment.**

impulse /im′puls/ [L, *impellere,* to drive], **1.** (in psychology) a sudden irresistible, often irrational inclination, urge, desire, or action resulting from a particular feeling or mental state. **2.** also called **nerve impulse, neural impulse,** (in physiology) the electrochemical process involved in neural transmission. **—impulsive,** *adj.*

impulse-conducting system [L, *impellere,* to drive, *conducere,* to conduct; Gk, *systema*], the Purkinje fibers within the heart muscle that conduct impulses controlling the contractions of the atria and ventricles.

impulse control disorder, a behavior in which the individual fails to resist performing a potentially harmful act. The individual usually has a sense of tension or arousal before committing the act and a sense of relief or pleasure when it is committed.

impulse control training, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient to mediate impulsive behavior through application of problem-solving strategies to social and interpersonal situations. See also **Nursing Interventions Classification.**

impulse self-control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the self-restraint of compulsive or impulsive behaviors. See also **Nursing Outcomes Classification.**

impulsion /impul′shən/ [L, *impellere,* to drive], an urge to act without consideration of consequences.

impulsive. See **impulse.**

Imuran, a trademark for an immunosuppressive **(azathioprine).**

IMV, abbreviation for **intermittent mandatory ventilation.**

In, symbol for the element **indium.**

in-, **1.** prefix meaning "fiber": *inaxon, inemia, initis.* **2.** prefix meaning "in, on, within, into or toward": *inborn, inbreeding.* **3.** prefix meaning "not, lack of, opposite of": *inarticulate.*

-in, suffix meaning "neutral substance": *albumin, gelatin.*

-in, -ine, **1.** suffix meaning an "antibiotic": *bacitracin, penicillin, streptomycin.* **2.** suffix meaning a "pharmaceutic product": *aspirin, niacin.* **3.** suffix meaning a "chemical compound": *albumin, gelatin, palmitin.* **4.** suffix meaning an "enzyme": *emulsin, myrosin, pepsin.*

inactivated measles virus vaccine /inak′tivā′tid/ [L, *in,* not, *activus* + OE, *masala,* blister; L, *virus,* poison, *vaccinus,* of a cow], a measles vaccine virus that has been treated so that it is no longer capable of replication. It is an alternative to live attenuated measles vaccine, which may be contraindicated for some individuals, such as those who are immunodeficient.

inactivation, the halting of biological activity.

inactive colon /inak′tiv/ [L, *in,* not, *activus,* active; Gk, *kolon,* colon], hypotonicity of the bowel that results in decreased contractions and propulsive movements and a delay in the normal 12-hour transit time of luminal contents from the cecum to the anus. Colonic inactivity may be caused by acquired or congenital megacolon, anticholinergic drugs, depression, faulty habits of elimination, inadequate fluid intake, lack of exercise, a low-residue or starvation diet, neuroendocrine response to surgical stress, prolonged bed rest, or a neurological disease such as diabetic visceral neuropathy, multiple sclerosis, parkinsonism, or spinal cord lesions. Normal motility of the colon is frequently compromised by the continued use of laxatives. Acquired megacolon, characterized by an abnormally large, inactive bowel and chronic constipation, is common in mentally retarded children and adults with chronic mental illness. In congenital megacolon (Hirschsprung's disease), congenital absence of myenteric innervation in a distal segment of the colon causes loss of motility and massive dilation of the proximal segment of the large bowel and extreme constipation. The disorder is more common in males than females and in severe cases retards growth. Treatment of colonic inactivity includes a stimulus-response training program to establish regular bowel habits, the use of stool softeners and hydrophilic colloids to increase fecal bulk, and a diet containing adequate roughage.

inactive electrode, in electrocautery, the electrode through which current distributed through the active electrode is returned to the generator.

inadequate personality /inad′əkwit/ [L, *in,* not, *adaequare,* to equal, *personalis,* of a person], a personality characterized by a lack of physical stamina, emotional immaturity, social instability, poor judgment, reduced motivation, ineptness—especially in interpersonal relationships—and an inability to adapt or react effectively to new or stressful situations.

inamrinone lactate /am′rinōn/, an IV cardiac inotropic drug. Formerly called **amrinone lactate.**

■ INDICATIONS: It is prescribed in the short-term management of congestive heart failure in patients who do not respond to therapy with digitalis, diuretics, and vasodilators.

■ CONTRAINDICATIONS: Concomitant use with disopyramide and any combination therapy should be closely monitored for potential interactions.

■ ADVERSE EFFECTS: Among the more serious adverse effects are thrombocytopenia, arrhythmias, hypotension, nausea, vomiting, liver impairment, and hypersensitivity effects.

inanimate /inan′imit/ [L, *in,* not, *animus,* life spirit], not alive; lacking signs of life.

inanition /in′ənish′ən/ [L, *inanis,* empty], **1.** an exhausted condition resulting from lack of food and water or a defect in assimilation; starvation. **2.** a state of lethargy characterized by a loss of vitality or vigor in all aspects of social, moral, and intellectual life.

inborn /in′bôrn/ [L, *in,* within; AS, *beran,* to bear], innate; acquired or occurring during intrauterine life, with reference to both normally inherited traits and developmental or genetically transmitted anomalies. See also **congenital, hereditary, inborn error of metabolism.**

inborn error of metabolism, one of many abnormal metabolic conditions caused by an inherited defect of a single enzyme or other protein. Although people with such diseases are defective in only one protein, they generally display a large number of physical signs that are characteristic of the genetic trait and are related to excesses or deficiencies of the substrate on which the enzyme acts. The diseases are rare. Kinds of inborn errors of metabolism include **galactosemia, glucose-6-phosphate dehydrogenase deficiency, Lesch-Nyhan syndrome, phenylketonuria,** and **Tay-Sachs disease.**

■ OBSERVATIONS: Inborn errors of metabolism may be detected in the fetus in utero by the examination of squamous and blood cells obtained by amniocentesis and fetoscopy. Laboratory tests after birth often show higher than normal levels of particular metabolites in the blood and urine, such as phenylpyruvic acid and phenylalanine in phenylketonuria (PKU) and galactose in galactosemia. The values are higher in homozygous than in heterozygous carriers. Signs of the various defects are usually seen only in homozygous carriers.

■ INTERVENTIONS: Treatment for some pathological inborn errors may be removal of food in the diet containing the nondegradable metabolite to prevent its accumulation. Removal of dietary phenylalanine in PKU and galactose in galactosemia is effective in preventing the development of symptoms if treatment is begun early. In those cases of inborn errors of metabolism in which the nondegradable metabolite is endogenous, such as in the mucopolysaccharidoses, no treatment is available.

inborn lysosomal disease, one of many inherited disorders of metabolism involving degradative enzymes normally located in lysosomes. The condition leads to storage of abnormal amounts of lysosomal agents. Also called **lysosomal storage disease.**

inborn reflex. See **unconditioned response.**

inbreeding /in′brēding/ [L, *in,* within; AS, *bredan,* to reproduce], the production of offspring by the mating of closely related organisms, the most extreme form being self-fertilization, which occurs in certain plants and animals. Inbreeding increases the chance that recessive alleles for both desirable and undesirable traits will become homozygous and be expressed phenotypically. In humans the amount of inbreeding in a specific population is largely controlled by tradition and cultural practices. Inbreeding is a standard agricultural method for developing desirable genotypes and pure lines in plants and animals. Compare **outbreeding.**

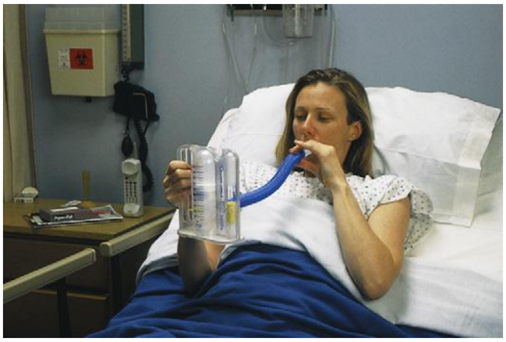
incandescent [L, *incandescere,* to begin to glow], hot to the point of glowing or emitting intense light rays, as an incandescent light bulb.

incapacitating agents, drugs that interfere with the ability to think clearly or cause unconsciousness or some other altered state of consciousness. Their primary use is not to kill, although they can be lethal in high doses. They include aerosolized opioids and the anticholinergic BZ. Treatment of exposure to incapacitating agents is supportive.

incarcerate /inkar′sərāt/ [L, *in,* within, *carcerare,* to imprison], to trap, imprison, or confine, such as a loop of intestine in an inguinal hernia. See also **hernia.**

incarcerated hernia [L, *in* + *carcerare,* to imprison, *hernia,* rupture], a loop of bowel with ends occluded so that solids cannot pass. The herniated bowel will not return to its normal position without manipulation or surgery. It is essential to correct the condition before the bowel becomes strangulated. Also called **irreducible hernia.**

incentive spirometry /insen′tiv/, a method of encouraging voluntary deep breathing by providing visual feedback about inspiratory volume. Using a specially designed spirometer, the patient inhales until a preset volume is reached, then sustains the inspiratory volume by holding his or her breath for 3 to 5 seconds. Incentive spirometry reduces the risk of atelectasis and pulmonary consolidation.



Incentive spirometry *(Harkreader, Hogan, and Thobaben, 2007)*

inception /insep′shən/ [L, *incipere,* to begin], the origin or beginning of anything.

incest /in′sest/ [L, *incestum,* defiled], sexual intercourse between persons too closely related to marry legally. **—incestuous,** *adj.*

incidence /in′sidəns/ [L, *incidere,* to happen], **1.** the number of times an event occurs. **2.** (in epidemiology) the number of new cases in a particular period. Incidence is often expressed as a ratio, in which the number of cases is the numerator and the population at risk is the denominator. See also **rate.**

incidence rate, the rate of new cases of a disease in a specified population over a defined period.

incidental additives /in′siden′təl/ [L, *incidere,* to happen, *additio,* something added], material added to food by the use of pesticides, herbicides, or chemicals used in food processing.

incident report, a document, usually confidential (protected from discovery by a plaintiff in a lawsuit), describing any accident or deviation from policies or orders involving a patient, employee, visitor, or student on the premises of a health care facility.

incident reporting, a nursing intervention from the Nursing Interventions Classification (NIC) defined as written and verbal reporting of any event in the process of patient care that is inconsistent with desired patient outcomes or routine operations of the health care facility. See also **Nursing Interventions Classification.**

incineration /insin′ərā′shən/ [L, *incinerare,* to burn to ashes], the removal or reduction of waste materials by burning.

incipient /insip′ē·ənt/ [L, *incipire,* to commence], coming into existence; at an initial stage; beginning to appear, such as a symptom or disease.

incipient carious lesion. See **primary dental caries.**

incipient dental caries, the earliest detectable signs of tooth decay. At this stage, the lesion has not penetrated the dentin.

incisal /insī′zəl/ [L, *incidere,* to cut into], **1.** cutting. **2.** pertaining to the cutting edge of an anterior tooth.

incisal angle /insī′səl/ [L, *incidere,* to cut into, *angulus,* corner], the angle between the hinge axis-orbital plane and the discluding surface of the maxillary incisors.

incisal guide. See **anterior guide.**

incisal guide pin, a metal rod, attached to the upper member of a dental articulator, that touches the incisal guide table to maintain the established vertical separation of the upper and lower members of the articulator. See also **articulator.**

incision /insizh′ən/ [L, *incidere,* to cut into], a cut produced surgically by a sharp instrument that creates an opening into an organ or space in the body.

incisional hernia /insish′ənəl/ [L, *incidere,* to cut into, *hernia,* rupture], a herniation through a surgical scar.

incision site care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as cleansing, monitoring, and promotion of healing in a wound that is closed with sutures, clips, or staples. See also **Nursing Interventions Classification.**

incisive canal cyst. See **nasopalatine duct cyst.**

incisive papilla. See **palatine raphe.**

incisor /insī′zər/, one of the four anterior teeth in each dental arch. Primary incisors appear during infancy and are replaced during childhood by secondary incisors. The crown of each incisor is chisel shaped and has a sharp cutting edge. Its labial surface is convex, smooth, and highly polished; its lingual surface is concave and, in many individuals, is marked by an inverted V-shaped basal ridge near the gingiva of the maxillary arch. The neck of an incisor is constricted, and the root is single, long, and conic. The upper incisors are larger and stronger than the lower and are directed downward and forward. Compare **canine tooth, molar, premolar.**

incisura /in′sisyo͞o′rə/ [L, *incidere,* to cut into], a notch or incision on an organ or body part.

inciting eye. See **exciting eye.**

inclusion /inklo͞o′zhən/ [L, *in,* within, *claudere,* to shut], **1.** the act of enclosing or the condition of being enclosed. **2.** a structure within another, such as an inclusion in the cytoplasm of the cells. **3.** models based on the premise that children with special needs should be educated in a regular classroom (instead of a self-contained classroom) with support personnel or services provided in that classroom.

inclusion bodies, normal or abnormal objects of various shapes and sizes observed in the nucleus or cytoplasm of blood cells or other tissue cells.

inclusion body myositis, a progressive inflammatory myopathy primarily involving muscles of the pelvic region and legs, usually seen in older people. The muscles are infiltrated by mononuclear inflammatory cells, sarcoplasmic vacuoles, masses of filaments and filamentous microtubules, and sometimes eosinophilic bodies.

inclusion cell disease. See **I cell disease.**

inclusion conjunctivitis, an acute purulent conjunctival infection caused by ***Chlamydia*** organisms. It occurs in two forms: the infection in infants is characterized by bilateral chemosis, redness, and purulent discharge. The adult variety is unilateral, less severe, and less purulent and is associated with preauricular lymphadenopathy. Local instillation of antibiotics is effective treatment.

inclusion dermoid cyst, a tumor derived from embryonal tissues, caused by the inclusion of foreign tissue when a developmental cleft closes.

inclusiveness principle /inklo͞o′sivnəs/ [L, *in,* within, *claudere,* to shut, *principium,* a beginning], a rule that response to various objects in the environment is proportional to the amount of stimulus provided by each object.

inclusive rate /inklo͞o′siv/, a method of calculating inpatient hospital charges in which a fixed amount covers all services, regardless of the number or intensity of services provided.

incoercible /in′kō·ur′sibəl/, pertaining to something that cannot be restrained or willfully terminated, as a siege of hiccups.

incoercible vomiting, vomiting that is intractable or uncontrollable. See also **pernicious vomiting.**

incoherent /in′kōhir′ənt/ [L, *in,* not, *cohaere,* to hold together], **1.** disordered; without logical connection; disjointed; lacking orderly continuity or relevance. **2.** unable to express one's thoughts or ideas in an orderly, intelligible manner, usually as a result of emotional stress.

incompatibility /in′kəmpat′ibil′itē/ [L, *in,* not, + *compatibilus,* agreeing], transfusion of a mismatched red blood cell unit, for instance, giving blood group A donor cells to a blood group O recipient, resulting in a transfusion reaction.

incompatible /in′kəmpat′əbəl/ [L, *in,* not, *compatibilus,* agreeing], unable to coexist. A tissue transplantation may be rejected because recipient and donor antibody factors are incompatible.

incompetence /inkom′pətəns/ [L, *in,* not, *competentia,* capable], **1.** lack of ability to function. Kinds of incompetence include *aortic incompetence,* **ileocecal incompetence,** and *valvular incompetence.* See also **incompetency.** **—incompetent,** *adj.* **2.** (in law) inability to function at a safe level or to provide care that is consistent with standards of practice.

incompetency /inkomp′ətənsē/, legal status of a person declared to be unable to provide for his or her own needs and protection proved in a court hearing.

incompetent. See **incompetence.**

incompetent cervix [L, *in,* not, *competentia,* capable, *cervix,* neck], (in obstetrics) a condition characterized by painless dilation of the cervical os of the uterus before term without labor or contractions of the uterus. Miscarriage or premature delivery may result. Incompetent cervix is treated prophylactically by cerclage or another procedure in which the cervix is held closed by a surgically implanted suture.

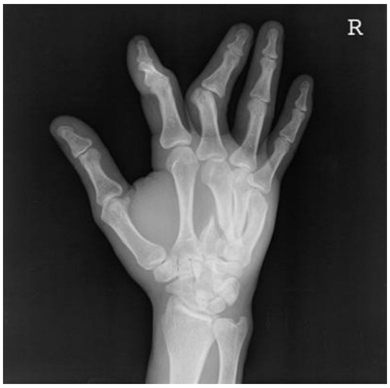
incomplete abortion /in′kəmplēt′/ [L, *in,* not, *complere,* to fill, *ab,* away from, *oriri,* to be born], termination of pregnancy in which the products of conception are not entirely expelled or removed. It often causes hemorrhage that may require surgical evacuation by curettage, oxytocics, and blood replacement. Infection is also a frequent complication of incomplete abortion. Compare **complete abortion.**

incomplete dislocation [L, *in* + *complere,* to fill, *dis* + *locare,* to place], a partial abnormal separation of the articular surfaces of a joint. Also called **subluxation.**

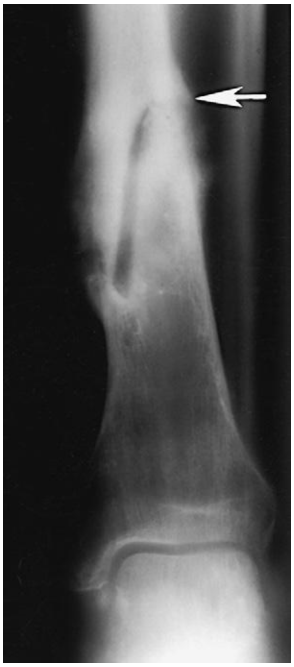
incomplete fistula. See **blind fistula.**

incomplete fracture, a bone break in which the crack in the osseous tissue does not completely traverse the width of the affected bone but may angle off in one or more directions.

incomplete hemianopia, loss of only a part of the half of the visual field. See also **hemiamblyopia.**



Fracture and incomplete dislocation of the third digit
(Kowalczyk and Mace, 2009)



Incomplete fracture *(Frank, Long, and Smith, 2007)*

incomplete hernia [L, *in* + *complere,* to fill up, *hernia,* rupture], a hernia that has not yet protruded through a weak spot or opening.

incomplete protein, a food that is inadequate in one or more of the nine amino acids essential for normal growth and maintenance of tissue when used as the sole source of protein and adequate energy is available.

incongruent communication /inkong′gro͞o·ənt/, a communication pattern in which the sender gives conflicting messages on verbal and nonverbal levels and the listener does not know which message to accept. See also **double bind.**

inconspicuous penis, a categorical term denoting a penis that appears to be abnormally small, although the shaft can be abnormal or normal in size. The category includes a variety of anomalies, including webbed penis, concealed penis, and micropenis.

incontinence /inkon′tinəns/ [L, *incontinentia,* inability to retain], the inability to control urination or defecation. Urinary incontinence may be caused by physiological, psychological, or pathological factors. Treatment depends on the diagnosed cause. Fecal incontinence may result from relaxation of the anal sphincter or disorders of the central nervous system or spinal cord and may be treated by a program of bowel training. A Bradford frame with an opening for a bedpan or urinal may be used for bedridden incontinent patients. See also **bowel training, urinary incontinence. —incontinent,** *adj.*

incontinent. See **incontinence.**

incontinentia pigmenti /inkon′tinen′shə pigmen′tī/, a male-lethal X-linked dominant syndrome with onset at birth or shortly thereafter, characterized by the presence of brown or slate-brown bands, whorls, swirls, or splatter-like hyperpigmented cutaneous lesions, preceded by vesiculobullous and verrucous inflammatory changes, often associated with developmental anomalies involving other structures, such as the hair, eyes, and skeletal and central nervous systems. Also called **Bloch-Sulzberger incontinentia pigmenti, Bloch-Sulzberger syndrome.**

incontinentia pigmenti achromians, a congenital neurocutaneous syndrome, not present at birth but appearing in early life, characterized by the presence of peculiar whorled, linear, and splatter-like patterns of hypopigmentation and often associated with other abnormalities, including hair loss and ocular, musculoskeletal, and mental disturbances. It is unrelated to **incontinentia pigmenti.** Also called **hypomelanosis of Ito.**

Increlex, a trademark for **mecasermin.**

increment /ing′krəmənt/ [L, *incresere,* to grow], **1.** an increase or gain. **2.** the act of growing or increasing. **3.** the amount of an increase or gain in intrauterine pressure as uterine contractions begin in labor. **—incremental,** *adj.*

incremental line /ing′krəmen′təl/, **1.** one of a series of lines showing successive layers deposited in a tissue. **2.** a very fine line of cementum that follows the contours of a tooth.

incremental lines of Ebner [Victor von Ebner, Austrian histologist, 1842–1925], delicate lines seen on ground sections of a tooth, demarcating increments of dentin.

incrustation, hardened exudate, scale, or scab.

incubation period /in′kyəbā′shən/ [L, *incubare,* to lie on; Gk, *peri,* around, *hodos,* way], **1.** the time between exposure to a pathogenic organism and the onset of symptoms of a disease. **2.** the time required to induce the development of an embryo in an egg or to induce the development and replication of tissue cells or microorganisms being grown in culture media or other special laboratory environment. **3.** the time allowed for a chemical reaction or process to proceed.

incubator /in′kyəbā′tər/, an apparatus used to provide a controlled environment, especially temperature. Other environmental components, such as darkness, light, oxygen, moisture, and dryness, may also be controlled, as in an incubator for the cultivation of eggs or microorganisms in a laboratory or an incubator for premature infants.

incud-, prefix meaning “an anvil (the incus)”: *incudectomy, incudiform, incudomalleal.*

incudectomy /in′kyo͞odek′təmē/ [L, *incus,* anvil, *ektomē,* excision], surgical removal of the incus, performed to treat conductive hearing loss that results from necrosis of the tip of the incus. The defective incus is excised and replaced with a bone chip graft so that sound vibrations are again transmitted. After surgery the nurse instructs the patient to change position slowly to avoid dizziness, to avoid blowing the nose and sneezing, and to report any fever, headache, dizziness, or ear pain.

incurable /inkyo͞o′rəbəl/, not responding to medical or surgical treatment.

incus /ing′kəs/ *pl.* **incudes** [L, anvil], one of the three ossicles in the middle ear, resembling an anvil. It transmits sound vibrations from the malleus to the stapes. Compare **malleus, stapes.** See also **middle ear.**

IND, abbreviation for **investigational new drug.**

indanedione derivative /indane′dē·ōn/, one of a small group of oral anticoagulants (e.g., anisindione) designed for long-term therapeutic use in patients who cannot tolerate other oral anticoagulants. Anticoagulation using indanediones is difficult to control, and these agents may cause grave adverse effects, including severe renal and hepatic toxicity, agranulocytosis, and leukopenia. For this reason coumarin derivatives are preferred. Regular evaluations of prothrombin time are necessary. Extreme fatigue, sore throat, chills, and fever are signs of impending toxicity and require discontinuation of the drug. Compare **coumarin.**

indemnify /indem′nifī/, to protect against loss or injury by compensating for the loss or injury.

indentation /in′dəntā′shən/ [L, *in,* within, *dens,* tooth], a notch, pit, or depression in the surface of an object, such as toothmarks on the tongue or skin. **—indent,** *v.*

independence /in′dəpen′dəns/ [L, *in,* not, *de,* from, *pendere,* to hang], **1.** the state or quality of being independent; autonomy; freedom from the influence, guidance, or control of a person or a group. **2.** a lack of requirement or reliance on another for physical existence or emotional needs. **—independent,** *adj.*

independent assortment. See **Mendel's laws.**

independent intervention. See **intervention.**

independent living center, rehabilitation facility in which disabled persons can receive special education and training in the performance of all or most activities of daily living with a particular handicap. A typical independent living center may contain a completely furnished multiroom apartment, including a kitchen with cabinets and cooking facilities that can be reached easily by a person in a wheelchair, designed for training patients in homemaking skills.

independent practice, (in nursing) the practice of certain aspects of professional nursing that are encompassed by applicable licensure and law and require no supervision or direction from others. Nurses in independent practice may have an office in which they see patients and charge fees for service. In all nursing settings, state practice acts define certain aspects of nursing practice that are independent and may define those that must be done only under supervision or direction of another individual, usually a physician.

Independent Practice Association (IPA), a U.S. type of physician alliance in which the physicians own the practice, as opposed to physicians employed by an entity such as a health maintenance organization. Physicians in the IPA are legally organized as a corporation, partnership, professional corporation, or foundation to contract as a group to provide services. Economic risk is shared, but overhead is not. The IPA may contract with a health maintenance organization (HMO) to service enrollees but will usually still see non-HMO clients. See also **health maintenance organization.**

independent variable, (in research) a variable that is manipulated (controlled) by the researcher and evaluated by its measurable effect on the dependent variable or variables. For example, in a study of the effect of nursing intervention on postoperative vomiting, nursing intervention is the independent variable evaluated by its effect on the dependent variable, the incidence of postoperative vomiting. Also called **experimental variable, predictor variable.** Compare **dependent variable.**

Inderal, a trademark for a nonselective beta-adrenergic blocking agent (propranolol).

indeterminate cleavage /in′ditur′minit/ [L, *in,* not, *determinare,* to fix limits; AS, *cleofan,* to split], mitotic division of the fertilized ovum into blastomeres that have similar developmental potential and, if isolated, can each give rise to a complete individual embryo. Also called **regulative cleavage.** Compare **determinate cleavage.** See also **regulative development.**

index /in′deks/ *pl.* **indexes, indices** [L, that which points out], **1.** also called **forefinger,** *index finger,* the second digit of the hand, the finger adjacent to the thumb. **2.** a unitless quantity, usually a ratio of two measurable quantities having the same dimensions, or such a ratio multiplied by 100. **3.** a core or mold used in dentistry to record or maintain the relative position of a tooth or teeth to one another and/or to a cast, to ensure reproduction in the dental prosthesis of their original position. **4.** a directory, in particular an alphabetized list of terms, each term accompanied by page numbers or other notations telling where it appears in a given work or set of works.

index astigmatism [L, *indicare,* to make known, *a* + *stigma,* point], an astigmatism caused by unequal refractive indices in different parts of the lens.

index case [L, *indicare,* to make known], (in epidemiology) the first case of a disease, as contrasted with subsequent cases. See also **propositus.**

Index Medicus, an index published monthly by the National Library of Medicine, which lists articles from the medical, nursing, and allied health literature from throughout the world by subject and by author. The *Cumulative Index Medicus* is published yearly. It contains the citations in all 12 issues of the *Index Medicus,* which can be accessed electronically.

index myopia, a kind of nearsightedness caused by a variation in the index of refraction of the eye media.

India ink test, a test used to detect ***Cryptococcus*** in wet preparations of patient specimens. The capsule of the yeast resists colorization by the India ink, resulting in clear organisms against dark background. The appearance of encapsulated yeast cells in cerebrospinal fluid is diagnostic for cryptococcal meningitis.

Indiana pouch, a type of continent urinary diversion in which part of the ileum and cecum is modified to form a pouch with modification of the ileocecal orifice to maintain continence. Also called **continent urostomy.**

Indian Health Service, a bureau of the Department of Health and Human Services for providing public health and medical services to Native Americans and Alaska natives in the United States. In Canada the services are provided by the **Ministry of Indian Affairs.**

Indian tick fever. See **Marseilles fever.**

indican /in′dikən/ [Gk, *indikon,* indigo], a substance **(potassium indoxyl sulfate)** produced in the intestine by the decomposition of tryptophan, absorbed by the intestinal wall, and excreted in the urine. Its level may be elevated in the urine of patients on high-protein diets or those suffering from GI disease. The normal accumulation of indican in urine is 10 to 20 mg/24 hr.

indication /in′dikā′shən/ [L, *indicare,* to make known], a reason to prescribe a medication or perform a treatment. A bacterial infection may be an indication for the prescription of a specific antibiotic; appendicitis is an indication for appendectomy. **—indicate,** *v.*

indicator /in′dikā′tər/, a tape, paper, tablet, or other substance that is used to test for a specific reaction because it changes in a predictable visible way. Some kinds of indicators are *autoclave indicator,* **dipstick,** and **litmus paper.** Also called **reagent.**

indicator-dilution method, a method for measuring blood volume. A known amount of a substance that dissolves freely in blood but does not leave the capillaries is injected intravenously. After a few minutes a sample of blood is withdrawn, and the volume of blood in the body is calculated from the concentration of the substance in the sample, the sample's volume, and the hematocrit.

indices. See **index.**

indifference-to-pain syndrome /indif′ərəns/, a congenital lack of pain sensitivity caused by defective development of sensory nerve endings in the skin.

indigence /in′dijəns/ [L, *indigere,* to need], a condition of having insufficient income to pay for adequate medical care without depriving oneself or one's dependents of food, clothing, shelter, or other living essentials.

indigenous /indij′ənəs/ [L, *indigena,* a native], native to or occurring naturally in a specified area or environment, as certain species of bacteria in the human digestive tract.

indigestible /in′dijes′təbəl/ [L, *in,* not, *digerere,* to separate], pertaining to a food substance that cannot be broken down within the digestive tract and converted into an absorbable nutrient.

indigestion. See **dyspepsia.**

indinavir, an antiretroviral protease inhibitor.

■ INDICATIONS: It is prescribed in the treatment of human immunodeficiency virus infection.

■ CONTRAINDICATIONS: It should not be given to patients with a risk of kidney stones. It should be administered with other medications to reduce the risk of resistance development.

■ ADVERSE EFFECTS: Protease inhibitors increase plasma glucose, cholesterol, and triglyceride levels and cause a redistribution of body fat toward the center. Indinavir also can cause nephrolithiasis and hyperbilirubinemia.

indirect anaphylaxis [L, *in,* not, *directus,* straight; Gk, *ana,* again, *phylaxis,* protection], an exaggerated reaction of hypersensitivity to one of a person's own antigens that occurs because the antigen has been altered in some way.

indirect calorimetry, the measurement of the amount of heat generated in an oxidation reaction by determining the intake or consumption of oxygen or by measuring the amount of carbon dioxide or nitrogen released and translating these quantities into a heat equivalent. Compare **direct calorimetry.**

indirect Coombs' test, a blood test used during blood compatibility crossmatching to detect the presence of circulating antibodies against red blood cells. The major purpose of this test is to determine whether the patient has serum antibodies (besides the major ABO/Rh system) to red blood cells that he or she might receive by blood transfusion.

indirect division. See **mitosis.**

indirect laryngoscopy [L, *in,* not, *directus,* straight; Gk, *larynx* + *skopein,* to view], a method of examining the larynx with a mirror.

indirect nursing care functions, liaison nurse activities used to solve problems with a consultee who is responsible and accountable for implementing and evaluating any recommended changes.

indirect ophthalmoscope, an ophthalmoscope with a biconvex lens that produces a reversed inverted and magnified stereoscopic image.

indirect percussion. See **percussion.**

indirect provider reimbursement, a method of payment to an agency for health services delivered by providers, such as nurses.

indirect restorative method, a technique for fabricating a restoration on a cast of the original tooth, such as the indirect construction of an inlay. After a die is made from an impression of the prepared tooth, a wax pattern is formed and the inlay is cast. The cast inlay is then fitted and finished on the die and then cemented into the tooth.

indirect retainer, that part of a removable partial denture that resists movement of a free-end denture base away from its tissue support by means of lever action on the opposite side of the fulcrum line.

indirect vision [L, *in* + *directus,* straight, *visio,* seeing], a visual sensation caused by stimulation of the extramacular portion of the retina. Also called **peripheral vision.**

indium (In) [L, *indicum,* indigo], a silvery metallic element with some nonmetallic chemical properties. Its atomic number is 49; its atomic mass is 114.82. It is used in electronic semiconductors.

indium 111 in ibritumomab tiuxetan, a chelate of indium 111 and the immunoconjugate ibritumomab tiuxetan, used in the treatment of non-Hodgkin's lymphoma. It is administered intravenously.

individual immunity /in′divij′o͞o·əl/ [L, *individuus,* indivisible, *immunis,* free from], a form of natural immunity not shared by most other members of the race and species. It is rare and probably occurs as the result of an infection that was not recognized when it occurred. Compare **racial immunity, species immunity.**

individual-model HMO, a health maintenance organization (HMO) in which individual physicians contract directly and independently with the HMO.

individual psychology, a modified system of psychoanalysis, developed by Alfred Adler, that views maladaptive behavior and personality disorders as resulting from a conflict between the desire to dominate and feelings of inferiority. See also **adlerian psychology, inferiority complex.**

Indocin, a trademark for a nonsteroidal antiinflammatory agent **(indomethacin).**

indocyanine green /in′dōsī′ənēn/, a dye occurring as an olive-brown, dark green, dark blue, or black powder, used intravenously as a diagnostic aid in the determination of blood volume, cardiac output, and hepatic function.

indocyanine green clearance, the hepatic clearance of indocyanine green, calculated in liver function tests.

indole /in′dōl/, a volatile chemical produced during serotonin metabolism. It is partly responsible for the odor of the feces.

indoleacetic acid /in′dōləsē′tik, -əset′ik/, a major terminal metabolite of tryptophan that is present in very small amounts in normal urine and excreted in elevated quantities by patients with carcinoid tumors. It is measured as 5-hydroxyindoleacetic acid.

indolent /in′dələnt/ [L, *in* + *dolere,* to suffer pain], **1.** pertaining to an organic disorder that is accompanied by little or no pain. **2.** slow to heal or grow, e.g., wounds that heal very slowly.

indomethacin /in′dōmeth′əsin/, a nonsteroidal antiinflammatory agent.

■ INDICATIONS: It is prescribed in the treatment of arthritis, gout attacks, and certain other inflammatory conditions.

■ CONTRAINDICATIONS: Upper GI disease or known hypersensitivity to this drug or to aspirin prohibits its use. It is not given to children less than 15 years of age or to pregnant or lactating women.

■ ADVERSE EFFECTS: The most serious adverse effect is peptic ulcers. GI upset, dizziness, tinnitus, and rashes also may occur.

induce /ind(y)o͞os′/ [L, *inducere,* to lead in], to cause or stimulate the start of an activity, as an enzyme induces a metabolic activity. See also **induced fever. —inducer, induction,** *n.*

induced abortion, an intentional termination of pregnancy before the fetus has developed enough to live if born. From 20% to 50% of pregnancies are terminated deliberately at the request of the mother or for medical indications, during the first trimester by vacuum aspiration and/or curettage or during the second trimester by dilation and evacuation, induction of labor, or hysterotomy. Termination of pregnancy by a trained person under proper conditions is safe. Compare **spontaneous abortion.** See also **septic abortion, therapeutic abortion.**

■ METHOD: The type of procedure depends on stage of pregnancy and may be either medical or surgical in nature. Mifepristone and misoprostol are oral medications administered within 7 weeks of the first day of the woman's last menstrual period. (Ultrasonography may be used if pregnancy duration is uncertain or ectopic pregnancy is suspected.) Mifepristone is taken first. Vaginal bleeding should occur within 1 to 2 days. Two days after mifepristone is taken, the misoprostol is taken to induce uterine cramps to speed the emptying of uterine contents. An ultrasound is then done to confirm a complete emptying of uterine contents. Menstrual extraction is usually performed in provider office or clinic up to 6 to 8 weeks into pregnancy. Equipment needed includes gloves, vaginal speculum, small sterile cannula, and a suction device (e.g., Del-Em) with one-way valve, collection jar, and syringe. The speculum is inserted in the vagina to expose the cervix. A small cannula is inserted in the uterus through an undilated cervix, and suction is applied to empty contents of the uterus. An oral pain or IV medication may be given before the procedure. An ultrasound may be done to confirm emptying of uterine contents. Vacuum curettage (suction dilation and curettage) is used up to 13 weeks from first day of LMP. Ultrasound is used to confirm pregnancy duration. This is a surgical procedure usually performed in an outpatient surgical center under either general anesthesia or local anesthesia accompanied by conscious sedation. Sterile technique is used to perform the procedure, which lasts 10 to 20 minutes. The woman is placed in the lithotomy position and prepped with a surgical scrub. The cervix is dilated with dilators, and a tube is then placed into the uterus and attached to a vacuum pump. The majority of the uterine contents are sucked out with the pump. A curette may then be used to scrape the walls of the uterus to remove any remaining tissue. The patient is then taken to recovery and observed until fully alert. An ultrasound is done postoperatively if incomplete evacuation is suspected. The patient is then released with antibiotics to prevent infection and oxytocic medications to contract the uterus. Dilation and evacuation are used between the 13th and 21st week of pregnancy. A medication, such as laminaria, is inserted into the vagina to help dilate the cervix 24 to 48 hours before this surgical procedure. When the cervix has dilated sufficiently, the woman is admitted to the operating room and placed under general anesthesia for a 30-minute procedure. The woman is placed in the lithotomy position and prepped with a surgical scrub. Sterile technique is followed as the cervix is further dilated with metal dilators. The uterine contents are then removed with suction, forceps, and curettes. IV oxytocics are administered, and the patient is taken to recovery and observed until fully alert. An ultrasound is done postoperatively if incomplete evacuation is suspected. The patient is then released with antibiotics to prevent infection and oxytocic medications to further contract the uterus.

■ OUTCOME CRITERIA: Ultrasound or tissue evidence and a physical exam are used to confirm complete removal of all uterine contents. Intercourse and use of tampons are discouraged. Normal activity can be resumed within a day or two if no complications occur. Potential complications include heavy bleeding, infection, abdominal pain, incomplete removal of all uterine contents, perforation of uterus, scar tissue in uterus, trouble becoming pregnant in the future, and psychological sequelae. Follow-up is routinely scheduled about 2 weeks after the procedure.

induced fever, a deliberate elevation of body temperature by application of heat or by inoculation with a fever-producing organism to kill heat-sensitive pathogens.

induced lethargy, a trancelike state produced during hypnosis. See also **hypnosis, lethargy.**

induced mutation [L, *inducere,* to lead in, *mutare,* to change], a mutation that is produced by treatment with a physical or chemical agent that affects the deoxyribonucleic acid molecules of a living organism.

induced phagocytosis [L, *inducere,* to lead in; Gk, *phagein,* to eat, *kytos,* cell], the ingestion of microorganisms and other foreign particles by cells (mostly macrophages) of the reticuloendothelial system because of a stimulus from the microorganisms or particles.

induced psychotic disorder, a severe mental disturbance in which there is a withdrawal from reality, resulting from exposure to a toxic agent such as a drug or hallucinogen.

induced trance, a somnambulistic state resulting from hypnotism.

induced vomiting [L, *inducere,* to lead in; *vomere,* to vomit], vomiting produced by administration of ipecac syrup, soapy water, or handwashing liquid detergent or by insertion of a finger or blunt instrument into the throat. Vomiting may be medically indicated in cases of ingestion of noncaustic poisons but may also be self-induced by patients afflicted with **bulimia.**

inducer /indo͞o′sər/, a substance, usually a substrate of a specific enzyme, that combines with and inactivates the repressor produced by a regulator gene in bacteria. This combination prevents the repressor from blocking activation of the operator gene, allowing one or more structural genes to be transcribed.

induction /induk′shən/ [L, *inducere,* to lead in], the process of stimulating and determining morphogenetic differentiation in a developing embryo through the action of chemical substances transmitted from one embryonic part to another. See also **evocation.**

induction chemotherapy, chemotherapy as the initial treatment for cancer, especially as part of combined modality therapy.

induction of anesthesia, **1.** the administration of a drug or combination of drugs at the beginning of an anesthetic that results in a state of general anesthesia. **2.** the process of causing general anesthesia by the administration of pharmaceutics.

induction of labor, an obstetric procedure in which labor is initiated artificially by means of amniotomy or administration of oxytocics. It is performed electively or for fetal or maternal indications. Elective induction is carried out for the convenience of the mother or the obstetrician, often to avert the possibility of delivery outside the hospital when labor is judged to be imminent and the mother is expected to have an unusually rapid birth. Elective inductions are performed less often now than in the past. Prerequisites for elective induction are a term gestation, a fetal weight of at least 2500 g, a cervix judged ready to dilate, a vertex presentation, and engagement of the presenting part of the fetus in the pelvis.

Errors in the estimation of gestational age and fetal weight may result in the delivery of an unexpectedly immature or low-birth-weight infant. Indicated induction is performed when its risk is judged to be less than that of continuing the pregnancy in such conditions as premature rupture of the membranes, severe maternal diabetes, and intractable preeclampsia. Surgical induction is effected by amniotomy, often with stripping of the membranes and digital stretching of the cervix; it is very often carried out in conjunction with medical induction. Medical induction is achieved through the administration of oxytocin, almost always by IV infusion, in a carefully controlled manner using microdrip equipment or an infusion pump. Beginning with very small amounts of oxytocin in an IV solution, the dosage is increased by gradual increments of the rate or concentration of infusion until effective labor is established. With IV oxytocin inductions a secondary, piggyback infusion without medication is always attached to the tubing so that an unmedicated infusion can be maintained if oxytocin is stopped. Prostaglandins are more commonly used to induce labor in the second trimester, particularly for therapeutic abortions. Electronic fetal and uterine monitoring is usually instituted during induction of labor to prevent hyperstimulation of the uterus and fetal distress. Ideally induced labor mimics natural labor, but in practice it usually does not. Longer and harder contractions commonly occur. In addition to unexpected fetal immaturity, complications of induction of labor include umbilical cord prolapse after amniotomy, tumultuous labor, tetanic uterine contractions, rupture of the uterus, placental abruption, fetal maternal hypotension, water intoxication, postpartum uterine atony and hemorrhage, and fetal asphyxia, hypoxia, or death. If the induction fails to produce effective labor, cesarean section is often required to prevent the adverse sequelae of the procedures used in the induction. For this reason it is usually recommended that induction of labor not be attempted unless delivery must be accomplished to prevent severe fetal or maternal morbidity.

induction phase, the period during which a normal cell becomes transformed into a cancerous cell.

induction therapy, the first therapeutic measure used to treat a disease, especially when combined modality therapy is planned. Also called **first line therapy.**

inductive approach /induk′tiv/, the analysis of data and examination of practice problems within their own context rather than from a predetermined theoretical basis. The approach moves from the specific to the general.

inductor /induk′tər/ [L, *inducere,* to lead in], (in embryology) a tissue or cell that emits a chemical substance that stimulates some morphogenetic effect in the developing embryo. See also **evocator, organizer.**

induration /in′dyərā′shən/ [L, *indurare,* to make hard], **hardening** of a tissue, particularly the skin, caused by edema, inflammation, or infiltration by a neoplasm. **—indurated,** *adj.*

indurative myocarditis /in′dyərā′tiv/ [L, *indurare,* to make hard; Gk, *mys,* muscle, *kardia,* heart, *itis,* inflammation], inflammation of the myocardium that leads to a hardening of the muscles of the heart walls.

industrial health [L, *industria,* diligence; ME, *helthe*], the health concerns associated with the workplace, such as exposure to asbestos, mining and milling dusts, and metal and acid vapors; lighting; and ergonomic factors.

industrial psychology [L, *industria,* diligence], the application of psychological principles and techniques to the problems of business and industry, including the selection of personnel, the motivation of workers, and the development of training programs. See also **applied psychology.**

indwelling catheter /in′dweling/ [L, *in,* within; AS, *dwellan,* to remain], any catheter designed to be left in place for a prolonged period. See also **self-retaining catheter.**

-ine, suffix meaning a "chemical substance": *chlorine, pyrrolidine, strychnine.*

inebriant /inē′brē·ənt/ [L, *inebriare,* to make drunk], a substance that induces inebriation or intoxication, as does ethanol.

inebriate /inē′brē·āt/, to make intoxicated.

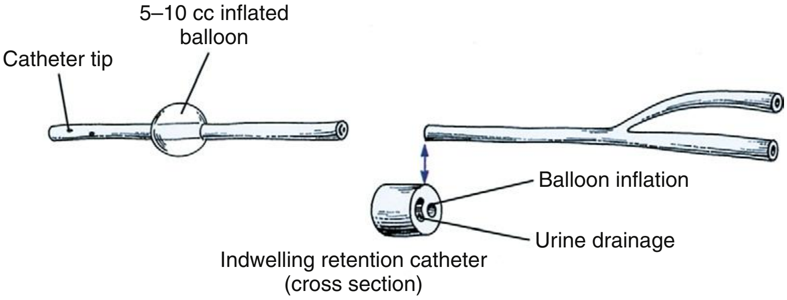
inert /inurt′/ [L, *iners,* idle], **1.** not moving or acting, such as inert matter. **2.** (of a chemical substance) not taking part in a chemical reaction. **3.** (of a medical ingredient) not active pharmacologically; serving only as a bulking, binding, or sweetening agent or other excipient in a medication.

inert gas, neutral monotomic elements with completely filled outer electron shells. These elements are all gaseous and extremely nonreactive. The inert gases are argon, helium, neon, and radon. Compounds are known for krypton and xenon, so they are no longer considered inert.

inertia /inur′shə/ [L, idleness], **1.** the tendency of a body at rest to remain at rest unless acted on by an outside force, and the tendency of a body in motion to remain at motion in the direction in which it is moving unless acted on by an outside force. **2.** an abnormal condition characterized by a general inactivity or sluggishness, such as colonic inertia or uterine inertia.

inertial impaction /inur′shəl/, the deposition of large aerosol particles on the walls of an airway conduit. The impaction tends to occur where the airway direction changes. Small particles have less inertia and are more likely to be carried around corners and continue in the path of the airflow.

inevitable abortion /inev′itəbəl/ [L, *inevitabilis,* unavoidable], a condition of pregnancy in which spontaneous termination is imminent and cannot be prevented. It is



Indwelling catheter *(Perry, Potter, and Elkin, 2012)* characterized by bleeding, uterine cramping, dilation of the cervix, and presentation of the conceptus in the cervical os. If heavy bleeding supervenes, immediate evacuation of the uterus may be required. Transvaginal ultrasound makes it possible to determine presence or absence of fetal heart movement at 5 weeks gestation. Compare **incomplete abortion, threatened abortion.**

in extremis, in the extremity, or at the point of death.

infant /in′fənt/ [L, *infans,* unable to speak], **1.** *n,* a child who is in the earliest stage of extrauterine life, a time extending from the first month after birth to approximately 12 months of age, when the baby is able to assume an erect posture. **2.** *n,* (in law) a person not of full legal age; a minor. **3.** *adj,* pertaining to infancy; in an early stage of development. **—infantile,** *adj.*

infant botulism, an intoxication by neurotoxins produced by ***Clostridium botulinum*** that occurs in children less than 6 months of age. The condition is characterized by severe hypotonicity of all muscles, constipation, lethargy, and feeding difficulties, and it may lead to respiratory insufficiency. The botulism neurotoxin is usually found in the GI tract rather than in the blood, indicating that it is probably produced in the gut rather than ingested. The epidemiological and pathophysiological characteristics of the syndrome are not clearly understood.

■ INTERVENTIONS: Treatment is supportive, including optimal management of fluids, electrolytes, and nutrition. Ventilatory support may also be necessary. There is no evidence that antitoxin therapy is helpful, and it is usually not recommended.

infant care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as provision of developmentally appropriate family-centered care to the child under 1 year of age. See also **Nursing Interventions Classification.**

infant death, the death of a live-born child between the ages of 1 month and 1 year of age.

infant feeder, a device for nourishing small or weak babies who cannot suck hard enough to get milk from the breast or a bottle. The feeder resembles a bulb syringe with a long soft nipple on the end. The bulb is squeezed slowly and gently, permitting the baby to suck and swallow without great effort and preventing the escape of fluid into the infant's trachea, where it could cause asphyxiation or aspiration pneumonia.

infant feeding. See **bottle feeding, breastfeeding.**

infanticide /infan′tisīd/ [L, *infans,* unable to speak, *caedere,* to kill], **1.** the killing of an infant or young child. The act is usually a psychotic reaction often associated with severe depression, such as that occurring in bipolar disorder and occasionally in extreme postpartum disturbances. Infanticide may become a neurotic obsession among mothers who do not want the baby or who do not feel physically, mentally, or emotionally capable of caring for or coping with the infant. **2.** one who takes the life of an infant or young child. **—infanticidal,** *adj.*

infantile /in′fəntīl/ [L, *infans,* unable to speak], **1.** characteristic of infants or infancy. **2.** lacking maturity, sophistication, or reasonableness. **3.** affected with infantilism. **4.** being in a very early stage of development.

infantile acrodermatitis. See **Gianotti-Crosti syndrome.**

infantile amnesia, (in psychology) the inability to remember events from early childhood. It is explained by a theory that a memory for skills develops earlier than a fact-memory system, which may not develop until the third year. Thus a person may learn skills without remembering how the skills were acquired.

infantile arteritis, a disorder in infants and young children characterized by inflammation of many arteries in which atherosclerotic lesions are rarely present.

infantile autism, a pervasive developmental disorder characterized by abnormal emotional, social, and linguistic development in a child. Symptoms include abnormal ways of relating to people, objects, and situations. It may result from organic brain dysfunction, in which case it occurs before 3 years of age. See also **autistic disorder.**

infantile celiac disease. See **celiac disease.**

infantile cerebral ataxic paralysis [L, *infans,* unable to speak, *cerebrum,* the brain; Gk, *ataxia,* without order, *paralyein,* to be palsied], a form of congenital diplegia characterized by cerebral maldevelopment, ataxia, spasticity of the legs, and possibly mental deficiency.

infantile cerebral sphingolipidosis. See **Tay-Sachs disease.**

infantile cirrhosis, a progressive fibrous liver disorder caused by protein malnutrition.

infantile colic [L, *infans,* unable to speak; Gk, *kolikos,* pain in the colon], a descriptive term for a suggested intestinal cause of discomfort in a newborn. Specific causes and mechanisms have not been defined. The typical infantile colic patient eats and gains weight but may also appear excessively hungry. Aerophagia caused by crying may lead to flatulence and abdominal distension.

infantile cortical hyperostosis, a familial disorder characterized in an infant by subperiosteal bone formation over many bones, causing swellings and tenderness in the affected areas. The child also tends to be feverish and irritable. The mandible is most commonly involved. Radiographs indicate areas of new bone growth beneath the periosteum. It appears before 6 months of age and disappears during childhood. Also called **Caffey's disease.**

infantile dwarf, a person whose mental and physical development is greatly retarded as a result of various causes, such as genetic or developmental defects.

infantile eczema. See **atopic dermatitis.**

infantile encephalitis [L, *infans,* unable to speak; Gk, *enkephalos,* brain, *itis,* inflammation], any of a group of brain inflammation conditions affecting infants. The cause may be a direct viral infection or a secondary encephalitis that is a complication of measles, chickenpox, rubella, or other diseases.

infantile fibromatosis. See **congenital generalized fibromatosis.**

infantile hemiplegia, paralysis of one side of the body that may occur at birth as a result of a cerebral hemorrhage, in utero as a result of lack of oxygen, or during a febrile illness in infancy.

infantile hydrocele [L, *infans* + Gk, *hydor,* water, *kele,* hernia], an accumulation of fluid in the tunica vaginalis. It may be present at birth or acquired.

infantile myofibromatosis, a condition present at birth or occurring soon after, characterized by solitary or multiple firm, rubbery, spherical, or ovoid nodules in the skin and subcutaneous tissue. The nodules are composed of myofibroblasts and may undergo ulceration and calcification. In about half of patients, skeletal fibromas also occur. When lesions are limited to the skin and bones (a condition sometimes known as *congenital multiple fibromatosis*), prognosis is good and lesions resolve spontaneously. Visceral involvement may also occur **(congenital generalized fibromatosis)** and is often lethal.

infantile neuroaxonal dystrophy, progressive hereditary degenerative encephalopathy transmitted as an autosomal-recessive trait, beginning in infancy with muscular hypotonia and arrest of development in late infancy, followed by dementia, blindness, spasticity, and ataxia. Pathologically it is characterized by widespread focal swellings and degeneration of the axons with scattered globular bodies in the brain. Also called **Seitelberger's disease.**

infantile paralysis. See **poliomyelitis.**

infantile pellagra. See **kwashiorkor.**

infantile poliomyelitis. See **acute atrophic paralysis.**

infantile scurvy, a nutritional disease caused by an inadequate dietary supply of vitamin C, which may occur because cow's milk unfortified with vitamin C is the principal food in an infant's diet. Families are counseled to feed their children foods rich in vitamin C or to use a formula supplemented with this vitamin. Also called **Barlow's disease, hemorrhagic scurvy.** See also **ascorbic acid, scurvy.**

infantile spasms, a syndrome of severe myoclonus appearing in the first 18 months of life and associated with general cerebral deterioration. It is marked by severe flexion spasms of the head, neck, and trunk and extension of the arms and legs. Also called *infantile massive spasms, jackknife seizures, jackknife spasms*.

infantile spinal muscular atrophy. See **Werdnig-Hoffmann disease.**

infantile spinal paralysis [L, *infans,* unable to speak, *spina* + Gk, *paralyein,* to be palsied], acute anterior poliomyelitis, a viral infection characterized by nonspecific illnesses, aseptic meningitis, and flaccid weakness of muscle groups.

infantile uterus, a uterus that has failed to attain adult characteristics.

infantilism /infan′tiliz′əm/ [L, *infans,* unable to speak], **1.** a condition in which various anatomical, physiological, and psychological characteristics of childhood persist in the adult. It is characterized by mental retardation, underdeveloped sexual organs, and usually small stature. Compare **progeria. 2.** a condition, usually of psychological rather than organic origin, characterized by speech and voice patterns in an older child or adult that are typical of very young children.

infant mortality, the statistical rate of infant death during the first year after live birth, expressed as the number of such deaths per 1000 live births in a specific geographic area or institution in a given period. Neonatal mortality (death within 28 days of birth) accounts for 70% of infant mortality.

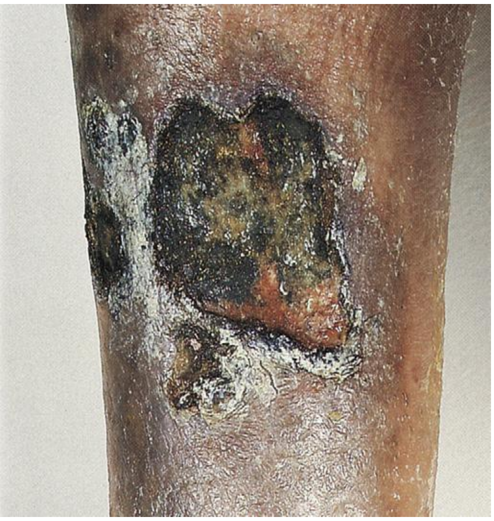
infant of chemically dependent mother, a newborn who shows withdrawal symptoms, usually within the first 24 hours of life, most commonly caused by maternal antepartum dependence on heroin, methadone, diazepam, phenobarbital, or alcohol. See also **fetal alcohol syndrome.**

■ OBSERVATIONS: Characteristic symptoms include tremors, irritability, hyperactive reflexes, increased muscle tone, twitching, increased mucus production, nasal congestion, respiratory distress, excessive sweating, elevated temperature, vomiting, diarrhea, and dehydration. The infants cry shrilly, often sneeze, frantically suck their fists but feed poorly, and frequently yawn but have difficulty falling asleep. They are usually pale, are often born with or develop nose and knee abrasions from fussiness and irritability, and are subject to convulsions.

■ INTERVENTIONS: The infant is kept warm, snugly swaddled in a padded crib, and exposed to minimal visual, auditory, and tactile stimulation. The baby is handled only when necessary and is then held firmly, close to the body.

■ NURSING CONSIDERATIONS: These high-risk infants require special attention, and the mother should be encouraged to participate in her baby's care as soon as possible. The nurse may help promote parent-child bonding.

infarct /infärkt′/ [L, *infarcire,* to stuff], a localized area of necrosis in a tissue resulting from anoxia. It is caused by an interruption in the blood supply to the area or, less frequently, by circulatory stasis produced by the occlusion of a vein that ordinarily carries blood away from the area. Some infarcts are pale and white because of the lack of circulation. Others may resemble a red, swollen bruise because of hemorrhage and an accumulation of blood in the area. Also called **infarction.**



Infarct *(du Vivier, 2002)*

infarct extension, a myocardial infarction that has spread beyond the original area, usually as a result of the death of cells in the ischemic margin of the infarct zone.

infarction /infärk′shən/ [L, *infarcire,* to stuff]. **1.** See **infarct. 2.** the development and formation of an infarct. Kinds of infarction include **myocardial infarction** and **pulmonary infarction.**

infect [L, *inficere,* to stain], to transmit a pathogen that may induce development of an infectious disease in another person.

infected abortion, a spontaneous or induced termination of an immature pregnancy in which the products of conception have become infected, causing fever and requiring antibiotic therapy and evacuation of the uterus. Compare **septic abortion.**

infected hydronephrosis, a dilation of the renal pelvis and calyces that has become complicated by bacterial infection.

infection /infek′shən/ [L, *inficere,* to stain], **1.** the invasion of the body by pathogenic microorganisms that reproduce and multiply, causing disease by local cellular injury, secretion of a toxin, or antigen-antibody reaction in the host. **2.** a disease caused by the invasion of the body by pathogenic microorganisms. Compare **infestation. —infectious,** *adj.*

infection control^1, programs of disease surveillance, generally within health care facilities, designed to investigate, prevent, and control the spread of infections and their causative microorganisms. Infection control can include the policies and procedures of a hospital or other health facility to minimize the risk of spreading of nosocomial or community-acquired infections to patients or members of the staff.

infection control^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as minimizing the acquisition and transmission of infectious agents. See also **Nursing Interventions Classification.**

infection control committee, a group of hospital health professionals composed of infection control personnel, with medical, nursing, administrative, and occasionally dietary and housekeeping department representatives, who plan and supervise infection control activities.

infection control: intraoperative, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preventing nosocomial infection in the operating room. See also **Nursing Interventions Classification.**

infection control nurse, a registered nurse who is assigned responsibility for surveillance and infection prevention, education, and control activities.

infection protection, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention and early detection of infection in a patient at risk. See also **Nursing Interventions Classification.**

infection severity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of infection and associated symptoms. See also **Nursing Outcomes Classification.**

infection severity: newborn, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of infection and associated symptoms during the first 28 days of life. See also **Nursing Outcomes Classification.**

infectious /infek′chəs/, **1.** capable of causing an infection. **2.** caused by an infection.

infectious arthritis [L, *inficere,* to stain; Gk, *arthron,* joint + *-itis,* inflammation], arthritis caused by bacteria, rickettsiae, mycoplasmas, viruses, fungi, or parasites. See also **septic arthritis.**

infectious bulbar paralysis [L, *inficere,* to stain, *bulbus,* swollen root; Gk, *paralyein,* to be palsied], a herpesvirus disease of animals (swine, cattle, dogs, cats, and rats) that may cause a mild pruritus when transmitted to humans. Also called **pseudorabies.**

infectious disease (ID) [L, *inficere,* to stain, *dis + Fr, aise,* ease], any clinically evident communicable disease, or one that can be transmitted from one human being to another or from animal to human by direct or indirect contact. Compare **communicable disease.**

infectious endocarditis, endocarditis caused by infection with microorganisms, especially bacteria and fungi. It was formerly classified according to course as acute and subacute: the acute form is usually caused by staphylococci, pneumococci, gonococci, or streptococci, involves a normal heart valve, and has a short history and rapid course; the subacute form usually is caused by viridans or fecal streptococci or fungi, affects damaged heart valves, and has a prolonged course. Because underlying causes and available therapies have changed, this division has little current clinical validity and has been largely replaced by classification on the basis of cause or underlying anatomy.

infectious-exhaustive syndrome. See **postinfectious psychosis.**

infectious gastritis, any type of inflammation of the gastric mucosa, usually chronic, caused by a bacterial infection in the stomach, the most common type being ***Helicobacter pylori*** **gastritis.** Many cases are asymptomatic, but symptoms can include dyspepsia and gastrointestinal bleeding. In immunocompromised patients, gastritis may occur as a complication of tuberculosis, syphilis, or other conditions.

infectious granuloma [L, *inficere,* to stain, *granulum,* little grain; Gk, *oma,* tumor], a lumpy lesion of granuloma tissue that may develop in diseases such as tuberculosis, syphilis, and actinomycosis.

infectious hepatitis (I.H.). See **hepatitis A.**

infectious isolation [L, *inficere,* to stain; It, *isolare,* to detach], a practice of confining a patient with a particularly virulent disease to an isolated room or other area to reduce the risk of contact and spread of the disease among hospital personnel.

infectious mononucleosis [L, *inficere,* to stain; Gk, *monos,* single; L, *nucleus,* nut; Gk, *osis,* condition], an acute herpesvirus infection caused by the Epstein-Barr virus (EBV). The disease is usually transmitted by droplet infection but is not highly or predictably contagious. Young people are most often affected. In childhood the disease is mild and usually unnoticed; the older the person, the more severe the symptoms are likely to be. Infection confers permanent immunity, although the virus continues to replicate and can be transmitted. When infection lasts more than six months it is called *chronic EBV*. See also **Epstein-Barr virus, viral infection.**

■ OBSERVATIONS: The hallmark signs of mononucleosis are profound fatigue; a fever that peaks in the late afternoon at 101° F to 105° F (38.3° C to 40.6° C); severely painful and exudative pharyngitis; and symmetric lymphadenopathy. Splenomegaly is usually present in the second or third week. Mild hepatomegaly may also be present. A maculopapular rash, palatal petechiae, and periorbital edema are less common signs. Fatigue and general malaise may persist for months after infection clears. Diagnosis is made by the presence of clinical manifestations plus a differential WBC count showing lymphocytes and monocytes more than 50%; a heterophil agglutination antibody test with an antibody titer greater than 1:40; and an EBV-immunoglobulin M test with antibodies more than 1:80. Liver function tests (aspartate aminotransferase [AST], alanine aminotransferase [ALT], and bilirubin) will be elevated if the liver is involved. Complications are rare but include splenic rupture, **anemia, Guillain-Barré syndrome, meningitis,** and **encephalitis.**

■ INTERVENTIONS: Treatment is supportive in nature with bed rest during the acute phase, saline throat gargles, adequate hydration; nonaspirin analgesics and antipyretics; and steroids for treating impending airway obstruction, severe thrombocytopenia or hemolytic anemia. Transfusions may be indicated for severe anemia or thrombocytopenia. Splenectomy is indicated for splenic rupture.

■ NURSING CONSIDERATIONS: The focus is on stressing rest to prevent injury to the liver and the spleen and supportive care such as gargles to ease sore throat and antipyretics, cool cloths, and sponge baths to relieve fever. Education should stress the avoidance of heavy lifting and contact sports for at least 2 months after acute recovery to prevent injury to the spleen. Prevention is impossible as more than 95% of the adult population are carriers of the EB virus and intermittently shed the virus in their saliva.

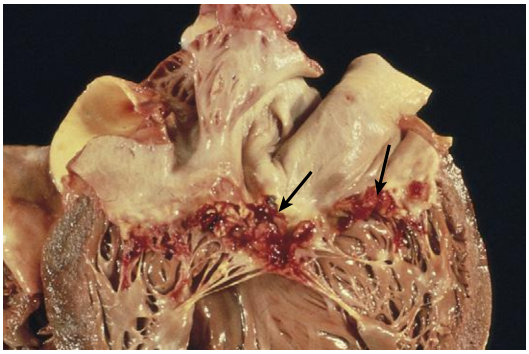
infectious myringitis, an inflammatory contagious condition of the eardrum caused by viral or bacterial infection. *Mycoplasma* is a common cause of this infection. It is characterized by the development of painful vesicles on the eardrum, very often linked to otitis media. The pain begins suddenly, with a duration of 24 to 48 hours. Also called **bullous myringitis.**

infectious nucleic acid, deoxyribonucleic acid or, more commonly, viral ribonucleic acid that is able to infect the nucleic acid of a cell and induce the host to produce viruses.

infectious parotitis. See **mumps.**

infectious polyneuritis. See **Guillain-Barré syndrome.**

infective endocarditis. See **bacterial endocarditis.**



Bacterial infective endocarditis *(Kumar et al, 2010)*

infective tubulointerstitial nephritis [L, *inficere,* to stain, *tubulus,* tubule, *interstitium,* space between], an acute inflammation of the kidneys usually caused by an infection by ***Escherichia coli*** or another pyogenic pathogen. The condition is characterized by chills, fever, nausea and vomiting, flank pain, dysuria, proteinuria, and hematuria. The kidney may become enlarged, and portions of the renal cortex may be destroyed. Infection is usually the result of bacterial contamination of a urinary catheter, but it may occur in any condition characterized by urinary stasis.

infectivity /infektiv′itē/ [L, *inficere,* to stain], the ability of a pathogen to spread rapidly from one host to another.

inferior /infir′ē·ər/ [L, *inferus,* lower], **1.** situated below a given point of reference, as the feet are inferior to the legs. **2.** of poorer quality or value. Compare **superior.**

inferior alveolar artery, an artery that descends with the inferior alveolar nerve from the first or mandibular portion of the maxillary artery to the mandibular foramen on the medial surface of the ramus of the mandible. It enters the mandibular canal and continues to the first premolar tooth, where it divides into the mental and incisor branches. Also called **arteria alveolaris inferior.**

inferior aperture of minor pelvis, an irregular opening bounded by the coccyx, the sacrotuberous ligaments, part of the ischium, the sides of the pubic arch, and the pubic symphysis.

inferior aperture of thorax, an irregular opening bounded by the twelfth thoracic vertebra, the eleventh and twelfth ribs, and the edge of the costal cartilages as they meet the sternum.

inferior carotid triangle [L, *inferior,* lower; Gk, *karos,* heavy sleep; L, *triangulus,* three-cornered], a triangular area bounded by the midline of the neck, the superior belly of the omohyoid muscle above, and the sternocleidomastoid muscle behind. Also called **muscular triangle.**

inferior cervical ganglion, a ganglion at the lower end of the cervical part of the sympathetic trunk that combines with the first thoracic ganglion to form the stellate ganglion.

inferior conjunctival fornix, the space in the fold of conjunctiva created by the reflection of the conjunctiva covering the eyeball and the lining of the lower eyelid. Compare **superior conjunctival fornix.**

inferior gastric node, a node in one of two groups of gastric lymph glands, lying between the two layers of the lesser omentum along the pyloric half of the greater curvature of the stomach. Compare **hepatic node, superior gastric node.**

inferior gluteal artery, a large terminal trunk of the internal iliac artery that contributes to the blood supply of the gluteal region and anastomoses with a network of vessels around the hip joint.

inferior gluteal nerve, a nerve that supplies the gluteus maximus.

inferiority complex /infir′ē·ôr′itē/, **1.** a personal feeling or sense of being inadequate. It is largely unconscious and influences attitudes and behaviors. **2.** (in psychoanalysis) a complex characterized by striving for unrealistic goals motivated by an unresolved Oedipus complex. **3.** *(informal)* a feeling of being inferior.

inferior kidney, inferior segment of kidney; the renal segment located most inferiorly.

inferior maxillary bone. See **mandible.**

inferior mesenteric artery, a visceral branch of the abdominal aorta, arising just above the division into the common iliacs and supplying the left half of the transverse colon, all of the descending and iliac colons, and most of the rectum. It has left colic, sigmoid, and superior rectal branches.

inferior mesenteric node, a node in one of the three groups of visceral lymph glands serving the viscera of the abdomen and the pelvis. The inferior mesenteric nodes are associated with the branches of the inferior mesenteric artery. The inferior mesenteric nodes drain the descending colon, the iliac and sigmoid parts of the colon, and the upper part of the rectum. Their efferent vessels pass to the preaortic nodes. Compare **gastric node, superior mesenteric node.**

inferior mesenteric vein, the vein in the lower body that returns the blood from the rectum, the sigmoid and descending colons, and part of the transverse colon. It receives the sigmoid veins from the sigmoid colon and the iliac colon and the left colic vein from the descending colon and the left colic flexure. Compare **superior mesenteric vein.**

inferior olivary nucleus [L, *inferior,* lower, *oliva,* olive, *nucleus,* nut kernel], a small purse-shaped collection of nerve cells lying posterolateral to the pyramid, just below the level of the pons. It is a source of cerebellar climbing fibers.

inferior orbital fissure, a groove in the inferolateral wall of the orbit that contains the infraorbital and zygomatic nerves and the infraorbital vessels.

inferior phrenic artery, a small visceral branch of the abdominal aorta that arises from the aorta itself, the renal artery, or the celiac artery. It divides into the medial and lateral branches and supplies the diaphragm. A few vessels of the inferior vena cava stem from the lateral branch of the right phrenic artery. Some branches of the left phrenic artery supply the esophagus.

inferior pole of kidney. See **poles of kidney.**

inferior radioulnar joint. See **distal radioulnar articulation.**

inferior rectal plexus, the subcutaneous portion of the rectal venous plexus, below the pectinate line.

inferior right lateral flexure of rectum, the fourth bend of the rectum, where it deviates laterally to the right.

inferior sagittal sinus, one of the six venous channels of the posterior dura mater, draining blood from the brain into the internal jugular vein. It receives deoxygenated blood from several veins from the falx cerebri and, in some individuals, from a few veins from the cerebral hemispheres. Compare **straight sinus, superior sagittal sinus, transverse sinus.**

inferior subscapular nerve /subskap′yo͞olər/, one of three small nerves that arise from the posterior cord of the brachial plexus. It supplies part of the subscapularis and ends in the teres major. Compare **superior subscapular nerve.**

inferior thyroid vein, one of the few veins that arise in the venous plexus on the thyroid gland and form a plexus ventral to the trachea, under the sternothyroideus muscle. A left vein descends from this plexus to join the left brachiocephalic trunk; a right vein descends obliquely to open

Inferior vena cava and its tributaries

into the right brachiocephalic vein at its junction with the superior vena cava.

inferior ulnar collateral artery, one of a pair of branches of the deep brachial arteries, arising about 5 cm from the elbow, passing inward to form an arch with the deep brachial artery, and carrying blood to the muscles of the forearm. Compare **superior ulnar collateral artery.**

inferior vena cava, the large vein that returns deoxygenated blood to the heart from parts of the body below the diaphragm. It is formed by the junction of the two common iliac veins to the right of the fifth lumbar vertebra and ascends along the vertebral column, pierces the diaphragm, and opens into the right atrium of the heart. As it passes through the diaphragm, it receives a covering of serous pericardium. The inferior vena cava contains a semilunar valve that is rudimentary in the adult but very large and important in the fetus. The vessel receives blood from the two common iliacs, the lumbar veins, and the testicular veins. Compare **superior vena cava.**

inferior vesical artery, an artery in men that supplies branches to the bladder, ureter, seminal vesicle, and prostate.

infero-, prefix meaning "low": *inferolateral, inferomedial, inferoposterior.*

inferolateral /in′fərōlat′ərəl/ [L, *inferus,* lower, *latus,* side], pertaining to a location situated below and to the side.

inferomedial /in′fərōmē′dē·əl/ [L, *inferus,* lower, *medius,* middle], pertaining to a location situated below and toward the center.

infertile /infur′təl/ [L, *in,* not, *fertilis,* fruitful], denoting the inability to produce offspring. This condition may be present in one or both sex partners and may be temporary and reversible. The cause may be physical, including immature sexual organs, abnormalities of the reproductive system, hormonal imbalance, and dysfunction or anomalies in other organ systems, or it may result from psychological or emotional problems. The condition is classified as primary, in which pregnancy has never occurred, and secondary, when one or more pregnancies have occurred. Compare **sterile.**

infertility /in′furtil′itē/, the condition of being unable to produce offspring. Compare **sterility.**

infest /infest′/, to attack, invade, and subsist on the skin or in the internal organs of a host. Compare **infect.**

infestation /in′festā′shən/ [L, *infestare,* to attack], the presence of animal parasites in the environment, on the skin, or in the hair of a host.

infiltrate /infil′trāt/, **1.** *v.* to penetrate the interstices of a tissue or substance. **2.** *n.* the material or solution so deposited.

infiltration /in′filtrās′hən/ [L, *in,* within, *filtare,* to strain through], the process whereby a fluid passes into the tissues, such as when a local anesthetic is administered or an IV infusion infiltrates.

infiltrative disorder /infil′trətiv/, a condition caused by the diffusion or accumulation in cells or tissues of substances not normally found in those cells or tissues, as in granulomatous diseases.

infirmary /infur′mərē/ [L, *infirmus,* weak], a place that provides care for sick or infirm persons.

inflammable. See **flammable.**

inflammation [L, *inflammare,* to set afire], the protective or destructive response of body tissues to irritation or injury. Inflammation may be acute or chronic. Its cardinal signs are redness (rubor), heat (calor), swelling (tumor), and pain (dolor), often accompanied by loss of function. The process begins with a transitory vasoconstriction, then is followed by a brief increase in vascular permeability. The second stage is prolonged and consists of sustained increase in vascular permeability, exudation of fluids from the vessels, clustering of leukocytes along the vessel walls, phagocytosis of microorganisms, deposition of fibrin in the vessel, disposal of the accumulated debris by macrophages, and finally migration of fibroblasts to the area and development of new, normal cells. The severity, timing, and local character of any particular inflammatory response depend on the cause, the area affected, and the condition of the host. Histamine, kinins, and various other substances mediate the inflammatory process. **—inflammatory,** *adj.*

inflammatory autobullectomy, spontaneous regression of a bulla caused by inflammation in patients with bullous emphysema.

inflammatory bowel disease. See **ulcerative colitis.**

inflammatory cell, a neutrophil, macrophage, monocyte, eosinophil, or basophil that participates in the inflammatory response to a foreign substance.

inflammatory dysmenorrhea [L, *inflammare* + Gk, *dys+men,* month, *rhein,* to flow], menstrual pain that accompanies pelvic infection, fibroids, or endometritis. Also called **secondary dysmenorrhea.**

inflammatory fracture [L, *inflammare,* to set afire, *fractura,* break], a break in bone tissue weakened by inflammation.

inflammatory response, a tissue reaction to injury or an antigen that may include pain, swelling, itching, redness, heat, and loss of function. The response may involve dilation of blood vessels and consequent leakage of fluid, causing edema; leukocytic exudation; and release of plasma proteases and vasoactive amines such as histamine.

inflammatory scoliosis [L, *inflammare* + Gk, *skoliosis,* curvature], a form of scoliosis caused by muscle spasms associated with acute inflammation.

inflatable pessary. See **pessary.**

inflatable splint /inflā′təbəl/ [L, *in,* within, *flare,* to blow; ME, *splente*], a tubular device that is placed around a patient's extremity and inflated with air to maintain rigidity. Also called **pneumatic splint.**

inflection, the act of bending inward or the state of being bent inward.

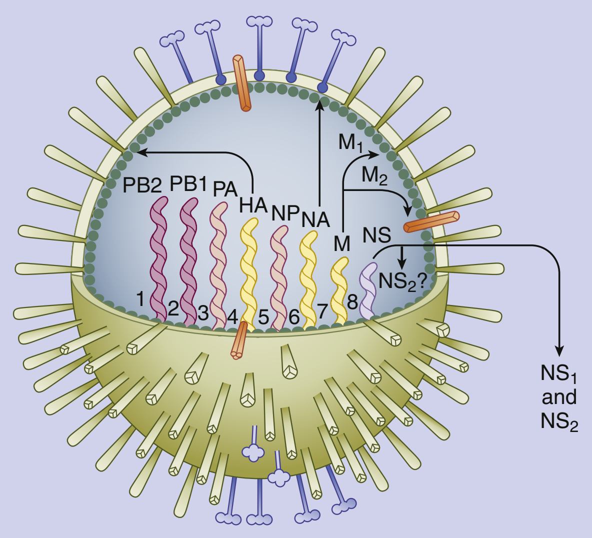
infliximab, a monoclonal antibody.

■ INDICATIONS: It is used to treat moderate to severe fistulizing Crohn's disease.

■ CONTRAINDICATIONS: Known hypersensitivity to murines prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include anaphylaxis, anemia, and tachycardia. Other adverse effects include dry skin, sweating, flushing, hematoma, pruritus, upper respiratory infection, pharyngitis, bronchitis, cough, dyspnea, sinusitis, myalgia, back pain, arthralgia, dysuria, urinary frequency, chest pain, hypertension, and hypotension. Common side effects include nausea, vomiting, abdominal pain, stomatitis, constipation, dyspepsia, flatulence, headache, dizziness, depression, vertigo, fatigue, anxiety, fever, rash, dermatitis, and urticaria.

influenza /in′flo͞o·en′zə/ [It, influence], a highly contagious infection of the respiratory tract caused by orthomyxovirus and transmitted by airborne droplet infection. It occurs in isolated cases, epidemics, and pandemics. Symptoms include sore throat, cough, fever, muscular pains, and weakness. The incubation period is brief (from 1 to 3 days), and the onset is usually sudden, with chills, fever, respiratory symptoms, headache, myalgia, and extreme fatigue. Treatment is symptomatic and usually involves bed rest, acetaminophen, and drinking of fluids. Fever and constitutional symptoms distinguish influenza from the common cold. Complete recovery in 3 to 10 days is the rule, but bacterial pneumonia may occur among high-risk patients, such as the elderly, the very young, and people who have chronic pulmonary disease, and lead to death. On average, 5% to 20% of the population suffer influenza infection annually, and approximately 56,000 die. Three main strains of influenza virus have been recognized: type A, type B, and type C. New strains of the virus emerge at regular intervals and are named according to their geographic origin, for example, **Asian flu.** Yearly vaccination with the currently prevalent strain of influenza virus is recommended for elderly or debilitated persons and health care personnel. Treatment or prophylaxis in high-risk patients may be achieved with rimantadine. Oseltamavir (oral) and Zanamivir (aerosol), when administered within 48 hours of onset, can lessen the severity and duration of symptoms. Also called *(informal)* **flu, grippe, la grippe.**



Influenza: virus structure

(Goldman et al, 2008/Courtesy Dr. Robert G. Webster)

influenza A virus, influenza B virus, influenza C virus, species in the genera ***Influenzavirus A, Influenzavirus B,*** and ***Influenzavirus C.*** See also ***Influenzavirus.***

influenza-like illness, nonspecific respiratory illness whose symptoms resemble those of influenza but which are usually caused not by influenza virus infection but by other viruses or by bacteria.

Influenzavirus /in′flo͞o·en′zävi′rus/, former genus name for the viruses that cause influenza, now found to be two different genera, which are named ***Influenzavirus A*** and ***Influenzavirus B.***

Influenzavirus A, a genus of viruses of the family Orthomyxoviridae containing the agent of influenza A. It is usually the cause of epidemics and pandemics. It is divided into subgroups based on two surface proteins: neuraminidase and haemoglutinin. Vaccination against influenza A is available. See also **influenza.**

Influenzavirus B, a genus of viruses of the family Orthomyxoviridae containing the agent of influenza B. It affects only humans. It can cause epidemics, albeit not as severe as those caused by influenza A. Vaccination against influenza B is available. See also **influenza.**

Influenzavirus C, a genus of viruses of the family Orthomyxoviridae containing the agent of influenza C, a very mild infection. See also **influenza.**

influenza-virus vaccine, an active immunizing agent.

■ INDICATION: It is prescribed for immunization against influenza.

■ CONTRAINDICATIONS: Acute infection or allergy to eggs prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are anaphylaxis and Guillain-Barré syndrome.

informal admission, a type of admission to a psychiatric hospital in which there is no formal or written application and the patient is free to leave at any time. Compare **involuntary patient.**

informatics, computerized automated delivery and manipulation of information to and by users of computer systems.

information processing, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to acquire, organize, and use information. See also **Nursing Outcomes Classification.**

information systems director [L, *informatio,* idea], a person who directs and administers a data processing facility. Also called *chief information officer.*

informed consent [L, *informare,* to give form, *consentire,* to sense], permission obtained from a patient to perform a specific test or procedure. Informed consent is required before most invasive procedures are performed and before a patient is admitted to a research study. The document used must be written in a language understood by the patient and be dated and signed by the patient and at least one witness. Signed consent should be obtained by the person performing the procedure. Included in the document are clear, rational statements that describe the procedure or test. Also required is a statement that care will not be withheld if the patient does not consent. Informed consent is voluntary. By law, informed consent must be obtained more than a given number of days or hours before certain procedures, including therapeutic abortion and sterilization, and must always be obtained when the patient is fully competent. An individual must be of a certain legal age to give consent; laws vary from state to state. Compare **implied consent.**

infra-, prefix meaning "situated, formed, or occurring beneath": *infraclavicular, infracortical, infratemporal.*

infrabony pocket. See **periodontal pocket.**

infraclavicular fossa /in′frəkləvik′yələr/, a small pocket or indentation just below the clavicle on both sides of the body.

infraclusion /in′frəklo͞o′zhən/ [L, *infra,* below + *occludere,* to close up], malocclusion in which a tooth has failed to erupt fully and reach the line of occlusion and is out of contact with the opposing tooth. Also called **infraversion.**

infraction fracture /infrak′shən/ [L, *infractio,* a breaking, *fractura,* break], a neoplastic fracture characterized by a small radiolucent line in radiographs and most commonly associated with a disorder of metabolism. See also **greenstick fracture.**

infradentale /in′frədentā′lē/, a bone measurement landmark, being the highest anterior point on the gingiva between the mandibular central incisors.

infradian rhythm /in′frā′dē·ən/ [L, *infra,* below, *dies,* day; Gk, *rhythmos*], a biorhythm that has a period shorter than 24 hours.

infraglenoid tubercle, a large triangular roughening inferior to the glenoid cavity in the scapula that is the site of attachment for the long head of the triceps brachii muscle.

infraglottic. See **subglottic.**

infrahyoid /in′frəhī′oid/, pertaining to the area below the hyoid bone, particularly the group of muscles attached to it.

inframammary fold (IMF), the angle of deflection where the breast tissue meets the chest wall below the breast.

inframammary region, the part of the pectoral region inferior to the breast, bordered inferiorly by the hypochondriac region of the abdomen.

inframandibular. See **submandibular.**

inframaxillary, **1.** pertaining to the mandible, or lower jaw. **2.** lying below the maxilla, or upper jaw.

infranodal block /in′frənō′dəl/ [L, *infra,* below, *nodus,* knot; Fr, *bloc*], a type of atrioventricular (AV) block caused by an abnormality below the AV node, either in the bundle of His or in both bundle branches. An infranodal block has more serious clinical implications than a block at the level of the AV node. The condition is often the result of arteriosclerosis, degenerative diseases, a defect in the conduction system, or a tumor. It most often occurs in older persons. Symptoms include frequent episodes of fainting and a pulse rate of 20 to 40 beats/min. Diagnosis is made by an electrocardiogram, which shows intraventricular conduction disturbances during sinus rhythm and distinguishes nodal from infranodal block. The usual therapy is implantation of a demand pacemaker. Compare **bundle branch block, intraventricular block.** See also **Adams-Stokes syndrome, atrioventricular block, cardiac conduction defect, heart block, intraatrial block, sinoatrial block.**

infranodal disease, a cardiac disorder involving the electrical conduction system of the heart below the atrioventricular node. Examples include bundle branch block.

infraorbital /in′frə·ôr′bitəl/ [L, *infra,* below, *orbita,* wheeltrack], pertaining to the area beneath the floor of the bony cavity in which the eyeball is located.

infraorbital foramen [L, *infra,* below, *orbita,* wheeltrack, *foramen,* hole], an opening on the anterior aspect of the maxilla. Through it pass the inferior orbital nerves and blood vessels.

infrapatellar fat pad /in′frəpətel′ər/, an area of palpable soft tissue in front of the joint space on either side of the patellar tendon.

infrapatellar synovial joint. See **alar fold.**

infrared radiation /in′frəred′/ [L, *infra* + AS, *read,* red; L, *radiare,* to emit rays], electromagnetic radiation with wavelengths between about 700 nm and 1 mm, longer than those of visible light but shorter than those of microwaves and radio waves. Infrared radiation that strikes the body surface is perceived as heat.

infrared therapy, treatment by exposure to various wavelengths of infrared radiation. Hot water bottles and heating pads of all kinds emit longwave infrared radiation; incandescent lights emit shortwave infrared radiation. Infrared treatment is performed to relieve pain and to stimulate circulation of blood.

infrared thermography, measurement of temperature through the detection of infrared radiation emitted by heated tissue. Temperature measurement from multiple body areas can be used to generate an image of the body in real time.

infrasonics /in′frəson′iks/, sound frequencies that are below the range of human hearing.

infraspinatus. See **infraspinous muscle.**

infraspinous fossa, a large triangular region of the posterior scapula below the spine.

infraspinous muscle /in′frə·spī·nās/ [L, *infra,* below + *spina,* spine], the muscle arising from the infraspinous fossa and inserting in the greater tubercle of the humerus. It functions to rotate the humerus laterally. Also called **infraspinatus.**

infraversion /in′frəver′zhən/ [L, *infra,* below + *vertere,* to turn], **1.** See **infraclusion. 2.** the downward deviation of one eye. **3.** conjugate downward rotation of both eyes. Also called **deorsumversion.**

infundibula. See **infundibulum.**

infundibular stalk /in′fundib′yələr/ [L, *infundibulum,* funnel; ME, *stalke*], an elongated funnel-shaped structure that connects the hypothalamus with the pituitary gland.

infundibulopelvic ligament, the suspensory ligament of the ovary.

infundibulum /in′fundib′yələm/ *pl.* **infundibula** [L, funnel], a funnel-shaped structure or passage, such as the cavity formed by the fimbriae tubae at the distal end of the fallopian tubes, the stalk that extends from the hypothalamus to the posterior lobe of the pituitary gland, or the passage connecting the middle meatus of the nose with the frontal sinus.

infundibulum of gallbladder, the tapering part of the gallbladder, ending at the neck.

infusate /infyo͞o′sāt/, a parenteral fluid slowly introduced into a patient over a specific period.

infusate contamination, the introduction of pathogens into a sterile container, the contents of which are to be infused through a sterile setup with tubing into a patient's intravascular system during surgery or other procedures.

infused oil, a mixture comprised of the herb's volatile oils and another oil. The so-called carrier oil is used to extract an herb's volatile oils by soaking plant parts in it for a specified time period.

infusion /infyo͞o′zhən/ [L, *in,* within, *fundere,* to pour], **1.** the introduction of a substance, such as a fluid, electrolyte, nutrient, or drug, directly into a vein or interstitially by means of gravity flow. Sterile techniques are maintained, the equipment is periodically checked for mechanical difficulties, and the patient is observed for swelling at the site of injection and for cardiac or respiratory difficulties. Compare **injection, instillation, insufflate. 2.** the substance introduced into the body by infusion. **3.** the steeping of a substance, such as an herb, to extract its medicinal properties. **4.** a liquid preparation made by pouring water over plant parts (such as dried or fresh leaves, flowers, fruits) and allowing the mixture to steep. Boiling water is usually used, but cold water may also be used. Making a cup of herbal tea is an example. **—infuse,** *v.*

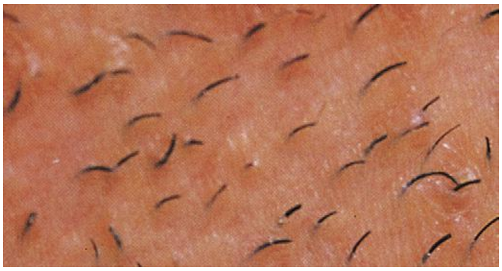
infusion pump, an apparatus designed to deliver measured amounts of a drug or IV solution through IV injection over time. Some kinds of infusion pumps can be implanted surgically.

IVAC
MedSystem III
A
B
C

Infusion pump *(Aehlert, 2009)*

ingestion /injes′chən/ [L, *in,* within, *gerere,* to carry], the oral taking of substances into the body. The term is generally applied to both nutrients and medications.

ingrown hair [L, *in,* within; AS, *growen,* to grow, *haer*], a hair that fails to follow the normal follicle channel to the surface, with the free end becoming embedded in the skin. The hair then acts like a foreign body, and inflammation and suppuration follow.

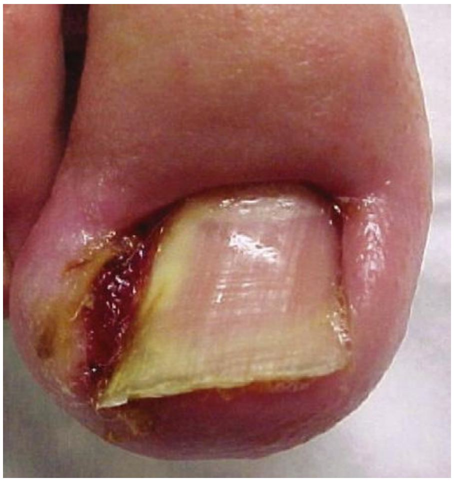


Ingrown hair *(du Vivier, 2002)*

ingrown toenail, a toenail whose distal lateral margin grows or is pressed into the skin of the toe, causing an inflammatory reaction. Granulation tissue may develop, and secondary infection is common. Treatment includes use of wider shoes, proper trimming of the nail, and various surgical procedures to narrow the nail or to reduce the size of the lateral nail fold.

inguinal /ing′gwinəl/ [L, *inguen,* groin], pertaining to the groin.

inguinal canal, the tubular passage through the lower muscular layers of the abdominal wall that contains the spermatic

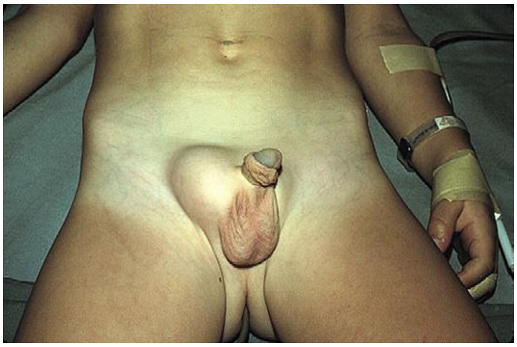


Ingrown toenail *(Marks and Miller, 2006)*

cord in the male and the round ligament in the female. It is a common site for hernias.

inguinal falx, the inferior terminal portion of the common aponeurosis of the internal abdominal oblique and the transverse abdominis. It is inserted into the crest of the pubis, just below the superficial inguinal ring, and strengthens that part of the anterior abdominal wall. The width and the strength of the inguinal falx vary. Also called **conjoined tendon, falx inguinalis.**

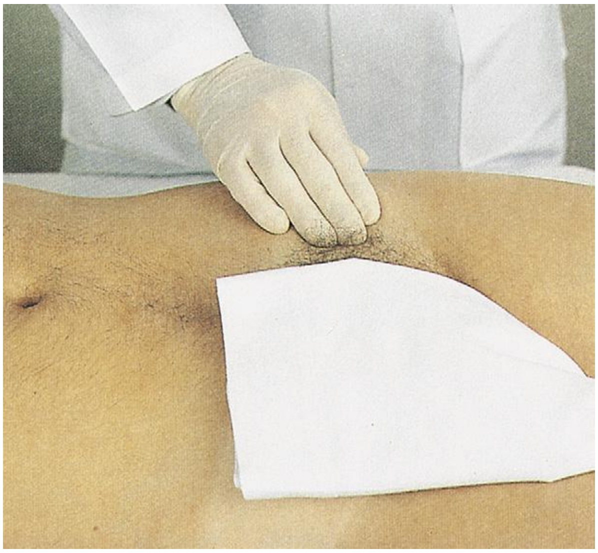
inguinal hernia, a hernia in which a loop of intestine enters the inguinal canal. In a male it sometimes fills the scrotal sac. An inguinal hernia is usually repaired surgically to prevent the herniated segment from becoming strangulated, gangrenous, or obstructive, thereby blocking passage of waste through the bowel. Of all hernias, 75% to 80% are inguinal hernias. See also **hernia.**



Inguinal hernia *(Brandt, 2008)*

inguinal ligament, a band of fibrous tissue that spans the gap between the anterior superior iliac spine and the pubic tubercle. Also called **crural ligament.**

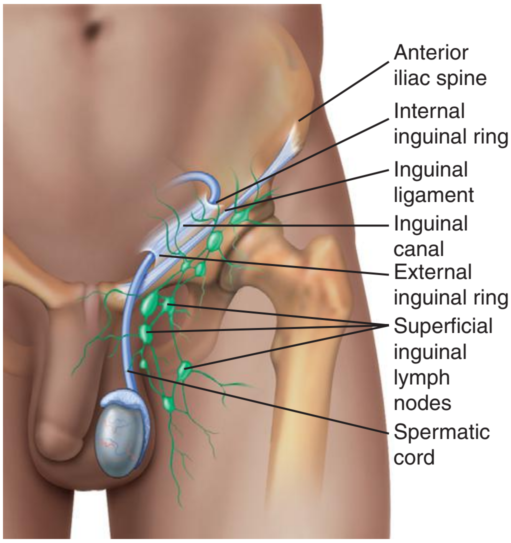
inguinal node, any of the approximately 18 nodes in the group of lymph glands in the upper femoral triangle of the thigh. These nodes are divided into the superficial inguinal nodes and the subinguinal nodes. Compare **anterior tibial node, popliteal node.**



Palpation of inguinal nodes *(Seidel et al, 2003)*

inguinal part of ductus deferens, a middle part of the ductus deferens, located within the inguinal canal.

inguinal region, the part of the abdomen surrounding the inguinal canal, in the lower zone on both sides of the pubic region. Also called **iliac region.** See also **abdominal regions.**



Structures of the inguinal region
(Harkreader, Hogan, and Thobaben, 2007)

inguinal ring, either of the two apertures of the inguinal canal, the internal end opening into the abdominal wall and the external end opening into the aponeurosis of the obliquus externus abdominis above the pubis.

inguinal ring, external, superficial inguinal ring.

inguinal ring, internal, deep inguinal ring.

inguinal triangle, a triangular area in the lower abdominal wall bounded laterally by the inferior epigastric artery, medially by the rectus abdominis muscle, and inferiorly by the inguinal ligament.

inguino-, combining form meaning "groin": *inguinocrural, inguinodynia, inguinoscrotal.*

inguinocrural hernia /ing′gwinōlkro͞o′rəl/ [L, *inguen,* groin, *crus,* thigh, *hernia,* rupture], an inguinal hernia that has turned from the inguinal canal laterally over the groin. Also called **Holthouse's hernia.**

INH, abbreviation for *isonicotinic acid hydrazide*. See **isoniazid.**

inhalant /inhā′lənt/, a substance introduced into the body by inhalation. It may be a medication, such as an aerosol, administered in respiratory therapy or a volatile chemical that is abused, such as toluene, used in glue sniffing.

inhalation. See **inspiration.**

inhalation administration of medication /in′həlā′shən/ [L, *in,* within, *halare,* to breathe], the administration of a drug by inspiration of the vapor released from a fragile ampule packed in a fine mesh that is crushed for immediate administration. Amyl nitrate and ammonia act quickly and are often used in this way. The medication is absorbed into the circulation through the mucous membrane of the nasal passages. Vaporized medication is also given by inhalation. See also **inhalation therapy, respiratory therapy.**

inhalational challenge test, a type of challenge test done to determine reactivity to drugs or causative allergens in allergic asthma, in which a dilute concentrate of the suspected substance is inhaled and the patient is assessed for bronchial reactivity, which may be either early or late. Also called *inhalational challenge, inhalational provocation*.

inhalation anesthesia, anesthesia achieved by the inhalation of an anesthetic gas or a vapor. Although general anesthesia by inhalation has been used to permit surgical operations for over a century, the mechanism by which these anesthetics act is not completely understood. In adults, administration of an inhalation anesthetic is usually initiated during the induction phase of anesthesia after IV administration of a short-acting hypnotic drug, such as sodium pentothal, etomidate, or propofol. In pediatrics, inhalation anesthesia is often used to initiate anesthesia by using a mask induction with a nonpungent inhalational agent such as sevoflurane and nitrous oxide. The procedure may require endotracheal intubation or other methods of maintenance of airway patency and control. Among the principal inhalation anesthetics are nitrous oxide, desflurane, sevoflurane, and isoflurane.

inhalation anthrax. See **anthrax.**

inhalation injury, damage to the pulmonary parenchyma caused by inhalation of substances such as very hot air, toxic gas, asbestos, and chemical products of plastic manufacture.

inhalation therapy, a treatment in which a substance is introduced into the respiratory tract with inspired air. Oxygen, water, and various drugs may be administered by techniques of inhalation therapy. The goals of treatment are varied, such as improved strength of respiratory function in a bedridden patient, bronchodilation in an asthmatic patient, or liquefaction of mucus in a person with chronic obstructive lung disease.

inhalation toxicity, a severe neuromuscular disorder with symptoms like those of Parkinson's disease, caused by prolonged inhalation of manganese dust.

inhale /inhāl′/ [L, *in,* within, *halare,* to breathe], to breathe in or to draw in with the breath. Also **inspire.**

inhaler [L, *in* + *halare;* to breathe], a device for administering medications to be inhaled, such as vapors, fine powders, or volatile substances. An inhaler also may be designed to administer anesthetic gases.

in-hand manipulation, moving objects within the hand.

inherent /inhir′ənt/ [L, *inhaerere,* to cling to], inborn, innate; natural to an environment. Compare **indigenous.**

inherent rate, the frequency of impulse formation attributed to a given pacemaker location within the heart. The following rates are representative of the adult heart: sinus node, 60 to 100 beats/min; atrioventricular junction, 40 to 60 beats/min; ventricle, 15 to 40 beats/min. In adults a rate above 100 beats/min is normal during exercise, exertion, strong emotion, or pain. Most clinicians are alert to possible problems when the sinus rate is greater than 90 beats/min and are not concerned unless it drops to less than 50 beats/min. In children the normal sinus rate is higher, decreasing as the age of the child increases.

inheritance /inher′itəns/ [L, *in,* within, *hereditare,* to inherit], **1.** the acquisition or expression of traits or conditions by transmission of genetic material from parents to offspring. **2.** the sum of the genetic qualities or traits transmitted from parents to offspring; the total genetic makeup of a fertilized ovum. Kinds of inheritance include **alternative inheritance, amphigenous inheritance, autosomal inheritance, blending inheritance, codominant inheritance, complemental inheritance, crisscross inheritance, cytoplasmic inheritance, holandric inheritance, hologynic inheritance, homochronous inheritance, maternal inheritance, monofactorial inheritance, multifactorial inheritance, supplemental inheritance,** and **X-linked inheritance. —inherit,** *v.* **inherited,** *adj*.

inherited disorder /inher′itid/, any disease or condition that is genetically determined and involves a single gene mutation, a multifactorial inheritance, or a chromosomal aberration. Also called **genetic disorder, hereditary disorder.**

inherited trait [L, *in,* within, *hereditare,* to inherit; Fr, *trait,* a draft], a distinguishing quality or characteristic that is transmitted genetically from one generation to the next.

inhibin /inhib′in/, a gonadal hormone that inhibits activity of the follicle-stimulating hormone secreted by the anterior pituitary gland.

inhibiting gene /inhib′iting/ [L, *inhibere,* to restrain; Gk, *genein,* to produce], a gene that prevents the expression of another gene. See also **epistasis.**

inhibiting hormone. See **hormone.**

inhibition /in′hibish′ən/ [L, *inhibere,* to restrain], **1.** (in psychology) the unconscious restraint of a behavioral process, usually resulting from the social or cultural forces of the environment; the condition inducing such restraint. **2.** (in psychoanalysis) the process in which the superego prevents the conscious expression of an unconscious instinctual drive, thought, or urge. **3.** (in physiology) the restraint, checking, or arrest of the action of an organ or cell or the reduction of a physiological activity by antagonistic stimulation. **4.** (in chemistry) the stopping or slowing of the rate of a chemical reaction.

inhibition assay, an immunoassay in which an excess of antigens prevents or inhibits the completion of either the initial or the indicator phase of the reaction.

inhibition of reflexes [L, *inhibere,* to restrain, *reflectere,* to bend back], **1.** the prevention of a reflex action, requiring a series of biochemical mechanisms to restrict the flow of excitatory impulses at presynaptic and postsynaptic points in the system. **2.** a negative reflex effect that may become established during differential conditioning. The negative conditioned reflex represents an inhibition of a conditioned reflex.

inhibitor /inhib′itər/, a drug or other agent that prevents or restricts a certain action.

inhibitor of apoptosis protein (IAP), any of a class of proteins that play a regulatory role in apoptosis in many species by inhibiting caspase activity, which in turn blocks apoptosis. Such proteins are also expressed abnormally in many tumors.

inhibitory /inhib′itôr′ē/ [L, *inhibere,* to restrain], tending to stop or slow a process, such as a neuron that suppresses the intensity of a nerve impulse. Compare **induce.**

inhibitory enzyme [L, *inhibere,* to restrain; Gk, *en,* within; *zyme,* ferment], an enzyme that blocks rather than catalyzes a chemical reaction.

inio-, prefix meaning "the occiput": *iniodymus, iniopagus, iniops.*

inion /in′ē·on/ [Gk]. See **external occipital protuberance.**

initial contact stance stage /inish′əl/ [L, *initium,* beginning, *contigere,* to touch], one of the five stages in the stance phase of walking or gait, specifically associated with the moment when the foot touches the ground or floor and the leg prepares to accept the weight of the body. The initial contact stance stage figures in the diagnoses of many abnormal orthopedic conditions and is often correlated with electromyographic studies of the muscles used in walking, such as the pretibial muscle and the gluteus maximus. Compare **loading response stance stage, midstance, preswing stance stage, terminal stance.** See also **swing phase of gait.**

initial lesion. See **primary lesion.**

initiation codon /inish′ē·ā′shən kō′don/ [L, *initium,* beginning, *caudex,* book], the triplet of nucleotides, usually adenine-uracil-guanine (AUG) or, in some cases, guanine-uracil-guanine (GUG), that in eukaryotes and archea code for methionine and in bacteria code for formylmethionine, the first amino acids in all protein sequences. Also called *initiator codon,* **start codon.**

initiator /inish′ē·ā′tər/, a cocarcinogenic factor that causes a usually irreversible genetic mutation in a normal cell and primes it for uncontrolled growth. Examples include radiation, aflatoxins, urethane, and nitrosamines.

inject. See **injection.**

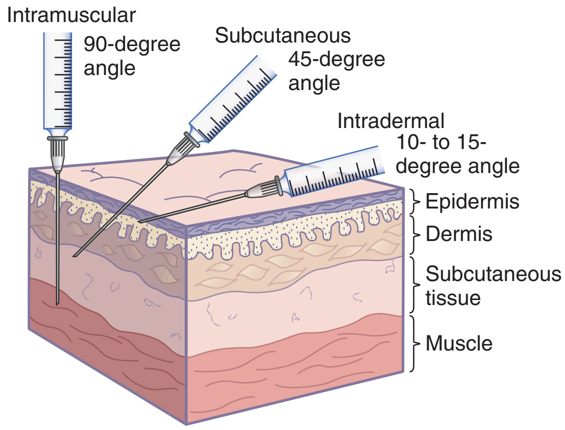
injectable contraceptive /injek′təbəl/, medroxyprogesterone acetate, a progestin used as a contraceptive, administered intramuscularly at a dose sufficient to prevent ovulation. The muscle into which the hormone is injected serves as a depot from which the hormone is slowly released so that injections need to be given only every 3 months. This is a very convenient and highly effective method of contraception.

injectable silicone [L, *in* + *jacere,* to throw, *silex,* silicon], polymeric organic compounds of silicone that are used in plastic surgery. The silicones are injected beneath the skin for cosmetic benefits. Foreign body reactions to silicone injections for breast augmentation may cause an appearance of tender hard nodules.

injection /injek′shən/ [L, *in,* within, *jacere,* to throw], **1.** the act of forcing a liquid into the body by means of a needle and syringe. Injections are designated according to the anatomical site involved; the most common are intraarterial, intradermal, intramuscular, intravenous, and subcutaneous. Parenteral injections are usually given for therapeutic reasons, although they may be used diagnostically. Sterile technique is maintained. Compare **infusion, instillation, insufflate. 2.** the substance injected. **3.** redness and swelling observed in the physical examination of a part of the body, caused by dilation of the blood vessels secondary to an inflammatory or infectious process. **—inject,** *v.*

injection cap, a rubber diaphragm under a plastic cap. It permits needle insertion into a catheter or vial.

injection technique. See **intradermal injection, intramuscular injection, intrathecal injection, intravenous injection, subcutaneous injection,** and other specific injection techniques.



Different angles of insertion for injection
(Bonewit-West, 2012)

injunction /injungk′shən/ [L, *injungere,* to enjoin], a court order that prevents a party from performing a specified act.

injury severity score (ISS), an evaluation system developed to predict the outcomes of traumas, including mortality and length of hospital stay. See also **Glasgow Coma Scale.**

inlay /in′lā/ [L, *in,* within; AS, *lecan,* lay], **1.** material, such as bone or skin, inserted into a tissue defect. **2.** (in dentistry) a restoration made outside of a tooth to correspond with the form of a prepared cavity and then cemented into the tooth.

inlay splint [L, *in,* within; AS, *lecan,* lay], a casting for fixing or supporting one or more approximating teeth. It is composed of either a single casting or two or more inlays soldered together.

inlet [L, *in,* within; ME, *leten*], a passage leading into a cavity, such as the pelvic inlet that marks the brim of the pelvic cavity.

inlet contraction. See **contraction.**

in loco parentis /in lō′kō pəren′tis/ [L, in the parents' place], the assumption by a person or institution of the parental obligations of caring for a child without adoption.

innate /in′āt, ināt′/ [L, *innatus,* inborn], **1.** existing in or belonging to a person from birth; inborn; hereditary; congenital. **2.** a natural and essential characteristic of something or someone; inherent. **3.** originating in or produced by the intellect or the mind.

innate immunity. See **natural immunity.**

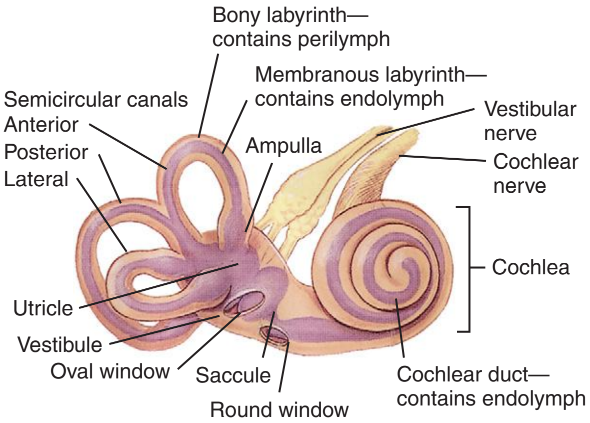
inner cell mass [AS, *innera,* within; L, *cella,* storeroom, *massa,* lump], a cluster of cells localized at the animal pole of the blastocyst of placental mammals from which the embryo develops. See also **trophoblast.** Also called **cell mass.**

inner ear, the complex inner structure of the ear, containing receptors for hearing and balance. The maculae and crystae cells help maintain equilibrium; the organ of Corti cells translate sound vibrations into impulses for the sense of hearing. The auditory receptor cells are innervated by the cochlear nerve. Also called **internal ear, labyrinth.** Compare **external ear, middle ear.**

inner layer of glomerular capsule, the visceral layer of glomerular capsule.

innervate /in′ərvāt/ [L, *in* + *nervus*], to supply a body part or organ with nerves or nervous stimuli.

innervation /in′ərvā′shən/ [L, *in,* within, *nervus,* nerve], the distribution or supply of nerve fibers or nerve impulses to a body part. **—innervate,** *v.*



Internal ear *(Applegate, 2011)*

innervation apraxia. See **motor apraxia.**

inner zone of renal medulla, the part of the renal medulla farthest in from the cortex, containing the innermost part of the loop of Henle and medullary collecting tubule.

innidation. See **nidation.**

innocent /in′əsənt/ [L, *innocens,* harmless], benign, innocuous, or functional; not malignant, such as an innocent heart murmur.

innocuous /inok′yo͞o·əs/ [L, *innocuus,* harmless], pertaining to use of a substance or procedure that causes no ill effects.

innominate /inom′ināt/ [L, *innominatum,* nameless], without a name or unnamed. The term is traditionally applied to certain anatomical structures, often identified by their descriptive name, such as the hip bone and brachiocephalic artery.

innominate artery, one of the three arteries branching from the arch of the aorta, running about 5 cm from the level of the cranial border of the second right costal cartilage; ascending cranially, dorsally, and obliquely to the right; and dividing into the right common carotid and the right subclavian arteries. Also called **brachiocephalic artery, brachiocephalic trunk.**

innominate bone, the **hip bone**. It consists of the ilium, ischium, and pubis and unites with the sacrum and coccyx to form the pelvis. Also called **os coxae.**

innominate substance, a region of the forebrain that lies ventral to the anterior half of the lentiform nucleus. It contains the basal forebrain, which receives afferent input from the reticular formation, hypothalamus, and limbic cortex. Also called **substantia innominata.**

innominate vein, a large vein on either side of the neck that is formed by the union of the internal jugular and subclavian veins. The two veins drain blood from the head, neck, and upper extremities and unite to form the superior vena cava. Also called **brachiocephalic vein.**

in(o) [word element, Gr.], *fiber.*

Inocor, a trademark for a cardiac inotropic drug **(inamrinone lactate).**

inocula, inoculant. See **inoculum.**

inoculation /inok′yəlāshən/ [L, *inoculare,* to graft], (medical term) the introduction of a substance (inoculum) into the body to produce or to increase immunity to the disease or condition associated with the substance. It is performed by making multiple scratches in the skin after placement of a drop of the substance on the skin, by puncture of the skin with an implement bearing multiple short tines, or by intradermal, subcutaneous, or intramuscular injection. Introduction can also be intranasal or oral. —**inoculate**, *v.*

inoculum /inok′yo͞oləm/ *pl.* **inocula** [L, *inoculare,* to graft], a substance introduced into the body to cause or to increase immunity to a specific disease or condition. It may be a toxin; a live, attenuated, or killed virus or bacterium; or an immune serum. Also called *inoculant*. See also **immune system.**

inoperable /inop′ərəbəl/ [L, *in* + *operari,* to work], pertaining to a medical condition that would not benefit from surgical intervention or for which the risk outweighs the benefits.

inorganic /in′ôrgan′ik/ [L, *in,* not; Gk, *organikos,* natural], (in chemistry) pertaining to a chemical compound that is not primarily based on or derived from hydrocarbons.

inorganic acid, a compound containing no carbon that is composed of hydrogen and one or more electronegative elements, such as chlorine. An example is hydrochloric acid.

inorganic chemistry, the study of the properties and reactions of all chemical elements and compounds other than hydrocarbons or their derivatives.

inorganic dust, dry, finely powdered particles of an inorganic substance, especially dust, which, when inhaled, can cause abnormal conditions of the lungs. See also **anthracosis, asbestosis, berylliosis, pneumoconiosis, silicosis.**

inorganic phosphorus, phosphorus that may be measured in the blood as phosphate ions. Its increased concentration may indicate bone, kidney, or glandular disease; decreased concentration may be associated with alcoholism, vitamin deficiency, and other problems. Normal concentrations in the serum of adults are 1.8 to 2.6 mEq/L. See also **phosphorus.**

inoscopy, the diagnosis of disease by artificial digestion and examination of the fibers or fibrinous matter of the sputum, blood, effusions, etc. Also called **fibrinoscopy.**

inosine /in′əsēn, -sīn/, a nucleoside derived from animal tissue, especially intestines, originally used in food processing and flavoring. It has been used in the treatment of cardiac disorders and is now under investigation in studies of cancer and virus chemotherapy. See also **inosiplex.**

inosiplex /inō′sipleks/, a form of inosine that acts as a stimulator of the immune system. It is currently under investigation for use in cancer therapy, in the treatment of herpesvirus and rhinovirus infections, and in immune restoration in pre-AIDS patients. Also called **methisoprinol.**

inositol /inō′sətōl, inos′-/, an isomer of glucose that occurs widely in plant and animal cells. Although inositol has no current therapeutic use, it is an essential cell constituent.

inotropic /in′ōtrop′ik/ [Gk, *inos,* fiber, *trope,* turning], pertaining to the force or energy of muscular contractions, particularly those of the heart. An inotropic agent increases myocardial contractility.

inotropic agent, a substance that influences the force of muscular contractions; an agent that increases the force of muscular contractions of the heart.

inpatient /in′pāshənt/ [L, *in,* within, *patior,* to suffer], **1.** *n,* a patient who has been admitted to a hospital or other health care facility for at least an overnight stay. **2.** *adj,* pertaining to the treatment or care of such a patient or to a health care facility to which a patient may be admitted for 24-hour care. Compare **outpatient.**

inpatient care unit, a hospital unit organized for the provision of medical and nursing services to a group of inpatients. Units are usually grouped according to diagnosis or other common characteristics, such as maternity or surgical patients.

input, the information or material that enters or is manually entered, e.g., with a keyboard.

input device [L, *in,* within; ME, *putten,* to place], an implement that allows for the entry of commands or information for processing in a form acceptable to a computer, such as a mouse, keyboard, tape drive, disk drive, microphone, or light pen.

inquest /in′kwest/ [L, *in,* within, *quaerere,* to seek], a legal inquiry or examination.

INR, abbreviation for **International Normalized Ratio.**

insane /insān′/ [L, *in,* not, *sanus,* sound], a legal term describing unsound, diseased, or deranged mental functioning, particularly as it pertains to a person who is unable to provide adequate self-care if there is a need to protect the patient and the public from each other. In the United States the precise definition of this legal term varies from state to state.

insanity /insan′itē/ [L, *in,* not, *sanus,* sound] *(informal)* a term used more in legal and social than in medical terminology. It refers to those mental illnesses that are of such a serious or debilitating nature as to interfere with one's capability of functioning within the legal limits of society and performing the normal activities of daily living.

insatiable /insā′shē·əbəl/ [L, *insatiatus,* not satisfied], pertaining to an appetite for food or other needs that cannot be satisfied.

insect bite [L, *in,* within, *secare,* to cut], the bite of any parasitic or venomous arthropod such as a louse, flea, mite, tick, or arachnid. Many arthropods inject venom that produces poisoning or severe local reaction, saliva that may contain viruses, or substances that produce mild irritation. The degree of irritation produced by an insect's bite is affected by the design and shape of its mouth parts: A horsefly, for example, makes a short lateral and coarse wound whereas a tick takes hold with its backward curved teeth, making its removal difficult. Spiders inflict a sharp pinprick bite that may remain unnoticed until the injected venom has begun to produce a painful reaction. Treatment of a bite depends on the species of insect, the reaction to the bite, and the risk of sequelae from it. First aid treatment is generally symptomatic and includes ice or cold packs, careful cleaning of the wound, and antihistamines or specific antivenin as necessary.

insecticide /insek′tisīd/, a chemical agent that kills insects.

insecticide poisoning. See **chlorinated organic insecticide poisoning.**

insemination /insem′inā′shən/, the injection of semen into the vagina. It may involve an artificial process unrelated to sexual intercourse.

insenescence /in′sines′əns/ [L, *insenescere,* to begin to grow old], **1.** the process of aging. **2.** the state of being chronologically old but retaining the vitality of a young person.

insensible /insen′sibəl/ [L, *in* + *sentire,* to feel], **1.** pertaining to a person who is unconscious for any reason. **2.** pertaining to a person who is apathetic or deprived of normal sense perceptions.

insensible perspiration [L, *in,* not, *sentire,* to feel, *per,* through, *spirare,* to breathe], the loss of body fluid by evaporation, such as normally occurs during respiration. A small amount of perspiration is continually excreted by the sweat glands in the skin. The portion that evaporates before it may be observed also contributes to insensible perspiration. Also called **insensible water loss.**

insensible water loss, the amount of fluid lost on a daily basis from the lungs, skin, respiratory tract, and water excreted in the feces. The exact amount cannot be measured, but it is estimated to be between 40 and 600 mL in an adult under normal circumstances.

insertion /insur′shən/ [L, *inserere,* to introduce], (in anatomy) the place of attachment, such as that of a muscle to the bone it moves.

insertion forceps. See **point forceps.**

insertion site, the point in a vein where a needle or catheter is inserted.

inservice education [L, *in,* within, *servus,* a slave, *educare,* to rear], a program of instruction or training provided by an agency or institution for its employees. The program is held in the institution or agency and is intended to increase the skills and competence of the employees in a specific area. Inservice education may be a part of any program of staff development. See also **staff development.**

insheathed /inshēthd′/ [L, *in,* within; AS, *scaeth,* sheath], enclosed within a sheath.

insidious /insid′ē·əs/ [L, *insidiosus,* cunning], describing a development that is gradual, subtle, or imperceptible. Certain chronic diseases, such as glaucoma, can develop insidiously with symptoms that are not detected by the patient until the disorder is established. Compare **acute.**

insight /in′sīt/ [L, *in,* within; AS, *gesihth,* sight], **1.** the capacity for comprehending the true nature of a situation or for penetrating an underlying truth. **2.** an instance of penetrating or comprehending an underlying truth, primarily through intuitive understanding. **3.** (in psychology) a type of self-understanding encompassing both intellectual and emotional awareness of the unconscious nature, origin, and mechanisms of one's attitudes, feelings, and behavior. It is one of the most important goals of psychotherapy and, with integration, leads to modification of maladaptive behavioral patterns. See also **integration.**

insipid /insip′id/ [L, *in* + *sapidus,* savory], dull, tasteless, or lifeless.

in situ /in sī′to͞o, sit′o͞o/ [L, *in,* within, *situs,* position], **1.** in the natural or usual place. **2.** describing a cancer that has not metastasized or invaded neighboring tissues, such as carcinoma in situ.

insoluble /insol′yəbəl/ [L, *in,* not, *solubilis,* soluble], unable to be dissolved, usually in a specific solvent, such as a substance that is insoluble in water.

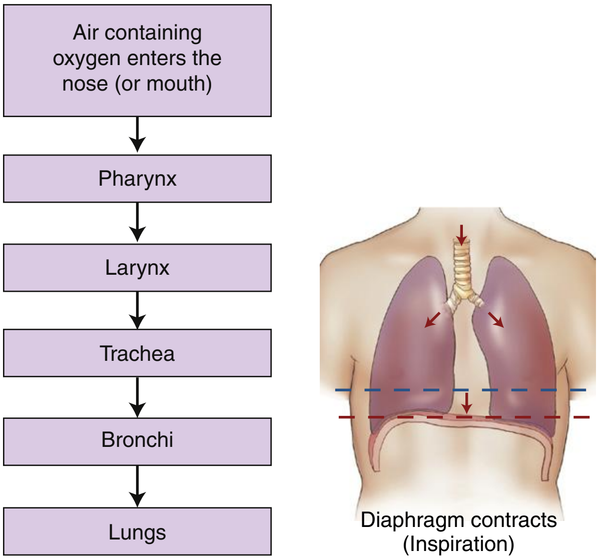
insoluble fiber, fiber that is not soluble in water, composed mainly of lignin, cellulose, and hemicelluloses and primarily found in the bran layers of cereal grains. Its actions include increasing fecal bulk and decreasing free radicals in the GI tract.

insomnia /insom′nē·ə/ [L, *in,* not, *somnus,* sleep], chronic inability to sleep or to remain asleep throughout the night; wakefulness; sleeplessness. Insomnia may be the symptom of a psychiatric disorder. Formerly called **agrypnia.**

insomniac /insom′nē·ak/, **1.** *n,* a person with insomnia. **2.** *adj,* pertaining to, causing, or associated with insomnia. **3.** *adj,* characteristic of or occurring during a period of sleeplessness.

inspiration /in′spirā′shən/ [L, *inspirare,* to breathe in], the act of drawing air into the lungs. The major muscle of inspiration is the diaphragm, the contraction of which creates a reduced pressure in the chest, causing the lungs to expand and air to flow inward. Accessory inspiratory muscles include the external intercostals, scaleni, scapular elevators, and sternocleidomastoids. Since expiration is usually a passive process, these muscles of inspiration alone produce normal respiration. Lungs at maximal inspiration have an average total capacity of 5.5 to 6 L of air. Also called **inhalation.** Compare **expiration.** See also **inspiratory reserve volume. —inspiratory,** *adj.*

inspiratory /inspī′rətôr′ē/ [L, *inspirare,* to breathe in], pertaining to inspiration.



Air containing oxygen enters the nose (or mouth)
Pharynx
Larynx
Trachea
Bronchi
Lungs
Diaphragm contracts (Inspiration)

Inspiration *(LaFleur Brooks and LaFleur Brooks, 2012, and Leonard, 2012)*

inspiratory capacity (IC), the maximum volume of gas that can be inhaled from the end of a resting exhalation. Equal to the sum of the tidal volume and the inspiratory reserve volume, it is measured with a spirometer.

inspiratory dyspnea [L, *inspirare,* to breathe in; Gk, *dys,* without, *pnoia,* breath], a form of breathing difficulty caused by an obstruction in the larynx, trachea, or bronchi. The patient attempts to compensate for this deficiency with prolonged, deep inspirations.

inspiratory gas flow rate, the amount of gas delivered per minute to a patient's lungs by mechanical ventilation.

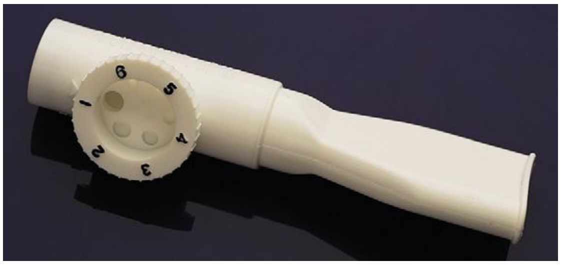
inspiratory hold, either of two kinds of modification in an inhalation produced by intermittent positive-pressure breathing: (1) a pressure hold, in which a preset pressure is reached and held for a designated period, or (2) a volume hold, in which a predetermined volume is delivered and then held for a designated period.

inspiratory muscle fatigue, weakness or exhaustion of the muscles that produce inspiration, resulting in a condition of threatened acute respiratory failure.

inspiratory reserve volume (IRV), the maximum volume of gas that can be inhaled beyond a normal resting inspiration.

inspiratory resistance muscle training, exercises that require inhalation against some type of resisting force. An example of such training is abdominal breathing practice with the Pflex or threshold inspiratory muscle trainer. The amount of resistance is gradually increased over several weeks of abdominal muscle training. Resistance may also be used against expansion of the rib cage by the intercostal musculature during inspiration. The resistance may be provided by a therapist pushing against the ribs or by applying a belt or swathe tightly about the costal margin.

inspiratory waveform, one of several flow patterns during inspiration associated with mechanical ventilation. These patterns include a square wave, in which the inspiratory flow rises rapidly to a preset level and stays at that level until expiration begins; a sinusoidal wave, in which the flow gradually increases and decreases throughout inspiration; and a descending ramp wave, in which the flow increases very rapidly and then decreases gradually until the end of inspiration. The last pattern is most similar to normal breathing.



Inspiratory muscle trainer
(Courtesy of Philips Respironics, Inc.)

inspire. See **inhale.**

inspirometer /in′spirom′ətər/ [L, *inspirare,* to breathe in; Gk, *metron,* measure], an apparatus used to measure the volume, force, and frequency of a patient's inspirations.

inspissate /inspis′āt/ [L, *inspissare,* to thicken], (of a fluid) to thicken or harden through the absorption or evaporation of liquid, such as milk in an inspissated milk duct. **—inspissation,** *n.*

instillation /in′stilā′shən/ [L, *instillare,* to drip], **1.** a procedure in which a fluid is slowly introduced into a cavity or passage of the body and allowed to remain for a specific length of time before being drained or withdrawn. It is performed to expose the tissues of the area to the solution, to warmth or cold, or to a drug or substance in the solution. **2.** a solution so introduced. Compare **infusion, injection, insufflate. —instill,** *v.*

instinct /in′stingkt/ [L, *instinctus,* impulse], an inborn psychological need, such as life instincts of hunger, thirst, and sex, as well as the destructive and aggressive death instincts.

instinctive reflex. See **unconditioned response.**

institutionalism syndrome /in′stityo͞o′shənəliz′əm/, a condition characterized by apathy, withdrawal, submissiveness, and lack of initiative. A patient with this syndrome may resist leaving a hospital, even when the surroundings are barely adequate, because it is familiar and predictable and demands are minimal.

institutionalize /in′stityo͞o′shənəlīz′/ [L, *instituere,* to put in place], to place a person in an institution for psychological or physical treatment or for the protection of the person or society. **—institutionalization,** *n.,* **institutionalized,** *adj.*

institutional licensure /in′stityo͞o′shənəl/ [L, *instituere,* to put in place, *licere,* to be permitted], a procedure in which individual licensure for health professions would be abandoned and the responsibility for assessing professional competence would fall to the health care facility where the health professional is used. Proponents of the procedure maintain that health needs would be better and more flexibly served. Opponents maintain that knowledge, judgment, and competency are the products of a good basic education in the profession and that educators cannot teach the profession without a set of standardized expectations, as are now provided by government-controlled licensing procedures and certifying examinations. In addition, health care facilities may not have the expertise or resources necessary to evaluate the various kinds of health care providers.

institutional review board (IRB), an organizational committee that reviews and approves biomedical research that uses humans as subjects.

instructive series, a test consisting of a series of x-ray films performed on the abdomen of patients with suspected bowel obstruction, paralytic ileus, perforated viscus, abdominal abscess, kidney stones, appendicitis, or foreign body ingestion.

instrument /in′strəmənt/ [L, *instrumentum,* tool], a surgical tool or device designed to perform a specific function, such as cutting, dissecting, grasping, holding, retracting, or suturing. Surgical instruments are usually made of steel and are specially treated to be durable, heat-resistant, rust-resistant, and stain-proof. Some kinds of instruments are **clamp, needle holder, retractor,** and **speculum.**

instrumental activities of daily living (IADL) /in′strəmen′təl/, the activities often performed by a person who is living independently in a community setting during the course of a normal day, such as managing money, shopping, telephone use, travel in community, housekeeping, preparing meals, and taking medications correctly. Increasing inability to perform IADLs may result in the need for care facility placement. Compare **activities of daily living.**

instrumental conditioning. See **operant conditioning.**

instrumental labor [L, *instrumentum,* tool, *labor,* work], child delivery in which the use of instruments, such as forceps or perforators, is required.

instrumentation /in′strəməntā′shən/, the use of instruments for treatment and diagnosis.

insufficiency /in′səfish′ənsē/ [L, *in,* not, *sufficere,* to be adequate], inability to perform a necessary function adequately. Some kinds of insufficiencies are **adrenal insufficiency, aortic insufficiency, ileocecal insufficiency, pulmonary insufficiency,** and *valvular insufficiency*.

insufficient sleep syndrome /in′səfish′ənt/, a neurological disorder in which individuals persistently fail to obtain enough sleep to support normal wakefulness.

insufflate /in′səflāt, insuf′lāt/ [L, *insufflare,* to blow into], to blow a gas or powder into a tube, cavity, or organ to allow visual examination, to remove an obstruction, or to apply medication. See also **Rubin's test. —insufflation,** *n.*

insufflator /in′səflā′tər/ [L, *insufflare,* to blow into], an apparatus used to blow air or gas into a body cavity.

insul-, prefix meaning "island or island-shaped": *insula, insulin, insuloma*.

insulation /in′səlā′shən/, a nonconducting substance that offers a barrier to the passage of heat or electricity.

insulin /in′səlin/ [L, *insula,* island], **1.** a naturally occurring polypeptide hormone secreted by the beta cells of the islets of Langerhans in the pancreas in response to increased levels of glucose in the blood as well as to the parasympathetic nervous system and other stimuli. The hormone acts to regulate the metabolism of glucose and the processes necessary for the intermediary metabolism of fats, carbohydrates, and proteins. Insulin lowers the blood glucose level and promotes transport of glucose into the muscle cells and other tissues. Inadequate secretion of insulin causes elevated blood glucose and triglyceride levels and ketonemia, as well as the characteristic signs of diabetes mellitus, including increased desire to eat, excessive thirst, increased urination, and eventually lethargy and weight loss. Uncorrected severe deficiency of insulin is incompatible with life. Normal findings of insulin assay in adults are levels of 5 to 24 mmU/mL. **2.** a pharmacological preparation of the hormone administered in treating diabetes mellitus. The various preparations of insulin available for prescription vary in onset, intensity, and duration of action. Animal source insulins, pork and beef, have been discontinued in the U.S. market. Human insulin is derived by recombinant DNA technology and is termed quick acting, intermediate acting, or long acting. Most replacement insulin is given by subcutaneous injection in individualized dosage schedules and insulin pumps, but insulin also can be replaced intravenously. Adverse reactions include hypoglycemia and insulin shock that result from excess dosage and hyperglycemia and diabetic ketoacidosis from inadequate dosage. Fever, stress, infection, pregnancy, surgery, and hyperthyroidism may significantly increase insulin requirements; liver disease, hypothyroidism, vomiting, and renal disease may decrease them. Blood tests for glucose and ketones are performed to determine the need for adjustment of the dosage or of the schedule of administration. See also **human insulin.**

insulin allergy, a hypersensitivity reaction to insulin, usually a reaction to its protein components. More purified insulins have now been developed that are less likely to cause an allergic reaction and other complications. Human insulin, prepared by recombinant genetic engineering, eliminates many problems associated with repeated insulin injections because of reduced antibody concentrations.

insulin antibody test, a blood test used to detect the presence of insulin antibodies, which develop in nearly all patients treated with exogenous insulin. These antibodies may reduce the amount of insulin available for glucose metabolism and may contribute to insulin resistance. See also **blood glucose test, fasting plasma glucose.**

insulinase, an enzyme that inactivates insulin.

Insulins

Type	*Description*	*Effect on blood glucose (time after administration)*		
		Onset	*Peak*	*Duration*
Ultra-short acting	Clear	15 min	1 hr	4-5 hr
Short acting				
Regulate (crystalline zinc)	Clear	30-60 min	2 to 4 hr	6 to 8 hr
Semilente (SL)	Cloudy: amorphous insulin zinc suspension, no protamine	1 hr	4 to 6 hr	12 to 16 hr
Intermediate acting				
NPH	Cloudy: crystalline zinc insulin suspension, 50% saturated with protamine	2 to 3 hr	8 to 12 hr	18 to 24 hr
Lente	Cloudy: mixture 30% SL +70% UL, no protamine	2 to 3 hr	8 to 12 hr	18 to 24 hr
Long acting				
PZI	Cloudy: excess protamine	6 hr	14 to 20 hr	24 to 36 hr
Ultralente (UL)	Cloudy: crystalline insulin suspension, high zinc content, no protamine	6 hr	16 to 18 hr	30 to 36 hr

insulin aspart, a rapid-acting analog of human insulin created by recombinant DNA technology, in which an aspartate residue has been substituted for the usual proline at position 28 on the insulin B chain. It is administered subcutaneously for the treatment of diabetes mellitus.

insulin assay, a blood test used to diagnose insulinoma (tumor of the islets of Langerhans) and to evaluate patients with fasting hypoglycemia. It is often combined with a fasting plasma glucose test to increase its diagnostic value.

insulin-dependent diabetes mellitus. See **type 1 diabetes mellitus.**

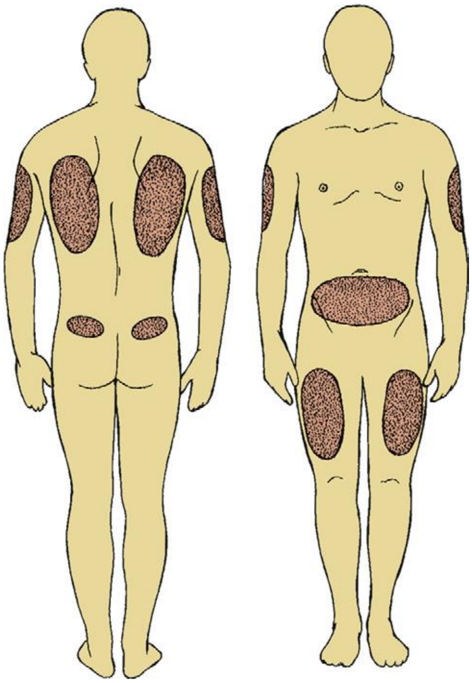
insulinemia /in′səlinēmē·ə/ [L, *insula,* island; Gk, *haima,* blood], an abnormally high level of insulin in the blood.

insulin glargine, an analog of human insulin produced by recombinant DNA technology, differing from human insulin in that the asparagine at position A21 is replaced by glycine and two arginines are added to the C-terminus of the B-chain. It is administered subcutaneously for once-daily insulin replacement therapy.

insulin human zinc suspension, an intermediate-acting insulin consisting of a sterile suspension of human insulin in buffered water with the addition of a suitable zinc salt such that the solid phase of the suspension contains a 7:3 ratio of crystalline to amorphous insulin. It is administered subcutaneously.

insulin hypoglycemic test, a postoperative procedure for determining the completeness of vagotomy for peptic ulcer disease. Insulin is administered to cause hypoglycemia. If vagotomy is complete, the acid output from the stomach should be less than before surgery.

insulin injection sites, body tissue areas that allow optimal use of subcutaneous injections of insulin. The choice of sites can affect the rate of absorption and peak action times, but repeated use of the same injection site can lead to localized tissue damage, resulting in malabsorption of insulin. These problems are minimized by systematic rotation of injection sites within the selected anatomical area.



Insulin injection sites *(Potter et al, 2011)*

insulin kinase, an enzyme, assumed to be present in the liver, that activates insulin.

insulin-like growth factor (IGF), hormones that stimulate protein synthesis and sulfation. IGF I and II play a role in uterine and placental growth and early fetal growth during pregnancy. IGF I is also called **somatomedin C.**

insulin lipodystrophy [L, *insula,* island; Gk, *lipos,* fat; *dys,* bad, *trophe,* nourishment], the loss of local fat deposits in patients with diabetes as a complication of repeated insulin injections into the same subcutaneous tissue.

insulin lispro, a pancreatic hormone.

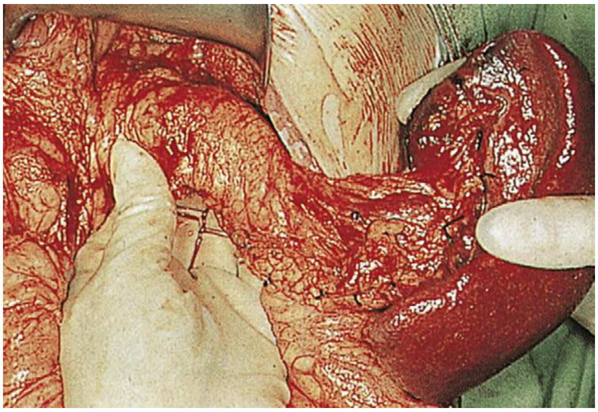
■ INDICATIONS: It is used to treat ketoacidosis types I and II and types 1 and 2 diabetes mellitus.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to protamine prohibits its use.

■ ADVERSE EFFECTS: Anaphylaxis is a life-threatening effect of this drug. Other adverse effects include blurred vision, dry mouth, flushing, rash, urticaria, warmth, lipohypertrophy, swelling, redness, and rebound hyperglycemia (the Somogyi effect). Lipodystrophy and hypoglycemia are common side effects.

insulinogenic /in′səlin′ōjen′ik/ [L, *insula* + Gk, *genein,* to produce], promoting the production and release of insulin by the islets of Langerhans in the pancreas.

insulinoma /in′səlinō′mə/ *pl.* **insulinomas, insulinomata** [L, *insula* + Gk, *oma,* tumor], a tumor, usually benign, of the insulin-secreting cells of the islets of Langerhans. Surgical resection of the tumor may be possible, thus limiting the development of hypoglycemia. Also called **insuloma, islet cell adenoma.** Compare **islet cell tumor.**



Insulinoma *(Greig and Garden, 1996)*

insulin pump [L, *insula,* island; ME, *pumpe*], a portable battery-powered instrument that delivers a measured amount of insulin through the abdominal wall. It can be programmed to deliver varied doses of insulin according to the body's needs at the time.

insulin reaction, the adverse effects caused by excessive levels of circulating insulin causing hypoglycemia. See also **hyperinsulinism.**

insulin rebound, extreme fluctuations in blood glucose levels as a result of overreaction of the body's homeostatic feedback mechanisms for control of glucose metabolism. When exogenous insulin is given, the hypoglycemia triggers an outpouring of glucagon and epinephrine, both of which raise the blood glucose concentration markedly, so that, although the patient may actually have periods of hypoglycemia, urine and blood glucose tests will show hyperglycemia.

Insulin infusion pump *(Courtesy of Animas Corporation)*

Treatment is aimed at modifying the extremes by gradually lowering the insulin dosage so as to reduce stimulation of the feedback system of glucose regulation. The patient may need to take smaller doses of insulin or take it at more frequent intervals and at different times during the day.

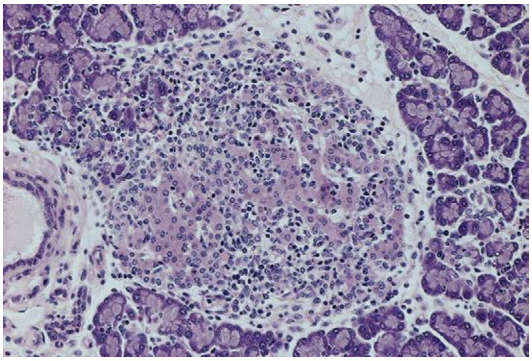
insulin resistance, a cause of type 2 diabetes mellitus characterized by a need for an increased amount of insulin per day to control hyperglycemia and ketosis. It is associated with decreased or ineffective glucose transporter proteins with insulin-sensitive cells or insulin-binding by high levels of antibody. Insulin-resistant states also may occur with acanthosis nigrans, Werner's syndrome, ataxia telangiectasia, Alström syndrome, pineal hyperplasia syndrome, and various lipodystrophic disorders.

insulin shock, a condition of severe hypoglycemia caused by an overdose of insulin, decreased intake of food, or excessive exercise. It is characterized by sweating, trembling, chilliness, nervousness, irritability, hunger, hallucination, numbness, and pallor. Uncorrected, it progresses to convulsions, coma, and death. Treatment requires an immediate dose of glucose orally or parenterally or glucagon IM or IV. Persons with insulin-treated diabetes mellitus should wear a bracelet (Medic-Alert) that indicates that they have the disease. Compare **diabetic coma, ketoacidosis.**

insulin tolerance test, a test of the body's ability to use insulin, in which insulin is given and blood glucose is measured at regular intervals. Thirty minutes after the insulin is administered, blood glucose level is usually lower but not less than half of the fasting glucose level. Glucose levels usually return to normal after about 90 minutes. In people who have hypoglycemia, the glucose levels may drop lower and be slower to return to normal.

insulintropin /in′səlintrop′in/ [L, *insula,* island], a naturally occurring hormone produced in the intestines when food is ingested. It causes the release of insulin from the pancreas, which in turn regulates blood glucose levels. It has been administered to patients with type 2 diabetes but is not useful in its present form in the treatment of patients with type 1 diabetes, in whom the pancreas does not secrete insulin.

insulitis /in′səlī′tis/, a lymphocytic infiltration of the pancreatic beta cells in the islets of Langerhans. The condition is associated with the development of type 1 diabetes mellitus. Also called **isletitis.**



Insulitis *(Kumar et al, 2010/Courtesy Dr. Arthur Like, University of Massachusetts, Worchester, Massachusetts)*

insuloma. See **insulinoma.**

insurance authorization, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient and provider to secure payment for health services or equipment from a third party. See also **Nursing Interventions Classification.**

intake [L, *in,* within; AS, *tacan,* to take], **1.** the process in which a person is admitted to a clinic or hospital or is signed in for an office visit. The reason for the visit and various identifying data about the patient are noted. Certain routine preliminary procedures may be performed, such as obtaining a blood pressure reading or a urine specimen. In some clinical settings the intake may also include obtaining such additional information as the patient's basic health history and previous source of care. **2.** (in nursing) the amount of food or fluid ingested or infused in a given period. Intake is measured and noted in milliliters or grams per 8-, 12-, or 24-hour period.

Intal, a trademark for an antiasthmatic mast cell inhibitor agent **(cromolyn sodium).**

integral dose /in′təgrəl/ [L, *integrare,* to make whole; Gk, *dosis,* giving], the total amount of energy absorbed by a patient or object during exposure to radiation. Also called **volume dose.**

integrate. See **integration.**

integrated circuit, a circuit, such as a computer chip, whose components are fabricated on a single semiconductor substrate.

Integrated Group Without Walls /in′təgrā′tid/, a network of physicians who have merged legally but continue to practice individually. Selected functions, such as information management, are centralized.

Integrated Health Care Delivery System, a managed care system in the United States that includes a hospital organization that provides acute patient care, a multispecialty medical care delivery system, the capability of contracting for any other needed services, and a payer. Services are provided to enrollees of the health plan.

Integrated Multispecialty Group, a managed care system similar to a single-specialty medical group, except that various specialties and usually primary care are also provided. Also called **Multispecialty Medical Group.**

integrated system, **1.** (in managed care) a legal partnership between groups of physicians and hospitals that contract and share risk while working together. It may include foundations, management service organizations, and physician-hospital organizations. **2.** a group of interconnected units that form a functioning computer system.

integrating dose meter /in′təgrā′ting/, a device that measures the total amount of radiation administered to a patient during a radiotherapy exposure. It is usually placed on the patient's skin and may terminate the exposure when the desired amount is reached.

integration /in′təgrā′shən/ [L, *integrare,* to make whole], **1.** the act or process of unifying or bringing together. **2.** (in psychology) the organization of all elements of the personality into a coordinated functional whole that is in harmony with the environment, one of the primary goals in psychotherapy. It involves the assimilation of insight and the coordination of new and old data, experiences, and emotional reactions so that an effective change can occur in behavior, thinking, or feeling. See also **insight.** **—integrate,** *v.*

integration of self, one of the components of high-level wellness. It is a prerequisite for the achievement of maturity and is characterized by the integration of mind, body, and spirit into one harmoniously functioning unit.

integrin /integ′rin/, **1.** a protein that links the outside of a cell with its interior. **2.** a heterodimeric molecule involved in cell-substate and cell-cell adhesion.

integument /integ′yo͞omənt/ [L, *integumentum,* a covering], a covering or skin. **—integumentary,** *adj.*

integumentary system /integ′yəmen′tərē/, the skin and its appendages, hair, nails, and sweat and sebaceous glands.

integumentary system assessment, an evaluation of the general condition of a patient's integument and of factors or abnormalities that may contribute to the presence of a dermatological disorder.

■ METHOD: The patient is asked to supply subjective information about itching, pain, rashes, blisters, or boils; whether the skin usually is dry, oily, thin, rough, bumpy, or puffy; or whether it feels hot or cold, peels, changes in color, or is marked with dark liver (aging) spots. Objective information is gleaned from inspecting the skin. Observations are made of the intactness, turgor, elasticity, temperature, cleanliness, odor, wetness or dryness, and color of the skin. Cyanosis of the lips, circumoral area, mucous membranes, earlobes, or nailbeds; jaundice of the sclera; paleness of conjunctivae; and distribution of pigment are noted. Evidence of rashes, edema, needle marks, insect bites, scabies, acne, sclerema, decubiti, uremic frost on the beard or eyebrows, or pressure areas over bony prominences is recorded. The nails are examined for brittleness, lines, a convex ram's horn or concave spoon shape, and the condition of surrounding tissue, including clubbing of the fingers and toes. The existence and characteristics of lesions such as maculae, papules, vesicles, pustules, bullae, hives, warts, moles, ulcers, scars, keloids, petechiae, lipomas, crusts of dried exudate, flakes of dead epidermis, excoriations, blackheads, and chancres are noted. The patient's exposure to parasites, to internal allergens in food and drugs, and to external allergens in cosmetics, soaps, topical medication, and plants, as well as a family history of allergies, is investigated, as well as currently used medication, creams, lotions, ointments, hygienic measures, and sexual practices. Diagnostic aids contributing to the evaluation are skin and lesion cultures, punch biopsies, skin tests for allergies, a lupus erythematosus preparation, and a blood culture.

■ NURSING INTERVENTIONS: The nurse conducts the interview to obtain subjective data on the patient's condition, makes the necessary observations, and assembles the background information and results of the diagnostic tests.

■ OUTCOME CRITERIA: A well-conducted assessment of the patient's integument is a valuable aid in diagnosing a dermatological disorder or a disease with dermatological manifestations, such as palmar rash in syphilis.

intellect /in′təlekt/ [L, *intellectus,* perception], **1.** the power and ability of the mind for knowing and understanding, as contrasted with feeling or with willing. **2.** a person possessing a great capacity for thought and knowledge. **—intellectual,** *adj., n.*

intellectualization /in′təlek′cho͞o·əlīzā′shən/ [L, *intellectus* + Gk, *izein,* to cause], **1.** (in psychiatry) a defense mechanism in which reasoning is used as a means of blocking a confrontation with an unconscious conflict and the emotional stress associated with it. **2.** the overuse of abstract thinking or generalizations to control or minimize painful feelings.

intelligence /intel′ijəns/ [L, *intelligentia,* perception], **1.** the potential ability to acquire, retain, and apply experience, understanding, knowledge, reasoning, and judgment in coping with new experiences and in solving problems. **2.** the manifestation of such ability. See also **intelligence quotient.** **—intelligent,** *adj.*

intelligence quotient (IQ), a numeric expression of a person's intellectual level as measured against the statistical average of his or her age group. On several of the traditional scales, it is determined by dividing the mental age, derived through psychological testing, by the chronological age and multiplying the result by 100. Average IQ is considered to be 100. Compare **achievement quotient.** See also **accomplishment quotient.**

intelligence test, any of a variety of standardized tests designed to determine the mental age of an individual by measuring the relative capacity to absorb information and to solve problems. Compare **achievement test, aptitude test, personality test, psychological test.**

intelligent. See **intelligence.**

intelligent terminal, a computer terminal that can function as a processing device in addition to providing input/output facilities, whether operated independently or connected to a main computer.

intemperance /intem′pərəns/ [L, *in,* not, *temperare,* to moderate], excessive indulgence in eating, drinking, or other life style functions.

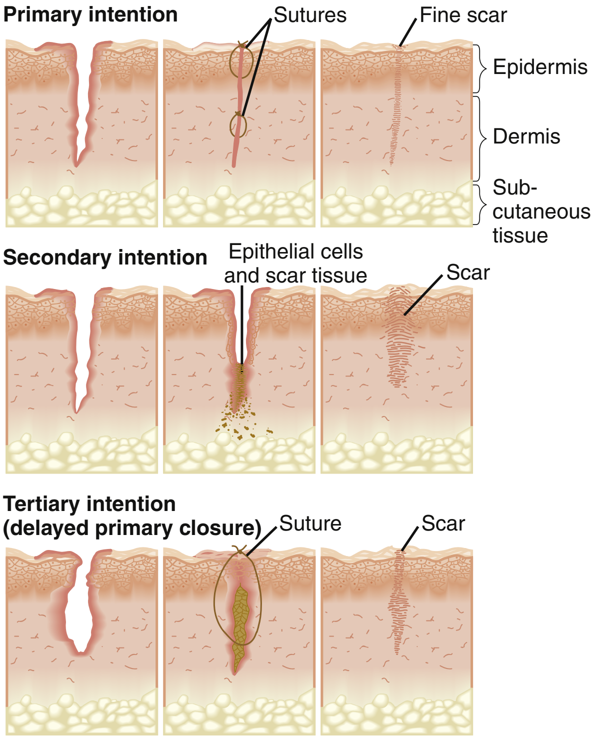
intensifying screen /inten′sifī′ing/ [L, *intensus,* tighten, *facere,* to make; ME, *screne*], a device consisting of fluorescent material, which is placed in contact with the film in a radiographic cassette. Radiation interacts with the fluorescent phosphor, releasing light photons. These photons expose the film with greater efficiency than would the radiation alone. Thus patient exposure to radiation can be reduced.

intensity-modulated radiation therapy (IMRT), a specialized method of delivering radiation so that the beam enters the body from many different angles to get to the tumor with pinpoint accuracy while sparing much of the surrounding healthy tissue.

intensive care /inten′siv/ [L, *intensus,* tighten, *garrire,* to chatter], constant complex health care as provided in various acute life-threatening conditions such as multiple trauma, severe burns, or myocardial infarction or after certain kinds of surgery. Care is most frequently given by specially trained personnel in a unit equipped with various technologically sophisticated machines and devices for treating and monitoring the condition of the patient. Also called **critical care.**

intensive care unit (ICU), a hospital unit in which patients requiring close monitoring and intensive care are kept. An ICU contains highly technical and sophisticated monitoring devices and equipment and is staffed by personnel trained to deliver critical care. A large tertiary care facility usually has separate units specifically designed for the intensive care of adults, infants, children, or newborns or for other groups of patients requiring a certain kind of treatment. See also **coronary care unit.**

intention /inten′shən/ [L, *intendere,* to aim], a kind of healing process. Healing by **primary intention** is the initial union of the edges of a wound, progressing to complete healing without granulation. Healing by **secondary intention** is wound closure in which the edges are separated, granulation tissue develops to fill the gap, and epithelium grows in over the granulations, producing a scar. Healing by **tertiary intention** is wound closure in which granulation tissue fills the gap between the edges of the wound, with epithelium growing over the granulation at a slower rate and producing a larger scar than the scar resulting from healing from secondary intention. Suppuration is also usually found.



Intention *(Black and Hawks, 2009)*

intentional additives, substances that are deliberately added in the manufacture of food or pharmaceutic products to improve or maintain flavor, color, texture, or consistency or to enhance or conserve nutritional value. Compare **incidental additives.**

Intentional Relationship Model (IRM), model developed by Renee Taylor, Ph.D., which involves 6 modes of interpersonal styles that are used in therapeutic relationships; modes include advocating, empathizing, collaborating, problem-solving, encouraging, and instructing.

intention tremor, fine, rhythmic, purposeless movements that tend to increase during voluntary movements. Compare **resting tremor.** See also **tremor.**

inter-, prefix meaning "situated, formed, or occurring between": *interacinar, intercalary, intercartilaginous.*

interacting systems framework, former name for the general systems framework and theory of goal attainment.

interactional model /-ak′shənəl/ [L, *inter,* between, *agere,* to do], a therapy model that views the family as a communication system comprising interlocking subsystems of family members. Family dysfunction occurs when the rules governing family interaction become vague and ambiguous. The therapeutic goal is to help the family clarify the rules governing their relationships.

interactionist theory /-ak′shənist/, an aging theory that views age-related changes as resulting from the interactions among the individual characteristics of the person, the circumstances in society, and the history of social interaction patterns of the person.

interaction processes, a component of the theory of effective practice. The processes consist of a series of interactions between a nurse and a patient. The series occurs in a sequence of actions and reactions until the patient and the nurse both understand what is wanted and the desired behavior or act is achieved.

interaction theory. See **communication theme.**

interactive guided imagery, the focusing of a patient's attention on a target visual stimulus to produce a specific physiological change that can promote healing. Imagery is effective in almost all of the major physiological systems of the body, including respiration, heart rate, blood pressure, metabolic rates in cells, gastrointestinal mobility and secretion, sexual function, cortisol levels, blood lipids, and immune responsiveness.

interactive terminal /-ak′tiv/, a data-processing terminal that is integrated into a system to allow two-way communication between the user and the system. Also called *interactive system,* **user interaction.**

interalveolar /-alvē′ələr/ [L, *inter,* between, *alveolus,* little hollow], pertaining to the area between alveoli.

interalveolar septum, **1.** the tissue between adjacent pulmonary alveoli, consisting of a dense capillary network covered on both sides by thin alveolar epithelial cells. Also called **alveolar septum. 2.** a bony partition between adjacent tooth sockets.

interarticular /-ärtik′yələr/ [L, *inter,* between, *articulus,* joint], pertaining to the areas between two joints or between facing surfaces of a joint.

interarticular fibrocartilage [L, *inter* + *articulus,* joint], one of four kinds of fibrocartilage, consisting of flattened fibrocartilaginous plates between the articular cartilage of the most active joints, such as the sternoclavicular, wrist, and knee joints. The synovial surfaces extend over the fibrocartilaginous plates and attach to surrounding ligaments. The fibrocartilaginous plates absorb shocks and increase mobility. Compare **circumferential fibrocartilage, connecting fibrocartilage, stratiform fibrocartilage.**

interarytenoid fold, a fold of mucosa forming the base of the rima glottidis at the bottom of the interarytenoid notch.

interatrial /in′tər·ā′trē·əl/ [L, *inter,* between + *atrium,* hall], situated between the atria of the heart.

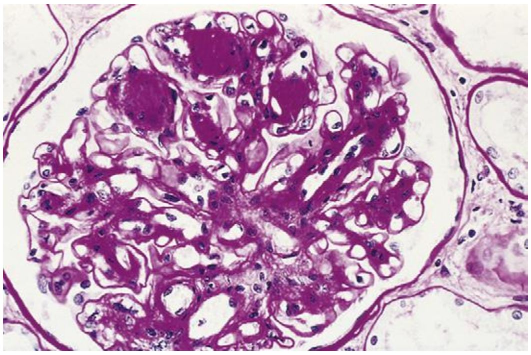
intercalary /intur′kəler′ē, in′tərkal′ərē/ [L, *intercalare,* to insert], occurring between two others, such as the absence of the middle part of a bone with the proximal and the distal parts present.

intercalate /intur′kəlāt/ [L, *intercalare*], to insert between adjacent surfaces or structures. **—intercalation,** *n.*

intercalated disks /in·tur′kə·lā·təd/, dense bands running between myocardial cells both transversely and longitudinally, forming a stepped configuration. They contain intercellular junctions that link adjacent cells both electrically and mechanically.

intercapillary /in′tər·kap′i·lar·ē/ [L, *inter,* between + *capillaris,* hairlike], among or between capillaries.

intercapillary glomerulosclerosis /-kap′iler′ē/ [L, *inter* + *capillaris,* hairlike, *glomerulus,* small ball; Gk, *sklerosis,* a hardening], an abnormal condition characterized by degeneration of the renal glomeruli. It is associated with diabetes and often produces albuminuria, nephrotic



Intercapillary glomerulosclerosis *(Kumar et al, 2010)*

edema, hypertension, and renal insufficiency. Also called **Kimmelstiel-Wilson syndrome.**

intercavernous sinuses /-kav′ərnəs/ [L, *inter,* between, *caverna,* cavity, *sinus,* curve], the cavities through which the cavernous sinuses of the dura mater communicate.

intercellular /-sel′yələr/ [L, *inter* + *cella,* storeroom], pertaining to the area between or among cells.

intercellular bridge, a structure that connects adjacent cells, occurring primarily in the epithelium and other stratified squamous epithelia. It consists of slender strands of cytoplasm that project from the surfaces of adjacent cells and merge at the desmosome. Also called **cytoplasmic bridge.**

interceptive orthodontics /in′tər·sep′tiv/, that phase of orthodontics concerned with elimination of a condition such as crossbite or spacing that might lead to the development of malocclusion.

intercerebral /-ser′əbrəl/ [L, *inter,* between, *cerebrum,* brain], pertaining to the area between the left and right cerebral hemispheres.

interchange. See **reciprocal translocation.**

interchondral articulation, the articulation of the cartilage of adjacent ribs, mainly between the costal cartilages of ribs VII to X but sometimes involving the costal cartilages of ribs V and VI. Interchondral joints provide indirect anchorage to the sternum and contribute to the formation of a smooth inferior costal margin. They are usually synovial, and the thin fibrous capsules are reinforced by interchondral ligaments.

interclavicular /-kləvik′yələr/ [L, *inter,* between, *clavicula,* little key], pertaining to the area between the clavicles.

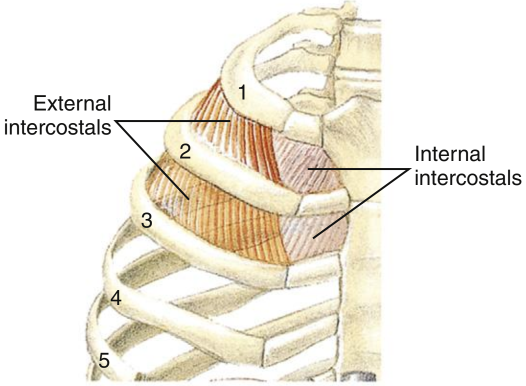
interconceptional gynecological care /-kənsep′shənəl/ [L, *inter* + *concipere,* to take in], health care of a woman during her reproductive years, between pregnancies, and 6 weeks after delivery. Screening tests for cervical cancer, breast and pelvic examinations, evaluation of general health, and laboratory determination of glucosuria and proteinuria and of the hematocrit or hemoglobin are common and routine aspects of interconceptional care. Testing and treatment for pelvic, vaginal, or genital infections may be required. A contraceptive method may also be discussed, taught, prescribed, or provided. Ordinarily the basic examination is performed annually. The method of contraception may be adjusted or changed at interim visits. Infections or other complaints are investigated, diagnosed, and treated as symptoms appear. Interconceptional care is increasingly given by nurse practitioners or nurse midwives who follow protocols for treatment and referral formulated in consultation with a supervising gynecologist.

intercondylar fracture /-kon′dilər/ [L, *inter* + Gk, *kondylos,* knuckle], a longitudinal fracture of the humerus between its two condyles.

intercostal /-kos′təl/ [L, *inter* + *costa,* rib], pertaining to the space between two ribs.

intercostal bulging, the visible expansion of the soft tissues between the ribs that occurs when increased expiratory effort is needed to exhale, as in asthma, cystic fibrosis, or obstruction of an airway by a foreign body. Compare **retraction of the chest.**

intercostal muscles, the muscles between adjacent ribs. They are designated as external and internal and function as secondary ventilatory muscles.



Intercostal muscles *(Thibodeau and Patton, 2003)*

intercostal neuralgia, pain in the intercostal spaces of the chest wall, involving intercostal nerves.

intercostal node, a node in one of three groups of thoracic parietal lymph nodes situated near the dorsal parts of the intercostal spaces. The nodes are associated with lymphatic vessels that drain the posterolateral area of the chest. The efferent vessels from the nodes in the caudal four or five spaces form a descending trunk that opens into the dilated origin of the thoracic duct. The efferent vessels from the nodes in the upper intercostal spaces on the left side connect with the thoracic duct. Those on the right side end in the right lymphatic duct. Compare **diaphragmatic node, sternal node.** See also **lymphatic system, lymph node.**

intercostal space [L, *inter,* between, *costa,* rib, *spatium*], the region between the ribs.

intercostobrachial nerve, a branch of the second intercostal nerve that contributes to cutaneous innervation of the medial surface of the upper arm.

intercourse. See **coitus.**

intercristal /-kris′təl/ [L, *inter* + *crista,* ridge], pertaining to the space between two crests.

intercurrent disease /-kur′ənt/ [L, *intercurrere,* to run between], a disease that develops in and may alter the course of another disease.

interdental canal /-den′təl/ [L, *inter* + *dens,* tooth], any one of the nutrient channels that pass upward to the teeth through the body of the mandible. Also called **nutrient canal.**

interdental gingiva, the supporting gingival tissues, containing prominent horizontal collagen fibers, that normally fill the space between two approximating teeth. Also called **gingival papilla.**

interdental groove, a linear vertical depression on the surface of the interdental papillae, which functions as a channel for the egress of food from the interproximal areas.

interdental spillway, a channel formed by the interproximal contours of adjoining teeth and their investing tissues.

interdependent intervention. See **intervention.**

interdigestive migrating motor complex /-dijes′tiv/, a pattern of small bowel cyclic motor activity that follows completion of food digestion and absorption. It consists of periods of inactivity alternating with segmental or propulsive contractions.

interdigestive period, a period of relative inactivity in the alimentary tract between two periods of digestive activity.

interest tests, psychological tests designed to clarify an individual's vocational potential or to compare an individual's performance with the average scores of a specific population.

interface /in′tərfās/ [L, *inter* + *facies,* face], **1.** the connection between different elements of a computer system or between different computers. **2.** the method by which a computer user interacts with a computer system as displayed on a monitor screen, such as a graphical user interface.

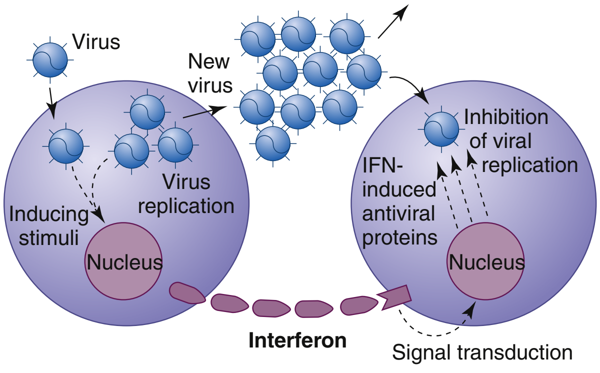
interfemoral /in′tərfem′ərəl/ [L, *inter,* between + *femur,* thigh], between the thighs.

interference /-fir′əns/ [L, *inter* + *ferire,* to strike], the effect of a component on the accuracy of measurement of the desired analyte.

interferent /-fir′ənt/ [L, *inter* + *ferire,* to strike], any chemical or physical phenomenon that can interfere with or disrupt a reaction or process.

interferential current therapy /-fərən′shəl/, a form of electrical stimulation therapy using two or three distinctly different currents that are passed through a tissue from surface electrodes. Portions of each current are canceled by the other, resulting in the application of a different net current to the target tissue.

interferon /-fir′on/ [L, *inter* + *ferire,* to strike], a natural glycoprotein formed by cells exposed to a virus or another foreign particle of nucleic acid. It induces the production of translation inhibitory protein (TIP) in noninfected cells. TIP blocks translation of viral RNA, thus giving other cells protection against both the original and other viruses. Interferon is species specific.



Mechanisms of action of interferon *(Lewis et al, 2011)*

interferon alfa-2a, a synthetic form of interferon-α produced by recombinant technology that acts as a biological response modifier, used as an antineoplastic in the treatment of hairy cell leukemia and AIDS-related Kaposi's sarcoma. It is administered intramuscularly or subcutaneously.

interferon alfa-2a, recombinant, a parenteral antineoplastic drug.

■ INDICATIONS: It is administered in the treatment of AIDS-related Kaposi's sarcoma, hairy cell and chronic myelogenous leukemia, and chronic hepatitis C. It also has a variety of unlabeled or investigational uses.

■ CONTRAINDICATIONS: Caution is recommended in prescribing this product for patients with severe cardiovascular disease.

■ ADVERSE EFFECTS: Among reported adverse effects are influenza-like symptoms, particularly at the beginning of therapy with the drug; confusion; dizziness; nervousness; depression; anorexia; nausea; vomiting; diarrhea; throat inflammation; dry and itching skin; alopecia; diaphoresis; blood pressure changes; and tachycardia.

interferon alfa-2b, a synthetic form of interferon-α produced by recombinant technology that acts as a biological response modifier, used in the treatment of venereal warts, hepatitis B, chronic hepatitis C, and as an antineoplastic in the treatment of hairy cell leukemia, malignant melanoma, non-Hodgkin's lymphomas, multiple myeloma, mycosis fungoides, and AIDS-related Kaposi's sarcoma. It is administered intramuscularly, subcutaneously, or intralesionally.

interferon alfa-2b, recombinant, a parenteral antineoplastic drug with indications, contraindications, and adverse effects similar to those of **interferon alfa-2a, recombinant.**

interferon alfacon-1, a recombinant type 1 interferon.

■ INDICATIONS: It is used to treat chronic hepatitis C infections. It is being used investigationally to treat hairy cell leukemia in combination with granulocyte colony–stimulating factor.

■ CONTRAINDICATIONS: Hypersensitivity to alpha interferons or to products derived from ***Escherichia coli*** prohibit its use.

■ ADVERSE EFFECTS: Life-threatening effects include granulocytopenia, thrombocytopenia, and leukopenia. Other adverse effects include headache, rigors, insomnia, dizziness, nausea, diarrhea, anorexia, vomiting, constipation, hemorrhoids, decreased salivation, musculoskeletal pain, dysmenorrhea, vaginitis, menstrual disorders, alopecia, pruritus, rash, erythema, tinnitus, earache, conjunctivitis, eye pain, granulocytopenia, ecchymosis, hypertension, palpitations, nervousness, depression, anxiety, emotional lability, abnormal thinking, upper respiratory infection, respiratory tract congestion, and bronchitis.

interferon alfa-n1 lymphoblastoid, a recombinant type 1 interferon.

■ INDICATION: It is used to treat chronic hepatitis C infections.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to alpha interferons and a history of anaphylactic reactions to bovine or ovine immunoglobulins, egg protein, polymyxin B, or neomycin sulfate.

■ ADVERSE EFFECTS: Life-threatening effects include granulocytopenia, thrombocytopenia, and leukopenia. Other adverse effects include ecchymosis and epistaxis. Common side effects include headache, fever, insomnia, dizziness, anxiety, hostility, lability, nervousness, depression, confusion, abnormal thinking, amnesia, abdominal pain, nausea, diarrhea, anorexia, vomiting, back pain, alopecia, pruritus, rash, erythema, dry skin, pharyngitis, upper respiratory infection, cough, dyspnea, and bronchitis.

interferon alfa-n3, a highly purified mixture of natural human interferon proteins that acts as a biological response modifier, used in the treatment of venereal warts. It is administered intralesionally.

interferon-alpha, cell-signaling glycoprotein (cytokine) produced by virus-induced lymphocyte cultures. It provides antiviral activity and activation of natural killer cells and is used to treat several types of neoplasms. Also spelled *interferon-alfa*.

interferon-beta, the major interferon produced by double-stranded RNA-induced fibroblast cultures. The major producer cells are fibroblasts, epithelial cells, and macrophages, and its major activity is antiviral.

interferon beta-1a, an antiviral and immune system regulator.

■ INDICATIONS: It is prescribed in the treatment of relapsing forms of multiple sclerosis. It can help reduce the number of neurological attacks and slow the progress toward physical disability.

■ CONTRAINDICATIONS: It should not be given to patients with allergy or sensitivity to interferon beta-1a or components of its formulation.

■ ADVERSE EFFECTS: The side effects most often reported include headache, muscle aches, chills, fever, weakness, and influenza-like symptoms.

interferon beta-1b, a synthetic modified form of interferon-beta produced by recombinant DNA techniques, used as a biological response modifier in the treatment of relapsing forms of multiple sclerosis. It is administered subcutaneously.

interferon beta-2, a cytokine derived from T cells that stimulate B cells to proliferate in vitro but, unlike B cell differentiation factors, does not stimulate antibody secretion.

interferon gamma, a small, species-specific glycoprotein produced by mitogen-stimulated T cells. It possesses antiviral activity and plays a central role in the immunoregulatory processes.

interferon gamma-1b, a synthetic form of interferon-beta produced by recombinant technology that acts as a biological response modifier and antineoplastic. It is used to reduce the frequency and severity of serious infections associated with chronic granulomatous disease; it is administered subcutaneously.

interferon nomenclature, a system recommended by the International Interferon Nomenclature Committee for identifying interferon compounds. For a specific interferon, the name consists of "interferon" followed by a Greek letter (spelled out), a dash, an arabic number, and a lowercase letter, as in **interferon alfa-2a.**

interfibrillar mass of Flemming, interfilar mass. See **hyaloplasm.**

interim rate /in′tərim/ [L, meanwhile, *ratum,* calculate], a method of third-party payment for costs of hospital services in which an amount is paid periodically pending an accounting of actual costs at the end of a designated period.

interior /in·tēr′ē·ər/ [L, inner], **1.** situated inside; inward. **2.** an inner part or cavity.

interiorization /intir′ē·ərīzā′shən/ [L, *interior,* inner; Gk, *izein,* to cause], the merging of reflex and cognitive processes as a response to the environment.

interior mesenteric artery [L, inner; Gk, *mesos,* middle, *enteron,* intestine, *arteria,* airpipe], a visceral branch of the abdominal aorta, arising just above the division into the common iliacs and supplying the left half of the transverse colon, all of the descending and iliac colons, and most of the rectum. It has left colic, sigmoid, and superior rectal branches.

interkinesis /in′tərkinē′sis, -kīnē′sis/ [L, *inter* + Gk, *kinein,* to move], the interval between the first and second nuclear divisions in meiosis. See also **interphase.**

interlace mode /-lās′/, a process whereby a conventional video camera tube produces 2 fields of 262.5 lines each in 17 ms to form a 525-line video frame in 33 ms. Each field represents repeated adjacent active traces and horizontal retraces of the electron beam across a video screen.

interleukin /-lo͞o′kin/, one of a large group of proteins produced mainly by T cells and in some cases by mononuclear phagocytes or other cells. Interleukins participate in communication among leukocytes and are important in the inflammatory response. Most interleukins direct other cells to divide and differentiate. Each acts on a particular group of cells that have receptors specific to that interleukin.

interleukin-1 (IL-1), a protein with numerous immune system functions, including activation of resting T cells, endothelial cells, and macrophages; mediation of inflammation; and stimulation of the synthesis of lymphokines, collagen, and collagenases. IL-1 can also induce fever, sleep, adrenocorticotropic hormone release, and nonspecific resistance to infection.

interleukin-2 (IL-2), a protein with various immunological functions, including the ability to initiate proliferation of activated T cells. IL-2 is used in the laboratory to grow T cell clones with specific helper, cytotoxic, and suppressor functions.

interleukin-3 (IL-3), an immune-response protein that supports the growth of pluripotent bone marrow stem cells and is a growth factor for mast cells.

interleukin-4 (IL-4), an immune-response protein that is a growth factor for activated B cells, resting T cells, and mast cells. Also called **B cell stimulating factor-1.**

interleukin-5 (IL-5), a cytokine produced by helper T cells. It stimulates B cells and eosinophils and facilitates the differentiation of B cells that secrete immunoglobulin A.

interleukin-6 (IL-6), a cytokine derived from fibroblasts, macrophages, and tumor cells. It is an antiviral protein that is also used in the treatment of some types of cancer. Also called **beta$_2$-interferon.**

interleukin-7 (IL-7), a cytokine produced by bone marrow stromal cells that causes lymphoid stem cells to differentiate into progenitor B and T cells and stimulates the killing of foreign cells by T cells and monocytes.

interleukin-8 (IL-8), a cytokine produced by various cell types involved in inflammation that attracts and activates neutrophils.

interleukin-9 (IL-9), a glycoprotein that helps induce the growth of some helper T cell clones but not of cytotoxic T cell clones.

interleukin-10 (IL-10), a protein expressed by CD4 and CD8 T cells, monocytes, macrophages, and activated B cells. It inhibits cytokine synthesis and suppresses the functions of macrophages and natural killer T cells.

interleukin-11 (IL-11), a cytokine produced by bone marrow stromal cells. It induces IL-6-dependent murine plasmacytoma cells to proliferate and plays an important role in early platelet hematopoiesis.

interleukin-12 (IL-12), a protein produced by activated T cells that stimulates cell-mediated killing by natural killer cells and lymphocytes. It promotes the maturation of cytotoxic T cells.

interleukin-13 (IL-13), a protein produced by activated T cells that inhibits inflammatory cytokine production by peripheral blood monocytes. It suppresses cell-mediated immune responses and promotes B cell differentiation.

interleukin-14 (IL-14), a protein produced by follicular dendritic cells, germinal T cells, and some malignant B cells. It enhances the proliferation of B cells and induces memory B cell production and maintenance.

interleukin-15 (IL-15), a growth factor that enhances peripheral blood T cell production.

interlobular arteries of kidney. See **cortical radiate arteries.**

interlobular duct /-lob′yələr/ [L, *inter* + *lobulus,* small lobe], any duct connecting or draining the lobules of a gland.

interlobular ductules, interlobular bile ducts; small channels between the hepatic lobules, draining into the biliary ductules.

interlobular emphysema. See **distal acinar emphysema.**

interlobular pleurisy, encysted pleurisy between the lobes of the lung. Also called *interlobitis.*

interlocked twins [L, *inter* + AS, *loc,* a fastening], monozygotic twins so positioned in the uterus that the neck of one becomes entwined with that of the other during presentation, making vaginal delivery impossible. Such interlocking occurs when one fetus is a breech presentation and the other a vertex presentation. Also called *interlocking twins.*

intermaxillary segment, median palatine process.

intermediary /-mē′dē·er′ē/ [L, *inter* + *mediare,* to divide], a private insurance company or public or private agency selected by health care providers to pay claims under the Medicare program.

intermediary metabolism [L, *inter,* between, *mediary,* to divide; Gk, *metabole,* change], the metabolic processes involved in the synthesis of cellular components between digestion of food and excretion of waste products.

intermediate-acting insulin [L, *inter* + *mediare,* to divide, *activus,* active], a preparation of synthetic human or pork insulin to which zinc has been added under specific chemical conditions that has an intermediate range of action. Neutral Protamine Hagedorn insulin starts to work about 60 to 90 minutes after injection, peaks 4 to 12 hours after injection, and lasts about 18 hours. Lente Insulin has a similar action time. See also **insulin.** Compare **long-acting insulin, short-acting insulin.**

intermediate care /-mē′dē·it/, **1.** a level of medical care for certain chronically ill or disabled individuals in which room and board are provided but skilled nursing care is not. Title XI of U.S. Medicaid legislation mandates standards and federal subsidies for intermediate care of the recipients of public assistance. **2.** a unit for patients who do not require intensive care but who are not yet ready to be kept in a regular medical-surgical unit.

intermediate care facility (ICF), a health facility that provides medically related services to persons with a variety of physical or emotional conditions requiring institutional facilities but without the degree of care provided by a hospital or skilled nursing facility. An example is an intermediate care facility for mentally retarded or other developmentally disabled persons.

intermediate care unit, a transitional unit for patients from critical care units that provides close monitoring and provision of noncritical care before discharge.

intermediate cell mass. See **nephrotome.**

intermediate column. See **lateral horn.**

intermediate cuneiform bone, the smallest of the three cuneiform bones of the foot, located between the medial and the lateral cuneiform bones. Also called **middle cuneiform bone, second cuneiform bone.**

intermediate-density lipoprotein (IDL), a lipid-protein complex with a density between those of very-low-density lipoprotein and low-density lipoprotein. The product has a relatively short half-life and is normally in the blood in very low concentrations. In a type III hyperlipoproteinemic state the IDL concentration in the blood is elevated.

intermediate disk. See **Z line.**

intermediate host, any animal in which the larval or intermediate stage of a parasite develops but does not sexually reproduce. Certain snails are intermediate hosts for liver flukes and schistosomes. Humans are intermediate hosts for malaria parasites. Also called **secondary host.** Compare **dead-end host, definitive host, reservoir host.** See also **host.**

intermediate left lateral flexure of rectum, the third bend of the rectum, where it deviates laterally to the left.

intermediate mass, the connecting mass of nervous tissue between two lobes of the diencephalon.

intermediate mesoderm. See **nephrotome.**

intermediate nerve, the smaller root of the facial nerve, lying between the main root and the vestibulocochlear nerve. It consists of parasympathetic and sensory fibers, and its branches supply the lacrimal, nasal, palatine, submandibular, and sublingual glands, as well as the anterior two thirds of the tongue.

intermenstrual /-men′stro͞o·əl/ [L, *inter* + *menstruum,* menstrual fluid], pertaining to the time between menstrual periods.

intermenstrual fever, the normal slight elevation of temperature that marks ovulation, usually occurring about 14 days before the onset of menses.

intermenstrual pain. See **mittelschmerz.**

intermittent /-mit′ənt/ [L, *inter* + *mittere,* to send], occurring at intervals; alternating between periods of activity and inactivity, such as rheumatoid arthritis, which is marked by periods of signs and symptoms followed by periods of remission.

intermittent acute porphyria. See **acute intermittent porphyria.**

intermittent assisted ventilation (IAV), a system of respiratory therapy in which assisted ventilation is combined with spontaneous breathing. Also called **intermittent demand ventilation.**

intermittent claudication. See **claudication.**

intermittent compression, external compression used to control and reduce accumulation of lymph in body tissues. Devices to provide intermittent compression in an on-off timing sequence include inflated pressure sleeves and linear compression pumps. Some devices provide cold temperatures with compression to assist in controlling edema. Intermittent compression is also used to decrease acute bleeding.

intermittent demand ventilation. See **intermittent assisted ventilation.**

intermittent explosive disorder, a mental disturbance beginning in childhood and characterized by discrete episodes of violence and aggressive behavior or destruction of property in otherwise normal individuals. The acts may occur as an overreaction to an ordinarily minor event.

intermittent fever, a fever that recurs in cycles of paroxysms and remissions, such as in malaria. Kinds of intermittent fever include **biduotertian fever, double quartan fever,** and **quartan malaria.**

intermittent hydrosalpinx [L, *inter,* between, *mittere,* to send; Gk, *hydor,* water, *salpinx,* tube], a fluid accumulation in a fallopian tube. The fluid is released periodically through the uterine cavity. Also called **hydrops tubae profluens.**

intermittent incontinence [L, *inter,* between, *mittere,* to send, *incontinentia,* inability to retain], urinary incontinence that occurs only when there is pressure on the bladder or muscular exertion. See also **incontinence.**

intermittent mandatory ventilation (IMV), a mode of mechanical ventilation in which the patient is allowed to breathe independently except during certain prescribed intervals, when a ventilator delivers a breath either under positive pressure or in a measured volume. Compare **intermittent positive-pressure breathing.** See also **respiratory therapy.**

intermittent positive-pressure breathing (IPPB), a form of assisted or controlled respiration produced by a ventilatory apparatus in which compressed gas is delivered under positive pressure into a person's airways until a preset pressure is reached. Passive exhalation is allowed through a valve, and the cycle begins again as the flow of gas is triggered by inhalation. Also called **IPPV (intermittent positive-pressure ventilation).**

■ METHOD: The use of the IPPB unit involves the combined efforts of the physician, the respiratory therapist or technician, and the nurse. The specific pressure and volume and the use of nebulizing or other attachments are ordered individually. The equipment is tested and introduced to the patient by the respiratory therapist. The nurse observes that the patient closes the lips around the mouthpiece and does not allow air to escape from the nose or mouth during inspiration and determines whether the therapy is effective. Exhaled tidal volume is measured, with a goal of achieving 10-15 mL/kg of body weight.

■ INTERVENTIONS: The patient may require reassurance that the machine will automatically shut off airflow at the end of inspiration and encouragement to relax and allow the lungs to be completely filled by the machine. The patient is cautioned not to manipulate any of the controls.

■ OUTCOME CRITERIA: Ventilation may be greatly improved by the use of the IPPB unit. Secretions may be thinned and cleared, and the passages may be humidified, allowing greater comfort and a better exchange of gases.

intermittent positive-pressure breathing unit. See **IPPB unit.**

intermittent positive-pressure ventilation. See **intermittent positive-pressure breathing.**

intermittent pulse [L, *inter,* between, *mittere,* to send, *pulsare,* to beat], a pulse in which an occasional beat is absent. It tends to occur with second-degree heart block or extrasystole. Also called **dropped-beat pulse.**

intermittent torticollis [L, *inter,* between, *mittere,* to send, *tortus,* twisted, *collum,* neck], intermittent, powerful spasms of the neck muscles, drawing the head to one side. The spasms usually occur in the sternocleidomastoid muscle.

intermittent tremor [L, *inter,* between, *mittere,* to send, *tremere,* to tremble], a rhythmic involuntary shaking that occurs intermittently.

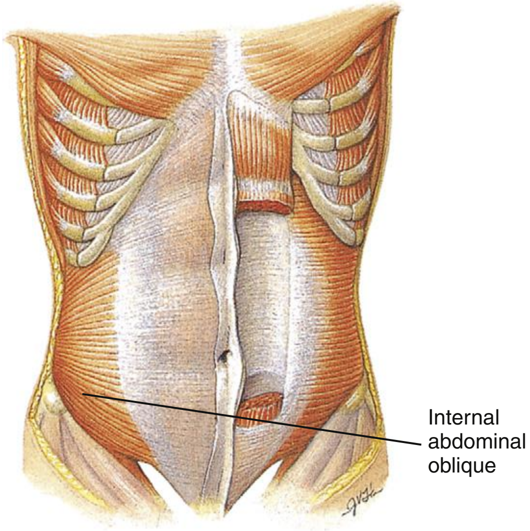
intern /in′turn/ [L, *internus,* inward], **1.** *n,* a physician in the first postgraduate year who is learning medical practice under supervision before beginning a residency program. **2.** *n,* any immediate postgraduate trainee in a clinical program. **3.** *v,* to work as an intern. Also spelled *interne.*

internal /intur′nəl/ [L, *internus,* inward], within or inside. **—internally,** *adv.*

internal abdominal oblique muscle, one of a pair of anterolateral muscles of the abdomen, lying under the external oblique muscle in the lateral and ventral part of the abdominal wall. It is smaller and thinner than the external oblique muscle. It functions to compress the abdominal contents and assists in micturition, defecation, emesis, parturition, and forced expiration. Both muscles acting together serve to flex the vertebral column, drawing the costal cartilages toward the pubis. One side acting alone bends the vertebral column laterally and rotates it, drawing the shoulder of the opposite side downward. Also called **obliquus internus abdominis.** Compare **external abdominal oblique muscle.**

internal acoustic meatus, an opening in the petrous portion of the temporal bone through which the facial, intermediate, and vestibulocochlear nerves and the labyrinthine artery pass. Also called **meatus acusticus internus.**

internal aperture of tympanic canaliculus, the upper opening of the tympanic channel in the temporal bone, leading to the tympanum.



Internal oblique muscle *(Thibodeau and Patton, 2003)*

internal bleeding [L, *internus,* inward; AS, *blod*], hemorrhage into an internal organ, tissue, or body cavity, e.g., intraperitoneal bleeding or intestinal bleeding.

internal carotid artery, each of two arteries starting at the bifurcation of the common carotid arteries, opposite the cranial border of the thyroid cartilage, through which blood circulates to many structures and organs in the head.

internal carotid plexus, a network of nerves on the internal carotid artery, formed by the internal carotid nerve. The internal carotid plexus supplies sympathetic fibers to the branches of the internal carotid artery, the tympanic plexus, the nerves of the cavernous sinus, and the cranial parasympathetic ganglia through which the fibers pass. Compare **common carotid plexus, external carotid plexus.**

internal cervical os, an internal opening of the uterus that corresponds to the slight constriction or isthmus of that organ about midway in its length. The internal cervical os separates the body of the uterus from the cervix. Compare **external cervical os.**

internal cuneiform bone. See **medial cuneiform bone.**

internal ear. See **inner ear.**

internal fertilization, the union of gametes within the body of the female after insemination. See also **artificial insemination.**

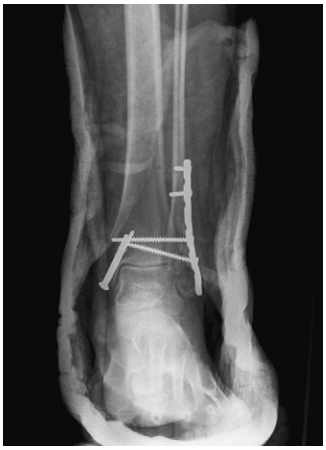
internal fistula, an abnormal passage between two internal organs or structures.

internal fixation, any method of holding together the fragments of a fractured bone without the use of appliances external to the skin. After open reduction of the fracture, smooth or threaded pins, Kirschner wires, screws, plates attached by screws, or medullary nails may be inserted through an appropriate incision to stabilize the fragments. In some instances the device is removed at a later operation, but it may remain in the body permanently. Compare **external pin fixation.**

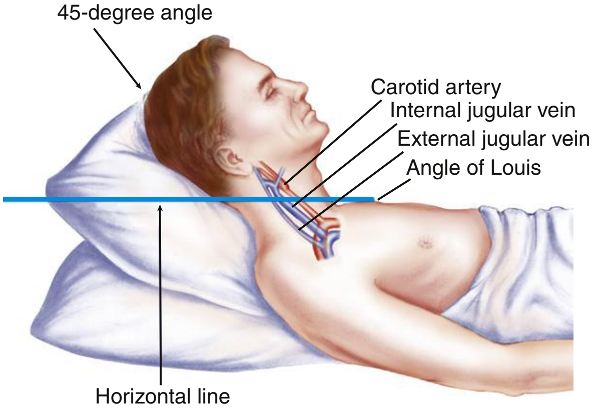
internal hemorrhage, bleeding into a serous cavity, a hollow viscus, or tissues.

internal hemorrhoid, a fold of mucous membrane at the anorectal junction, caused by edema or dilation of the interior rectal vein.

internal hernia, a protrusion of an intraperitoneal viscus into a recess or compartment within the peritoneal cavity.



Internal fixation *(Kowalczyk and Mace, 2009)*



Internal jugular vein *(Thompson et al, 2002)*

internal iliac artery, a division of the common iliac artery, supplying the walls of the pelvis, the pelvic viscera, the genital organs, and part of the medial thigh. In the fetus the internal iliac artery is twice as large as the external iliac artery and is the direct continuation of the common iliac artery. After birth the internal iliac artery becomes smaller than the external iliac artery. Also called **hypogastric artery.** Compare **external iliac artery.**

internal iliac node, a node in one of seven groups of parietal lymph nodes serving the abdomen and the pelvis. The internal iliac nodes surround the internal iliac vessels and receive lymphatic vessels corresponding to the branches of the internal iliac artery. Their afferent vessels drain lymph from the pelvic viscera, the buttocks, and the dorsal portions of the thighs. Their efferent vessels end in the common iliac nodes. Compare **external iliac node, iliac circumflex node.** See also **lymph, lymphatic system, lymph node.**

internal iliac vein, one of the pair of veins in the lower body that join the external iliac vein to form the two common iliac veins. Each vein begins at the greater sciatic foramen and at the pelvic brim joins the external iliac vein. Compare **external iliac vein.**

internal injury [L, *internus,* inward, *injuria*], any hurt, wound, or damage to the viscera.

internalization /intur′nəlīzā′shən/ [L, *internus* + Gk, *izein,* to cause], the process of adopting within the self, either unconsciously or consciously through learning and socialization, the attitudes, beliefs, values, and standards of another person or more generally of the society or group to which one belongs. See also **socialization.**

internal jugular catheter, a central venous catheter inserted through the internal jugular vein.

internal jugular vein, one of a pair of veins in the neck. Each vein collects blood from one side of the brain, the face, and the neck, and both unite with the subclavian vein to form the brachiocephalic vein. Each internal jugular vein is continuous with the sigmoid in the posterior part of the jugular foramen at the base of the skull. Compare **external jugular vein.**

internal locus of control. See **locus of control.**

internally. See **internal.**

internal malleolus. See **medial malleolus.**

internal mammary artery. See **internal thoracic artery.**

internal mammary artery bypass, a surgical procedure to correct a coronary artery obstruction. The internal mammary artery in situ and still attached to the subclavian artery is anastomosed to the coronary artery beyond the obstruction.

internal mammary node. See **sternal node.**

internal medicine, the branch of medicine concerned with the study of the physiological and pathological characteristics of the internal organs and with the medical diagnosis and treatment of disorders of these organs.

internal os, the internal opening of the cervical canal.

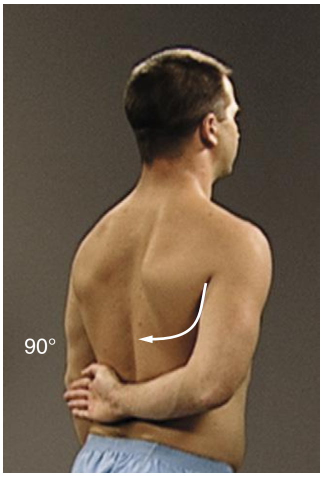
internal podalic version and total breech extraction. See **version and extraction.**

internal pterygoid muscle, one of the four muscles of mastication. It acts to close the jaws. Also called **pterygoideus medialis.** See also **external pterygoid muscle.**

internal pudendal artery, a branch of the anterior trunk of the internal iliac artery in the pelvis with branches that supply the rectum and perineum and the erectile tissues of the penis and clitoris.

internal respiratory nerve of Bell. See **phrenic nerve.**

internal rotation, **1.** the turning of a limb about its axis of rotation toward the midline of the body. **2.** medial rotation.



Internal rotation *(Seidel et al, 2011)*

internal secretion [L, *internus,* inward, *secernere,* to separate], a type of secretion in which substances pass directly from a gland into the bloodstream.

internal sphincter muscle of urethra, a circular layer of smooth muscle fibers, innervated by the vesical nerve, that surrounds the internal urethral orifice in males and acts to close it. No such structure exists in females.

internal standard, an element or compound added in a known amount to yield a signal against which an instrument or an analyte to be measured can be calibrated.

internal strabismus. See **esotropia.**

internal strangulation [L, *internus,* inward, *strangulare,* to choke], a state of extreme constriction of an organ, such as a loop of intestine trapped in an opening, resulting in an interruption in the blood supply and ischemia. See also **inguinal hernia, intestinal strangulation.**

internal thoracic artery, one of a pair of arteries that arise from the first portions of the subclavian arteries, descend to the margin of the sternum, and divide into the musculophrenic and superior gastric arteries at the level of the sixth intercostal space. The artery supplies the pectoral muscles, the breasts, the pericardium, and the abdominal muscles. In females, it is also called the **internal mammary artery.**

internal thoracic vein, one of a pair of veins that accompanies the internal thoracic artery, receiving tributaries that correspond to those of the artery. It forms a single trunk that runs up on the medial side of the artery and ends in the corresponding brachiocephalic vein. The superior phrenic vein usually opens into the internal thoracic vein.

International Association for Dental Research (IADR), an international organization concerned with research in dentistry and the exchange of information regarding such research.

International Classification of Diseases (ICD), an official list of categories of diseases, physical and mental, issued by the World Health Organization (WHO). It is used primarily for statistical purposes in the classification of morbidity and mortality data. Any nation belonging to WHO may adjust the classification to meet specific needs. See also ***Diagnostic and Statistical Manual of Mental Disorders.***

International Commission on Radiation Protection (ICRP), a nongovernmental organization founded in England in 1928 to provide general guidance on the safe use of radiation sources, including appropriate protective measures and codes of practice for medical radiology. The ICRP was originally established as a source of information about the hazards of x-rays and radium in medicine but was reorganized in 1950 to include effects of nuclear energy.

International Council of Nurses (ICN), the oldest international health organization. It is a federation of nurses' associations from 112 countries and was one of the first health organizations to develop strict policies of nondiscrimination on the basis of nationality, race, creed, color, politics, sex, or social status. The objectives of the ICN include promotion of national associations of nurses, improvement of standards of nursing and competence of nurses, improvement of the status of nurses within their countries, and provision of an authoritative international voice for nurses. The following ICN definition of the nurse is accepted internationally and serves as a pattern in developing nursing practice and nursing education throughout the world: "A nurse is a person who has completed a program of basic education and is qualified and authorized in her/his country to practice nursing. Basic nursing education is a formally recognized program of study that provides a broad and sound foundation for the practice of nursing, and for postbasic education, which develops specific competency. At the first level, the educational program prepares the nurse, through study of behavior, life, and nursing sciences and clinical experience, for effective practice and direction of nursing care and for the leadership role. The first level nurse is responsible for planning, providing, and evaluating nursing care in all settings for the promotion of health, prevention of illness, care of the sick, and rehabilitation; and functions as a member of the health team. In countries with more than one level of nursing personnel, the second level program prepares the nurse, through study of nursing theory and clinical practice, to give nursing care in cooperation with and under the supervision of a first level nurse." The ICN is active in the World Health Organization, the United Nations Educational, Scientific, and Cultural Organization, and other international organizations.

International Normalized Ratio (INR), a comparative rating of a patient's prothrombin time (PT) ratio, used as a standard for monitoring the effects of warfarin. The INR indicates what the patient's PT ratio would have been if measured by using the primary World Health Organization International Reference reagent.

International Red Cross Society, an international philanthropic organization, based in Geneva, Switzerland, concerned primarily with the humane treatment and welfare of the victims of war and calamity and with the neutrality of hospitals and medical personnel in times of war. See also **American Red Cross.**

International Sign Language, a sign language composed of a blending of vocabulary signs from numerous different countries, sometimes used at international meetings and events of deaf persons. Formerly called *Gestuno.*

International Society of Surgery (ISS), an international professional organization of surgeons.

International System of Units (SI), an internationally accepted scientific system of expressing length, mass, and time in base units (IU) of meters, kilograms, and seconds, replacing the old **centimeter-gram-second system.** The SI system includes as standard measurements the **ampere, candle, Kelvin scale,** and **mole.**

International Union Against Cancer (UICC) [Fr. *Union Internationale Contre le Cancer*], an international, nongovernmental organization founded in 1933 addressing all aspects of cancer control. See also **cancer.**

International Unit (IU, I.U.), a unit of measure in the International System of Units. See also **SI units.**

interneuron /-no͝or′on/, a nerve cell whose axon and dendrite lie entirely within the central nervous system and whose function is to relay impulses within the central nervous system.

internist /intur′nist, in′turnist/ [L, *internus,* inward], a physician who specializes in internal medicine.

internship /in′turnship′/, a period of apprenticeship for a medical school graduate who serves in a hospital for a specified period before beginning a professional practice. Some hospitals offer internships for new graduates in nursing or for senior nursing students.

internuncial neuron /-nun′sē·əl/ [L, *inter* + *nuntius,* messenger], a connecting neuron in a neural pathway, usually serving as a link between two other neurons.

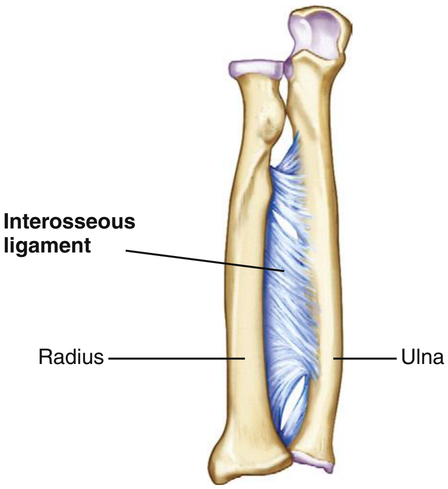
interocclusal distance, interocclusal gap. See **freeway space.**

interocclusal record /-əklo͞o′səl/, an imprint of the positional relation of opposing teeth or jaws to each other, made of the surfaces of occlusal rims or teeth with a material such as plaster of paris, wax, zinc oxide-eugenol paste, an elastomeric material or acrylic resin.

interoceptive /in′tərōsep′tiv/ [L, *internus,* inward, *capere,* to take], pertaining to stimuli originating from within the body that are related to the functioning of the internal organs or the receptors they activate. Compare **exteroceptive, proprioception.**

interoceptor /-sep′tər/ [L, *internus* + *capere*, to take], any sensory nerve ending located in cells in the viscera that responds to stimuli originating from within the body in relation to the function of the internal organs, such as digestion, excretion, and blood pressure. Compare **exteroceptor, proprioceptor.**

interosseous /-os′ē·əs/ [L, *inter*, between, *os*, bone], pertaining to an area between bones or a structure, such as a ligament, connecting two bones.



Interosseous ligament

interparietal fissure. See **intraparietal sulcus.**

interparoxysmal /-per′əksis′məl/ [L, *inter*, between, *paroxysmos*, irritation], pertaining to something that happens between paroxysms.

interperiosteal fracture /in′tərper′ē·os′tē·əl/ [L, *inter* + Gk, *peri*, around, *osteon*, bone], an incomplete fracture in which the periosteum is not disrupted.

interpersonal /-pur′sənəl/ [L, *inter*, between, *personalis*], pertaining to the interactions of individuals.

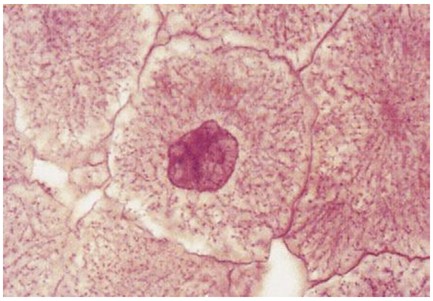
interpersonal psychiatry [L, *inter* + *persona*, mask], a theory of psychiatry introduced by Harry Stack Sullivan (1892–1949) that stresses the nature and quality of relationships with significant others as the most critical factor in personality development.

interpersonal therapy, a kind of psychotherapy that views faulty communications, interactions, and interrelationships as basic factors in maladaptive behavior. A kind of interpersonal therapy is **transactional analysis.**

interphase /in′tərfās′/ [L, *inter* + Gk, *phasis*, phase], the stage in the cell cycle during which the cell is not dividing, the chromosomes are not individually distinguishable, and such biochemical and physiological activities as DNA synthesis occur. Interphase follows telophase of one cell division and extends to the beginning of prophase of the next division. See also **anaphase, interkinesis, karyostasis, metaphase, mitosis, prophase, telophase.**

interpleural space /-plo͝or′əl/ [L, *inter*, between; Gk, *pleura*, rib; L, *spatium*], the potential space of the mediastinum between the two pleural linings, which contains serous fluid. Also called **pleural cavity.**

interpolated premature ventricular contraction /intur′pəlā′tid/ [L, *interpolare*, to refurbish], a ventricular extrasystole that occurs between two consecutive sinus-conducted beats. It is not followed by a compensatory pause.



Interphase *(© Ed Reschke; used with permission)*

interpolation /intur′pəlā′shən/, **1.** the transfer of tissues, as in plastic surgery or transplantation. **2.** (in statistics) the introduction of an estimated intermediate value of a variable between known values.

interpreter /intur′prətər/ [Fr, *interpreter*, to translate], a computer program that remains in the source and translates or executes higher-level language.

interproximal film image. See **bite wing film image.**

interpubic disk /-pyo͞o′bik/ [L, *inter* + *os pubis*, pubic bone; Gk, *diskos*, flat plate], the fibrocartilaginous plate connecting the opposed surfaces of the bodies of the pubic bones. Varying in thickness, it is strengthened by interlacing fibers and often contains a cavity that usually appears after the tenth year of life. Also called **discus interpubicus.**

interpulse interval /-puls′/, the time elapsed between successive nerve impulses; the reciprocal of impulse frequency.

interradicular septum. See **interalveolar septum.**

interradicular space /-radik′yələr/ [L, *inter* + *radix*, root, *spatium*], the area between the roots of a multirooted tooth, normally occupied by a bony septum and the periodontal membrane.

interrogatories /in′tərog′ətôr′ēz/ [L, *inter* + *rogare*, to ask], (in law) a series of written questions submitted to a witness or other person having information of interest to the court. The answers are transcribed and are sworn to under oath. Interrogatories are used during the pretrial period as a means of discovery. They differ from depositions in that there is no opportunity for cross-examination. Compare **deposition, discovery.**

interrupted suture /in′tərup′tid/ [L, *interrumpere*, to sever, *sutura*], a single suture tied separately, as distinguished from a continuous suture.

intersection syndrome, a condition of pain, crepitus, and a squeaky sensation in the dorsal radial forearm. It occurs most commonly among weight lifters and rowers and is treated with splinting, analgesics, and steroid injection as needed.

intersex /in′tərseks′/ [L, *inter* + *sexus*, sex, gender], any individual who has anatomical characteristics of both sexes or whose external genitalia are ambiguous or inappropriate for either the normal male or female. See also **intersexuality, pseudohermaphroditism.**

intersexuality /-sek′sho͞o·al′itē/ [L, *inter* + *sexus*, male or female], the condition in which an individual has both male and female anatomical characteristics to varying degrees or in which the appearance of the external genitalia is ambiguous or differs from that characteristic of the gonadal or genetic sex. See also **hermaphroditism, pseudohermaphroditism. —intersexual,** *adj.*

intersphincteric groove, an indistinct groove in the anal canal, forming the lower border of the pecten analis, marking the change between the subcutaneous part of the external anal sphincter and the border of the internal anal sphincter.

interspinales, the true segmental muscles of the back.

interspinal ligament /-spī′nəl/ [L, *inter* + *spina,* spine, *ligare,* to bind], one of many thin, narrow membranous ligaments that connect adjoining spinous processes of the vertebrae and extend from the root of each process to the apex. The interspinal ligaments are only slightly developed in the neck.

interspinous /-spī′nəs/ [L, *inter* + *spina,* spine], pertaining to the space between any spinous processes.

interstitial /in′tərstish′əl/ [L, *inter* + *sistere,* to stand], pertaining to the space between cells, as interstitial fluid, or between organs. Also **intercellular.**

interstitial cell-stimulating hormone (ICSH), a hormone secreted by the anterior pituitary gland that stimulates the production of testosterone by the Leydig, or interstitial, cells of the testis. Also called **luteinizing hormone** for its effects on the female reproductive system.

interstitial cystitis (IC), an inflammation of the bladder, believed to be associated with an autoimmune or allergic response. The bladder wall becomes inflamed, ulcerated, and scarred, causing frequent painful urination. Hematuria may occur. Treatment may include distension of the bladder and cauterization of the ulcers (if present), dietary modification, oral or intravesical medication, pain management, and alternative therapies such as acupuncture. Cystectomy with urinary diversion is rarely indicated. The condition occurs most often in women and may resemble the early stages of bladder cancer. Diagnosis is often by exclusion and may require cystoscopy and biopsy. Also called **painful bladder syndrome.** See also **Hunner's ulcer.**

interstitial emphysema, a form of emphysema in which air or gas escapes into the interstitial tissues of the lung after a penetrating injury or a rupture in an alveolar wall. Because the alveoli must be decompressed, there is danger that the pleura will be torn, causing a pneumothorax. The condition is diagnosed by chest x-ray films. See also **pneumothorax.**

interstitial fibroid [L, *interstitium,* space between, *fibra,* fiber; Gk, *eidos,* form], a fibrous tumor that develops in the muscular wall of the uterus and tends to grow inward.

interstitial fluid, an extracellular fluid that fills the spaces between most of the cells of the body and provides a substantial portion of the liquid environment of the body. Formed by filtration through the blood capillaries, it is drained away as lymph. It closely resembles blood plasma in composition but contains less protein. Compare **intracellular fluid, lymph, plasma.**

interstitial growth, an increase in size by hyperplasia or hypertrophy within the interior of a part or structure that is already formed. Compare **appositional growth.**

interstitial hypertrophic neuropathy. See **Déjérine-Sottas disease.**

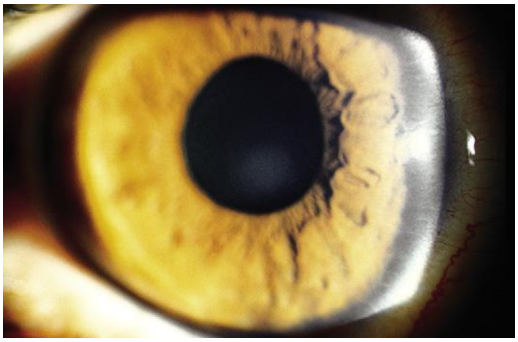
interstitial implantation, (in embryology) the complete embedding of the blastocyst within the endometrium of the uterine wall.

interstitial inflammation [L, *interstitium,* space between, *inflammare,* to set afire], an inflammation in an area of connective tissues.

interstitial infusion. See **hypodermoclysis.**

interstitial keratitis, an uncommon inflammation within the layers of the cornea. The first symptom is a diffuse haziness. Blood vessels may grow into the area and cause permanent opacities. The causes are syphilis, tuberculosis, leprosy, and vascular hypersensitivity. Treatment is specific to the infection or condition.

interstitial lung disease (ILD), a respiratory disorder characterized by a dry, unproductive cough and dyspnea on exertion. The patient may have swallowing disorders or joint and muscle pain and a history of industrial exposure to inorganic dusts, such as asbestos or silica. X-ray films usually show fibrotic infiltrates in the lung tissue, usually in the lower lobes. The fibrosing or scarring of lung tissue is often the result of an immune reaction to an inhaled substance. However, interstitial lung disease may result from viral, bacterial, or other infections; uremic pneumonitis; cancer; a congenital or inherited disorder; or circulatory impairment. The condition may be self-limiting, progress to respiratory or cardiac failure, or undergo spontaneous recovery.



Interstitial keratitis *(Spalton, Hitchings, and Hunter, 2005)*

interstitial mastitis [L, *interstitium,* space between; Gk, *mastos,* breast], an inflammation of the connective tissue between ducts of the breast.

interstitial myositis. See **myositis fibrosa.**

interstitial nephritis, inflammation of the interstitial tissue of the kidney, including the tubules. The condition may be acute or chronic. **Acute interstitial nephritis** is an immunological adverse reaction to certain drugs, often sulfonamide or methicillin (allergic interstitial nephritis). Acute renal failure, fever, rash, and proteinuria are characteristic of this condition. Most people regain normal kidney function when the offending drug is discontinued. **Chronic interstitial nephritis** is a syndrome of interstitial inflammation and structural changes, sometimes associated with such conditions as ureteral obstruction, pyelonephritis, exposure of the kidney to a toxin, rejection of a transplant, and certain systemic diseases. Gradually renal failure, nausea, vomiting, weight loss, fatigue, and anemia develop. Acidosis and hyperkalemia may follow. The nurse watches carefully for signs of electrolyte imbalance, dehydration, and hypovolemia, especially if there is frequent vomiting. Fluids and electrolytes may be replaced intravenously. Treatment includes correction of the underlying cause. If the cause is an obstruction of the urinary tract, rapid recovery may follow removal of the obstruction. In other cases, hemodialysis and kidney transplantation may be necessary.

interstitial plasma cell pneumonia. See **pneumocystosis.**

interstitial pneumonia, a condition of diffuse, chronic inflammation of the lungs beyond the terminal bronchioles, characterized by fibrosis and collagen formation in the alveolar walls and by the presence of large mononuclear cells in the alveolar spaces. The symptoms are progressive dyspnea, clubbing of the fingers, cyanosis, and fever. The disease may result from a hypersensitive reaction to busulfan, chlorambucil, hexamethonium, or methotrexate. It may also be an autoimmune reaction, because it often accompanies celiac disease, rheumatoid arthritis, Sjögren's syndrome, and systemic sclerosis. X-ray films of the lungs show patchy shadows and mottling, as in bronchopneumonia. Later stages of the disease reveal bronchiectasis, dilation of the bronchi, and shrinkage of the lungs. Treatment includes bed rest, oxygen therapy, and corticosteroids. Most patients die within 6 months to a few years, usually as a result of cardiac or respiratory failure. Also called **diffuse fibrosing alveolitis, giant cell interstitial pneumonia, Hamman-Rich syndrome.** Compare **bronchopneumonia.**

interstitial pregnancy. See **ectopic pregnancy.**

interstitial therapy, radiotherapy in which needles or wires that contain radioactive material are implanted directly into tumor areas. See also **brachytherapy.**

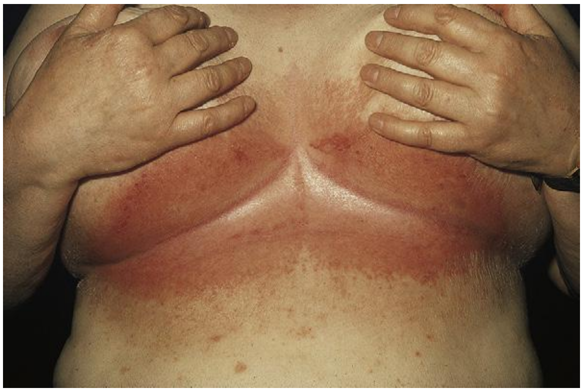
interstitial tissue [L, *interstitium,* space between; OFr, *tissu*], the connective and supporting tissue within and surrounding major functional elements of an organ.

interstitial tubal pregnancy, a kind of tubal pregnancy in which implantation occurs in the proximal interstitial portion of one of the fallopian tubes. See also **tubal pregnancy.**

interstitium /-stish′ē·əm/, the space between cells in a tissue.

intertransverse ligament /-transvurz′/ [L, *inter* + *transversus,* cross-direction], one of many fibrous bands connecting the transverse processes of vertebrae. In the cervical region, intertransverse ligaments consist of a few scattered fibers; in the thoracic region they are rounded cords intimately connected with the deep muscles of the back. In the lumbar region they are thin and membranous.

intertrigo /in′tərtrī′gō/ [L, *inter* + *terere,* to scour], an erythematous irritation of opposing skin surfaces caused by friction, moisture, warmth, or sweat retention. Common sites are the axillae, the folds beneath large or pendulous breasts, and the inner aspects of the thighs. Maceration and candidal infection may be complications if the area is also warm and moist. Prevention is by weight reduction, powdering, cleansing, and use of antifungal topical medication when necessary. **—intertriginous,** *adj.*



Intertrigo *(Conlon and Snydman, 2000)*

intertrochanteric crest /in′tərtrō′kanter′ik/ [L, *inter* + *trochanter,* runner, *crista,* ridge], one of a pair of ridges along the thigh bones, curving obliquely from the greater to the lesser trochanter.

intertrochanteric fracture, a crack in the proximal femur between the greater and the lesser trochanters that usually requires surgical intervention.

intertrochanteric line, a line that runs across the anterior surface of the thigh bone from the greater to the lesser trochanter, winding around the medial surface and ending in the linea aspera. The proximal half of the intertrochanteric line is the attachment for the iliofemoral ligament; the distal half holds the vastus medialis muscle.

intertuberous diameter /-to͞o′bərəs/ [L, *inter* + *tuber,* swelling; Gk, *dia,* across, *metron,* measure], the distance between the ischial tuberosities, a factor used in determining the dimensions, including the narrowest diameter, of the pelvic outlet.

interureteral /in′terure′teral/, situated between the ureters.

interval /in′tərval/ [L, *intervallum,* space between], a space between things or events, or a break or interruption in an otherwise continuous flow.

interval health history [L, *intervallum,* space between], a kind of health history that notes the general condition of a client during the period between visits and is not limited to facts relevant to a particular condition. The interval health history provides an ongoing account of a person's health, serving to bring the data base up to date.

intervention /in′tərven′shən/ [L, *inter* + *venire,* to come], an act performed to prevent harm to a patient or to improve the mental, emotional, or physical function of a patient. A physiological process may be monitored or enhanced, or a pathological process may be arrested or controlled. Independent intervention is any health care activity pertaining to aspects of professional practice that are encompassed by licensure and law and require no supervision or direction from others. Interdependent intervention refers to any health care activity carried out by one health care professional in collaboration with another. See also **nursing intervention.**

interventional cardiology, the subspecialty of cardiology that uses intravascular catheter-based techniques with fluoroscopy to treat coronary artery, valvular, and congenital cardiac disease.

interventricular /-ventrik′yələr/ [L, *inter,* between, *ventriculus,* little belly], pertaining to the location between the ventricles, as the septum of the heart.

interventricular septum [L, *inter,* between, *ventriculus,* little belly, *saeptum,* fence], the wall between the ventricles of the heart. Also called **ventricular septum.**

intervertebral /in′tərvur′təbrəl/ [L, *inter* + *vertebra,* back joint], pertaining to the space between any two vertebrae, such as the fibrocartilaginous disks.

intervertebral disk, one of the fibrous, broad, and flattened disks found between adjacent spinal vertebrae, except the axis and the atlas. The disks vary in size, shape, thickness, and number, depending on the location in the back and the particular vertebrae they separate.

intervertebral fibrocartilage. See **intervertebral disk.**

intervertebral foramen, any of the passages between adjacent vertebrae through which the spinal nerves and vessels pass.

intervertebral ganglion [L, *inter,* between, *vertebra,* back joint; Gk, *ganglion,* knot], the ganglionic enlargement of a spinal nerve root between adjacent vertebrae.

interview /in′tərvyo͞o/, a verbal interaction with a patient initiated for a specific purpose and focused on a specific content area. A *problem-seeking interview* is an inquiry that focuses on gathering data to identify problems the patient needs to resolve. A *problem-solving interview* focuses on problems that have been identified by the patient or health care professional.

intervillous space /in′tərvil′əs/ [L, *inter* + *villus,* hair, *spatium*], one of many spaces between the chorionic villi of the endometrium of the gravid uterus, beneath the placenta. The intervillous spaces act as small reservoirs for oxygenated maternal blood from which the fetal circulation may take up the nutrients and gases by osmosis, hydrostatic pressure, and diffusion.

intestinal. See intestine.

intestinal absorption [L, *intestinum,* intestine, *absorbare,* to swallow], the passage of the products of digestion from the lumen of the small intestine into the blood and lymphatic vessels in the wall of the gut. The surface area of the intestine is greatly increased by the presence of fingerlike projections called villi, each of which contains capillaries and a lymphatic vessel, or lacteal. Most dissolved nutrients pass quickly into the capillary bed for transport through the portal circulation to the liver. Lipids enter the lymphatic channels, which eventually rejoin the venous circulation at the thoracic duct in the neck.

intestinal amebiasis. See **amebic dysentery.**

intestinal angina, chronic vascular insufficiency of the mesentery caused by atherosclerosis and resulting ischemia of the smooth muscle of the small bowel. Also called **chronic intestinal ischemia.**

intestinal apoplexy, the sudden occlusion of one of the three principal arteries to the intestine by an embolism or a thrombus. This condition leads rapidly to necrosis of intestinal tissue and is often fatal. Treatment is usually surgical. The occlusion is removed, and often the affected portion of the bowel is resected. See also **atherosclerosis.**

intestinal atresia [L, *intestinum* + Gk, *a* + *tresis,* boring], a pathological obstruction of the continuous lumen of the intestinal tract caused by a defect of development in utero.

intestinal bypass [L, *intestinum* + AS, *bi* + Fr, *passer* + Gk, *cheirourgos*], a surgical procedure to shorten the digestive tract. It is performed so that less intestinal surface will be available to absorb nutrients from the digested food passing through, as in morbid obesity, or to bypass a blocked or diseased portion of the intestine. The technique usually involves anastomosing the jejunum to the ileum. See also **ileal bypass.**

intestinal colic [L, *intestinum* + Gk, *kolikos,* colonic pain], spasmodic pain in intestinal disorders.

intestinal dyspepsia, an abnormal condition characterized by impaired digestion associated with a disorder that originates in the intestines. See also **dyspepsia.**

intestinal fistula, an abnormal passage from the intestine to other internal organs or to an external abdominal opening or stoma, usually created surgically for the exit of feces after removal of a malignant, severely ulcerated, or diseased segment of the bowel. See also **colostomy.**

intestinal flora [L, *intestinum* + *flos,* flowers], the natural bacterial content of the inside of the digestive tract.

intestinal flu, a viral gastroenteritis, an inflammation of the stomach and intestines, usually caused by infection by an enterovirus. It is characterized by abdominal cramps, diarrhea, nausea, and vomiting. Outbreaks may be sporadic or epidemic, and the disease usually is mild and self-limited. Treatment is symptomatic. Control of diarrhea may be achieved with antidiarrheal medication and a diet limited to clear fluids. See also **enteric infection, gastroenteritis.**

intestinal fluke [L, *intestinum* + AS, *floc*], any internal parasite of the genera *Fasciolopsis, Heterophyes,* and *Metagonimus* in North America and of other genera in Asia and in tropical countries. They enter the body through the mouth as encysted larvae in aquatic vegetation or freshwater fish. Symptoms of intestinal fluke infestation usually include abdominal pain and obstruction and diarrhea.

intestinal gas [L, *intestinum*], gas in the digestive tract arising from three sources—swallowed air, gas produced by digestive processes, and blood gases diffused into the intestinal lumen. Gases produced in the intestine and diffused from blood are mainly hydrogen (H_2), most of which is a bacterial fermentation product of ingested carbohydrates, carbon dioxide (CO_2), and methane (CH_4).

intestinal glands. See **Lieberkühn's glands.**

intestinal infarction. See **intestinal strangulation.**

intestinal juices, the secretions of glands lining the intestine.

intestinal lipodystrophy. See **lipodystrophy.**

intestinal lipophagic granulomatosis. See **Whipple's disease.**

intestinal lymphangiectasia. See **hypoproteinemia.**

intestinal obstruction, any obstruction that results in failure of the contents of the intestine to progress through the lumen of the bowel. The most common cause is a mechanical blockage resulting from adhesions, impacted feces, tumor of the bowel, hernia, intussusception, volvulus, or the strictures of inflammatory bowel disease. Obstruction may also be the result of paralytic ileus. Obstruction of the small bowel may cause severe pain, vomiting of fecal matter, dehydration, and eventually a drop in blood pressure. Obstruction of the colon causes less severe pain, marked abdominal distension, and constipation. Radiographic examination may reveal the level of obstruction and its cause. Treatment includes the evacuation of intestinal contents by means of an intestinal tube. Surgical repair is sometimes necessary. Fluid balance and electrolyte balance are restored by carefully monitored IV infusion. Nonnarcotic analgesics are usually prescribed to prevent the decrease in intestinal motility that often accompanies the administration of narcotic analgesics. Also called *(informal)* **ileus.** See also **hernia, intussusception, volvulus.**

intestinal perforation [L, *intestinum* + *perforare,* to pierce], the escape of digestive tract contents into the peritoneal cavity as the result of trauma or a disease condition such as a ruptured appendix or perforated ulcer. The condition inevitably leads to peritonitis.

intestinal pseudoobstruction [L, *intestinum,* intestine; Gk, *pseudes,* false; L, *obstruere,* to build against], a condition characterized by constipation, colicky pain, and vomiting, but without evidence of organic obstruction apparent at laparotomy.

intestinal strangulation, the arrest of blood flow to the bowel, causing edema, cyanosis, and gangrene of the affected loop of bowel. This condition is usually caused by a hernia, intussusception, or volvulus. Early signs of intestinal strangulation resemble those of intestinal obstruction, but peritonitis, shock, and the presence of a tender mass in the abdomen are important findings in making a differential diagnosis. In addition to surgery, treatment includes the immediate correction of fluid and electrolyte imbalance. Also called **intestinal infarction.**

intestinal tonsil, one of a group of lymphatic nodules forming a single layer in the mucous membrane of the ileum opposite the mesenteric attachment. The nodules are oval patches about 1 cm wide and extend for about 4 cm along the intestine. In most individuals they appear in the distal ileum, but they also appear in the jejunum of a few individuals. Also called **Peyer's patches.** Compare **lingual tonsil, palatine tonsil, pharyngeal tonsil.**

intestinal tract [L, *intestinum* + *tractus*], the segments of the small and large intestines between the pyloric valve and the rectum. The intestinal tract forms part of the digestive tract.

intestinal tube [L, *intestinum* + *tubus*], a tube into the intestines, inserted for therapeutic measures.

intestinal villi, the multitudinous threadlike projections that cover the surface of the mucosa of the small intestine and serve as the sites of absorption (by active transport and diffusion) of fluids and nutrients.

intestine /intes′tin/ [L, *intestinum*], the portion of the alimentary canal extending from the pyloric opening of the stomach to the anus. It includes the small and large intestines. Also called **bowel. —intestinal,** *adj.*

intima /in′timə/ *pl*. **intimae** [L, *intimus*, innermost], the innermost layer of a structure, such as the lining membrane of an artery, vein, lymphatic vessel, or organ. **—intimal,** *adj*.

intimal fibroplasia, a type of fibromuscular dysplasia that affects mainly children and young adult men, characterized by short localized areas of smooth stenosis of the tunica intima, either symmetric or asymmetric. Sometimes it is a result of trauma, surgery, or infection.

intimal sclerosis [L, *intimus*, innermost; Gk, *sklerosis*, hardening], a hardening of the innermost layer of a blood vessel wall. See also **atherosclerosis.**

intimate partner violence. See **domestic abuse.**

intoe. See **metatarsus varus.**

intolerance /intol′ərəns/ [L, *in*, not, *tolerare*, to bear], a condition characterized by inability to absorb or metabolize a nutrient or medication. Exposure to the substance may cause an adverse reaction, as in lactose intolerance. Compare **allergy, atopic.**

intoxicant /intok′sikənt/ [L, *in* + Gk, *toxikon*, poison], any agent that can cause intoxication or poisoning.

intoxication /intok′sikā′shən/ [L, *in*, within; Gk, *toxikon*, poison], **1.** the state of being poisoned by a drug or other toxic substance. **2.** the state of being inebriated as a result of an excessive consumption of alcohol. **3.** a state of mental or emotional hyperexcitability, usually euphoric.

intra-, prefix meaning "situated, formed, or occurring within": *intrabronchial, intracutaneous, intramatrical*.

intraabdominal infection /in′trə·abdom′inəl/, a disease caused by organisms, usually bacterial or fungal, situated within the cavity of the abdomen. The infection may be in the retroperitoneal space or the peritoneal cavity and can arise as a result of surgery. Intraperitoneal infections may be diffuse or localized in one or more abscesses in recesses such as the pelvic space or perihepatic spaces. Abscesses also form about diseased viscera. Treatment depends on the type of infectious organism and the site of the infection.

intraabdominal pressure [L, *intra*, within, *abdomen*, belly], the degree of pressure within the abdominal cavity.

intraalveolar pocket. See **periodontal pocket.**

intraaortic balloon pump (IABP) /in′trə·ā·ôr′tik/ [L, *intra* + *aeirein*, to rise], a counterpulsation device that provides temporary cardiac assist in the management of refractory left ventricular failure that may follow myocardial infarction or occur in preinfarction angina. The balloon is attached to a catheter inserted into the aorta and is automatically inflated during diastole and deflated during systole. Also called **aortic balloon pump,** *intraaortic balloon counterpulsation*. See also **counterpulsation.**

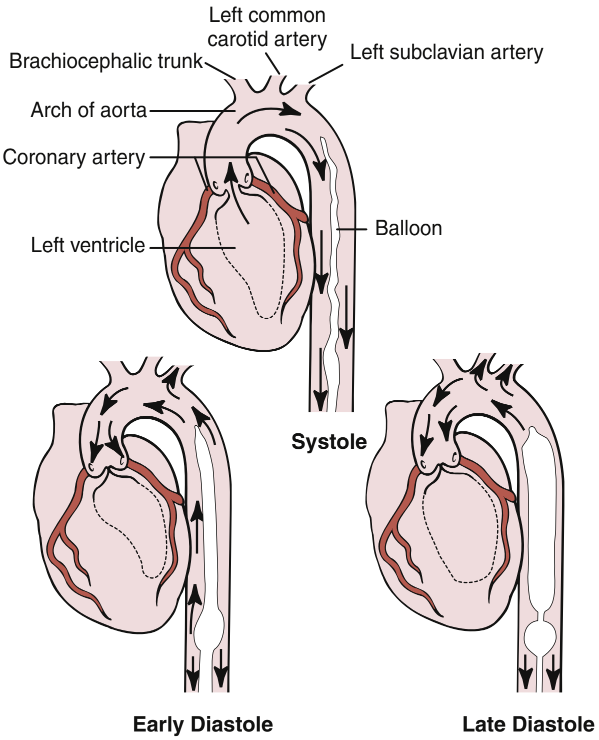
intraarterial /in′trə·ärtir′ē·əl/, pertaining to a structure or action inside an artery.

intraarticular /in′trə·ärtik′yələr/ [L, *intra* + *articulus*, joint], within a joint.

intraarticular fracture, a fracture involving the articular surfaces of a joint.

intraarticular injection, the injection of a medication into a joint space, usually to reduce inflammation, such as in bursitis or fibromyositis. With the same technique abnormally excessive fluid may be withdrawn from the joint space. The fluid may be a result of trauma or inflammation.

intraarticular ligament, a ligament that forms part of the joints between 16 of the 24 ribs, dividing the joints into two cavities, each containing a synovial membrane. Each intraarticular ligament consists of a short, flattened band of fibers inside the joint, attached by one extremity to the rib and by the other to the intervertebral disk. Intraarticular ligaments are not present in the joints of the first, tenth, eleventh, and twelfth ribs, each of which has only one synovial cavity. Compare **radiate ligament.**



Intraaortic balloon pump *(Lewis et al, 2011)*

intraatrial /in′trə·ä′trē·əl/ [L, *intra* + *atrium*, hall], pertaining to the space or substance within an atrium of the heart.

intraatrial block, delayed or abnormal conduction of the cardiac impulse within the atria. It is identified on an electrocardiogram by a prolonged and often a notched P wave. See also **atrioventricular block, heart block,** and **intraventricular block.** Also called *sinoatrial block*.

intrabony pocket. See **periodontal pocket.**

intracanalicular fibroma /-kan′əlik′yələr/ [L, *intra* + *canaliculus*, small channel], a tumor containing glandular epithelium and fibrous tissue, occurring in the breast.

intracanicular papilloma /-kənik′yələr/, a benign warty growth in certain glands, especially the breast.

intracapsular fracture /-kap′syələr/ [L, *intra* + *capsula*, little box], a fracture within the capsule of a joint.

intracardiac /-kar′dē·ak/ [L, *intra*, within; Gk, *kardia*, heart], pertaining to the interior of the heart chambers.

intracardiac catheter. See **cardiac catheter.**

intracardiac electrogram, a record of changes in the electric potentials of specific cardiac loci as measured by electrodes placed within the heart via cardiac catheters. It is used for loci that cannot be assessed by body surface electrodes, such as the bundle of His or other regions within the cardiac conducting system.

intracardiac lead /lēd/ [L, *intra* + Gk, *kardia*, heart; AS, *laedan*, lead], **1.** an electrocardiographic conductor in which the exploring electrode is placed within one of the cardiac chambers, usually by means of cardiac catheterization. **2.** *(informal)* a tracing produced by such a lead on an electrocardiograph.

intracartilaginous endochondral ossification. See **ossification.**

intracatheter /-kath′ətər/ [L, *intra* + Gk, *katheter,* something lowered], a thin, flexible plastic catheter introduced through a stainless steel needle and threaded into a blood vessel to infuse blood, fluid, or medication. Also called *(informal) intracath.*

intracavernosal injection, introduction of a hypodermic needle into the corpus cavernosum of the penis in order to administer a medication. It is used for treatment of erectile dysfunction.

intracavitary /in′trəkav′itər′ē/ [L, *intra* + *cavum,* cave], pertaining to the space within a body cavity.

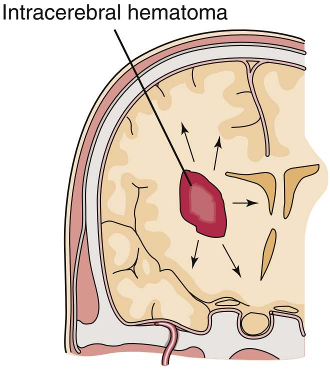
intracavitary therapy, a kind of radiotherapy in which one or more radioactive sources are placed, usually with the help of an applicator or holding device, within a body cavity to irradiate the walls of the cavity or adjacent tissues.

intracellular /-sel′yələr/ [L, *intra,* within, *cella,* storeroom], **1.** pertaining to the interior of a cell. **2.** within a cell.

intracellular fluid (ICF) [L, *intra* + *cella,* storeroom, *fluere,* to flow], a fluid within cell membranes throughout most of the body, containing dissolved solutes that are essential to electrolytic balance and to healthy metabolism. Also called *intracellular water.* Compare **extracellular fluid, interstitial fluid, lymph, plasma.**

intracerebral /-ser′əbrəl/ [L, *intra* + *cerebrum,* brain], pertaining to the area or substance within the cerebrum.

intracerebral hematoma, a localized collection of extravasated blood within the cerebrum, associated with a cerebral laceration resulting from a contusion. See also **intracerebral hemorrhage.**



Intracerebral hematoma (arrows indicate directions of pressure) *(Monahan et al, 2007)*

intracerebral hemorrhage (ICH), a type of hemorrhagic stroke in which bleeding directly into the brain occurs. It is most often caused by hypertension and is associated with increased intracranial pressure. ICH usually occurs in the basal ganglia, thalamus, pons, and cerebral and cerebellar white matter.

intracervical. See **endocervical.**

intracistronic /in′trəsistron′ik/ [L, *intra* + *cis,* this side, *trans,* across], within a cistron.

intracoronal retainer /-kôr′ənəl/ [L, *intra* + *corona,* crown], **1.** a cast restoration, such as an inlay, that lies largely within the contour of the tooth crown. The retention to displacement is developed between the restoration and the walls of the prepared tooth cavity. **2.** a direct retainer used in the construction of removable partial dentures. It consists of a female portion within the coronal segment of the crown of an abutment and a male portion attached to the denture proper. See also **inlay.**

intracostal /-kos′təl/, pertaining to the inner surface of a rib.

intracranial /-krā′nē·əl/ [L, *intra,* within; Gk, *kranion,* skull], pertaining to the area within the cranium (the bony skull).

intracranial abscess. See **brain abscess.**

intracranial aneurysm, localized dilation of any of the cerebral arteries. Characteristics of the condition include sudden severe headache, stiff neck, photophobia, nausea, vomiting, and sometimes loss of consciousness. Rupture of an intracranial aneurysm produces a mortality rate approaching 50%, and survivors face a high risk of recurrence. Some forms of intracranial aneurysm may be treated surgically. Kinds of intracranial aneurysms include **berry aneurysm, fusiform aneurysm,** and **mycotic aneurysm.**

intracranial hemorrhage [L, *intra,* within; Gk, *kranion,* skull, *haima,* blood], a hemorrhage within the cranium.

intracranial pneumatocele. See **pneumocephalus.**

intracranial pressure (ICP), pressure that occurs within the cranium.

intracranial pressure (ICP) monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as measurement and interpretation of patient data to regulate intracranial pressure. See also **Nursing Interventions Classification.**

intractable /intrak′təbəl/ [L, *intractabilis,* hard to manage], having no relief, such as a symptom or a disease that is not relieved by the therapeutic measures used.

intractable pain [L, *intractabilis,* hard to manage, *poena,* penalty], pain that is not relieved by ordinary medical, surgical, and nursing measures. The pain is often chronic and persistent and can be psychogenic in nature.

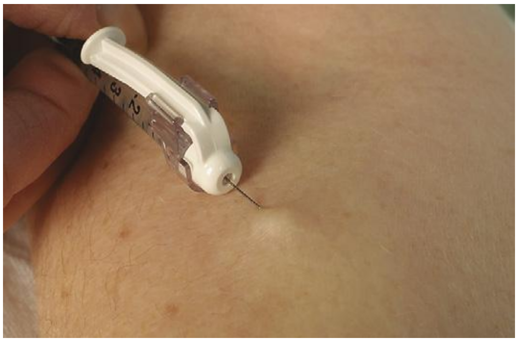
intracutaneous /-kyo͞otā′nē·əs/ [L, *intra* + *cutis,* skin], within the skin, particularly the dermis.

intracystic papilloma /-sis′tik/ [L, *intra* + Gk, *kystis,* bag], a benign epithelial tumor formed within a cystic adenoma.

intracytoplasmic sperm injection (ICSI), a micromanipulation technique used in male factor infertility, in which a single spermatocyte is inserted into an oocyte by micropuncture.

intradermal /-dur′məl/ [L, *intra,* within; Gk, *derma,* skin], in the skin.

intradermal injection, the introduction of a hypodermic needle into the dermis for the purpose of instilling a substance, such as a serum or vaccine.



Formation of bleb following intradermal injection *(Potter et al, 2011)*

intradermal test [L, *intra* + Gk, *derma,* skin], a procedure used to identify suspected allergens by subcutaneously injecting the patient with small amounts of extracts of the suspected allergens. The injections are made at spaced intervals, usually in the forearm or the scapular region. The patient is concurrently injected with the diluent alone as a control procedure. The test result is positive if within 15 to

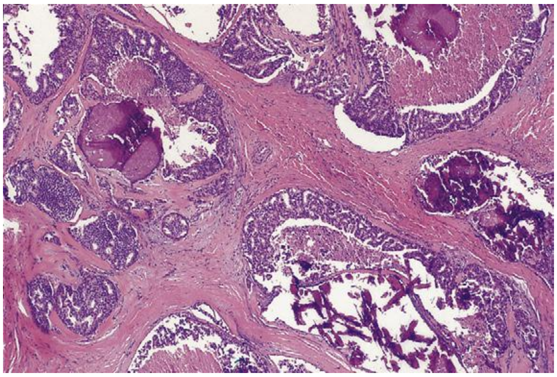
30 minutes the injection of extract produces a wheal surrounded by erythema and the control injection produces no symptoms. The intradermal test is started with highly diluted solutions; if the initial test result is negative, the procedure is repeated with stronger solutions. This gradual method is used to prevent a systemic reaction, which is more of a risk with intradermal testing than with other kinds of allergy testing, such as the scratch test. The intradermal test tends to be more accurate than the scratch test and is often performed if scratch test results are negative or unclear. Intradermal testing also limits to between 20 and 30 the number of suspected allergens that can be examined simultaneously in the skin of one patient. Also called **subcutaneous test.** Compare **patch test, scratch test.** See also **conjunctival test, use test.**

intradialytic hypotension, hypotension sometimes seen as a complication of hemodialysis.

intradiscal electrothermal therapy, a minimally invasive procedure for the treatment of discogenic low back pain.

intraductal /-duk′təl/, within a duct.

intraductal carcinoma [L, *intra* + *ductus,* duct], a neoplasm that occurs most often in the breast but can occur elsewhere, as in the salivary glands. The lesion on cross section usually shows well-differentiated tumor cells in calcified and dilated ducts.



Intraductal carcinoma of the salivary gland
(Fletcher, 2007)

intraductal papilloma, a small benign epithelial tumor in a milk duct of the breast, occasionally marked by bleeding from the nipple. See also **papilloma.**

intradural lipoma [L, *intra* + *dura,* hard], a fatty tumor in or beneath the dura mater of the spine or sacrum that tends to infiltrate the dorsal column and roots of spinal nerves, causing pain and dysfunction.

intraepidermal carcinoma /in′trə·ep′idur′məl/ [L, *intra* + Gk, *epi,* above, *derma,* skin], a neoplasm of squamous epidermal cells that does not proliferate into the basal area and often occurs in many sites simultaneously. The lesions, which enlarge slowly, are resistant to chemotherapy and to radiation. Also called **precancerous dermatitis.**

intraepidermal vesicle, a fluid-filled blisterlike cavity within the epidermis, usually less than 1 cm in diameter.

intraepithelial carcinoma. See **carcinoma in situ.**

intrafollicular insemination (IFI), method of assisted reproductive technology in which semen is injected into a follicle.

intrafusal muscle fiber /-fyo͞o′zəl/, the striated muscle fiber within a muscle spindle.

intrahepatic cholestasis, a result of some condition inside the liver, such as an infection, sepsis, cirrhosis, an abscess, a tumor, or a complication from medication.

intrahepatic cholestasis of pregnancy, a type of intrahepatic cholestasis sometimes seen during the third trimester of pregnancy, characterized by severe itching, hepatomegaly, and sometimes jaundice. It clears up after delivery. The cause is unknown, but because it occurs far more in certain ethnic groups than in others, there may be a genetic link.

intraluminal /-lo͞o′minəl/, **1.** within the lumen of any tubular structure or organ. **2.** between or among tubes.

intraluminal coronary artery stent, a device permanently inserted into a coronary artery to maintain patency of the lumen of the vessel.

intramammary abscess /-mam′ərē/, a collection of pus within a mammary gland.

intramembranous ossification. See **ossification.**

intramenstrual pain /-men′stro͞o·əl/ [L, *intra,* within, *menstrualis,* monthly, *poena,* penalty]. See **mittelschmerz.**

intramural /-myo͞o′rəl/ [L, *intra,* within, *murus,* wall], pertaining to events or structures within the walls of an organ, body part, or cavity.

intramural part of male urethra, the short, most proximal part of the urethra, running almost vertically down from the bladder to where it enters the prostate.

intramural part of ureter, the short distal portion of the ureter after it bends to run obliquely through the wall of the bladder.

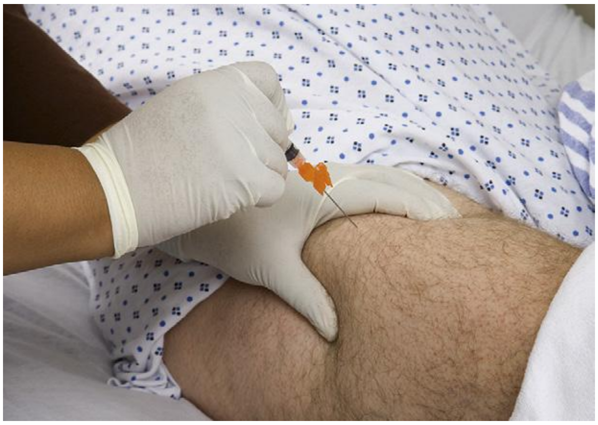
intramuscular (IM) /-mus′kyələr/ [L, *intra,* within, *musculus,* muscle], pertaining to the interior of muscle tissue.

intramuscular injection [L, *intra* + *musculus*], the introduction of a hypodermic needle into a muscle to administer a medication.

■ METHOD: The equipment is selected, and the medication drawn up into the syringe. The selected site is prepared by cleansing with alcohol. The sites most commonly used are the upper outer quadrant of the gluteal area, the ventrogluteal area, the vastus lateralis of the thigh, or the deltoid muscle. Care must be taken to identify landmarks and select sites to prevent damage to nerves and adjacent structures. The skin is stretched between the thumb and forefinger. The needle is introduced at a 90-degree angle to the muscle with a quick thrust and advanced as necessary—not as far as the hub of the needle, but deep into the muscle. The plunger is withdrawn slightly to be sure that the needle has not been placed in a blood vessel. The solution is injected slowly, the needle is withdrawn, and the injection site is massaged unless contraindicated.

■ INTERVENTIONS: If the gluteal area is chosen, the patient is asked to lie prone with ankles bent and feet curved in, so that the toes of each foot are directed toward the opposite foot to relax the gluteal muscles, thus making the injection less painful. Injection into deltoid muscles is more painful than in other sites and is avoided if possible. The ventrogluteal area and the vastus lateralis are the preferred injection sites in infants. Care is taken not to hit the femur with the tip of the needle when injecting into the vastus lateralis. Needles and syringes are always disposed of safely in a puncture-resistant container without recapping.

■ OUTCOME CRITERIA: Infection may result from nonaseptic technique; care is taken not to contaminate the needle before injection or to suffer a needlestick. Certain medications can cause tissue necrosis if injected into the subcutaneous tissues. Many medications may be given intravenously or intramuscularly, but the intravenous dose may be much smaller. Inadvertent injection into a blood vessel can cause severe systemic reactions of an overdose. Often biologicals, such as antigens, serums, or vaccines, may leave a knot in the muscle that is not painful and that subsides slowly over several weeks or months, though it may cause concern in the patient or in the parents of younger patients. The lump should not grow larger or become more painful. If it does, one may assume that an abscess has formed.



Intramuscular injection in the vastus lateralis muscle
(Potter et al, 2011)

intraocular /-ok′yələr/ [L, *intra* + *oculus*, eye], pertaining to structures or substances within the eyeball.

intraocular lens (IOL), a plastic artificial lens generally inserted into the capsule of the lens after cataract removal.

intraocular pressure, the internal pressure of the eye, regulated by resistance to the flow of aqueous humor through the fine sieve of the trabecular meshwork. Contraction or relaxation of the longitudinal muscles of the ciliary body affects the size of the opening in the meshwork. In older persons the trabecular meshwork may become sclerotic and obstructed, preventing the normal flow of aqueous humor from passing out at the proper rate and causing an increase in the intraocular pressure. See also **glaucoma.**

intraoperative /-op′ərətiv′/ [L, *intra* + *operari*, to work], pertaining to the period during a surgical procedure. Compare **perioperative.**

intraoperative hyperthermia [L, *intra* + *operari*, to work], hyperthermia delivered as a therapeutic measure to internal sites that have been exposed by a surgical procedure. After heating the incision is "closed."

intraoperative lymphatic mapping. See **sentinel node biopsy.**

intraoperative radiotherapy (IORT), the use of a single high dose of radiation at the time of surgery as adjuvant therapy in tumor resection.

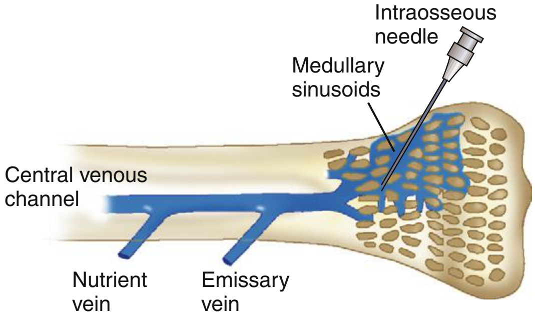
intraoperative ultrasound, a diagnostic technique that uses a portable ultrasound device to scan the spinal cord during spinal surgery. The method enables surgeons to locate and identify tumors of the central nervous system that may not be detected by computed tomography or other techniques. Intraoperative ultrasound can distinguish between syrinxes, or fluid-filled cysts, and neoplastic growths in nervous system tissue.

intraoral examination. See **dental examination.**

intraoral orthodontic appliance /in′trə·ôr′əl/ [L, *intra* + *oralis*, mouth], a device placed inside the mouth to correct or alleviate malocclusion.

intraosseous /in′trə·os′ē·əs/ [L, *intra*, within, *os*, bone], pertaining to the interior of bone.

intraosseous infusion, the injection of blood, medications, or fluids into bone marrow rather than into a vein. The technique may be performed in emergency treatment of a child when IV infusion is not feasible.



Intraosseous infusion *(Sanders et al, 2000)*

intraparietal sulcus /-perī′ətəl/ [L, *intra* + *paries*, wall, *sulcus*, groove], an irregular groove on the convex surface of the parietal lobe that marks the division of the inferior and superior parietal lobules of the cerebrum. Also called **interparietal fissure.**

intrapartal care[1] /-pär′təl/ [L, *intra* + *partus*, birth], care of a pregnant woman from the onset of labor to the completion of the fourth stage of labor with the expulsion of the placenta. See also **antepartal care, emergency childbirth, newborn intrapartal care, postpartal care.**

■ METHOD: The signs and symptoms of true labor are observed. Uterine contractions increase in frequency, duration, and strength. Pressure of the presenting part of the fetus causes dilation and effacement of the cervix and contractions of the amniotic sac, producing a bloody discharge called "bloody show." A physical examination of the mother is performed. Urine is measured regularly through labor and may be tested for levels of ketones, protein, and glucose to determine specific gravity. A microhematocrit is often done. The position, attitude, and presentation of the fetus are ascertained by abdominal palpation. The cervical effacement and dilation and the station of the presenting part of the fetus are determined periodically by vaginal examination, using careful aseptic technique. If the amniotic sac has broken, the color, character, and quantity of the amniotic fluid are noted. The fetal heart rate is counted, and variations are noted in relation to the timing and intensity of contractions.

intrapartal care[2]**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring and management of stages one and two of the birth process. See also **Nursing Interventions Classification.**

intrapartal care: high-risk delivery, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting with vaginal delivery of multiple or malpositioned fetuses. See also **Nursing Interventions Classification.**

intrapartal period, the period spanning labor and birth.

intrapartum /-pär′təm/, pertaining to the period of labor and birth.

intrapartum hemorrhage, copious bleeding, usually caused by abruptio placentae or placenta previa during labor. See also **hemorrhage.**

intraperiosteal fracture /in′trəper′ē·os′tē·əl/ [L, *intra* + Gk, *peri*, around, *osteon*, bone], a fracture that does not rupture the periosteum.

intraperitoneal insemination (IPI), method of assisted reproductive technology in which semen is injected into the peritoneal cavity.

intrapleural space /-plo͝or′əl/ [L, *intra*, within; Gk, *pleura*, rib; L, *spatium*], the cavity of the pleura.

intrapsychic conflict /-sī′kik/ [L, *intra* + Gk, *psyche*, mind], an emotional clash of opposing impulses within oneself, for example, of the id versus the ego or the ego versus the superego. See also **conflict.**

intrapulmonary /-pul′məner′ē/ [L, *intra,* within, *pulma,* lung], pertaining to the interior of the lungs.

intrapulmonary shunt [L, *intra* + *pulmoneus,* relating to the lung], (in respiratory therapy) a condition in which a region of the lungs is perfused with little or no ventilation. It is indicated by a low ratio of QS/QT, in which QS represents the difference between end capillary oxygen content and mixed venous oxygen content and QT represents cardiac output. The condition may occur in atelectasis, pneumonia, pulmonary edema, and adult respiratory distress syndrome.

intrarenal azotemia, an elevated blood urea concentration caused by a reduced glomerular filtration rate resulting in acute or chronic diseases of the renal parenchyma.

intrarenal hemodynamics /-rē′nəl/ [L, *intra* + *ren,* kidney], the pattern of blood flow or distribution in the various parts of the kidney. Normally the renal cortex and outer medulla receive the major portion of renal blood flow.

intraspinal hypodermic /-spī′nəl/ [L, *intra,* within, *spina,* spine, *hypo,* under, *derma,* skin], pertaining to the injection of a substance into the spinal canal.

intrathecal /in′trəthē′kəl/ [L, *intra* + *theca,* sheath], pertaining to a structure, process, or substance within a sheath, such as within the spinal canal.

intrathecal injection, the introduction of a hypodermic needle into the subarachnoid space for the purpose of instilling a material for diffusion throughout the spinal fluid.

intrathoracic goiter /-thôras′ik/ [L, *intra* + Gk, *thorax,* chest; L, *guttur,* throat], an enlargement of the thyroid gland that protrudes into the thoracic cavity.

intrathoracic kidney, an ectopic kidney that partially or completely protrudes above the diaphragm into the posterior mediastinum. Also called *thoracic k.*

intratubal insemination (ITI), method of ART in which washed semen is injected into the fallopian tube.

intrauterine /in′trəyo͞o′tərin/ [L, *intra,* within, *uterus,* womb], pertaining to the inside of the uterus.

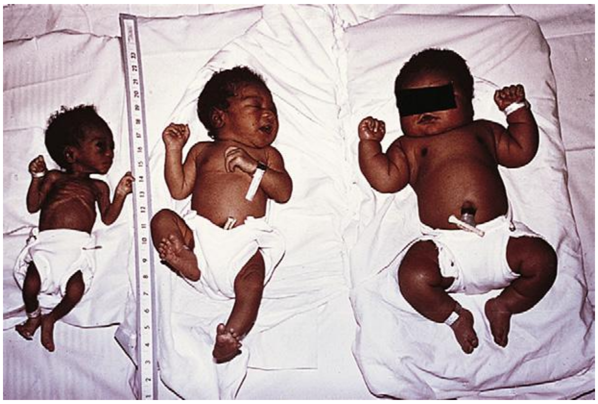
intrauterine catheter. See **catheter.**

intrauterine device (IUD) [L, *intra* + *uterus,* womb; Fr, *devise*], a contraceptive device, consisting of a bent strip of radiopaque plastic with a fine monofilament tail. The addition of copper wire and/or bands increases the effectiveness. Progesterone-filled IUDs are also available. The mechanism of action is not known. Insertion into the cervix is performed during or just after menstruation when the cervix is slightly open and menstruation assures that a pregnancy does not exist. The tail string of the IUD is left projecting a few centimeters from the cervix. By feeling the string with her finger at least once each menstrual cycle the wearer can be sure the device is in place. The string also provides a hold for removing the IUD. The rate of failure for the IUD method of contraception is approximately one to five unplanned pregnancies in 100 women using the device for 1 year. IUDs can cause complications; the most serious is pelvic inflammatory disease. When such infections occur in pregnancy, they may be overwhelming and lethal; therefore the IUD is removed if pregnancy is suspected. Some other complications are cervicitis, perforation of the uterus, salpingitis that causes sterility, ectopic pregnancy, abortion, embedding of the device in the wall of the uterus, endometritis, bleeding, pain, cramping, undetected expulsion, and irritation of the penis. Also called *(informal)* **coil,** *intrauterine contraceptive device, (informal)* **loop.**

intrauterine fracture, a fracture that occurs during fetal life.

intrauterine growth curve, a line on a standardized graph representing the mean weight for gestational age through pregnancy to term. It provides a method for classifying infants according to their state of maturity and fetal development.

intrauterine growth retardation, an abnormal process in which the development and maturation of the fetus are impeded or delayed more than two deviations below the mean for gestational age, sex, and ethnicity. It may be caused by genetic factors, maternal disease, or fetal malnutrition that results from placental insufficiency. See also **growth retardation, small for gestational age infant.**



Three babies of the same gestational age, with weights of 600, 1400, and 2750 g, respectively, from left to right *(Lewis et al, 2010)*

intrauterine insemination (IUI), artificial insemination in which specially washed sperm is injected through the cervix directly into the uterus.

intrauterine transfusion, direct transfer of Rh-negative blood cells into a fetus in utero in cases of isoimmunization. See also **transfusion.**

intravascular /-vas′kyələr/ [L, *intra* + *vasculum,* little vessel], pertaining to the inside of a blood vessel.

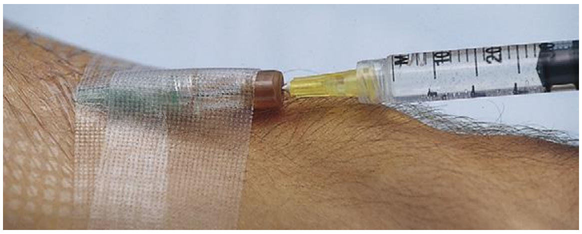
intravascular coagulation test, a test for detecting coagulation of blood within the blood vessels.

intravascular fluid, a term sometimes used to refer to that part of the extracellular fluid that is within the blood vessels, i.e., the plasma.

intravenous (IV) /-vē′nəs/ [L, *intra* + *vena,* vein], pertaining to the inside of a vein, as of a thrombus or an injection, infusion, or catheter.

intravenous alimentation. See **total parenteral nutrition.**

intravenous bolus, a relatively large dose of medication administered into a vein in a short period, usually within 1 to 30 minutes. The IV bolus is commonly used when rapid administration of a medication is needed, such as in an emergency; when drugs that cannot be diluted, such as many cancer chemotherapeutic drugs, are administered; and when the therapeutic purpose is to achieve a peak drug level in the bloodstream of the patient. The IV bolus is not used when the medication must be diluted in a large-volume parenteral fluid before entering the bloodstream or when the rapid administration of a medication, such as potassium chloride, may be life-threatening. The IV bolus is normally not used for patients who have decreased cardiac output, decreased urinary output, pulmonary congestion, or systemic edema. Such patients have decreased tolerance to medications, which therefore must be diluted more than usual and administered at slower rates. A wristwatch with a second hand is recommended for the timing of all IV bolus injections. The amount of medication to be delivered per minute is determined by dividing the total amount to be injected by the prescribed time for delivery. The IV bolus site is prepared with an appropriate antiseptic, and sterile technique is used to enter the site with a venipuncture needle. A winged-tip needle is used for administering an IV bolus because it is small enough to lessen the risk of collapsing the vein and causing trauma and is more stable than a syringe needle. If a primary IV line is already established, the IV bolus is administered by mixing the prescribed drug with the appropriate amount of diluent and then administering the drug into the primary line, after first determining whether it is compatible with the primary IV solution. Also called **intravenous push.**



Administration of medication by intravenous bolus
(Potter and Perry, 2005)

intravenous catheter [L, *intra,* within, *vena,* vein; Gk, *katheter,* a thing inserted], a catheter that is inserted into a vein for supplying medications or nutrients directly into the bloodstream or for diagnostic purposes such as studying blood pressure.

intravenous cholangiography (IVC), (in diagnostic radiology) a procedure for outlining the major bile ducts. A radiopaque contrast material is injected intravenously, and serial radiographic films are taken. See also **cholangiography.**

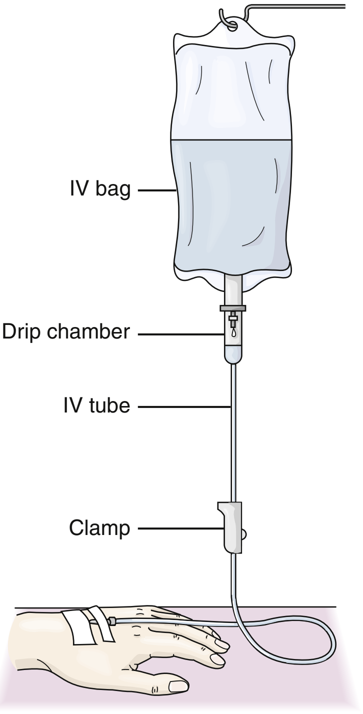
intravenous controller, any of several devices that automatically deliver IV fluid at selectable flow rates. The controller is commonly equipped with a rate selector, drop sensor, and alarm. When the infusion does not flow at the prescribed rate, the drop alarm emits a visual and an audible signal. The IV controller works by gravity, so the IV container must be placed at least 30 inches (76.20 cm) above the venipuncture site. The controller cannot exert the positive pressure of a true pump and is not recommended for the delivery of highly viscous fluid or for maintenance of an open arterial line. Compare **intravenous peristaltic pump, intravenous piston pump, intravenous syringe pump.**

intravenous digital subtraction angiography (IV-DSA), a procedure for the radiographic visualization of arteries after injection of a radiopaque contrast medium into a vein.

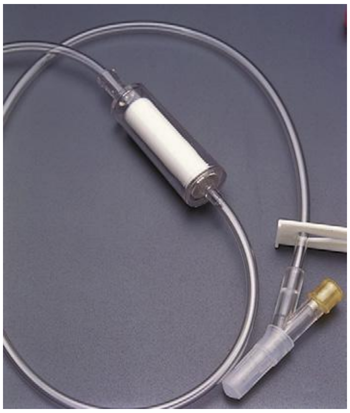
intravenous fat emulsion, a preparation of 10% fat administered into a vein to help maintain the weight of an adult patient or the weight and growth of a younger patient. Such fat emulsions are prepared from refined soybean oil and egg-yolk phospholipids and may contain such major fatty acids as linoleic, oleic, palmitic, and linolenic acids. The IV fat emulsion is isotonic and may be administered into a peripheral vein, but it is not mixed with other solutions used in parenteral alimentation. IV fat emulsions are often administered when hyperalimentation is not sufficient to maintain adequate treatment of a patient or when the patient needs calories but cannot tolerate the high percentage of dextrose contained in hyperalimentation solutions. Such emulsions may also be administered to patients who need more essential fatty acids than are contained in hyperalimentation solutions or who need general nutritional improvement, especially postoperative patients. IV emulsions are not administered to patients suffering from disturbances of normal fat metabolism (such as hyperlipemia), severe hepatic diseases, blood coagulation defects caused by decreased blood-platelet counts, pulmonary diseases, lipoid nephrosis, hepatocellular damage, or bone marrow dyscrasia or to those being treated with anabolic inhibitory drugs. If possible, the IV fat emulsion is usually administered during the day so that the patient may follow a normal eating pattern with rest during the night and lower nocturnal urinary flow. Once the primary IV line has been established, IV fat emulsions are usually administered with the aid of an electronic control device to maintain an even flow rate and prevent fatty-acid overload. The patient's fluid intake and output are regularly measured during the delivery of such an emulsion, and daily blood studies are conducted to determine the level of free-floating triglycerides. Hepatic function tests are performed if the patient receives consecutive IV fat emulsion infusions over a long period. Immediate adverse reactions or those that may occur up to 2½ hours after the onset of the infusion may include temperature rise, flushing, sweating, pressure sensations over the eyes, nausea, vomiting, headache, chest and back pain, dyspnea, and cyanosis. Delayed adverse reactions or those that occur within 10 days of the onset of such infusions may include hepatomegaly, splenomegaly, thrombocytopenia, focal seizures, hyperlipemia, hepatic damage, jaundice, hemorrhagic diathesis, and gastroduodenal ulcer.

intravenous feeding, the administration of nutrients through a vein or veins.

intravenous infusion filter, any of the numerous devices used to help ensure the purity of an IV solution. IV filters strain the solution to remove such contaminants as dissolved impurities (detergents, proteins, and polysaccharides), extraneous salts, microorganisms, particles, precipitates, and undissolved drug powders. Any such contaminants may complicate the IV therapy and patient recovery. Some filters are built into the primary IV tubing; others must be attached. One of the main criteria for selecting a filter is the assurance that the filter is not too fine for the IV solution to be strained;



Intravenous equipment *(Sorrentino, 2012)* filters that are too fine clog. The size of filter membranes varies from 5 to 0.22 µm. Filters of 1 to 5 µm will remove most particulate debris but not most fungi or bacteria. Filters that are 0.45 µm or less remove fungi and most bacteria; filters that are 0.22 µm remove all fungi and bacteria but also reduce the flow rate of the IV solution, which is crucial when rapid delivery is required. See also **needle filter.**

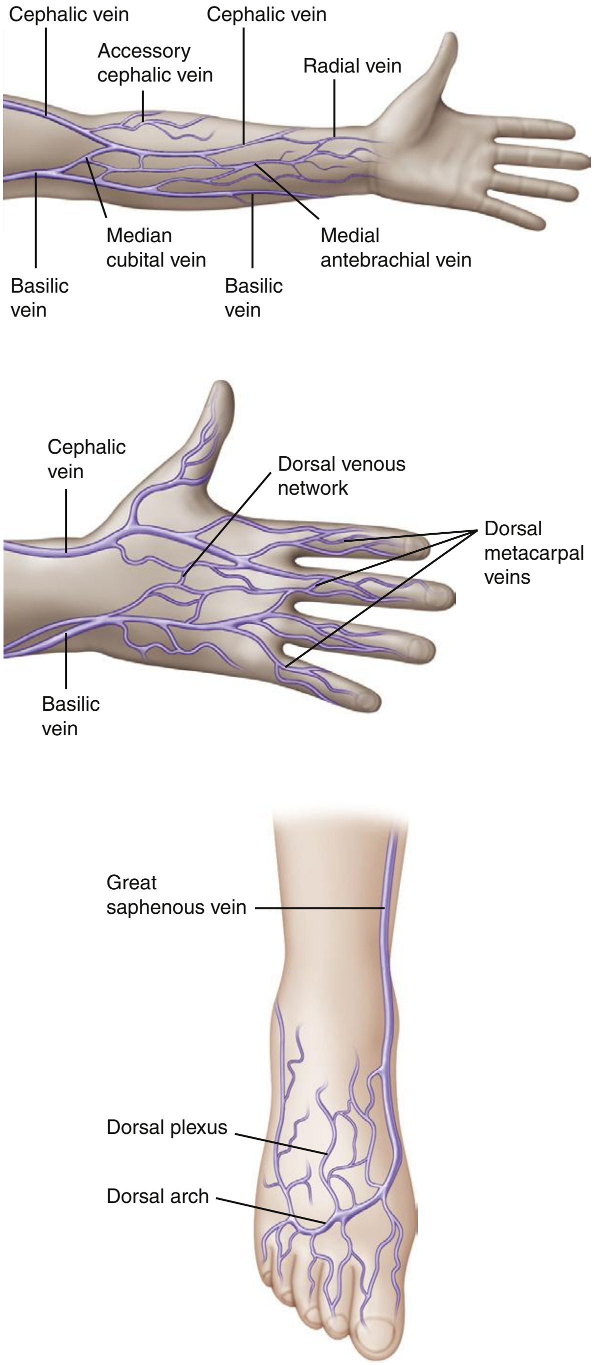


Intravenous infusion filter
(Courtesy Millipore Corporation)

intravenous infusion, **1.** a solution administered into a vein through an infusion set that includes a plastic or glass vacuum bottle or bag containing the solution and tubing connecting the bottle to a catheter or a needle in the patient's vein. **2.** the process of administering a solution intravenously. Swelling of the limb around and distal to the site of injection may indicate that the tip of the catheter or needle is in the subcutaneous tissue and not in the vein. The fluid may be infiltrating the tissue spaces. It should be withdrawn and the limb elevated. Redness, swelling, heat, and pain around the vein at the site of injection or proximal to it may indicate thrombophlebitis. The infusion should be discontinued and the inflammatory condition treated. The infusion is usually begun again at another site. See also **venipuncture.**

intravenous infusion technique, the calculations for determining the delivery rate of IV fluid for the individual patient and the necessary spiking of the container and priming of the tubing before venipuncture and fluid administration.

■ METHOD: The rate at which solution is to be administered by IV infusion can be determined from the procedure formula. The hands are washed thoroughly before assembling the container of IV solution, the IV pole, and the proper tubing with the flow clamp placed in a position directly beneath the drip chamber and clamped. If a bottle with a rubber stopper is used, the protective metal cap is removed, and, with the bottle held securely on a stable surface, the spike of the tubing is pushed firmly into the stopper. To spike an IV bottle with an indwelling vent and latex diaphragm, the metal cap and diaphragm are removed and the spike is inserted into the nonvented hole. If a hiss, indicating a vacuum, does not follow, the bottle is contaminated and should be discarded. Nonvented tubing is used with this kind of bottle. A plastic bag of IV fluid is hung on a hook for spiking, the cap is removed by pulling it smoothly to the right, and a nonvented spike is inserted into the port by using one quick, even motion to prevent the escape of fluid. An IV bag with a firm, easily grasped port with a lip to prevent touch contamination may be spiked before hanging by grasping the port firmly; squeezing the bag may expel air and is carefully prevented.



Common intravenous infusion sites
(Harkreader, Hogan, and Thobaben, 2007)

After the hanging bag or bottle is spiked, the drip chamber is gently squeezed until it is half full before the tubing is primed. The end of the tubing is held over a sink or wastebasket as the protective cap is removed, and the cap is kept uncontaminated for reuse. The flow clamp is released, and the tubing is allowed to fill with fluid until all air bubbles are expelled; if a back check valve is on the tubing, the valve is inverted during priming. The flow clamp is then closed, the protective cap is replaced, and the tubing is looped over the

IV pole so that it does not interfere with venipuncture. Once the needle or intracatheter is inserted and connected to the tubing, the fluid container is hung securely from the IV pole or a hook 3 feet (0.0762 m) above the insertion site. The flow clamp is opened, and the proper fluid delivery rate is adjusted by counting the number of drops entering the drip chamber in a minute. Throughout the administration of IV fluid, rate of flow is checked periodically and any necessary readjustments of the clamp are made. IV fluids also may be delivered via IV pump. IV pump tubing is then used, and the flow rate is calculated in mL/hr.

■ INTERVENTIONS: The nurse assembles the apparatus for the IV infusion, spikes the fluid container, primes the tubing, calculates the proper rate for the patient, and ensures that the rate of delivery and asepsis are maintained. The nurse carefully observes the patient for signs of circulatory overload, such as a bounding pulse, engorged peripheral veins, dyspnea, cough, and pulmonary edema, indicating that the infusion rate is too rapid and requires adjustment.

■ OUTCOME CRITERIA: IV solutions administered to maintain normal body fluid levels and electrolyte balance do not overload the circulation when delivered at the flow rate required by the individual patient.

intravenous injection, a hypodermic injection into a vein for the purpose of instilling a single dose of medication, injecting a contrast medium, or beginning an IV infusion of blood, medication, or a fluid solution, such as saline or dextrose in water. See also **venipuncture.**

intravenous (IV) insertion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as insertion of a needle into a peripheral vein for the purpose of administering fluids, blood, or medications. See also **Nursing Interventions Classification.**

intravenous (IV) therapy, **1.** the administration of fluids into a vein through a needle or small-caliber catheter. Ongoing assessment and attention to patient comfort are important. **2.** a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration and monitoring of intravenous fluids and medications. See also **Nursing Interventions Classification.**

intravenously, through a vein.

intravenous medication [L, *intra,* within, *vena,* vein, *medicare,* medicine], a pharmaceutic delivered directly into the bloodstream via a vein.

intravenous peristaltic pump, any one of several devices for administering IV fluids by exerting pressure on the IV tubing rather than on the fluid itself. Most peristaltic pumps operate with normal IV tubing and deliver fluid at a selectable cubic centimeter per hour rate. This device is equipped with a drop sensor, rate selector, power switch indicator lamp, and drop indicator and alarm. The alarm sounds when the infusion does not flow at the prescribed rate. Compare **intravenous controller, intravenous piston pump, intravenous syringe pump.**

intravenous piston pump, any of several devices that accurately control the infusion of IV fluids by piston action. Most IV piston pumps can be operated by battery, as well as by electric current, and require special tubing. Some models are portable. IV piston pumps are commonly equipped with controls that allow selectable flow rates and indicators that display flow rates, dose limits, and cumulative fluid volumes. Such pumps commonly monitor the patient's skin for infiltration by IV fluid and are equipped with infiltration and flow alarms. The IV piston pump monitors the actual volume of IV fluid administered instead of counting drops of fluid; hence, its accuracy is not affected by drop size, temperature, or fluid viscosity. The pump is designed to reduce the delivery rate to a keep-vein-open rate if the proper flow rate or the dose limit is exceeded. The pump also stops delivery of the IV fluid if the line is clogged or if infiltration is detected. Compare **intravenous controller, intravenous peristaltic pump, intravenous syringe pump.**

intravenous pump, a pump designed to regulate the rate of flow of a fluid administered through an IV catheter. See also **Abbott pump, Harvard pump.**

intravenous push. See **intravenous bolus.**

intravenous pyelography (IVP), a radiographic technique for examining the structure and function of the urinary system. A contrast medium is injected intravenously, and serial x-ray films are taken as the medium is cleared from the blood by the kidneys. The renal calyces, renal pelvis, ureters, and urinary bladder are all visible on the radiographs. Tumors, cysts, stones, and many structural and functional abnormalities may be diagnosed with this technique. Fasting and bowel cleansing with a cathartic or an enema before the procedure improve visualization of the urinary tract. The patient may also be asked to void immediately before injection of the contrast medium to prevent dilution of the medium in the bladder and immediately afterward to check residual urine in the bladder. Also called **descending urography, excretory urography, intravenous urography, pyelography.**

intravenous syringe pump, any one of several devices that automatically compress a syringe plunger at a controlled rate. Such devices are used with disposable syringes that can deliver blood, medications, or nutrients by IV, arterial, or subcutaneous routes. IV syringe pumps can deliver small volumes of fluid at rates as low as 0.01 mL/hr. They are often used in the treatment of infants and are especially useful in the care of ambulatory patients. They are ideal for keeping arterial lines open and are usually battery operated and portable. Compare **intravenous controller, intravenous peristaltic pump, intravenous piston pump.**

intravenous team, a group of registered nurses and licensed practical nurses with special training who administer IV therapy. State laws may restrict practice of IV therapy to specific categories of health professionals.

intravenous (IV) therapy, the administration of fluids or drugs, or both, into the general circulation through a venipuncture.

intravenous urography. See **intravenous pyelography.**

intraventricular /-ventrik′yələr/ [L, *intra* + *ventriculus,* little belly], pertaining to the space within a ventricle or to the conduction system within the walls of a ventricle.

intraventricular block, altered conduction of the cardiac impulse within the ventricles. The block can occur as a right bundle branch block, left bundle branch block, hemiblock, left anterior or posterior fascicular block, or bifascicular block. Intraventricular blocks are identified on an electrocardiogram when the QRS duration is greater than normal. They can be caused by coronary artery disease, valvular heart disease, ventricular hypertrophy and fibrosis, cardiomyopathy, or degeneration of the conduction system. Prognosis is based on the underlying cardiac condition. See also **bundle branch block, heart block, hemiblock, and intraatrial block.** Also called *sinoatrial block.*

intraventricular conduction defect, a delay in conduction of a ventricular impulse within the ventricles that does not correspond to either a right bundle branch block or a left bundle branch block.

intraventricular hydrocephalus. See **hydrocephalus.**

intraventricular pressure [L, *intra,* within, *ventriculus,* little belly], the pressure of the blood within the heart's ventricles. It varies with the phase of the cardiac cycle.

Complications of intravenous fluid therapy

Observations	*Nursing actions*
Circulatory overload	
Bounding pulse, venous distention, hoarseness, dyspnea, cough, pulmonary rales, restlessness	Notify physician. Reduce flow to "keep open" rate. Raise head of bed to facilitate breathing.
Local infiltration	
Decreased rate or cessation of fluid flow Tissue around needle or catheter site cold, pale, swollen, hard Complaint of local pain	Stop infusion. Arrange to restart infusion at another site. Apply moist heat. Elevate lower arm.
Thrombophlebitis	
Pain, redness, warmth, edema along vein	Same as for local infiltration. Cold compress may be applied initially.
Pyrogenic reaction	
Fever, chills, general malaise, nausea, and vomiting 30 min after infusion started Hypotension (if severe)	Switch to another infusion solution and run at "keep open" rate. Notify physician. Monitor vital signs. Save infusion fluid for culture.
Anaphylactic reaction (with proteins)	
Apprehension, dyspnea, wheezing, tightness of chest, itching, hypotension	Switch infusion to nonprotein solution and run at "keep open" rate. Notify physician. Monitor vital signs.

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St Louis, 2007, Mosby.

intraventricular sulcus, one of the two sulci (anterior and posterior) that separate the two ventricles of the heart. The anterior intraventricular sulcus contains the anterior interventricular artery and the great cardiac vein. The posterior interventricular sulcus contains the posterior interventricular artery and the middle cardiac vein.

intravesical pressure, the pressure exerted on the contents of the urinary bladder, being the sum of the intraabdominal pressure from outside the bladder and the detrusor pressure exerted by the bladder wall musculature itself. Also called *bladder pressure, vesical pressure*.

intravesical ureterocele, a ureterocele located entirely inside the bladder. It may be either orthotopic or ectopic.

intrinsic /intrin′sik/ [L, *intrinsecus,* inside], **1.** denoting a natural or inherent part or quality. **2.** originating from or situated within an organ or tissue.

intrinsic asthma, a nonseasonal, nonallergic form of asthma, which usually first occurs later in life than allergic asthma and tends to be chronic and persistent rather than episodic. Precipitating factors include inhalation of irritating pollutants, such as dust particles, smoke, aerosols, strong cooking odors, and paint fumes and other volatile substances. Intrinsic asthma may also be triggered by exposure to cold, damp weather; sudden inhalation of cold, dry air; physical exercise; violent coughing or laughing; respiratory infections, such as the common cold; or psychological factors, such as anxiety. Compare **allergic asthma.** See also **asthma.**

intrinsic factor, a substance secreted by the gastric mucosa that is essential for the intestinal absorption of cyanocobalamin. Intrinsic factor forms a bond with molecules of cyanocobalamin, and this complex is transported across the ileal membrane. A deficiency of intrinsic factor, caused by gastrectomy, myxedema, or atrophy of the gastric mucosa, causes pernicious anemia. See also **pernicious anemia.**

intrinsic minus hand deformity, an abnormality that results from interruption of the ulnar and median nerves at the wrist. It causes metacarpophalangeal joint hyperextension and interphalangeal joint flexion.

intrinsic motivation, a prompt to action that comes from within the individual; a drive to action that is rewarded by doing the activity itself, rather than deriving some external reward from it.

intrinsic muscles, muscles that are entirely within the body part or segment moved by them, as the tongue muscles.

intrinsic muscles of the tongue, the superior longitudinal, inferior longitudinal, transverse, and vertical muscles, which alter the shape of the tongue by lengthening and shortening it, curling and uncurling its apex and edges, and flattening and rounding its surface.

intrinsic pathway of coagulation, an in vitro sequence of reactions leading to fibrin formation, beginning with the contact activation of factor XII, followed by the sequential activation of factors XI, IX, and VIII, and resulting in the activation of factor X, which in activated form initiates the common pathway of coagulation. Compare **extrinsic pathway of coagulation.** See also **coagulation cascade, common pathway of coagulation.**

intrinsic PEEP, abbreviation for **intrinsic positive end-expiratory pressure.**

intrinsic positive end-expiratory pressure (intrinsic PEEP), elevated positive end-expiratory pressure and dynamic pulmonary hyperinflation caused by insufficient expiratory time or a limitation on expiratory flow. It cannot be routinely measured by a ventilator's pressure monitoring system but only by an expiratory hold maneuver done by the clinician. Its presence increases the work required to trigger the ventilator, causes errors in the calculation of pulmonary compliance, may cause hemodynamic compromise, and complicates interpretation of hemodynamic measurements. Also called **auto-PEEP.**

intro-, prefix meaning "into or within": *introgastric, introjection, introspection*.

introitus /intrō′itəs/ [L, *intro,* inside, *ire,* to go], an entrance or orifice in a cavity or a hollow tubular structure of the body, such as the vaginal introitus.

introjection /-jek′shən/ [L, *intro* + *jacere,* to throw], an ego defense mechanism whereby an individual unconsciously incorporates into his own ego structure the qualities of another person, usually a significant other. It happens early in life and continues less intensely throughout.

intromission /-mish′ən/, the insertion of one object into another, such as the introduction of the penis into the vagina.

intron /in′tron/ [L, *intra,* within, *regin,* region], a sequence of nucleotides in eukaryotic DNA that does not code for amino acids and interrupts the coding sequence of a gene. Some genes contain numerous long introns. Compare **exon.**

Intron A, a trademark for a parenteral antineoplastic **(interferon alfa-2b, recombinant).**

Intropin, a trademark for an adrenergic **(DOPamine hydrochloride).**

introspection /-spek′shən/ [L, *introspicere,* to look into], **1.** the act of examining one's own thoughts and emotions. **2.** a tendency to look inward and view the inner self. **—introspective,** *adj.*

introsusception /-susep′shən/ [L, *intro,* inside, *suscipere,* to receive], the telescoping or invagination of one segment of the digestive tract into another segment, usually a lower segment. The process can cause obstruction and strangulation of the bowel.

introversion /-vur′zhən/ [L, *intro* + *vertere,* to turn], **1.** the tendency to direct one's interests, thoughts, and energies inward or toward things concerned with the self. **2.** the state of being totally or primarily concerned with one's own intrapsychic experience. Also spelled *intraversion.* Compare **extroversion.**

introvert /in′trəvurt/ [L, *intro* + *vertere,* to turn], **1.** *n,* a person whose interests are directed inward and who is shy, withdrawn, emotionally reserved, and self-absorbed. **2.** *v,* to turn inward or to direct one's interests and thoughts toward oneself. Compare **ambivert, extrovert.** See also **egocentric.**

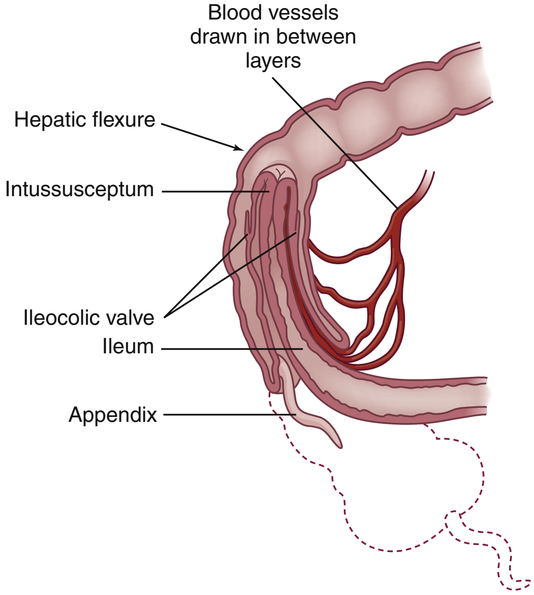
introverted personality /-vur′tid/ [L, *intro,* inside, *vertere,* to turn, *personalis*], a personality that is preoccupied with inner thoughts and fantasies rather than with the outer world of people and things.

intrusion /in·tro͞o′zhən/ [L, *intrudere,* to push or force in], an orthodontic technique of depressing a tooth back into the occlusal plane or attempting to prevent its eruption or elongation during correction of an excessive overbite. Compare **extrusion** (def. 3).

intubate /in′tyo͞obāt/ [L, *in,* within, *tubus,* tube], to catheterize or insert a tube into an organ or body part.

intubation [L, *in,* within, *tubus,* tube, *atio,* process], passage of a tube into a body aperture, specifically the insertion of a breathing tube through the mouth or nose into the trachea to ensure a patent airway for the delivery of anesthetic gases and oxygen or both. **Blind intubation** is the insertion of a breathing tube without the use of a laryngoscope. Kinds of intubation include **endotracheal intubation** and *nasotracheal intubation.*

intussusception /in′təsəsep′shən/ [L, *intus,* within, *suscipere,* to receive], prolapse of one segment of bowel into the lumen of another segment. This kind of intestinal obstruction may involve segments of the small intestine, the colon, or the terminal ileum and cecum. Intussusception occurs most often in infants and small children and is characterized by abdominal pain, vomiting, and presence of bloody mucus in the stool (currant jelly stool). Barium enema is used to confirm the diagnosis, and surgery is usually necessary to correct the obstruction. See also **intestinal obstruction.**



Ileocolic intussusception *(Huether and McCance, 2008)*

intussusceptum, the portion of the intestine that has been invaginated within another part in intussusception.

inulin /in′yo͝olin/, a fructose-based starch derived from rhizomes of plants from the *Compositae* family. It is used as a diagnostic aid in tests of kidney function, specifically glomerular filtration. It is not metabolized or absorbed by the body. It is freely filtered by the glomeruli of the kidney but is neither secreted nor reabsorbed by the tubules, making its clearance equivalent to the glomerular filtration rate.

inulin clearance, a test of the rate of filtration of a starch, inulin, in the glomerulus of the kidney. Inulin is given by mouth, and the glomerular filtration rate can be estimated from the amount of inulin that appears in the urine. The clearance rate of inulin in urine for adults with normal renal function is 100 to 150 mL/min.

inunction /inungk′shən/ [L, *in,* within, *ungere,* to smear], **1.** the rubbing of a drug mixed with an oil or fatty substance into the skin, with absorption of the active ingredient. **2.** any compound so applied.

inundation fever. See **scrub typhus.**

in utero /inyo͞o′tərō/, inside the uterus.

invagination /invaj′ənā′shən/ [L, *in,* within, *vagina,* sheath], **1.** a condition in which one part of a structure telescopes into another, as the intestine during peristalsis. If the invagination is extensive or involves a tumor or polyp, it may cause an intestinal obstruction, necessitating surgery. **2.** surgery for repair of a hernia by replacement of the contents of the hernial sac in the abdominal cavity. General or spinal anesthesia may be used. See also **hernia, intestinal obstruction, intussusception, peristalsis. —invaginate,** *v.*

invariable behavior /inver′ē·əbəl/ [L, *in,* not, *variare,* to vary], behavior that results from physiological response to a stimulus and is not modified by individual experience, such as a reflex. Compare **variable behavior.**

invasion /invā′zhən/ [L, *in,* within, *vadere,* to go], the process by which malignant cells move through the basement membrane and gain access to blood vessels and lymphatic channels.

invasion of privacy, (in law) the violation of another person's right to be left alone and free of unwarranted publicity and intrusion. See also **HIPAA.**

invasive /invā′siv/ [L, *in,* within, *vadere,* to go], characterized by a tendency to spread, infiltrate, and intrude.

invasive carcinoma, a malignant neoplasm composed of epithelial cells that infiltrate and destroy surrounding tissues and may metastasize.

invasive hemodynamic monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as measurement and interpretation of invasive hemodynamic parameters to determine cardiovascular function and regulate therapy as appropriate. See also **Nursing Interventions Classification.**

invasive mole. See **chorioadenoma destruens.**

invasive procedure [L, *in* + *vadere,* to go, *procedere,* to proceed], a diagnostic or therapeutic technique that requires entry of a body cavity or interruption of normal body functions. Examples include the Pap test and colonoscopy.

invasive thermometry, measurement of tissue temperature, using probes placed directly into the tissue.

Invega, a trademark for **paliperidone.**

inverse anaphylaxis /invurs′, in′vurs/, an exaggerated reaction of hypersensitivity induced by an antibody rather than an antigen. Also called **reverse anaphylaxis.**

inverse I:E ratio, an inspiratory/expiratory ratio in mechanical ventilation in which the duration of inspiration is prolonged relative to that of expiration. This condition is sometimes instituted to improve oxygenation, as in the care of infants with idiopathic respiratory distress syndrome and of adults in whom conventional ventilator techniques fail. I:E ratios in such cases may be approximately 2:1 or 3:1. Also called **reversed I:E ratio.** See also **I:E ratio.**

inverse Marcus Gunn syndrome. See **Marin Amat's syndrome.**

inverse relationship. See **negative relationship.**

inverse square law, a law stating that the amount of radiation reaching a surface is inversely proportional to the square of the distance between the source and the surface. For example, a person standing 1 m from a patient being treated with radium is exposed to four times more radiation than a person standing 2 m from the patient.

Inversine, a trademark for a ganglionic blocking agent **(mecamylamine hydrochloride).**

inversion /invur′zhən/ [L, *invertere,* to turn over], **1.** an abnormal condition in which an organ is turned inside out, such as a uterine inversion. **2.** a chromosomal defect in which a segment of a chromosome breaks off and then reattaches to the chromosome in the reverse orientation, causing the genes carried on that part of the chromosome to be in an abnormal position and sequence.

inversion recovery (IR), a magnetic resonance pulse sequence designed to emphasize T_1 differences.

inversion traction, a positional form of traction for the prevention and treatment of back disorders. Special equipment is used to lengthen the spinal column while the patient is in an inverted position. A similar effect is achieved by hanging upside down from a chinning bar.

invert /in′vurt/ [L, *invertere,* to turn over], to turn something upside down or inside out.

invertebrate /invur′təbrit/, an animal that lacks a vertebral column. Invertebrates comprise more than 95% of all species of animals.

invert sugar [L, *invertere,* to turn over; Gk, *sakcharon*], a mixture of equal amounts of dextrose and fructose, obtained by hydrolyzing sucrose. It is used in solution as a parenteral nutrient.

investigational device exemption (IDE) /inves′tigā′shənəl/ [L, *investigare,* to search for], an agreement through which the federal government permits the testing of new medical devices.

investigational new drug (IND), a drug not yet approved for marketing by the U.S. Food and Drug Administration (FDA) and available only for use in experiments to determine its safety and effectiveness. The use of an investigational new drug in human subjects requires approval by the FDA of an application that includes reports of animal toxicity tests, descriptions of proposed clinical trials, and a list of the investigators and their qualifications.

investing fascia, a layer of fascia that closely invests a muscle or ligament.

Invirase, a trademark for an antiretroviral protease inhibitor **(saquinavir).**

invisible differentiation /inviz′ibəl/ [L, *in,* not, *visibilis,* visible, *differentia,* difference], (in embryology) a fixed determination for specialization and diversification that exists in embryonic cells but is not yet visibly apparent. See also **chemodifferentiation.**

in vitro /invē′trō/ [L, *in,* within, *vitreus,* glassware], occurring in a laboratory apparatus. Compare **in vivo.**

in vitro fertilization (IVF), a method of fertilizing human ova outside the body by collecting the mature ova and placing them in a dish with a sample of spermatozoa. After an incubation period of 48 to 72 hours, the fertilized ova are injected into the uterus through the cervix. The procedure takes from 2 to 3 days. See also **gamete intrafallopian transfer.**

in vitro susceptibility testing, a laboratory trial of the sensitivity of microorganisms, particularly fungi, to potential therapeutic chemicals.

in vivo /invē′vō/ [L, *in,* within, *vivo,* alive], occurring in an organism. Compare **in vitro.**

in vivo fertilization, a method of fertilization of an ovum within a fallopian tube of a fertile female donor for transplantation into an infertile recipient.

in vivo tracer study, a diagnostic procedure in which a series of images of an administered radioactive tracer demonstrates normal or abnormal structures or processes as the tracer passes through a patient's body. A strip-chart recording of the procedure, such as a radionuclide angiocardiogram, shows the passage of the tracer through body.

involucrum /in′vəlo͞o′krəm/ *pl.* **involucra** [L, *involvere,* to wrap up], a sheath or coating, such as that encasing a sequestrum of necrotic bone.

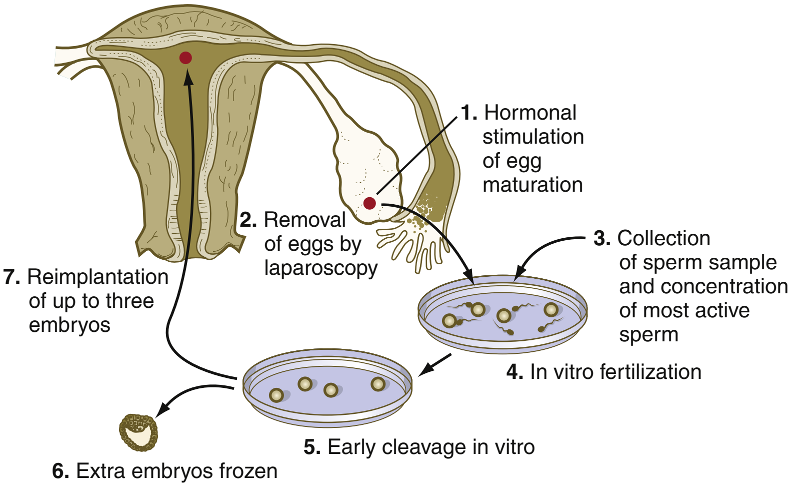
involuntary /invol′ənter′ē/ [L, *in,* not, *voluntas,* will], occurring without conscious control or direction. See also **autonomy.**

involuntary muscle. See **smooth muscle.**

involuntary nervous system. See **visceral nervous system.**

involuntary patient, a person admitted to a psychiatric facility against his or her will. See also **informal admission.**

involution /in′vəlo͞o′shən/ [L, *involvere,* to wrap up], **1.** a normal process of turning or rolling inward characterized by a decrease in the size of an organ caused by a decrease in the size of its cells, such as postpartum involution of the uterus. **2.** (in embryology) a developmental process in which a group of cells grows over the rim at the border of the organ



1. Hormonal stimulation of egg maturation
2. Removal of eggs by laparoscopy
3. Collection of sperm sample and concentration of most active sperm
4. In vitro fertilization
5. Early cleavage in vitro
6. Extra embryos frozen
7. Reimplantation of up to three embryos

In vitro fertilization *(Carlson, 2009)*

or part and, rolling inward, rejoins the organ or part to form a tube, such as in the heart or bladder.

involutional melancholia, a former term for a state of depression that occurs during the climacteric (menopause of women). It is now treated as a major depressive episode. See also **depression.**

inward aggression /in′wərd/ [AS, *inweard*], destructive behavior that is directed against oneself. See also **aggression, masochism.**

-io, **1.** noun-forming suffix: *abrasio, evulsio, injectio.* **2.** suffix for iodine-containing contrast medium.

iodide /ī′ədīd/ [Gk, *ioeides,* violet], an anion of iodine. Sodium and potassium iodide are the salts most commonly used in medicine.

iodinated serum albumin /ī′ədinā′tid/, a sterile, buffered, isotonic solution containing radioiodinated normal human serum used in diagnostic tests of blood volume and cardiac output. It is adjusted to provide not more than 1 mCi of radioactivity per milliliter.

iodine (I) /ī′ədīn/ [Gk, *ioeides,* violet], a nonmetallic element of the halogen group. Its atomic number is 53; its atomic mass is 126.90. Iodine is a bluish black solid that becomes a violet vapor on heating without going through a liquid phase. Iodine is an essential micronutrient or trace element. Almost 80% of the iodine present in the body is in the thyroid gland, mostly in the form of thyroglobulin. Iodine deficiency can result in goiter or cretinism. Iodine is found in seafood, iodized salt, and some dairy products. It is used as a contrast agent for blood vessels in computed tomography scans. Radioisotopes of iodine are used in radioisotope scanning procedures and in palliative treatment of cancer of the thyroid.

iodine poisoning [Gk, *ioeides,* violet; L, *potio,* drink], toxic effects of ingesting iodine, a potent antiseptic with low tissue toxicity. Symptoms include burning pain in the mouth and esophagus, abdominal pain, vomiting, diarrhea, delirium, shock, nephritis, laryngeal edema, and circulatory collapse. The mucous membranes are stained brown by the iodine.

iodism /ī′ədiz′əm/ [Gk, *ioeides* + *ismos,* process], a condition produced by excessive amounts of iodine in the body. It is characterized by increased lacrimation and salivation, rhinitis, weakness, and skin eruption.

iodize /ī′ədīz/ [Gk, *ioeides* + *izein,* to cause], to treat or impregnate with iodine or an iodide. Table salt is iodized to prevent the occurrence of goiter in areas with insufficient iodine in the drinking water or food. Iodized oil, a viscous liquid with the odor of garlic, has been used as a contrast medium in radiology.

iodized oil, an iodine addition product of vegetable oil, used as a radiopaque contrast medium in various diagnostic procedures.

iodized salt [Gk, *ioeides,* violet; AS, *sealt*], table salt to which potassium or sodium iodide has been added to protect against goiter, particularly in regions where soil and drinking water have low iodine content. The iodides are added to achieve approximately 100 ppm.

iodo-, prefix meaning "iodine": *iododerma, iodogenic, iodolography.*

iododerma /ī·ō′dōdur′mə/ [Gk, *ioeides* + *derma,* skin], a skin rash of follicular papules and pustules caused by a hypersensitivity to ingested iodides. The lesions may be acneiform, bullous, or fungating. Treatment requires removal of iodides.

iodophor /ī·ōdəfôr/ [Gk, *ioeides* + *phoros,* bearer], an antiseptic or disinfectant that combines iodine with another agent, such as a detergent.

iodopsin /ī′ōdop′sin/ [Gk, *ioeides* + *optikos,* vision], a photosensitive chemical in the cones of the retina that reacts in association with other chemicals and plays a part in color vision. Iodopsin is more stable when exposed to bright light than rhodopsin, which is found in the rods of the retina. Color vision, a synthesis of red, green, and blue light, is induced by changes within the pigments of different types of cones during a photochemical process in which coded nerve impulses are sent to the brain. Research on the exact role of iodopsin in color vision, which is still unknown, is ongoing.

iodoquinol /ī′ōdō′kwinol/, an amebicide.

■ INDICATIONS: It is prescribed in the treatment of intestinal amebiasis. It is also used as a preventative in high-risk people.

■ CONTRAINDICATIONS: Hepatic disease and known hypersensitivity to iodine or 8-hydroxyquinoline prohibit its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are dizziness, thyroid enlargement, optic neuropathy, optic atrophy, and peripheral neuropathy.

iodotherapy /ī·ō′dōther′əpē/, a treatment that uses iodine or an iodide.

ion /ī′ən, ī′on/ [Gk, *ienai,* to go], an atom or group of atoms that has acquired an electrical charge through the gain or loss of an electron or electrons.

-ion, **1.** suffix meaning an "electrically charged particle": *anion, cation, ion.* **2.** noun-forming suffix: *endognathion, osteopedion, parhelion.*

ion exchange chromatography, the process of separating and analyzing different substances according to their affinities for chemically stable but very reactive synthetic exchangers, which are composed largely of polystyrene and cellulose. The process uses an absorbent containing ionizing groups and accommodates the exchange of ions between a solution of substances to be analyzed and the absorbent. Ion exchange chromatography is often used to separate components of nucleic acids and proteins elaborated by various structures throughout the body. Different ions deposited in the absorbent during the exchange produce bands of different colors, which constitute a chromatograph. Compare **column chromatography, gas chromatography.**

ionic bonding /ī·on′ik/ [Gk, *ienai* + ME, *band,* to bind], an electrostatic force between ions. Ionic compounds do not form true molecules; in aqueous solution they separate into their hydrated constituent ions.

ionic dissociation, a phenomenon whereby ions in ionic compounds in an aqueous solution are freed from their mutual attractions and distribute themselves uniformly throughout the solvent.

ionic strength, the sum of the concentrations of all ions in a solution multiplied by the square of their charge.

ionization /ī′ənīzā′shən/ [Gk, *ienai* + *izein,* to cause], the process in which a neutral atom or molecule gains or loses electrons and thus acquires a negative or positive electrical charge. Ionizing radiation produces ionization in its passage through body tissue or other matter. Ionization can also cause cell death or mutation.

ionization chamber, a small cavity filled with air that collects the ionic charge liberated during irradiation. The exposure and dose of radiation can be calculated from the amount of change liberated and the mass of air in the chamber.

ionization constant (K), after establishment of ionic equilibrium, the product of the molar concentration of the ions divided by the molar concentration of the nonionized molecules.

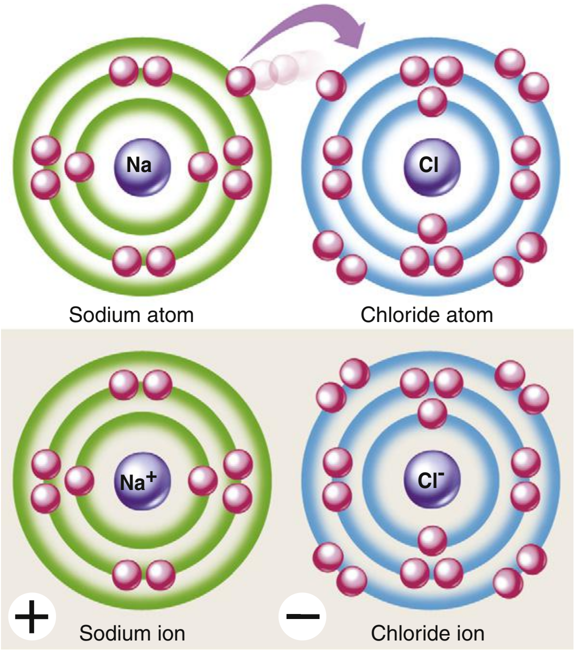
ionize /ī′ənīz/ [Gk, *ienai* + *izein,* to cause], to separate or change into ions. See also **ion.**

ionized calcium, the ionized, unbound, noncomplexed fraction of serum calcium that is biologically active.

ionizing energy /ī′ənī′zing/, the average energy lost by ionizing radiation in producing an ion pair in a gas. In air the value is approximately 33.73 electron volts.

ionizing radiation, high-energy electromagnetic waves (such as x-rays and gamma rays) and particles (such as alpha and beta particles, neutrons, protons, and heavy nuclei) that cause substances in their paths to dissociate into ions. The spatial distribution of the ionization depends on the kind of radiation, its penetrating power, the location of the source, and the nature of the irradiated material. High-energy x-rays penetrate deeply, most beta particles penetrate only a few millimeters, and alpha particles penetrate only a fraction of a millimeter. However, all three produce intense ionization along their tracks. Ionizing radiation directly affects living organisms by killing cells or retarding their development and by producing gene mutations and chromosome breaks. Tissues containing elements with relatively high atomic masses, such as calcium in bones and teeth, absorb much higher doses of ionizing radiation than do soft tissues.

ionizing radiation injury [Gk, *ion,* going; L, *radiare,* to shine, *injuria*], damage or ill effects suffered by exposure to ionizing radiation, including cellular harm resulting from radiation for diagnostic or therapeutic application. The risk of cell death or injury from radiation depends on the type of tissue cells, the stage of cell division at the time of exposure, the intensity and time span of exposure, and the type of radiation administered. See also **radiation burn.**



Ionization

ion-selective electrode, a potentiometric electrode that develops a potential in the presence of one ion (or class of ions) but not in the presence of a similar concentration of other ions.

iontophoresis /ī·on′tōfôrē′·sis/ [Gk, *ion,* going, *pherein,* to carry], the introduction of ions of soluble salts into the tissues by direct current. Also called **galvanoionization,** *iono-phoresis* /ī·ō′nō-/, **medical ionization.**

iontophoretic pilocarpine test [Gk, *ienai* + *pherein,* to carry], a sweat test used in the diagnosis of cystic fibrosis. Pilocarpine iontophoresis is used to stimulate production of sweat, which is absorbed from the forearm in a previously weighed gauze pad. The sweat sample is then analyzed for concentrations of sodium and chloride electrolytes.

ion transfer, a method of transporting chemicals across a membrane by using an electric current as a driving force.

iopromide /i′opro′mīd/, a nonionic, low-osmolality radiopaque medium used for cardiovascular imaging, excretory urology, and contrast enhancement in computed tomography.

iota /ī·ō′tə/, I, ι, the ninth letter of the Greek alphabet. Iota is also used to refer to something tiny, such as one iota.

ioversol /i′over′sol/, a nonionic contrast medium used in angiography and urography and for contrast enhancement in computed tomography.

Iowa trumpet /ī′əwə/, a trademark for a kind of needle guide used in performing a pudendal block. It consists of a long, thin cylinder through which a needle may be passed. A ring is attached to the proximal end of the guide, allowing the operator to hold it securely.

ioxilan /iok′slan/, a low-viscosity, low-osmolality, nonionic contrast agent used in arteriography, excretory urography, and computed tomography.

IPA, abbreviation for **Independent Practice Association.**

IPAA, abbreviation for *International Psychoanalytical Association*.

IPA-Model HMO, a health maintenance organization (HMO) that contracts with an independent practice association (IPA) for physician services. The IPA processes and adjudicates claims. The HMO provides enrollees and hospital contracts.

IPA paradigm shift, an independent practice association that takes on the role of the health maintenance organization and contracts with its participating providers but is neither a payer nor a provider.

ipecac /ip′əkak/, an emetic.

■ INDICATIONS: It is prescribed to cause emesis in certain types of recent poisonings and drug overdoses.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not used in unconscious patients or for poisoning by petroleum distillates, strong alkalis, acids, or strychnine.

■ ADVERSE EFFECT: The most serious adverse effect is cardiotoxicity if vomiting does not occur and the substance is retained.

■ NOTE: If vomiting does not occur, the ipecac can be recovered by gastric lavage.

IPOF, abbreviation for **immediate postoperative fit.** See **immediate postoperative fit prosthesis.**

ipomea /ipəmē′ə/, a resin prepared from the dried root of *Ipomoea orizabensis,* formerly used as a cathartic.

IPPB, abbreviation for **intermittent positive-pressure breathing.**

IPPB unit, a pressure-cycled ventilator providing a flow of air into the lungs at a predetermined pressure. As the pressure is attained, the flow is stopped, pressure is released, and the patient exhales. The IPPB device is used to prevent postoperative atelectasis, to promote full expansion of the lungs, to improve oxygenation, and to administer nebulized medications into the respiratory passages.

IPPV, abbreviation for **intermittent positive-pressure ventilation.** See **intermittent positive-pressure breathing.**

Iprivask, a trademark for **desirudin.**

ipsi-, prefix meaning “the same, or self”: *ipsilateral*.

IPSID, abbreviation for **immunoproliferative small intestine disease.**

ipsilateral [L, *ipse,* same, *latus,* side], affecting the same side of the body. Compare **contralateral.**

IPSP, abbreviation for *inhibitory postsynaptic potential*.

IPV, abbreviation for **poliovirus vaccine inactivated.** See **poliovirus vaccine.**

IQ, abbreviation for **intelligence quotient.**

Ir, symbol for the element **iridium.**

IR, **1.** abbreviation for **image receptor.** **2.** abbreviation for *interventional radiology*. **3.** abbreviation for **inversion recovery.**

IRB, abbreviation for **institutional review board.**

irbesartan, an antihypertensive.

■ INDICATIONS: It is used to treat hypertension, either alone or in combination with other drugs. It is also used investigationally to treat heart failure and hypertension in patients with diabetic nephropathy caused by type 2 diabetes mellitus.

■ CONTRAINDICATIONS: Known hypersensitivity and second- and third-trimester pregnancy prohibit its use.

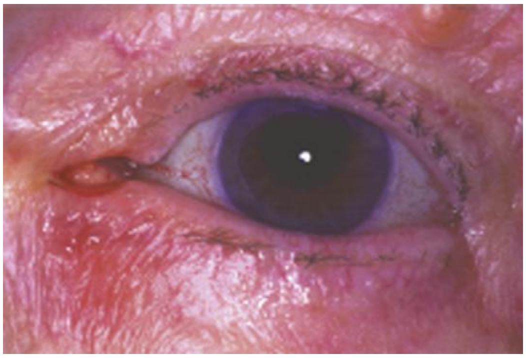
■ ADVERSE EFFECTS: Anxiety, headache, fatigue, diarrhea, and dyspepsia are among the adverse effects. Common side effects include dizziness, cough, and upper respiratory infection.

Iressa, a trademark for **gefitinib.**

Ir g, abbreviation for *immune response function gene*. See **immune response.**

irid-, prefix for terms pertaining to the iris.

iridectomy /ī′ridek′təmē/ [Gk, *iris,* rainbow, *ektomē,* excision], surgical removal of part of the iris of the eye. It is performed most often to restore drainage of the aqueous humor in glaucoma or to remove a foreign body or a malignant tumor. An incision is made through the cornea, and the iris is grasped with forceps or a hook and drawn out through the incision. The affected area is cut away, and the elastic iris is allowed to slip back into place. Subjunctival antibiotics may be instilled, and an eye pad is applied. After surgery, the patient is observed for signs of local hemorrhage or excessive pain.



Irregular pupil caused by iridectomy
(Lemmi and Lemmi, 2000)

iridemia /ī′ridē′mēə/, hemorrhage from the iris.

iridescence /ir′ides′əns/ [L, *iridescere,* to shine like a rainbow], the property of light interference or ability to break up light waves into colors of the spectrum.

iridic. See **iris.**

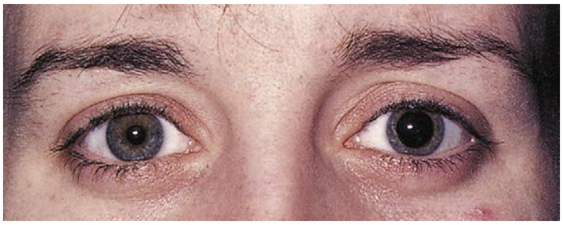
iridium (Ir) /irid′ē·əm/ [Gk, *iris,* rainbow], a silvery-bluish metallic element. Its atomic number is 77; its atomic mass is 192.22.

irido-, iro-, prefix meaning “the iris or a colored circle”: *iridocele, iridokeratitis, iridoplegia*.

iridology /ī′ridol′əjē/ [Gk, *iris,* rainbow, *logos,* science], the science that specializes in relations between disease and the shape, color, and other individual characteristics of the iris. There is considerable controversy over its validity.

iridopathy /ī′ridop′əthē/, any disease of the iris.

iridoplegia /ī′ridōplē′jə/ [Gk, *iris,* rainbow, *plege,* stroke], a condition of paralysis of the sphincter muscle of the iris or the dilator muscle or both.



Iridoplegia *(Perkin, 2002)*

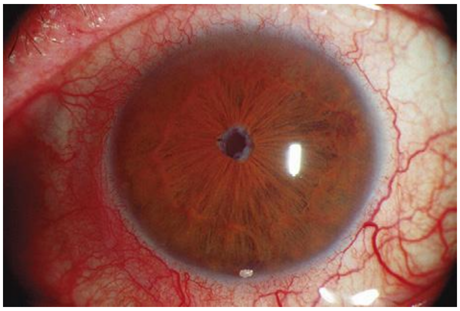
iridotomy /ī′ridot′əmē/ [Gk, *iris* + *temnein,* to cut], a surgical incision into the iris of the eye. It is performed to relieve occlusion of the pupil, to enlarge the pupil in cataract extraction, or to treat postoperative glaucoma. Topical anesthetic drops are used. An incision is made through the cornea, and a cut is made transversely across the sphincter fibers of the iris. Atropine and an antibiotic may be instilled, and a dressing and shield are applied. After surgery the dressing is observed for signs of drainage. Excessive pain is abnormal. See also **iridectomy, iris.**

irinotecan, an antineoplastic hormone.

- INDICATION: It is used to treat metastatic carcinoma of the colon or rectum.
- CONTRAINDICATIONS: Pregnancy and known hypersensitivity to this drug prohibit its use.
- ADVERSE EFFECTS: Life-threatening effects include leukopenia, anemia, and neutropenia. Other adverse effects include fever, headache, chills, dizziness, diarrhea, nausea, vomiting, anorexia, constipation, cramps, flatus, stomatitis, dyspepsia, site irritation, rash, sweating, dyspnea, increased cough, rhinitis, vasodilation, edema, asthenia, and weight loss.

iris /ī′ris/ [Gk, rainbow], an annular, colored membrane shaped like a disc, suspended in aqueous humor between the cornea and the crystalline lens of the eye and enclosing a circular pupil. Smooth muscle fibers of the iris contract and relax to allow more or less light to enter the eye through the pupil. The periphery of the iris is continuous with the ciliary body and is connected to the cornea by the pectinate ligament. The iris divides the space between the lens and the cornea into an anterior and a posterior chamber. The involuntary muscle of the iris is composed of circular fibers and radiating fibers. Dark pigment cells under the translucent tissue of the iris are variously arranged in different people to produce different colored irises. The pigment is absent in albinos. In blue eyes the pigment cells are confined to the posterior surface of the iris, but in gray eyes, brown eyes, and black eyes the pigment cells appear in the anterior layer of epithelium and in the stroma. See also **dilator pupillae, sphincter pupillae. —iridic,** *adj.*

iritis /īrī′tis/ [Gk, *iris* + *itis*], an inflammatory condition of the iris of the eye characterized by pain, lacrimation, photophobia, and, if severe, diminished visual acuity. On ophthalmic examination the eye looks cloudy, the iris bulges, and the pupil is contracted. The underlying cause is treated if identified, but the condition is most often idiopathic. The pupil is dilated, usually with atropine, and a corticosteroid may be prescribed to reduce inflammation. If the inflammation is allowed to continue and the pupil is left constricted, permanent scarring may occur, causing an opacity over the lens and diminished vision.



Iritis *(Kanski, 2006/Courtesy P. Gili)*

iro-. See **irido-.**

iron (Fe) /ī′ərn/ [AS, *iren*], a common metallic element essential for the synthesis of hemoglobin. Its atomic number is 26; its atomic mass is 55.85. Iron salts and complexes, including ferrocholinate, ferrous fumarate, ferrous gluconate, ferrous sulfate, and iron dextran, are used to treat iron-deficiency anemias.

iron-binding capacity (IBC), the extent to which transferrin in the serum of a given patient can bind serum iron.

iron deficiency anemia, a microcytic hypochromic anemia caused by inadequate supplies of iron needed to synthesize hemoglobin. Symptoms are pallor, fatigue, anorexia, malaise, and weakness. Laboratory diagnosis includes hemoglobin, hematocrit, transferrin saturation, ferritin, and serum iron concentration. Iron deficiency may be the result of an inadequate dietary supply of iron, poor absorption of iron by the digestive system, chronic bleeding, or compensated hemolytic anemia. Replacement iron can be supplied by oral ferrous sulfate. The anemia corrects in 2 months, but therapy is continued for another 4 months to replace tissue stores. Compare **hemolytic anemia, hypoplastic anemia.** See also **iron metabolism, nutritional anemia, red cell indexes.**

iron dextran, an injectable hematinic.

- INDICATION: It is prescribed in the treatment of iron deficiency anemia that is not responsive to oral iron therapy.
- CONTRAINDICATIONS: Early pregnancy, anemias other than iron deficiency anemia, or known hypersensitivity to this drug prohibits its use.
- ADVERSE EFFECTS: Among the more serious adverse effects are severe hypersensitivity reactions, including fatal anaphylaxis. Inflammation or phlebitis at the site of injection, arthralgia, headache, GI distress, fever, and lesser hypersensitivity reactions may occur.

iron level and total iron-binding capacity test, a blood test used to diagnose iron deficiency anemia and hemochromatosis (iron overload or poisoning), among other conditions.

iron lung. See **Drinker respirator.**

iron metabolism, a series of processes involved in the entry of iron into the body and its absorption, transport, storage, use in the formation of hemoglobin and other iron compounds, and eventual excretion. Iron normally enters through the intestinal mucosa and is oxidized from ferrous to ferric iron in the process. The rate at which iron enters is modulated by this absorption mechanism. When iron stores are high, iron no longer passes through but is trapped by the mucosal cells of the intestine to be eliminated. Once in the blood, iron cycles between the plasma and the reticuloendothelial or erythropoietic system. For hemoglobin synthesis, plasma iron is delivered to the normoblast, where it remains up to 4 months, functioning in the hemoglobin molecules of a mature red cell. Senescent red cells then deteriorate. The iron is released from the hemoglobin by the reticuloendothelial system to reenter the transport pool for recycling. The normal iron distribution in a 70-kg adult (male) totals approximately 3.7 g, more than 65% in circulating hemoglobin. Another 27% is found in the storage pool as hemosiderin or ferritin. The body normally conserves iron so well that loss, usually only through the feces, is normally limited to about 1 mg/day. This amount is easily provided by a dietary intake of only 10 mg/day. Iron deficiency may follow extended intervals of inadequate iron intake (especially in women), in pregnancy when higher levels of iron are needed, or with excessive blood loss. Iron overload sometimes occurs in disorders in which normal regulation of iron absorption is impaired, called **hemochromatosis**. Hemochromatosis may be inherited or acquired in long-term transfusion therapy for chronic anemias. See also **anemia, hemochromatosis, iron deficiency anemia, iron transport.**

iron overload, an excess of iron in the body. See also **hemochromatosis, hemosiderosis, siderosis.**

iron poisoning [AS, *iren* + L, *potio*, drink], toxic effects of ingesting iron salts, particularly ferrous sulfate and ferrous chloride. Ferrous sulfate tablets, sometimes mistaken for candy, can cause vomiting, collapse, and liver necrosis.

Ferrous chloride, a corrosive substance, causes vomiting, diarrhea, and hemorrhage when taken internally. Iron encephalopathy has resulted from excessive use of iron preparations.

iron-polysaccharide. See **polysaccharide-iron complex.**

iron-rich food, any food item containing a relatively large amount of iron. One of the best sources of dietary iron is liver. Oysters, clams, heart, kidney, lean meat, seafood, and iron-fortified foods are other good sources. Leafy green vegetables, whole grains, and legumes are among the best plant sources. See also **iron, iron deficiency anemia.**

iron salt poisoning, poisoning caused by overdose of ferric or ferrous salt, characterized by vomiting, bloody diarrhea, cyanosis, and gastric and intestinal pain.

iron-storage disease, an abnormal accumulation of iron in the parenchyma of many organs, as in hemosiderosis.

iron sucrose, a complex of ferric hydroxide, $Fe(OH)_3$, in sucrose, used intravenously to treat iron deficiency anemia in hemodialysis patients receiving supplemental erythropoietin therapy.

iron transport, the process whereby iron is carried from the intestinal mucosa to sites of use and storage. Iron binds with transferrin and shuttles to storage and utilization sites. Transferrin becomes attached to exogenous iron that enters through the intestinal villi or that reenters the plasma from the sinusoids of the spleen. The iron is then released to the normoblasts, and the transferrin is freed for additional transport functions that may involve iron stored as ferritin or hemosiderin. See also **hemochromatosis, iron metabolism, transferrin.**

irradiation /irā′dē·ā′shən/ [L, *irradiare,* to beam upon], exposure to any form of radiant energy, such as heat, light, or x-rays. Radioactive sources of radiant energy, such as x-rays or isotopes of iodine or cobalt, are used diagnostically to examine internal body structures. The same or similar sources of radioactivity in larger amounts are used to destroy microorganisms or tissue cells that have become cancerous. Infrared or ultraviolet light may be used to produce heat in body tissues for pain relief or to treat acne, psoriasis, or other skin ailments. Ultraviolet light is also used to identify certain bacteria and toxic molds. See also **radiation sickness, radioactivity, ultraviolet. —irradiate,** *v.*

irrational /irash′ənəl/ [L, *irrationalis,* contrary to reason], pertaining to events, conditions, or behavior that may be considered unreasonable.

irreducible /ir′əd(y)o͞o′sibəl/ [L, *in,* not, *reducere,* to bring back], unable to be returned to the normal position or condition, as an irreducible hernia. See also **incarcerate.**

irreducible hernia. See **incarcerated hernia.**

irregular pulse /ireg′yələr/ [L, *in,* not, *regula,* rule, *pulsare,* to beat], a variation in the force or rhythm of impulses in an artery, caused by cardiac arrhythmia.

irreversible /ir′əvur′sibəl/ [L, *irrevertere,* to not turn back], pertaining to a situation or condition that cannot be reversed.

irreversible coma. See **brain death.**

irreversible shock, a condition in which shock does not respond to available forms of treatment and in which recovery is impossible as a result of massive cellular damage.

irrigate /ir′igāt/ [L, *irrigare,* to supply water], to flush with a fluid, usually with a slow steady pressure on a syringe plunger. It may be done to cleanse a wound or to clear tubing.

irrigation /ir′igā′shən/, the process of washing out a body cavity or wounded area with a stream of water or other fluid. It is also used to cleanse a tube or drain inserted into the body, such as an indwelling catheter. The procedure is most commonly performed with water, saline, aminoacetic acid, or antiseptic solution on the eye, ear, throat, vagina, or urinary tract. Gentle pressure is applied in the introduction of the fluid, except in the debridement of wounds, and the solution is removed from internal cavities through suction or drainage. See also **lavage. —irrigate,** *v.*

irrigator /ir′igā′tər/, an apparatus with a flexible tube for flushing or washing out a body cavity.

irritability /ir′itəbil′itē/ [L, *irritare,* to tease], a condition of abnormal excitability or sensitivity.

irritable bladder /ir′itəbəl/ [L, *irritare,* to tease; AS, *blaedre*]. See **overactive bladder.**

irritable bowel syndrome (IBS) [L, *irritare,* to tease; OFr, *boel* + Gk, *syn,* together, *dromos,* course], abnormally increased motility of the small and large intestines, of unknown origins. Most of those affected are young adults who complain of diarrhea and, occasionally, pain in the lower abdomen. The pain is usually relieved by passing flatus or stool. In diagnosing irritable bowel syndrome, other more serious conditions, such as dysentery, lactose intolerance, and the inflammatory bowel diseases, must be ruled out. Because there is no organic disease present in irritable bowel syndrome, no specific treatment is necessary. Many persons benefit from the use of bulk-producing agents in the diet because bulk tends to stabilize the water content of the stool. Antidiarrheal drugs are helpful in decreasing the frequency of stool. Although this is a functional disorder, patients experience pain and discomfort and need emotional support. Mild tranquilizers or antidepressants are sometimes given to relieve anxiety or depression. Also called **functional bowel syndrome, mucous colitis, spastic colon.**

irritant /ir′itənt/ [L, *irritare,* to tease], an agent that produces inflammation or irritation.

irritant poison [L, *irritare,* to tease, *potio,* drink], any of a large number of toxic substances in the environment that can cause pain in the digestive tract, diarrhea, vomiting, abdominal cramps, and urinary tract disorders. Some irritant chemicals are industrial gases, such as ammonia, chlorine, phosgene, sulfur dioxide, hydrogen sulfide, and nitrogen dioxide, which may leak into the atmosphere.

irritation fibroma /ir′itā′shən/, a localized, peripheral, tumorlike enlargement of connective tissue caused by prolonged irritation. It commonly develops on the gums or the buccal mucosa.

IRV, abbreviation for **inspiratory reserve volume.** See **pulmonary function test.**

Irving technique, a method of tubal ligation in which the uterine tubes are ligated and severed and the proximal ends are sewn into the myometrium. Also called *Irving operation*.

Isaacs' syndrome /ī′zəks/ [H. Isaacs, American neurologist, 20th century], progressive muscle stiffness and spasms, with continuous muscle fiber activity similar to that seen with neuromyotonia. Compare **stiff-man syndrome**.

ischaemic contracture. See **Volkmann's contracture.**

ischemia /iskē′mē·ə/ [Gk, *ischein,* to hold back, *haima,* blood], a decreased supply of oxygenated blood to a body part. The condition is often marked by pain and organ dysfunction, as in ischemic heart disease. Some causes of ischemia are arterial embolism, atherosclerosis, thrombosis, and vasoconstriction. Also spelled *ischaemia*. Compare **infarction. —ischemic,** *adj*.

ischemic contracture. See **Volkmann's contracture.**

ischemic heart disease /iskē′mik/, a pathological condition caused by lack of oxygen in cells of the myocardium.

ischemic lumbago, a pain in the lower back and buttocks caused by vascular insufficiency, as in occlusion of the abdominal aorta.

ischemic necrosis. See **coagulation necrosis.**

ischemic pain, unpleasant, often excruciating pain associated with decreased blood flow caused by mechanical obstruction, constricting orthopedic casts, or insufficient blood flow that results from injury or surgical trauma. Ischemic pain caused by occlusive arterial disease is often severe and may not be relieved, even with narcotics. The individual with peripheral vascular disease may experience ischemic pain only while exercising because the metabolic demands for oxygen cannot be met as a result of occluded blood flow. The ischemic pain of partial arterial occlusion is not as severe as the abrupt, excruciating pain associated with complete occlusion, such as by an embolus or thrombus. See also **pain intervention.**

ischemic paralysis, loss of motor control in a body area caused by an interruption in the blood supply to the area's muscles or nerves.

ischemic penumbra, an area of moderately ischemic brain tissue surrounding an area of more severe ischemia. Theoretically, blood flow to this area may be enhanced in order to prevent the spread of a cerebral infarction.

ischemic pericarditis [Gk, *ischein,* to hold back, *haima,* blood, *peri,* near, *kardia,* heart, *itis,* inflammation], inflammation of the pericardium caused by interruption of its blood supply during myocardial infarction.

ischemic stroke, a cerebrovascular disorder caused by deprivation of blood flow to an area of the brain, generally as a result of thrombosis, embolism, or reduced blood pressure.

ischia. See **ischium.**

ischial spines /is′kē·əl/ [Gk, *ischion,* hip joint; L, *spina,* thorn], two relatively sharp posterior bony projections into the pelvic outlet from the ischial bones that form the lower border of the pelvis.

ischial tuberosity [Gk, *ischion,* hip joint; L, *tuber,* swelling], a rounded protuberance of the lower part of the ischium. It forms a bony area on which the human body rests when in a sitting position.

ischio-, prefix meaning "the ischium or the hip": *ischioanal, ischiodidymus, ischiopagus.*

ischioanal fossae, gutters in the anal triangle, one on each side of the anal aperture, formed by the levator ani muscles and adjacent pelvic walls as the two structures diverge inferiorly.

ischiocavernosus, one of two muscles that cover the crura of the penis and clitoris and force blood from the crura into the body of the erect penis and clitoris.

ischiocele. See **sciatic hernia.**

ischiococcygeal muscle, a muscle originating in the ischial spine. It inserts into the lateral border of the lower part of sacrum and the upper coccyx that supports and raises the coccyx. It is innervated by the third and fourth sacral nerves.

ischiofemoral ligament, a ligament that reinforces the posterior aspect of the fibrous membrane that encloses the hip. It is attached medially to the ischium, just posteroinferior to the acetabulum, and laterally to the ischial tuberosity deep to the iliofemoral ligament. It helps to stabilize the hip joint and reduce the amount of muscle energy required to maintain a standing position. See also **iliofemoral ligament, pubofemoral ligament.**

ischium /is′kē·əm/ *pl.* **ischia** [L; Gk, *ischion,* hip joint], one of the three parts of the hip bone, which joins the ilium and the pubis to form the acetabulum. The ischium comprises the dorsal part of the hip bone and is divided into the body of the ischium, which forms the posteroinferior two fifths of the acetabulum, and the ramus, which joins the inferior ramus of the pubis. The spine of the ischium provides attachment for various muscles, such as the gemellus superior, the coccygeus, and the levator ani. The greater sciatic notch above the spine transmits the superior and inferior gluteal vessels and various nerves, such as gluteal nerves and the sciatic nerve. A notch below the spine of the ischium transmits various ligaments, vessels, and nerves for other parts. The large dorsal tuberosity of the ischium provides attachment for various muscles, such as the adductor longus, the semimembranosus, the biceps femoris, and the semitendinosus. Compare **ilium, pubis.**

ischo-, prefix meaning "restraint or suppression": *ischemia, ischesis.*

ISCLT, abbreviation for *International Society of Clinical Laboratory Technologists.*

Isentress, a trademark for **raltegravir.**

ISG, abbreviation for **immune serum globulin.** See **immunoglobulin.**

ISH, abbreviation for **isolated systolic hypertension.**

Ishihara chart, the pseudoisochromatic chart used in the Ishihara test for color vision deficiencies.

Ishihara color test /ish′ēhä′rə/ [Shinobu Ishihara, Japanese ophthalmologist, 1879–1963], a test of color vision that uses a series of plates on which are printed pseudoisochromatic round dots in a variety of colors and patterns. People with normal color vision are able to discern specific numbers or patterns on the plates; the inability to pick out a given number or shape is symptomatic of a specific deficiency in color perception.

ISID, abbreviation for *International Society of Infectious Diseases.*

ISIS, abbreviation for *International Study of Infarct Survival.*

island /ī′lənd/ [OE, *īegland,* island]. See **islet.**

island fever. See **scrub typhus.**

island of Reil. See **central lobe.**

islands of Langerhans /lang′gərhanz/ [L, *insula,* island; Paul Langerhans, German pathologist, 1847–1888], clusters of cells within the pancreas that produce insulin, glucagon, and pancreatic polypeptide. They form the endocrine portion of the gland, and their hormonal secretions released into the bloodstream are balanced, important regulators of carbohydrate metabolism. The islands of Langerhans are scattered throughout the pancreas; the beta cells, which secrete insulin, usually appear in the center of each of the lobules. Alpha cells secrete glucagon, and pancreatic peptide cells secrete pancreatic peptide. The cells the islands comprise are arranged in plates interspersed by capillaries. Also called **islets of Langerhans.**

islet /ī′lət/ [MFr, *islette,* little island], a cluster of cells or an isolated piece of tissue. Also called **island.**

islet cell adenoma. See **insulinoma.**

islet cell antibody (ICA) /ī′lit/ [MFr, *islette,* little island], an immunoglobulin that reacts with cytoplasmic components of all of the cells in the pancreatic islets. These antibodies occur in about 60% to 70% of newly diagnosed patients with insulin-dependent diabetes mellitus, providing strong evidence for an autoimmune origin and pathogenesis of the disease. The presence of ICA can be demonstrated for years before the occurrence of symptoms. The antibody tends to disappear with time.

islet cell tumor, any tumor of the islands of Langerhans. Kinds of islet cell tumors include insuloma, gastrinoma, glucagonoma, and somatostatinoma.

isletitis. See **insulitis.**

islets of Langerhans. See **islands of Langerhans.**

-ism, -ismus, suffix meaning "condition of, practice of, theory of": *hyperthyroidism, hypopituitarism, strabismus.*

iso- /ī′sō-/, prefix meaning "equal": *isobar, isochromatic, isohydric.*

isoagglutination /ī′sō·əglo͞o′tinā′shən/ [Gk, *isos,* equal; L, *agglutinate,* to glue], the clumping of erythrocytes by agglutinins from the blood of another individual of the same species.

isoagglutinin /ī′sō·əglo͞o′tinin/ [Gk, *isos,* equal; L, *agglutinate,* to glue], an antibody that causes agglutination of erythrocytes in other members of the same species that carry the corresponding antigen on their erythrocytes. Also called **isohemagglutinin.** See also **ABO blood group, antibody.**

isoamyl alcohol. See **amyl alcohol.**

isoantibody /ī′sō·an′tibod′ē/ [Gk, *isos* + *anti,* against; AS, *boding,* body], an antibody to isoantigens found in other members of the same species. See also **autoimmune disease, tissue typing.**

isoantigen /ī′sō·an′tijən/ [Gk, *isos* + *anti,* against; AS, *boding,* body; Gk, *Geenen,* to produce], a substance present in some members of a species that stimulates production of antibodies in other members of the species. An example is a blood group antigen. Also called **alloantigen.** Compare **autoantigen, autoimmune disease.** See also **antigen.**

isobar /ī′səbär/ [Gk, *isos* + *barrios,* weight], **1.** a line connecting points of equal pressure on a graph, such as lines connecting points of equal carbon dioxide tension on a pH-bicarbonate diagram. **2.** (in nuclear medicine) one of a group of nuclides having the same total number of neutrons and protons in the nucleus but so proportioned that their atomic numbers have different values.

isobaric /-bär′ik/ [Gk, *isos,* equal, *barrios,* weight], **1.** pertaining to two substances or solutions of the same specific gravity. **2.** pertaining to two isotopes that have the same mass number but different atomic numbers. **3.** having the same barometric pressure.

isobutyl alcohol ($C_4H_{10}O$) /ī′sobyo͞o′til/ [Gk, *isos* + *butyrin,* butter, *hyl,* matter; AR, *alcohol,* essence], a clear colorless liquid that is miscible with ethyl alcohol or ether. Also called *2-methyl-1-propanol*.

isocapnic /-kap′nik/, pertaining to a level of carbon dioxide in the tissues that remains steady despite changing levels of ventilation.

isocarboxazid /-kärbok′səzid/, a monoamine oxidase inhibitor.

■ INDICATION: It is prescribed in the treatment of mental depression.

■ CONTRAINDICATIONS: Liver or kidney dysfunction; congestive heart failure; pheochromocytoma; concomitant use of a sympathomimetic drug or foods high in tryptophan, tyramine, or caffeine; or known hypersensitivity to the drug prohibits its use. Must be used with caution in patients with suicidal ideation.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hyperactivity, cardiac arrhythmia, hypotension, vertigo, dryness of mouth, constipation, and blurred vision. Monoamine oxidase inhibitors produce many adverse drug interactions.

isochromosome /-krō′məsōm/, a chromosome whose arms are of equal length.

isocrotic, describing the separation of a mixture by chromatography using a single solvent or solvent mixture.

isodiametric, measuring the same in all diameters.

isodose chart /ī′sədōs/ [Gk, *isos* + *doss,* giving, *charta,* paper], a graphic representation of the distribution of radiation in a medium in which lines are drawn through points receiving equal doses. Isodose charts are determined for x-rays traversing the body, for radium applicators used in intracavitary or interstitial treatment, and for working areas where x-rays or radionuclides are used.

isodynamic law /ī′sōdīnam′ik/, the rule that for energy purposes different foods may replace one another in accordance with their caloric values, as determined when burned in a calorimeter.

isoeffect lines /ī′sō·ifekt′/, lines on a graph representing doses of radiation that have tumoricidal effects in normal tissues.

isoelectric /ī′sō·ilek′trik/ [Gk, *isos* + *electron,* amber], pertaining to the electric baseline of an electrocardiogram, which is the period between the end of the T wave and the beginning of the P wave.

isoelectric electroencephalogram. See **flat electroencephalogram.**

isoelectric focusing, the ordering and concentration of substances according to their isoelectric points.

isoelectric period, a period in physiological activity, such as nerve conduction or muscle contraction, when there is no variation in electric potential.

isoelectric point, the pH at which a molecule containing two or more ionizable groups is electrically neutral. The average number of positive charges equals the average number of negative charges.

isoenzyme /ī′sō·en′zīm/ [Gk, *isos* + *en,* in, *syme,* ferment], a chemically distinct form of an enzyme. The various forms are distinguishable in analysis of blood samples, which aids in the diagnosis of disease. Different enzymes that catalyze the same physiological reaction may also exist as isoenzymes in different animal species. Also called **isozyme.**

isoetharine, isoetharine hydrochloride. See **isoetharine mesylate.**

isoetharine mesylate /ī′sō·eth′ərēn/, a beta-adrenergic bronchodilator.

■ INDICATIONS: It is prescribed in the treatment of bronchial asthma, bronchitis, and emphysema.

■ CONTRAINDICATIONS: A history of cardiac arrhythmia or known hypersensitivity to this drug or to sympathomimetic medications prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are palpitations, tachycardia, arrhythmias, vertigo, nervousness, and headache.

isoexposure line /ī′sō·ikspō′zhər/, an imaginary line representing positions of equal exposure to radiation around a fluoroscopic instrument.

isoflows /ī′sōflōz/, a measure of early small airway dysfunction in a patient made by comparing forced expiratory flow rates of air and helium at fixed points in time.

isogamete /ī′sōgam′ēt/ [Gk, *isos* + *gamete,* wife], a reproductive cell of the same size and structure as the one with which it unites. Compare **anisogamete. —isogametic,** *adj.*

isogamy /īsog′əmē/ [Gk, *isos* + *gamos,* marriage], sexual reproduction in which there is fusion of gametes of the same size and structure, such as in certain algae, fungi, and protists. Compare **anisogamy. —isogamous,** *adj.*

isogeneic. See **syngeneic.**

isogenesis /-jen′əsis/ [Gk, *isos* + *genein,* to produce], development from a common origin and according to similar processes. Also called *isogeny* /īsoj′ənē/. **—isogenetic, isogenic,** *adj.*

isograft /ī′səgraft′/ [Gk, *isos* + *graphion,* stylus], surgical transplantation of histocompatible tissue between genetically identical individuals, such as monozygotic twins. Compare **allograft, autograft, xenograft.** See also **graft.**

isohemagglutinin. See **isoagglutinin.**

isohydric shift [Gk, *isos* + *hydor,* water; AS, *sciftan,* to divide], the series of reactions in red blood cells in which CO_2 is taken up and oxygen is released without the production of excess hydrogen ions.

isoimmunization /ī′sō·im′yənīzā′shən/, the development of antibodies against antigens from the same species, such as anti-Rh antibodies in an Rh-negative person. See also **erythroblastosis fetalis.**

isokinetic /-kinet′ik/, pertaining to a concentric or eccentric contraction that occurs at a set speed against a force of maximal resistance produced at all points in the range of motion.

isokinetic exercise [Gk, *isos,* equal, *kinesis,* motion; L, *exercere,* to keep at work], a form of exercise in which maximum force is exerted by a muscle at each point throughout the active range of motion as the muscle contracts. The effort of the patient to resist the movement is measured.

isolate /ī′səlāt/ [It, *isolare,* to detach], **1.** to separate a pure chemical substance from a mixture. **2.** to derive from any source a pure culture of a microorganism. **3.** to prevent an individual from having contact with the rest of a population.

isolated systolic hypertension (ISH), a type of hypertension in which only the systolic blood pressure is elevated. The condition, which usually affects the elderly, increases the risk of stroke or heart attack.

isolation /-lā′shən/ [L, *insula,* island], the separation of a seriously ill patient from others to prevent the spread of an infection or to protect the patient from irritating or infectious environmental factors. A patient undergoing radiation therapy may also be isolated to reduce the exposure of hospital personnel to effects of radioactive materials. Types of isolation include airborne, droplet, contact, and infectious.

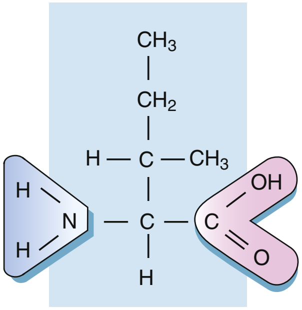
isolation incubator, an incubator bed regularly maintained for premature or other infants who require isolation.

isolation precautions, special precautionary measures, practices, and procedures used in the care of patients with contagious or communicable diseases. The Centers for Disease Control and Prevention provides explicit and comprehensive guidelines for control of the spread of infectious disease in the care of hospitalized patients. The type of infectious disease a patient has dictates the kind of isolation precautions necessary to prevent spread of the disease to others.

isolation ward [It, *isolare,* to detach; ME, *warden*], a room or section of a hospital in which certain categories of patients, particularly those infected with acute contagious diseases, can be treated with a minimum of contact with the rest of the patients and hospital personnel.

Isolette, a trademark for a self-contained incubator unit that provides a controlled heat, humidity, and oxygen microenvironment for the isolation and care of premature and low–birth-weight neonates. The apparatus is made of a clear plastic material and has a large door and portholes for easy access to the infant with a minimum of heat and oxygen loss. A servocontrol mechanism constantly monitors the infant's temperature and controls the heat within the unit.

isoleucine (Ile) /ī′sōlo͞o′sēn/ [Gk, *isos* + *leukos,* white], an amino acid that occurs in most dietary proteins and is essential for proper growth in infants and for nitrogen balance in adults. Also spelled *isoleuceine*. See also **amino acid, maple syrup urine disease, protein.**



Chemical structure of isoleucine

isologous graft /īsol′əgəs/ [Gk, *isos,* equal, *logos,* relation, *graphion,* stylus], a tissue transplant between two individuals who are genetically identical, as identical twins.

isomeric /-mer′ik/ [Gk, *isos,* equal, *meros,* part], pertaining to a chemical phenomenon in which two compounds of the same chemical formula may differ in chemical and physical properties. The difference is the result of the arrangement of atoms in the respective molecules, either the connections between the atoms or their arrangements in three-dimensional space.

isomers /ī′səmərz/, compounds that have the same formula but different structures, resulting in different properties.

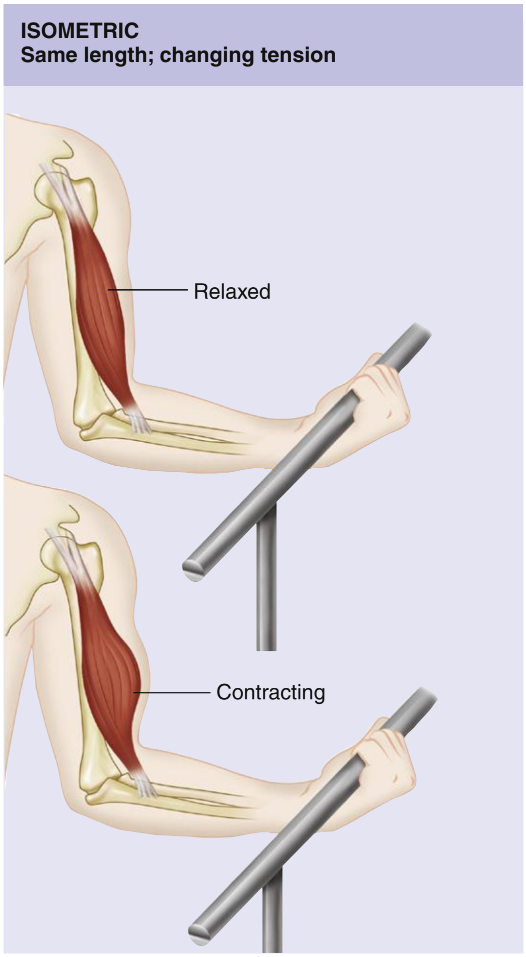
isometheptene hydrochloride /-məthep′tēn/, an antispasmodic and vasoconstrictor drug that is a component in some fixed-combination drugs used to treat migraine.

isometheptene mucate /i′somĕthep′tēn mu′kāt/, a vasoconstrictor that acts on dilated carotid and cerebral vessels, used in combination with dichloralphenazone and acetaminophen in treatment of migraine and tension headache.

isometric /ī′səmet′rik/ [Gk, *isos* + *metron,* measure], maintaining the same length or dimension.

isometric contraction [Gk, *isos,* equal, *metron,* measure; L, *contractio,* a drawing together], muscular contraction not accompanied by movement of the joint. Resistance applied to the contraction increases muscle tension without producing movement of the joint. Also called **muscle-setting exercise.**

isometric exercise, a form of active exercise in which muscle tension is increased while pressure is applied against stable resistance. This exercise may be accomplished by pushing or pulling against an immovable object or by simultaneously contracting opposing muscles, such as by pressing the hands together. There is no joint movement, and muscle length remains unchanged, but muscle strength and tone are maintained or improved. Compare **isotonic exercise.** See also **exercise.**



Isometric contraction *(Patton and Thibodeau, 2010)*

isometric growth, an increase in size of different organs or parts of an organism at the same rate. Compare **allometric growth.**

isoniazid /ī′sənī′əzid/, a tuberculostatic antibacterial. Also called *INH (isonicotinic acid hydrazide).*

■ INDICATIONS: It is prescribed for prophylaxis for those who have been exposed to tuberculosis and is used in combination with other agents in the treatment of tuberculosis caused by mycobacteria sensitive to the drug.

■ CONTRAINDICATIONS: Liver disease, a previous history of a hepatotoxic reaction to isoniazid, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects in long-term treatment are hepatotoxicity and peripheral neuropathy. Rashes, fever, and central nervous system effects commonly occur.

isoosmotic. See **isosmotic.**

isopentoic acid. See **isovaleric acid.**

isophane insulin suspension /ī′səfān/ [Gk, *isos* + *phanein,* to show; L, *insula,* island; *suspendere,* to hang up], a modified form of protamine zinc insulin suspension. It is an intermediate-acting insulin that is a stable, commonly prescribed preparation. Also called **NPH insulin.**

isoprenaline. See **isoproterenol hydrochloride.**

isopropanol. See **isopropyl alcohol.**

isopropylacetic acid. See **isovaleric acid.**

isopropyl alcohol (C_3H_8O) /ī′sōprō′pil/, a clear, colorless bitter aromatic liquid that is miscible with water, ether, chloroform, and ethyl alcohol. A solution of approximately 70% isopropyl alcohol in water is used as a rubbing compound. Also called **avantin, dimethyl carbinol, isopropanol, 2-propanol, rubbing alcohol.** See also **alcohol.**

isopropylaminoacetic acid. See **valine.**

isoproterenol hydrochloride /ī′sōprəter′ənol/, a beta-adrenergic stimulant.

■ INDICATIONS: It is used as a bronchodilator and as a cardiac stimulant.

■ CONTRAINDICATIONS: Cardiac arrhythmia or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are arrhythmias, tachycardia, hypotension, and intensification of angina.

Isoptin, a trademark for a calcium channel blocker or calcium ion antagonist **(verapamil).**

Isopto Atropine, a trademark for an anticholinergic **(atropine sulfate).**

Isopto Carbachol, a trademark for a cholinergic (carbachol).

Isopto Carpine, a trademark for a cholinergic (pilocarpine hydrochloride).

Isopto Cetamide, a trademark for an antibacterial (sulfacetamide sodium).

Isopto Homatropine, a trademark for an anticholinergic (homatropine hydrobromide).

Isopto Hyoscine, a trademark for an anticholinergic (scopolamine hydrobromide).

Isordil, a trademark for an antianginal agent **(isosorbide dinitrate).**

isosmotic /ī′sozmot′ik/, pertaining to a solution that has the same solute concentration (osmolality) as another solution. Also **isoosmotic.** Compare **hyperosmotic, hypoosmotic.**

isosorbide dinitrate /-sôr′bīd/, an antianginal agent. Its prototype is nitrogycerin.

■ INDICATIONS: It is prescribed as a coronary vasodilator in the treatment of angina pectoris and congestive heart failure and esophageal spasm caused by GI reflux.

■ CONTRAINDICATIONS: Closed-angle glaucoma, known hypersensitivity to this drug, concurrent use of drugs for erectile dysfunction, narrow-angle glaucoma, head trauma, or severe anemia prohibits its use.

■ ADVERSE EFFECTS: The most serious effect is occasional marked hypotension. Flushing, headache, lightheadedness, and dizziness may also occur.

isosorbide mononitrate, an active metabolite of isosorbide dinitrate, having the same actions and uses. It is administered orally.

Isospora /ī·sos′pə·rə/ [Gk, *isos,* equal + *sporos,* seed], a genus of coccidian protozoa found in birds, amphibians, reptiles, and mammals, including humans, that infects the epithelial cells of the small intestine. It is the least common cause of coccidiosis. It includes the species *I. belli* and *I. hominis*. See also **isosporiasis.**

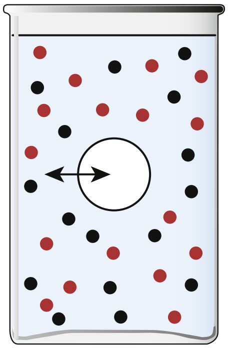
isosporiasis /ī·sos′pə·rī′ə·sis/, infection with *Isospora*. Two species, *I. hominis* and *I. belli,* affect humans, causing diarrhea with abdominal pain and cramping. See also **coccidiosis.**

isotachophoresis /-tak′ōfôrē′sis/ [Gk, *isos* + *tachos,* speed, *pherein,* to bear], the ordering and concentration of substances of intermediate effective mobilities between an ion of high effective mobility and one of much lower effective mobility, followed by their migration at a uniform speed.

isothermal /-thur′məl/ [Gk, *isos,* equal, *therme,* heat], having the same temperature. See also **synthermal.**

isotones /ī′sətōnz′/, atoms that have the same number of neutrons but different numbers of protons.

isotonic /ī′səton′ik/ [Gk, *isos* + *tonikos,* stretching], pertaining to a solution that causes no change in cell volume.

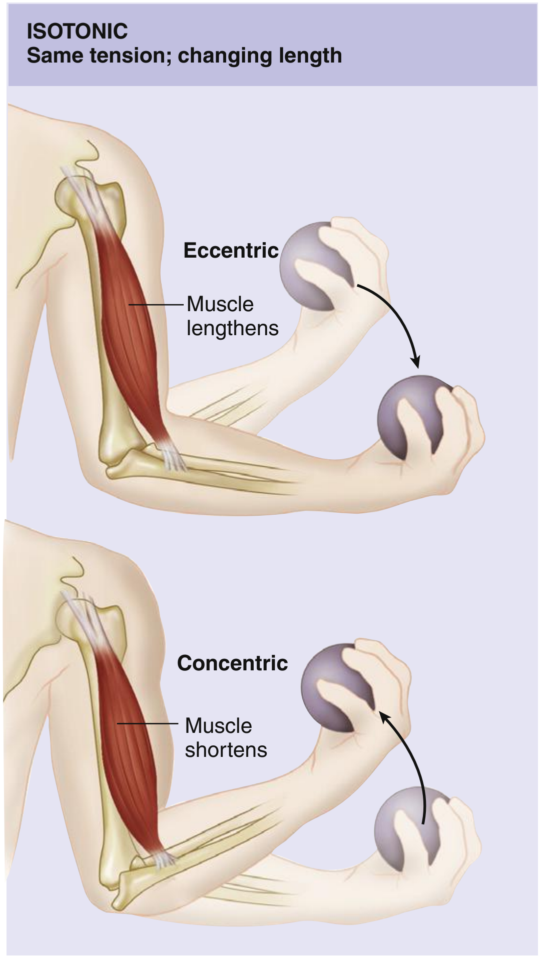


Isotonic *(Lewis et al, 2006)*

isotonic exercise, a form of active exercise in which muscles contract and cause movement. There is no significant change in resistance throughout the movement, so the force of contraction remains constant. Such exercise greatly enhances joint mobility and helps improve muscle strength and tone. Two examples of isotonic exercise are rising on tiptoes and stretching arms overhead. Compare **isometric exercise.** See also **exercise.**

isotonicity law /ī′sətonis′itē/, a law that describes a state of equal osmotic pressure in extracellular body fluids that results from equal concentrations of electrolytes and other solute particles in the fluid. If a hypertonic solution is ingested, additional water will be drawn from surrounding blood plasma to dilute the intestinal contents and maintain tonicity.

isotope /ī′sətōp/ [Gk, *isos* + *topos,* place], one of two or more forms of an atom having the same number of protons in the atomic nucleus but different numbers of neutrons and thus a different atomic mass. For example, two common isotopes of carbon are ^{12}C, which has six neutrons, and ^{14}C, which has eight. Many isotopes are used in diagnostic and therapeutic procedures.



Isotonic contraction *(Patton and Thibodeau, 2010)*

isotopic tracer /ī′sətop′ik/ [Gk, *isos* + *topos*, place; Fr, *tracer*, to track], an isotope or mixture of isotopes of an element incorporated into a sample to permit observation of the course of the element through a chemical, physical, or biological process. The observations may be made by measuring the radioactivity or the abundance of the isotope.

isotretinoin /-trətin′ō·in/, an antiacne agent.

■ INDICATION: Subject to significant restrictions, it is prescribed for the treatment of severe cystic acne.

■ CONTRAINDICATIONS: Pregnancy or sensitivity to the medication or any of its components prohibits its use.

■ ADVERSE EFFECTS: A powerful teratogen, young females must be thoroughly educated about the risk of pregnancy and are often placed on birth control pills. The most serious adverse effects to users are epistaxis, cheilitis, conjunctivitis, paresthesia, dizziness, and serum lipid and hematologic disturbances. It may also lower bone mineral density, a consideration for those participating in sports. Some patients become severely depressed or psychotic, which can make them aggressive or suicidal.

isotype /ī′sətīp/, an antigenic determinant that occurs in all members of a subclass of an immunoglobulin class. An antigenic determinant that is isotypic in one subclass may appear as an allotypic marker in another class.

isovaleric acid /-vəler′ik/ [Gk, *isos* + L, *valeriana*, herb, *acidus*, sour], a fatty acid with a pungent taste and disagreeable odor that is found in valerian and other plant products, as well as in cheese. It also occurs as a metabolite of the amino acid leucine and is found in the sweat of feet and in the urine of patients with smallpox, hepatitis, and typhus. It has been used commercially in a variety of drugs, perfumes, and flavorings. Isovaleric acidemia occurs in patients who have abnormally high levels of isovaleric acid in the blood and urine as a result of an inherited deficiency of the enzyme isovaleryl coenzyme A dehydrogenase. The condition is treated with diets that contain low-leucine foods. Also called **isopentoic acid, isopropylacetic acid.**

isovolume pressure-flow curve /-vol′yəm/, a curve on a graph describing the relationship of driving pressure to the resulting volumetric flow rate in the airways at any given lung inflation.

isovolumic contraction /-vəlo͞o′mik/ [Gk, *isos* + L, *volumen*, paper roll, *contractio*, drawing together], the early phase of systole, in which the myocardial muscle fibers have begun to shorten but have not developed enough pressure in the ventricles to overcome the aortic and pulmonary end-diastolic pressures and open the aortic and pulmonary valves. During this period of muscle fiber contraction, the ventricular volumes do not change. See also **afterload.**

isoxsuprine hydrochloride /īsok′səprēn/, a peripheral vasodilator.

■ INDICATIONS: It is prescribed for the symptomatic relief of cerebrovascular insufficiency and improvement of circulation in arteriosclerosis, Raynaud's disease, and Buerger's disease.

■ CONTRAINDICATION: Known hypersensitivity to this drug or arterial bleeding prohibit its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are tachycardia, hypotension, chest pain, and dermatitis.

isozyme. See **isoenzyme.**

isradipine /israd′ĭpēn/, a calcium channel blocking agent used alone or with a thiazide diuretic for the treatment of hypertension.

ISS, **1.** abbreviation for **International Society of Surgery.** **2.** abbreviation for **injury severity score.**

-ist, suffix meaning a "practitioner of a science": *audiologist, pharmacist, psychosomaticist*.

isthmus /is′məs/ *pl.* **isthmuses, isthmi** [Gk, *isthmos*, a narrow connection, passage, or constriction], a constriction between two larger parts of an organ or anatomical structure, such as the isthmus of the thyroid.

isthmus of gastric gland, the part of a gastric gland immediately adjacent to the opening into the gastric pit.

isthmus of thyroid [Gk, *isthmos* + *thyreos* + *eidos*, form], a part of the thyroid gland, anterior to the trachea, which joins the two lateral lobes of the gland.

Isuprel, a trademark for a beta-adrenergic stimulant (isoproterenol).

IT, abbreviation for **immunotoxin.**

itch [AS, *giccan*], **1.** *v,* to feel a sensation, usually on the skin, that makes one want to scratch. **2.** *n,* a tingling, annoying sensation on an area of the skin that makes one want to scratch it, caused in some people, for example, by rhus dermatitis, a mosquito bite, or an allergic reaction. **3.** *n,* the pruritic condition of the skin caused by infestation with the parasitic mite ***Sarcoptes scabiei.*** See also **pruritus. —itchy,** *adj.*

itch mite [AS, *giccan* + *mite*], a tiny arachnid with piercing and sucking mouthparts. At least three genera of itch mites are recognized: *Chorioptes, Notoedres,* and *Sarcoptes*.

itchy. See **itch.**

-ite, **1.** suffix meaning "compounds": *nitrite, phosphite, sulfite*. **2.** suffix meaning a "body part": *chondriomite, osteite, zygoite*.

ithy-, prefix meaning "erect or straight": *ithylordosis, ithyokyphosis*.

-itic, suffix meaning "related to something specified": *encephalitic, nephritic, syphilitic*.

-itis, suffix meaning an "inflammation of a (specified) organ": *carditis, cecitis, sarcitis*.

ITP, abbreviation for **immune thrombocytopenic purpura.**

IU, I.U., abbreviation for **International Unit;** on the "Do Not Use" abbreviation list due to the potential for misinterpretation.

IUD, abbreviation for **intrauterine device.**

-ium, **1.** suffix used to name metallic elements: *radium, sodium*. **2.** suffix for quaternary ammonium derivatives.

IUPC, abbreviation for *intrauterine pressure catheter.*

IV, **1.** abbreviation for **intravenous** or **intravenously.** **2.** *(informal)* equipment consisting of a bottle or bag of fluid, infusion set with tubing, and intravenous catheter, used in intravenous therapy. **3.** intravenous administration of fluids or medication by injection into a vein.

IVAC pump, a trademark for a portable IV pump that electronically regulates and monitors the flow of IV fluid. It is usually attached to the IV stand. See also **intravenous pump.**

IVC, abbreviation for **intravenous cholangiography.**

Ivemark's syndrome /ē′vəmärks, ī′v′märks/, a congenital defect in which organs on the left side of the body are a mirror image of their counterparts on the right side.

IVF, abbreviation for **in vitro fertilization.**

ivory bones. See **osteopetrosis.**

IVP, abbreviation for **intravenous pyelography.**

IV push. See **intravenous bolus.**

IVT, abbreviation for *intravenous transfusion*.

IV-type traction frame, a metal structure for holding traction equipment. It consists of two metal uprights, one at each end of the bed, which support an overhead metal bar. The base of each upright is clamped to a horizontal bar that fits into holders inserted at the corners of the bed. Compare **claw-type traction frame.** See also **traction frame.**

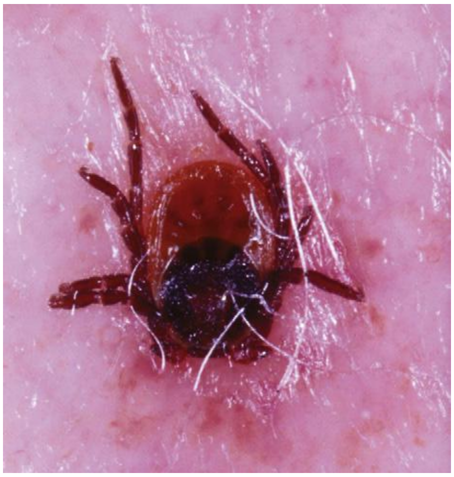
Ivy method [Robert H. Ivy, American surgeon, 1881–1947], a test of bleeding time in which a blood pressure cuff on the upper arm is inflated to 40 mm of mercury and a small wound is made with a scalpel and a template on the volar surface of the arm. Prolonged bleeding times are most often the result of a disorder of platelet production or the ingestion of aspirin or other antiinflammatory medications. Normal adult Ivy bleeding time is 1 to 9 minutes. See also **hemostasis.**

ivy poisoning. See **rhus dermatitis.**

ixabepilone, a miscellaneous antineoplastic.

■ INDICATION: This drug is used to treat breast cancer.

■ CONTRAINDICATIONS: Known hypersensitivity to drugs with polyoxyethylated castor oil, pregnancy, and breastfeeding prohibit the use of this drug.



Ixodes scapularis *(Marks and Miller, 2006)*

■ ADVERSE EFFECTS: adverse effects of this drug include bradycardia, abnormal ECG, angina, atrial flutter, cardiomyopathy, chest pain, edema, MI, vasculitis, abdominal pain, anorexia, colitis, constipation, coagulopathy, gastritis, jaundice, gastroesophageal reflux disease, hepatic failure, infections, rash, hypokalemia, metabolic acidosis, impaired cognition, chills, fatigue, fever, flushing, headache, insomnia, bronchospasm, cough, dyspnea, and dehydration. Life-threatening side effects include neutropenia, thrombocytopenia, anemia, and anaphylaxis. Common side effects include hypotension, nausea, vomiting, diarrhea, alopecia, arthralgia, myalgia, peripheral neuropathy, and hypersensitivity reactions.

Ixempra, a trademark for **ixabepilone.**

Ixodes /iksō′dēz/ [Gk, sticky], a genus of parasitic hard-shelled ticks associated with the transmission of a variety of infections, such as Rocky Mountain spotted fever, Lyme disease, erlichiosis, and babesiosis.

ixodi-, prefix meaning "ticks": *ixodiasis, ixodism*.

ixodiasis /ik′sōdī′əsis/, **1.** skin lesions created by the bites of ixodid ticks. **2.** any tick-transmitted disease.

ixodid /iksod′id, iksō′did/, pertaining to hard ticks of the family Ixodidae.

Iyengar yoga, a style of yoga that emphasizes correct body alignment in the asanas (postures) and holding the asanas for extended periods of time. It also uses props, such as wooden blocks and belts, to help achieve and support the asanas.

-ize, suffix to form verbs from adjectives and nouns. Verbs mean "to make, become, engage in, or use, or to treat or combine with": *oxidize, anesthetize*.

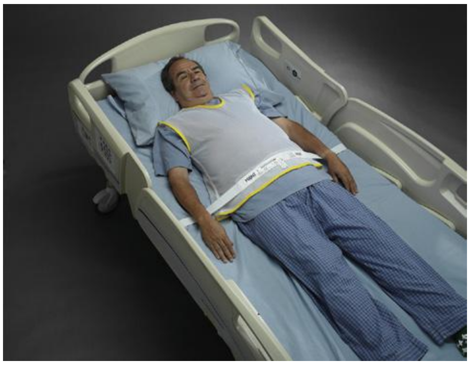
J

J, abbreviation for **joule.**

Jaccoud's dissociated fever /zhäko͞oz′/ [Sigismond Jaccoud, French physician, 1830–1913], a form of febrile meningitic fever accompanied by a paradoxical slow pulse rate, seen in patients with tuberculous meningitis.

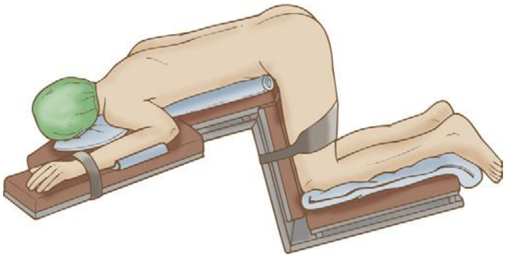
jacket [Fr, *jaquette*], a supportive or confining therapeutic casing or garment for the torso. It is also used to prevent edema in the extremities. See also **Minerva cast, Sayre's jacket.**

jacket restraint, an orthopedic device used to help immobilize the trunk of a patient in traction and to discourage the patient from sitting up in bed. The jacket restraint is attached to both sides of the bedspring frame by means of buckled webbing straps that are sewn into the side seams of the restraint. The jacket restraint may be used with most kinds of traction but is not usually used with Dunlop skin traction, Dunlop skeletal traction, Bryant traction, halo-femoral traction, or halo-pelvic traction. Compare **diaper restraint, sling restraint.**



Jacket restraint *(Courtesy of Posey Company)*

jackknife position /jak′nīf/, an anatomical position in which the patient is placed on the stomach with the hips flexed and the knees bent at a 90-degree angle and the arms outstretched in front of the patient. Examination and instrumentation of the rectum are facilitated by this position.



Jackknife position *(Rothrock, 2011)*

jackscrew /jak′skro͞o/, a threaded device used in orthodontic appliances for the separation or approximation of teeth or jaw segments.

Jackson crib, a removable orthodontic appliance retained in position by crib-shaped wires.

jacksonian epilepsy /jaksō′nē·ən/, epilepsy characterized by focal motor seizures with unilateral clonic movements that start in one group of muscles and spread systematically to adjacent groups, reflecting the march of the epileptic activity through the motor cortex **(jacksonian march).** The seizures are due to a discharging focus in the contralateral motor cortex.

jacksonian march. See **cortical march.**

jacksonian seizure, a series of focal seizures with unilateral clonic movements that start in one group of muscles and spread systematically to adjacent groups, reflecting the march of the epileptic activity through the motor cortex.

Jackson's sign [John H. Jackson, English neurologist, 1835–1911], (in hemiparesis) an observation that during quiet respiration the movement of the paralyzed side of the chest may be greater than that of the opposite side. However, the paralyzed side moves less under forced respiration.

Jackson tracheostomy tube, a trademark for a silver tracheostomy tube with a rubber cuff built onto the tube. The design is intended to prevent accidental migration of the cuff off the end of the tube, causing interference with airflow to the patient.

jackstone calculus, a urinary calculus with spikes like those of the toy in the game of jacks.

Jacob x membrane. See **retina.**

Jacquemier's sign /zhäkmē·āz′/ [Jean M. Jacquemier, French obstetrician, 1806–1879], a deepening of the color of the vaginal mucosa just below the urethral orifice. It may sometimes be noted after the fourth week of pregnancy, but it is not a reliable sign of pregnancy.

jactitation /jak′titā′shən/ [L, *jactare*, show off, display], twitchings or spasms of muscles or muscle groups, as observed in the restless body movements of a patient with a severe fever.

JADA, abbreviation for *The Journal of the American Dental Association*.

jail fever. See **epidemic typhus.**

Jake paralysis. See **ginger paralysis.**

Jakob-Creutzfeldt disease. See **Creutzfeldt-Jakob disease.**

JAMA /jä′mä, jam′ə, jā′ā′em′ā′/, abbreviation for *Journal of the American Medical Association*.

jamais vu /zhämāvY′, -vē′, -vo͞o′/ [Fr, never seen], the sensation of being a stranger when with a person one knows or when in a familiar place. The phenomenon occurs occasionally in healthy people but more frequently in those who have temporal lobe epilepsy. Compare **déjà vu.**

Janeway lesion /jān′wā/ [Edward G. Janeway, American physician, 1841–1911; L, *laedere*, to injure], a small, painless erythematous or hemorrhagic macule on the palms or soles. It is diagnostic of subacute bacterial endocarditis.

janiceps /jan′əseps/ [L, *Janus*, two-faced Roman god, *caput*, head], a conjoined twin fetus in which the heads are fused, with the faces looking in opposite directions. The faces and bodies of both twins may be fully formed, or one member may be only partially formed and act as a parasite on the more fully developed fetus.

Jansen's disease. See **metaphyseal dysostosis.**

Jansky-Bielschowsky disease /yahn′skē byelschov′ske/, the late infantile form of neuronal ceroid lipofuscinosis, occurring between 2 and 4 years of age and characterized by abnormal accumulation of lipofuscin. It begins as myoclonic seizures and progresses to neurological and retinal degeneration and death, usually by the age of 8 to 12 years.

Januvia, a trademark for **sitagliptin.**

Japanese encephalitis (JE), a severe epidemic infection of brain tissue seen in East and Southeast Asia and the South Pacific, including Australia and New Zealand. The virus is carried by domestic pigs and wild birds. The disease is characterized by shaking chills, paralysis, and weight loss and is caused by ***Flavivirus*** transmitted by the mosquito *Culex tritaeniorhynchus*. Symptoms include headache, fever, neck stiffness, tremors, seizures, spastic paralysis, and coma. Mortality rate ranges widely from 0.3% to 60%. Various neurological and psychiatric sequelae are common. An inactivated JE vaccine is available and recommended for travel to endemic areas. Treatment is supportive. Also called *Japanese B encephalitis*.

Japanese flood fever, Japanese river fever. See **scrub typhus.**

Japanese spotted fever, an acute infection occurring in Japan caused by *Rickettsia japonica* and transmitted by Ixodidae. It is characterized by fever and headache and the appearance of an eschar and rash.

JAPHA /jaf′ə, jā′ā′pē′āch′ā′/, abbreviation for *Journal of the American Public Health Association*.

jar, **1.** *v*, to shake or jolt. **2.** *n*, a cylindrical container.

Jarcho-Levin syndrome /jär′kō lev′in/ [Saul Wallenstein Jarcho, American physician, b. 1906; Paul M. Levin, American physician, 20th century], an autosomal-recessive disorder consisting of multiple vertebral defects, short thorax, rib abnormalities, camptodactyly, syndactyly, and, occasionally, urogenital abnormalities. Death from respiratory insufficiency usually occurs in infancy. Also called **spondylothoracic dysplasia.**

jargon (jar.) /jär′gən/ [Fr, *jargonner,* to speak indistinctly], **1.** incoherent speech or gibberish. **2.** a terminology used by scientists, artists, or others of a professional subculture that is not understood by the general population. **3.** a state in child language acquisition characterized by strings of babbled sounds paired with gestures.

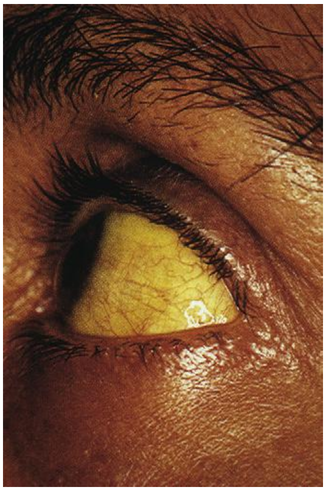
jargon aphasia [Fr, *jargonner* + Gk, *a* + *phasis,* speech], a form of speech in which several words are combined in a single word but in a jumbled manner with incorrect accents or words mixed with neologisms. Although outwardly incomprehensible, the speech may be meaningful when analyzed by a psychotherapist. It is noted in schizophrenia, especially the disorganized type. Also called **word salad.**

Jarisch-Herxheimer reaction /jä′ris herks′hīmər/ [Adolph Jarisch, Austrian dermatologist, 1850–1902; Karl Herxheimer, German dermatologist, 1861–1944], a transient, short-term immunological reaction commonly seen after antibiotic treatment of early and later stages of syphilis and less often in other diseases, such as borreliosis, brucellosis, typhoid fever, and trichinosis. It is seen in 50% of patients with primary syphilis and 90% of those with secondary syphilis. Manifestations include fever, chills, headache, myalgias, and exacerbation of cutaneous lesions. The reaction has been attributed to liberation of endotoxin-like substances or antigens from the killed or dying microorganisms, but its exact pathogenesis is unclear.

Jarotzky's treatment /jərot′skēz/ [Alexander Jarotzky, Russian physician, b. 1866], therapy for gastric ulcer consisting of a bland diet of egg whites, fresh butter, bread, milk, and noodles.

Jarvik-7 [Robert K. Jarvik, American cardiologist, b. 1946], an artificial heart designed by R. K. Jarvik for use in humans. The Jarvik-7 was an early model that depended on air pressure to drive the ventricles.

jaundice /jôn′dis, jän′dis/ [Fr, *jaune,* yellow], a yellow discoloration of the skin, mucous membranes, and sclerae of the eyes caused by greater than normal amounts of bilirubin in the blood. Because persons with dark skin sometimes have yellow-tinged sclerae, the hard palate of the mouth is often the best place to assess for jaundice. Persons with jaundice may experience nausea, vomiting, and abdominal pain and may pass dark urine and clay-colored stools. Jaundice is a symptom of many disorders, including liver diseases, biliary obstruction, and the hemolytic anemias. Physiological jaundice commonly develops in newborns and disappears after a few days. Rarer disorders causing jaundice are Crigler-Najjar syndrome and Gilbert's syndrome. Useful diagnostic procedures include a clinical evaluation of the signs and symptoms, tests of liver function, and techniques for direct or indirect visualization, such as x-ray film, computed tomographic scan, ultrasound, endoscopy or exploratory surgery, and biopsy. Also called **icterus** /ik′tərəs/. See also **anicteric hepatitis, hyperbilirubinemia.** —*jaundiced, adj*.



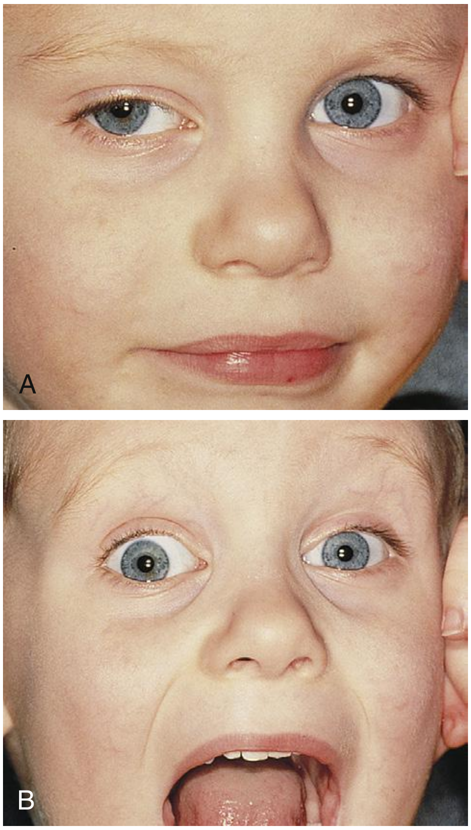
Jaundiced sclera *(Emond, Wellsby, and Rowland, 2003)*

jaw [AS, *ceowan,* to chew], a common term used to describe the maxillae and the mandible and the soft tissue that covers these structures, which contain the teeth and form the framework for the mouth. See also **jaw relation.**

jaw jerk, an abnormal reflex elicited by tapping the chin with a rubber hammer while the mouth is half open and the jaw muscles are relaxed. A quick snapping shut of the jaw implies damage to the area of cerebral cortex governing motor activity of the fifth cranial nerve. Also called **chin reflex, chin-jerk reflex, mandibular reflex.**

jaw relation, any relation of the mandible to the maxilla.

jaw-winking, an involuntary facial movement phenomenon in which the eyelid droops, usually on one side of the face, when the jaw is closed but rises when the jaw is opened or when the jaw is moved from side to side. The raising of the eyelid often appears exaggerated. Also called **Gunn's syndrome, Marcus Gunn's syndrome.** See also **Marin Amat's syndrome.**



Jaw-winking. *A,* In primary gaze with the mouth closed, there is right upper eyelid ptosis. *B,* With the jaw opened, the right upper eyelid elevates
(Yanoff and Fine, 2008)

J chain, a polypeptide chain that holds immunoglobulin A (IgA) dimers and IgM pentamers together.

J/deg, abbreviation for *joules per degree*.

JE, abbreviation for **Japanese encephalitis.**

Jefferson fracture, a fracture characterized by bursting of the ring of the first cervical vertebra.

jejuna. See **jejunum.**

jejunal /jijo͞o′nəl/ [L, *jejunus,* empty], pertaining to the **jejunum,** the length of intestine between the duodenum and the ileum.

jejunal atresia, atresia of the jejunum, a type of intestinal atresia.

jejunal feeding tube, a hollow tube inserted into the jejunum through the abdominal wall for administration of liquefied foods to patients who have a high risk of aspiration. See also **enteral tube feeding, tube feeding.**

jejunectomy /jij′o͞onek′təmē/, the surgical removal of all or part of the jejunum.

jejuno-, prefix meaning "the jejunum": *jejunocecostomy, jejunocolostomy, jejunotomy.*

jejunocolostomy /jijo͞o′nōkəlos′təmē/, the surgical creation of an anastomosis between the jejunum and colon.

jejunogastric intussusception, the prolapse of an anastomosed jejunum into the stomach; a complication sometimes seen after gastrojejunostomy.

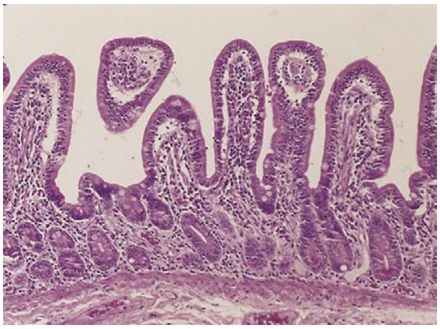
jejunoileitis. See **Crohn's disease.**

jejunostomy /jij′o͞onos′təmē/, a surgical procedure to create an artificial opening to the jejunum through the abdominal wall. It may be a permanent or a temporary opening.

jejunostomy feeding. See **tube feeding.**

jejunotomy /jij′o͞onot′əmē/, a surgical incision in the jejunum.

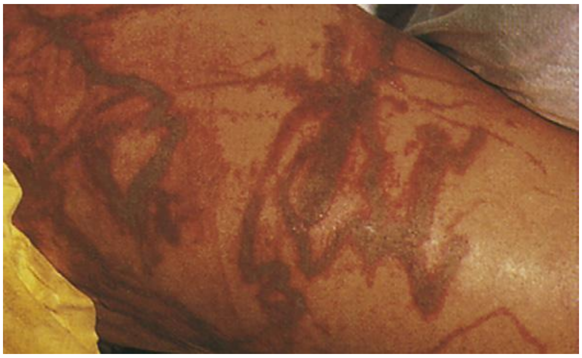
jejunum /jijo͞o′nəm/ *pl.* jejuna [L, *jejunus,* empty], the intermediate or middle of the three portions of the small intestine, connecting proximally with the duodenum and distally with the ileum. The jejunum has a slightly larger diameter, a deeper color, and a thicker wall than the ileum and contains heavy, circular folds that are absent in the lower part of the ileum. The jejunum also has larger villi than the ileum. Compare **ileum.** —*jejunal, adj.*



Jejunum *(Kumar, Abbas, and Fausto, 2005)*

jelly, a semisolid nonliquid colloidal solution. See also **gel.**

jellyfish sting [L, *gelare,* to congeal; AS, *fisc* + *stingan*], a wound caused by skin contact with a jellyfish, a sea animal with a bell-shaped gelatinous body and numerous suspended long tentacles containing stinging structures. In most cases a tender, red welt develops on the affected skin. In some cases, depending on the sensitivity of the person and the species of jellyfish, severe localized pain and nausea, weakness, excessive lacrimation, nasal discharge, muscle spasm, perspiration, difficulty in swallowing, and dyspnea may occur.



Tissue necrosis caused by a jellyfish sting
(Auerbach, 2012/Courtesy Dr. John Williamson)

Jendrassik's maneuver /yendrä′shiks/ [Ernst Jendrassik, Hungarian physician, 1858–1921; Fr, *manoeuvre,* action], (in neurology) a distracting maneuver in which the patient hooks the flexed fingers of the two hands together and forcibly tries to pull them apart, used to overcome the voluntary suppression of reflexes. While this tension is being exerted, the lower extremity reflexes are tested.

jerk, **1.** a sudden abrupt motion such as a thrust, yank, push, or pull. **2.** a quick muscular contraction induced when a tendon over a bone is tapped. See also **spasm.**

jerk finger. See **trigger finger.**

jerk nystagmus, a slow drift of the eyes in one direction, followed by a rapid recovery movement in the other direction.

jerks, a form of choreomania, or morbid desire to make rhythmic movements, sometimes associated with emotional fervor.

jet humidifier, a humidifier that increases the surface area for exposure of water to gas by breaking the water into small aerosol droplets. Air or a gas passes through a restriction after entering the humidifier, producing a foaming mixture of liquid and gas. Gas issuing from the unit has a maximum amount of water vapor and a minimum of liquid water particles.

jet lag [L, *jacere,* to throw; Scand, *lagga,* to fall behind], a condition of desynchrony with disruption of the normal circadian rhythm, caused by rapid travel across several time zones. It is characterized by fatigue, insomnia, and disturbances in body function.

jet nebulizer [L, *nebula,* mist], a humidifier that uses Bernoulli's principle to convert a pool of liquid into a fine mist of aerosol particles. A jet stream of gas is projected at high velocity across the end of a capillary tube. The gas jet reduces the pressure at the top of the tube, causing the liquid to move to the top, where it is continuously drawn off as aerosol particles that enter the outflow passage of the humidifier.

Jeune's syndrome /zhœnz, zho͞onz/ [Mathis Jeune, French pediatrician, b. 1910], a form of lethal short-limbed dwarfism characterized by constriction of the upper thorax and occasionally by polydactylism. It is inherited as an autosomal-recessive trait. Also called **asphyxiating thoracic dysplasia.**

jeweler's forceps, a thumb forceps with very fine, pointed tips, used for microvascular and ophthalmic procedures.

Jewett brace. See **Griswald brace.**

jigger. See **chigoe.**

jimson weed /jim′sən/, a common name for *Datura stramonium,* a poisonous plant with large trumpet-shaped flowers. It is a member of solanaceous plants and a natural source of cholinergic blockers. Its chief components are the anticholinergics hyoscyamine and scopolamine.

jitters, **1.** irregularities in ultrasound echo locations caused by mechanical or electronic disturbances. **2.** a very uneasy, nervous feeling.

J/kg, abbreviation for *joules per kilogram.*

Joanna Briggs Institute, an international research and development organization located at the University of Adelaide, South Australia, that supports the synthesis, transfer, and utilization of evidence.

Jobst garment, a trademark for a type of pressure wrap applied to control hypertrophic scar formation or lymphedema.

jock itch. See **tinea cruris.**

JOD, abbreviation for **juvenile-onset diabetes.** See **type 1 diabetes mellitus.**

Jod-Basedow phenomenon /jod′ bä′zədō′/ [Ger, *Jod,* iodine; Karl A. von Basedow, German physician, 1799–1854], thyrotoxicosis that may occur when dietary iodine is given to a patient with endemic goiter in an area of environmental iodine deficiency. It is presumed that iodine deficiency protects some patients with endemic goiter from development of thyrotoxicosis. The phenomenon may also occur when large doses of iodine are given to patients with nontoxic multinodular goiter in areas with sufficient environmental iodine. Also called *iodine-induced hyperthyroidism.*

Joffroy's reflex /zhôfrô·äz′, jof′roiz/ [Alexis Joffroy, French physician, 1844–1908], a reflex contraction of the gluteus muscles produced when firm pressure is applied to the buttocks of patients with spastic paralysis of the lower limbs.

Joffroy's sign [Alexis Joffroy], **1.** an upward direction of a patient's gaze, caused by the absence of facial muscle contraction in ophthalmic goiter. **2.** an inability to perform simple mathematical exercises, such as addition or multiplication, caused by an organic brain disease.

jogger's heel [ME, *joggen,* to shake; AS, *hela,* heel], a painful condition characterized by bruising, bursitis, fasciitis, or calcaneal spurs that results from repetitive and forceful striking of the heel on the ground. It is common among joggers and distance runners. Judicious selection of well-fitting running shoes and avoidance of running on hard surfaces are recommended to prevent occurrence or recurrence of the condition.

Johnson, Dorothy E. [Dorothy E. Johnson, American nurse, b. 1919 d. 1999], a nursing theorist who developed a behavioral systems model presented in *Conceptual Models for Nursing Practice* (Riehl and Roy, eds., 1973). Johnson's theory addresses two major components: the patient and nursing. The patient is a behavioral system with seven interrelated subsystems. Each subsystem has structural and functional requirements. The structural elements include drive or goal; predisposition to act; choice, alternatives for action; and behavior. The attachment-affiliative subsystem forms the basis for all social organization. The dependency subsystem promotes helping behavior. The biological (ingestive and eliminative) and sexual subsystems have to do with social and psychological functions as well as biological considerations. The function of the achievement subsystem is to attempt to manipulate the environment. The functions of the aggressive subsystem are protection and preservation. Johnson considered that problems in nursing are caused by disturbances in the structure or functions of the subsystems or the system. Her behavioral systems theory provides a conceptual framework for nursing education, practice, and research.

Johnson's method, a technique for filling root canals, in which gutta-percha cones are dissolved in a chloroform-rosin solution in the root canal to form a plastic mass. The plastic material is forced toward the apex of the root canal, and more is added until the canal is sealed. Compare **lateral condensation method.**

joint [L, *jungere,* to join], any one of the articulations between bones. Each is classified according to structure and movability as fibrous, cartilaginous, or synovial. Fibrous joints are immovable, cartilaginous joints are slightly movable, and synovial joints are freely movable. Typical immovable joints are those connecting most of the bones of the skull with a sutural ligament. Typical slightly movable joints are those connecting the vertebrae and the pubic bones. Most of the joints in the body are freely movable and allow gliding, circumduction, rotation, and angular movement. Also called **articulation.** See also **cartilaginous joint, fibrous joint, synovial joint.**

joint and several liability, (in law) a condition in which several persons share the liability for a plaintiff's injury and may be found liable individually or as a group.

joint appointment, **1.** a faculty appointment to two institutions within a university or system, as to the schools of nursing and medicine of the same university. **2.** (in academic nursing) the appointment of a member of the faculty of a university to a clinical service of an associated service

Classification of joints

Type of joint	*Example*	*Description*
Fibroid (synarthrosis)		No movement is permitted
Suture	Cranial sutures	United by thin layer of fibrous tissue
Synchondrosis	Joint between the epiphysis and diaphysis of long bones	Temporary joint in which the cartilage is replaced by bone later in life
Cartilaginous (amphiarthrosis)		Slightly movable joint
Symphysis	Symphysis pubis	Bones are connected by a fibrocartilage disk
Syndesmosis	Radius-ulna articulation	Bones are connected by ligaments
Synovial (diarthrosis)		Freely movable; enclosed by joint capsule, synovial membrane
Ball and socket	Shoulder 	Widest range of motion, movement in all planes
Hinge	Elbow 	Motion limited to flexion and extension in a single plane
Pivot	Atlantoaxis 	Motion limited to rotation
Condyloid	Wrist between radius and carpals 	Motion in two planes at right angles to each other, but no radial rotation
Saddle	Thumb at carpometacarpal joint 	Motion in two planes at right angles to each other, but no axial rotation
Gliding	Intervertebral: between the articular surfaces of successive vertebrae 	Motion limited to gliding

Adapted from Seidel et al: *Mosby's guide to physical examination*, ed 6, St Louis, 2006, Mosby. Illustrations from Patton KT, Thibodeau GA: *Anatomy & Physiology*, ed 7, St Louis, 2010, Mosby.

institution. A psychiatric nurse might hold appointment in a university as an assistant professor and might also be a clinical nurse specialist in a service institution. The practice of joint appointments began at Case Western Reserve University, University Hospital, Cleveland. See also **unification model.**

joint audit. See **nursing audit.**

joint capsule [L, *jungere,* to join, *capsula,* little box], a fibrous saclike structure of connective tissue that envelops the end of bones in a diarthrodial joint and contains synovial fluid.

joint chondroma, a cartilaginous mass that develops in the synovial membrane of a joint.

joint conference committee, a hospital organization composed of the governing board, administration, and medical staff representatives whose purpose is to facilitate communication between the groups.

joint fracture. See **intraarticular fracture.**

joint instability, an abnormal increase in joint mobility. See also **hypermobility.**

joint mouse, a small, movable stone formed in or near a joint, usually a knee. See also **loose body.**

joint movement, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of all joints with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: ankle, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the ankle with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: elbow, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the elbow with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: fingers, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the fingers with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: hip, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the hip with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: knee, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the knee with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: neck, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the neck with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: passive, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as joint movement with assistance. See also **Nursing Outcomes Classification.**

joint movement: shoulder, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the shoulder with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: spine, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the spine with self-initiated movement. See also **Nursing Outcomes Classification.**

joint movement: wrist, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as active range of motion of the wrist with self-initiated movement. See also **Nursing Outcomes Classification.**

joint planning, the development by two or more health care providers of a strategic plan to serve the health care needs of an area while sharing clinical or administrative services or data but not assets.

joint practice, **1.** the practice of one or more physicians, nurses, and other health professionals, usually private, who work as a team, sharing responsibility for a group of patients. **2.** (in inpatient nursing) the practice of making joint decisions about patient care by committees of the physicians and nurses working on a division.

joint protection, the use of orthotics with therapeutic exercise to prevent damage or deformity of a joint during rehabilitation to restore power and range of motion. An example is a metal ankle-foot orthosis that allows weight-bearing on an extended knee.

joint replacement. See **arthroplasty.**

Jones criteria /jōnz/, a standardized set of guidelines for the diagnosis of rheumatic fever, as recommended by the American Heart Association. See also **rheumatic fever.**

Joseph disease. See **Machado-Joseph disease.**

Joubert's syndrome /zho͞o·bārz′/ [Marie Joubert, Canadian neurologist, 20th century], an autosomal-recessive syndrome consisting of partial or complete agenesis of the cerebellar vermis, with hypotonia, episodic hyperpnea, mental retardation, and abnormal eye movements. Most patients die in infancy.

joule (J) /jo͞ol/ [James P. Joule, English physicist, 1818–1889], a unit of energy or work in the meter-kilogram-second system and the SI system. It is equivalent to 10^7 ergs or 1 watt second and 100 rad.

journaling, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of writing as a means to provide opportunities to reflect upon and analyze past events, experiences, thoughts, and feelings. See also **Nursing Interventions Classification.**

joystick, **1.** a vertical stick or lever that can be manipulated in various directions to control a cursor or other movements on a computer screen. It is used mainly in playing computer games. **2.** a vertical stick or lever that can be manipulated in various directions to drive an electric wheelchair.

J-pouch, a fecal reservoir formed surgically by folding over the distal end of the ileum in an ileoanal anastomosis.

JRA, abbreviation for **juvenile rheumatoid arthritis.**

Judd method, a technique for positioning a patient for radiographic examination of the atlas and odontoid process.

judgment /juj′mənt/ [L, *judicare,* to judge], **1.** (in law) the final decision of the court regarding the case before it. **2.** the reason given by the court for its decision; an opinion. **3.** an award, penalty, or other sentence of law given by the court. **4.** the ability to recognize the relationships of ideas and to form correct conclusions from those data as well as from those acquired from experience.

judgment call slanga decision based on experience, especially a judgment that resolves a serious problem in which the data are inconclusive or equivocal.

jug-, **1.** prefix meaning "a yoke type of connection": *jugal, jugum, conjugal.* **2.** prefix meaning "collarbone, throat, neck": *jugular, jugate.*

jugal /jo͞o′gəl/ [L, *jugum,* yoke], pertaining to structures attached or yoked, as the zygomatic bone or malar bone.

jugu-, prefix meaning "to kill": *jugulate, jugulation.*

jugular /jug′yələr/ [L, *jugulum,* neck], **1.** *adj,* pertaining to or involving the throat. **2.** *n, (informal)* the jugular vein.

jugular foramen [L, *jugulum,* neck, *foramen,* hole], one of a pair of openings between the lateral part of the occipital bone and the petrous part of the temporal bones in the skull. The foramen contains the inferior petrosal sinus; the transverse sinus; some meningeal branches of the occipital and ascending pharyngeal arteries; and the glossopharyngeal, vagus, and accessory nerves.

jugular foramen syndrome. See **Vernet's syndrome.**

jugular fossa, a deep depression adjacent to the interior surface of the petrosa of the temporal bone of the skull.

jugular notch of the sternum, the large notch in the manubrium of sternum. Also called **suprasternal notch.**

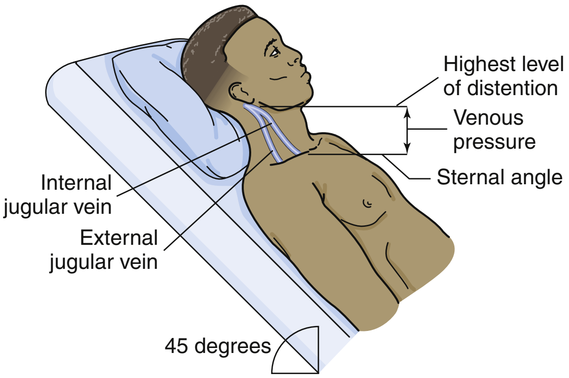
jugular process, a portion of the occipital bone that projects laterally from the squamous part to the temporal bone. On its anterior border a deep notch forms the posterior and medial boundary of the jugular foramen.

jugular pulse, a pulsation in the jugular vein caused by conditions that inhibit diastolic filling of the right side of the heart.

jugular trunk, one of the two lymphatic vessels, right and left, that drain the head and neck.

jugular tubercle, a large rounded mound of the occipital bone medial to the jugular foramen.

jugular venous pressure (JVP), blood pressure in the jugular vein, which reflects the volume and pressure of venous blood. JVP is estimated by positioning the head of a supine patient at a 30- to 45-degree angle and observing the neck veins. If the neck veins are filled only to a point a few millimeters above the clavicle at the end of exhalation, JVP is usually normal. With an elevated JVP the neck veins may be distended as high as the angle of the jaw. An elevated JVP is typically a sign of congestive heart failure.



Position of jugular veins to determine venous pressure *(Monahan et al, 2007)*

jugum /jo͞o′gəm/ [L, yoke], a ridge or furrow joining two points.

juice /jo͞os/ [L, *jus,* broth], any fluid secreted by the tissues of animals or plants. In humans it usually refers to the secretions of the digestive glands. Kinds of juices include **gastric juice, intestinal juice,** and **pancreatic juice.**

juice therapy, the use of concentrated nutritional elixirs of fruit extracts and vegetables for nutritional maintenance; illness prevention; detoxification; and adjunctive treatment of allergies, digestive disorders, rheumatoid arthritis, skin diseases, and other conditions such as hypotension and hypertension, bronchitis, obesity, and insomnia.

jumentous /jo͞omen′təs/ [L, *jumentum,* beast of burden], having a strong animal odor, especially that of a horse. The term is used to describe the odor of urine associated with certain disease conditions.

jumping disease, any of several culture-specific disorders characterized by exaggerated responses to small stimuli, muscle tics including jumping, automatic obedience even to dangerous suggestions, and sometimes coprolalia or echolalia. It is unclear whether the responses are neurogenic or psychogenic in origin. Examples include **Gilles de la Tourette's syndrome** and **jumping Frenchmen of Maine syndrome.**

jumping Frenchmen of Maine syndrome, a form of jumping disease observed in a group of lumbermen of French-Canadian descent working in a remote area of Maine. Affected individuals had exaggerated startle responses, automatic obedience, and often echolalia. It is believed to have represented a form of operant conditioning rather than a true disease. See also **jumping disease.**

jumping gene. See **transposon.**

junction /jungk′shən/ [L, *jungere,* to join], an interface or meeting place for tissues or structures.

junctional bigeminy /jungk′shənəl/ [L, *jungere,* to join, *bis,* twice, *geminus,* twin], cardiac arrhythmia in which each sinus beat is followed by a junctional beat after a constant delay.

junctional epithelium [L, *jungere,* to join; Gk, *epi* + *thele,* nipple], an area of epithelial soft tissue surrounding the abutment post of a tooth. Also called **attached epithelial cuff, epithelial cuff, gingival cuff.**

junctional extrasystole [L, *jungere,* to join, *extra,* beyond; Gk, *systole,* contraction], a premature heartbeat that usually arises from the junction of the atrioventricular (AV) node and the AV bundle, the primary junctional pacing site, but may also arise from within the AV bundle.

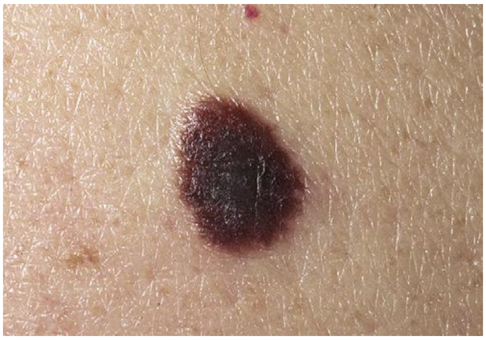
junctional parenchymal defect, on ultrasound of the kidney, an echogenic mass sometimes seen in the parenchyma, resembling a cortical scar but indicating only a benign collection of fat at the junction where two of the fetal lobes of the kidney fuse.

junctional rhythm, a cardiac rhythm usually originating at the junction of the atrioventricular (AV) node and the AV bundle. It may be a normal escape rhythm (rate between 40 and 60 beats/min) or an active focus (rate 60 beats/min or greater).

junctional tachycardia, a junctional rhythm with a rate greater than 100 beats/min. The mechanism may be enhanced normal automaticity, abnormal automaticity, or triggered activity caused by digitalis toxicity.

junction lines, vertical lines that appear in the mediastinum on a posterior-anterior projection radiographic image of the chest.

junction nevus [L, *jungere,* to join, *naevus,* birthmark], a hairless flat or slightly raised brown skin blemish arising from pigment cells at the epidermal-dermal junction. A junctional nevus may be found anywhere on the surface of the body. Malignant change may be signaled by increase in size, hardness or darkening, bleeding, or appearance of satellite discoloration around the nevus. Junctional nevi undergoing these changes and lesions found in areas subject to trauma should be evaluated by a dermatologist.



Junction nevus *(Habif, 2010)*

junctura cartilaginea. See **cartilaginous joint.**

junctura fibrosa. See **fibrous joint.**

junctura synovialis. See **synovial joint.**

juncture. a joint or union of two parts.

jungian psychology. See **analytic psychology.**

Junin fever. See **Argentine hemorrhagic fever.**

juniper tar /jo͞o′nipər/ [L, *juniperus* + AS, *teoru*], a dark, oily liquid obtained by the destructive distillation of the wood of *Juniperus oxycedrus* trees, used as an antiseptic stimulant in ointments for skin disorders such as psoriasis and eczema. Also called **cade oil.**

junk. See **heroin.**

jurisprudence /jo͞o′rispro͞o′dəns/ [L, *jus,* law, *prudentia,* knowledge], the science and philosophy of law. **Medical jurisprudence** relates to the interfacing of medicine with criminal and civil law.

justice [L, *justus,* sufficient], **1.** a principle of fair and equal treatment for all, with due reward and honor. **2.** (in research) equitable distribution of benefits and burdens of research. **3.** treating people in a nonprejudicial manner.

juvenile /jo͞o′vənəl, -vənīl/ [L, *juvenus,* youthful], **1.** *n,* a young person; a youth; a child; a youngster. **2.** *adj,* pertaining to, characteristic of, or suitable for a young person; youthful. **3.** *adj,* physiologically underdeveloped or immature. **4.** *adj,* denoting psychological or intellectual immaturity; childish.

juvenile alveolar rhabdomyosarcoma, a rapidly growing tumor of striated muscle occurring in children and adolescents, chiefly in the extremities. The prognosis is grave.

juvenile angiofibroma. See **nasopharyngeal angiofibroma.**

juvenile aponeurotic fibroma. See **aponeurotic fibroma.**

juvenile delinquency, persistent antisocial, illegal, or criminal behavior by children or adolescents to the degree that it cannot be controlled or corrected by the parents. It endangers others in the community, and it becomes the concern of a law enforcement agency.

juvenile delinquent, a person who performs illegal acts and who has not reached an age at which treatment as an adult can be accorded under the laws of the community having jurisdiction. Also called **juvenile offender, young offender.**

juvenile diabetes. See **type 1 diabetes mellitus.**

juvenile glaucoma [L, *juvenus,* young; Gk, *glaukcos,* bluish-gray], increased intraocular tension in a young adult caused by developing structural defects that restrict the outflow of fluid. There is a strong genetic influence.

juvenile kyphosis. See **Scheuermann's disease.**

juvenile laryngeal respiratory papillomatosis, multiple squamous cell tumors that develop in the larynx, usually in young children. The growths are transmitted by a papilloma virus and may be acquired from the mother. The laryngeal papillomas tend to undergo periods of remission and recurrence over a period of several years.

juvenile lentigo. See **lentigo.**

juvenile myoclonic syndrome, a condition in which myoclonic seizures begin to appear around the time of puberty. The myoclonic jerks are more likely to occur immediately after awakening and are often associated with sleep deprivation and photosensitivity.

juvenile myxedema. See **childhood myxedema.**

juvenile offender. See **juvenile delinquent.**

juvenile-onset diabetes, juvenile onset-type diabetes. See **type 1 diabetes mellitus.**

juvenile periodontitis, an abnormal, extremely invasive condition characterized by severe localized pocketing and bone loss in the dental alveoli of children and adolescents, generally associated with poor oral hygiene and inadequate nutrition.See **aggressive periodontitis.**
